## 2. Design of Steel Deck Plate

### 2. 1. Design Principle

#### (1) Analysis model according to equivalent grid method

Analysis of the steel deck plate is calculated according to the “equivalent grid method”. The “equivalent grid method” is an analysis using a general deformation method, using steel deck plates stiffened by longitudinal ribs and transverse ribs as a plane grid model.

#### (2) Analysis of relative stiffness

##### (a) Bending stiffness of members

The bending stiffness of longitudinal ribs and transverse ribs are calculated by taking into consideration the effective width of the deck plate as a flange as shown in “figure 9.4.2 Specifications for Highway Bridges Part II: STEEL BRIDGES”. The equivalent span length of the transverse ribs is calculated using effective width  $L$  for the intermediate section and  $2L$  for the flared section.

As for the longitudinal ribs of the U-shaped steel, torsional stiffness is taken into consideration. Also, in order to consider the load distribution between the longitudinal ribs of the deck plate, a virtual distribution girder should be installed equivalent to the interval of the transverse ribs.

##### (b) Torsion stiffness of U-shaped steel

Longitudinal ribs are considered as one individual bar member without cross-sectional deformation. Therefore, torsional stiffness (calculated using simple torsional resistance) does not reduce, and is considered 100% effective, calculated by the following equations.

$$\text{Torsion stiffness} = 4 \cdot A^2 / \left\{ \left( \frac{u}{tR} \right) + \left( \frac{a}{tP} \right) \right\}$$

$A$  : Cross-sectional area surrounded by U-shaped steel

$u$  : Developed width of U-shaped steel

$a$  : Upper side width of U-shaped steel

$tR$ : Thickness of U-shaped steel

$tP$ : Thickness of deckplate

(c) Calculations for equivalent virtual distribution girders

Flexural stiffness equivalent to a rigid frame structure composed of the deck plate and peripheral walls of the longitudinal rib is applied to virtual girders that function as load distribution between the longitudinal ribs when considering cross-sectional deformation. Because this rigid frame structure continues lengthwise to the bridge axial direction, first of all, the equivalent moment of inertia of area per unit length is calculated. Then for the lattice model, one distribution girder is installed at intervals of the transverse ribs and here flexural stiffness is concentrated.

(3) Cross-sectional force calculated by analyzing the influence line

As for calculating the cross-sectional force, analysis of the influence line is implemented at all times where maximum and minimum cross-sectional force is calculated by category of member such as longitudinal and transverse ribs.

(4) Other factors

Splice calculations for brackets are designed using maximum girder height within the group members.

## 2. 2. Load intensity

### (1) Death load

$$\text{Pavement (roadway)} \quad 0.080 \text{ m} * 22.50 \text{ kN/m}^3 = 1.80 \text{ kN/m}^2$$

$$\text{Steel weight} = 2.50 \text{ kN/m}^2$$

$$\begin{aligned} \text{Wheel guard(left side)} &= 4.85 \text{ kN/m} \quad \text{distance from inner line of wheel guard} = 0.300 \text{ m} \\ \text{(right side)} &= 4.85 \text{ kN/m} = 0.300 \text{ m} \end{aligned}$$

$$\text{Bridge railing(left side)} = 0.49 \text{ kN/m} = 0.300 \text{ m}$$

$$\text{(right side)} = 0.49 \text{ kN/m} = 0.300 \text{ m}$$

Median division load : refer to load intensity of each model

$$\text{Additive load (total width)} = 0.70 \text{ kN/m}^2$$

### (2) Live load

$$\text{T-load(Blive load)} \quad \text{rear wheel load } P = 100 \text{ kN}$$

※) Do not load T-load at median division.

### (3) Impact coefficient

$$\text{Longitudinal rib} \quad i = 0.4$$

$$\text{Transverse rib} \cdot \text{bracket} \quad i = 20/(50+L) \quad L: \text{Transverse rib} \cdot \text{bracket span length (m)}$$

## 2. 4. Calculation of longitudinal rib

### (1) G 1 · G 2 max / Model-6 Sec-1(effective span)

#### Cross-sectional force and calculation condition

For cross-section calculation  $M = 40.40 \text{ kN}\cdot\text{m}$   $S = 33.83 \text{ kN}$   
 For splice  $M_j = 40.40 \text{ kN}\cdot\text{m}$   $S_j = 33.83 \text{ kN}$

#### Calculation of effective width

\*equivalent span length  $L = 0.6 * LC = 0.6 * 232.5 = 139.5 \text{ cm}$

LC : transverse rib interval (longitudinal rib span length)

$B1 = 16.0 \text{ cm}$

## 2. 5. 2. Calculation of stiffeners

### (1) Description of the formula

Check of spacing of vertical stiffeners

It will be confirmed that K1 and K2 shall satisfy the below formula.

$$K1 = a/b \leq 1.5$$

1) In case no horizontal stiffeners are used

$$K2 = [b/(100*t)]^4 * [(\sigma/345)^2 + \{\tau/(77+58*(b/a)^2)\}^2] \leq 1 : (a/b > 1)$$

$$K2 = [b/(100*t)]^4 * [(\sigma/345)^2 + \{\tau/(58+77*(b/a)^2)\}^2] \leq 1 : (a/b \leq 1)$$

2) In case one rung of stiffener is used

$$K2 = [b/(100*t)]^4 * [(\sigma/900)^2 + \{\tau/(120+58*(b/a)^2)\}^2] \leq 1 : (a/b > 0.80)$$

$$K2 = [b/(100*t)]^4 * [(\sigma/900)^2 + \{\tau/(90+77*(b/a)^2)\}^2] \leq 1 : (a/b \leq 0.80)$$

2) In case two rungs of stiffener are used

$$K2 = [b/(100*t)]^4 * [(\sigma/3000)^2 + \{\tau/(187+58*(b/a)^2)\}^2] \leq 1 : (a/b > 0.64)$$

$$K2 = [b/(100*t)]^4 * [(\sigma/3000)^2 + \{\tau/(140+77*(b/a)^2)\}^2] \leq 1 : (a/b \leq 0.64)$$

Required stiffness of vertical stiffener

$$I_v \cdot req = b * t^3 / 11 * \gamma_v \cdot req \quad \gamma_v \cdot req = 8.0 * (b/a)^2$$

Minimum width :  $b/30 + 50$  (mm)

Minimum thickness : 1/13 of width of the stiffener

Required stiffness of horizontal stiffener

$$I_h \cdot req = b * t^3 / 11 * \gamma_h \cdot req \quad \gamma_h \cdot req = 30 * (a/b)$$

Definition of the symbol

a : Spacing between vertical stiffeners

b : Width of web

t : Thickness of web

$\sigma$  : Edge compressive stress of web

$\tau$  : Shear stress of web

### 3. Calculations of cross-sectional force

#### 3.1. Analysis Principle

Structural analysis is implemented by using a deformation method according to the unsolicited lattice theory, following the guidelines below.

- 1) Structural analysis consists of the main girder member and transverse member of the cross beam that has flexural stiffness.  
The analysis programs are based on displacement way is used and calculate the cross-sectional force using a calculator.
- 2) "LOAD" indicates DEAD-LOAD, LIVE-LOAD (AASHTO LOAD LRFD).
- 3) The difference between calculation inertia and real inertia is considered lower than 5%.
- 4) The difference between calculation weight of steel girder and real weight of steel girder is considered lower than 5%.
- 5) Coordinate system used for the analysis

Displacement value that the analysis software outputs is defined by the global coordinate system and the cross-sectional force is defined by the local coordinate system. When importing the cross-sectional force file by using the cross-section calculation software, one must be aware of the direction of the moment.

The correspondence between the cross-section calculation software and i edgewise cross-sectional force calculated by analysis software is as follows.

i edgewise cross-sectional force calculated by analysis software

Coordinate system of cross-section calculation software

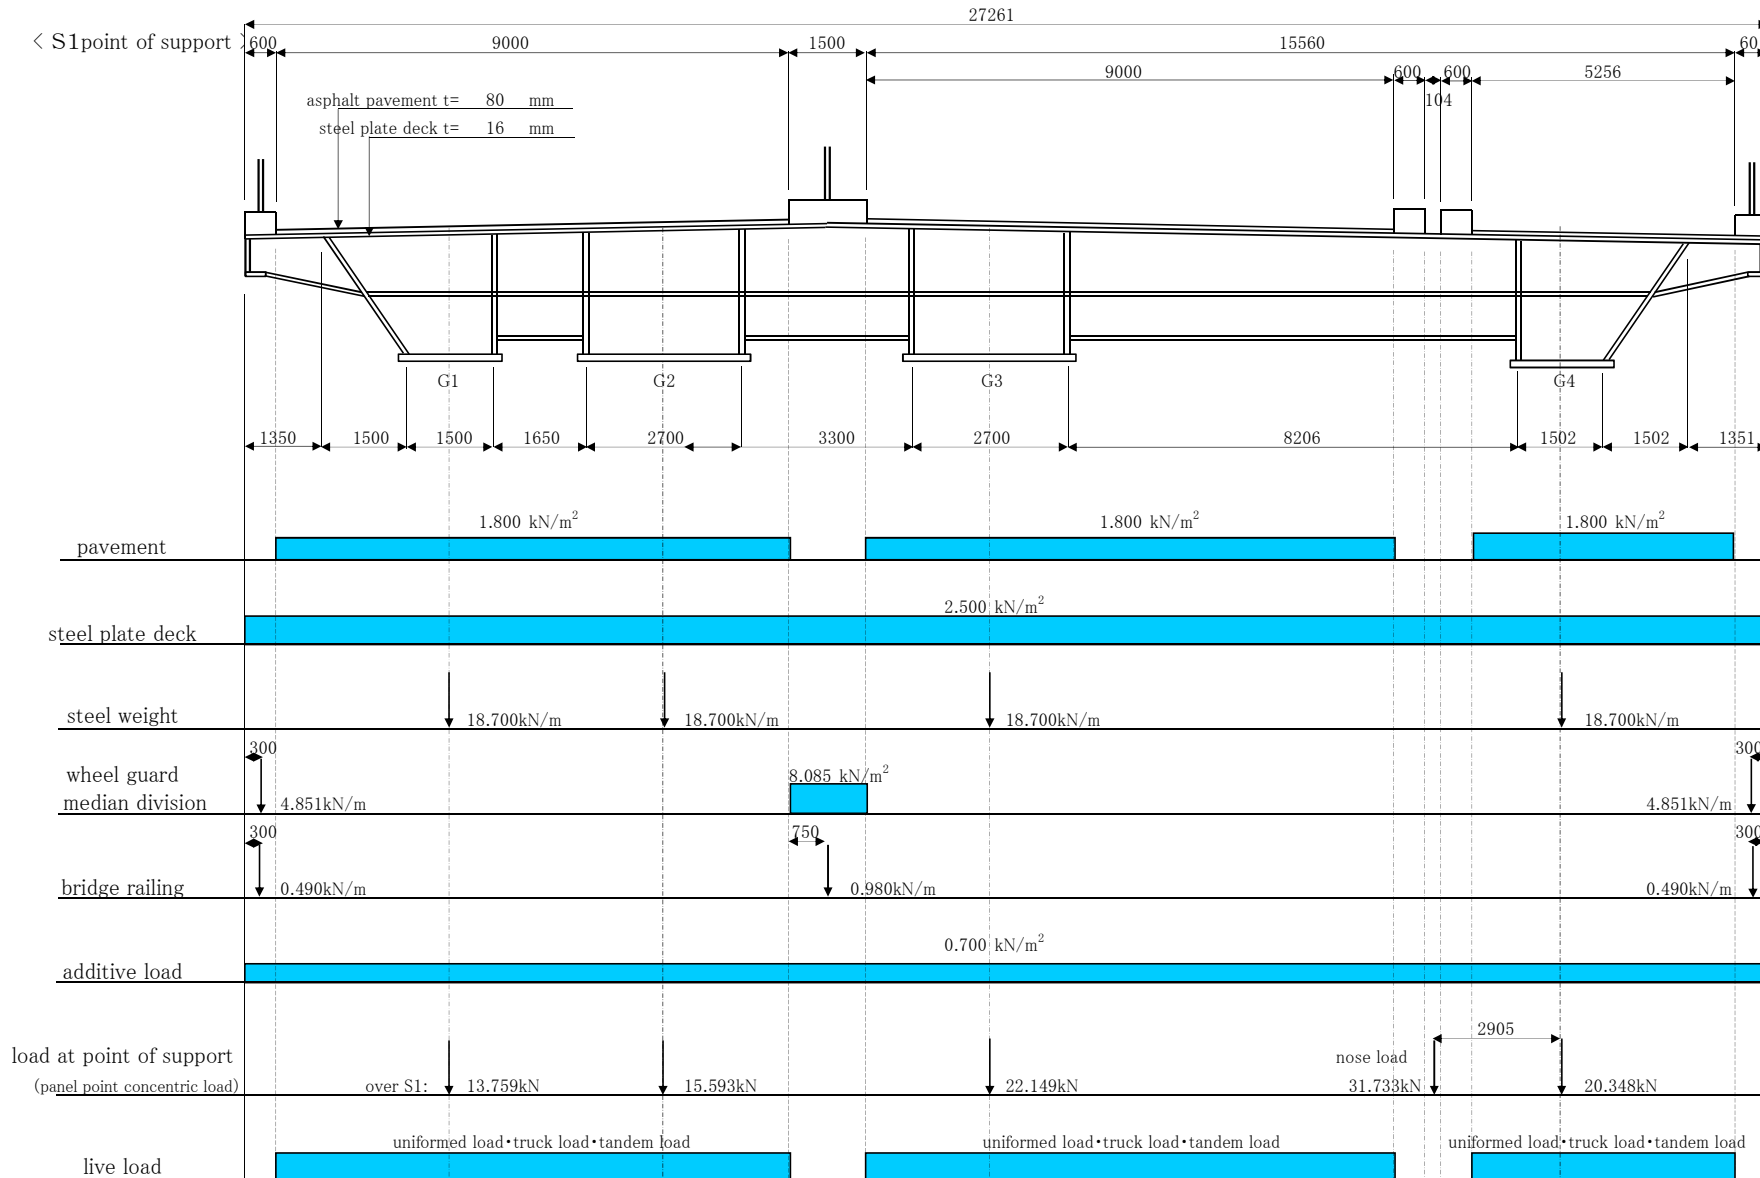

analysis software		cross-section calculation software
S2(2 axial force)	→	Sy(in-plane shear force)
TQ(1axis rotation force)	→	T(torsion moment)
M3(3axis rotation force)	→	Mx(in-plane bending moment)
