List of Tables

Notations used

N	=	Observed SPT value
N_{60}	=	SPT value corrected for energy, borehole diameter, sampling method, rod length
C_E	=	Energy (hammer) correction factor
C_B	=	Borehole diameter correction factor
C_R	=	Rod length correction factor
C_S	=	Sampling barrel correction factor
N'	=	SPT value corrected for overburden
C'	=	correction due to overburden
ϕ	=	Friction angle
ϕ'	=	Mobilized friction angle
R.D.	=	Relative density
q_{nu}	=	Net ultimate bearing capacity
q_{ns}	=	Net safe bearing capacity
q_s	=	Gross safe bearing capacity
N_c, N_q, N_γ	=	Bearing capacity factors
s_c, s_q, s_γ	=	Shape factors
d_c, d_q, d_γ	=	Depth factors
i_c, i_q, i_γ	=	Inclination factors
α	=	Inclination of the load to the vertical in degrees
N_c', N_q', N_γ'	=	Bearing capacity factors obtained from mobilized friction angle ϕ'
c	=	Cohesion
q	=	Effective surcharge at the base level of foundation
γ	=	Bulk unit weight of foundation soil
B	=	Width of footing
L	=	Length of footing
R_{w1}	=	Water table correction for surcharge
R_{w2}	=	Water table correction for water level below base of footing
D_f	=	Depth of footing
D_w	=	Depth of water table from ground level
a	=	Height of water table above the base of footing
b	=	Depth of water table below the base
ρ	=	Density of soil sample in gm/cc
D_{10}	=	Particle size corresponding to % of fines 10%
D_{50}	=	Particle size corresponding to % of fines 50%
D_{60}	=	Particle size corresponding to % of fines 60%
D_{90}	=	Particle size corresponding to % of fines 90%
C_u	=	Coefficient of uniformity
C_c	=	Coefficient of curvature

Chapter 1: **INTRODUCTION**

1.1 Project Background

Sindhuli road is one of the major road that links Kathmandu (capital of Nepal) with the Eastern Terai region of Nepal. Sindhuli road, having 160 km in total was constructed with grant assistance of government of Japan through JICA. The road has been in operation since 2015. Sindhuli road covers Bardibas, Sindhuli, Khurkot, Nepalthok and Dhulikhel.

Due to the heavy rainfall, the seasonal rivers (Bhyakure Khola, Ghyampe Khola) were over flooded causing substantial damage to the local road further resulting in delays in daily traffic flow. This called for the engineering assistance for its maintenance and design of the road structure accordingly for the sections of the road damage by the flood.

Hence, Nippon Koei appointed Soil Test P. Ltd to undertake the geotechnical drilling at each of the proposed bridge location. This geotechnical investigation report is prepared based on the results of the site works carried out by Soil Test P. Ltd, Sanepa, Lalitpur for proposed site of bridge foundation of Bhyakure Khola Bridge at Khaldhunga of Kavrepalanchok district and at Sunkoshi Gaupalika at Sindhuli District of Nepal. This report uses the result of borehole investigation to characterize the subsurface conditions and propose safe bearing capacities of the bridge foundation.

The soil investigation works for the four (4) boreholes were carried out from 10th September 2019 to 29th September, 2019.

1.2 Location of the Proposed Bridges

1.2.1 Bridge at Bhyakure Khola

The proposed bridge over Bhyakure Khola at Khaldhunga of Kavrepalanchok district lies in Roshi Gaupalika. The location of drilling points at Bhyakure Khola is shown in figure 1.1

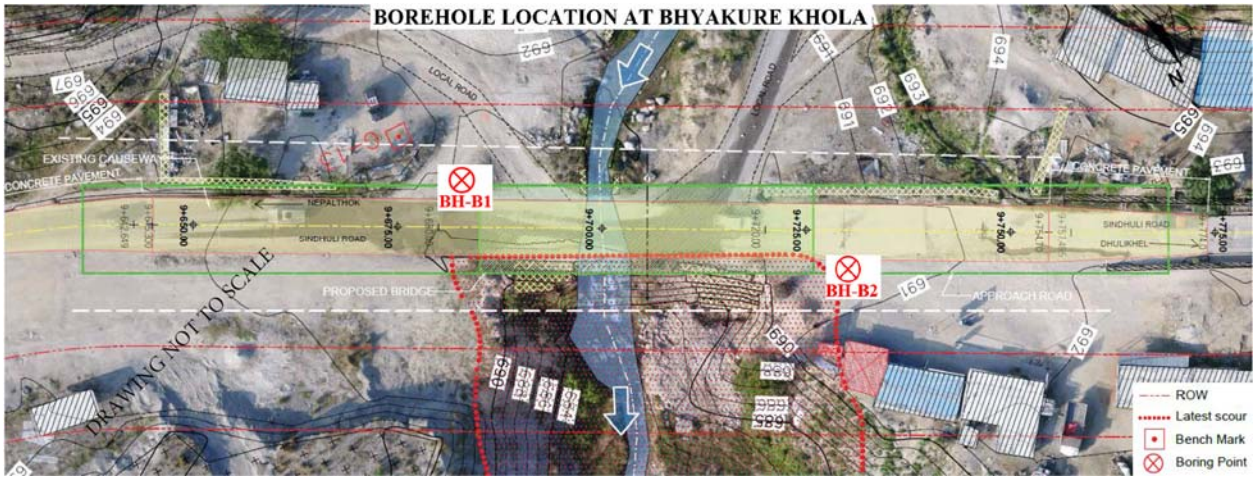

Figure 1.1 Location of Bhyakure Khola Bridge

1.2.2 Bridge at Ghyampe Khola

The proposed bridge over Ghyampe Khola at Sindhuli district lies in Sunkoshi Gaupalika. The location of drilling points at Ghyampe Khola is shown in figure 1.2.

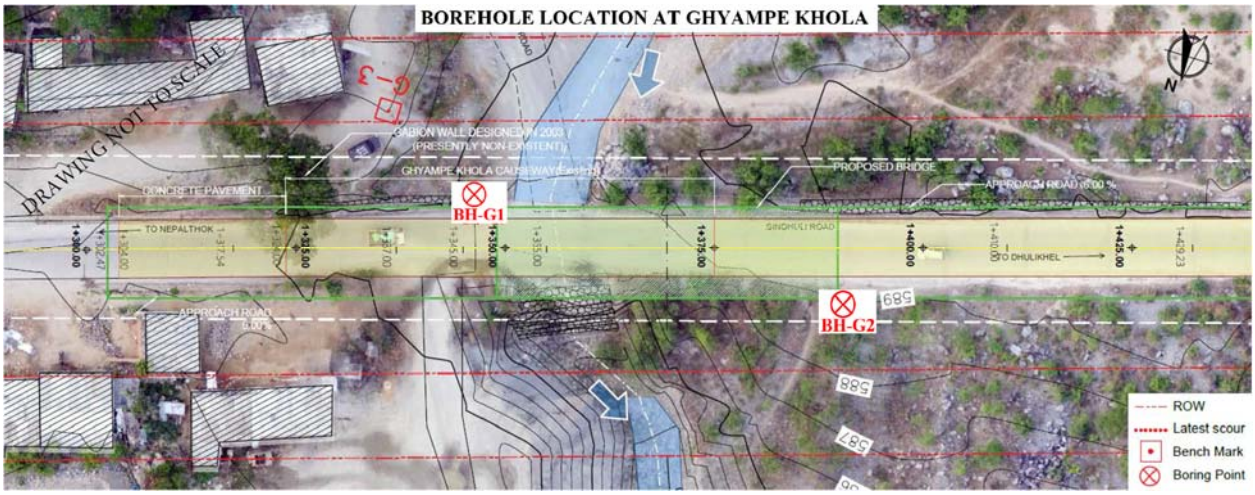

Figure 1.2: Location of Ghyampe Khola Bridge.

1.3 Scope of Work

This report includes:

- The findings of the geotechnical drilling of boreholes.
- The presentation, interpretation of the field data, borehole logs and calculation safe bearing capacities (Annex attached)

1.4 Collection and Review of Available Data

Literature Review of site conditions, topographical and geological characteristic of the project area was conduction via collecting and previously conducted soil investigation reports of nearby corridors, existing geological maps. Information stored in the form of maps, tables and published papers are collected from various sources. However, none of these institutions has a database to store and manage this valuable information, and a comprehensive computerized soil information system is not established.

Chapter 2: **ENGINEERING GEOLOGY**

2.1 General Geology

As per the Geological map of Nepal, the project site lies in Nawakot Group where rocks like phyllite, sandstones and quartzite were encountered.

Geological map of Nepal with the project area is shown in (Fig. 2-1). The Geological map of Nepal was published by the Department of Mines and Geology, Government of Nepal.

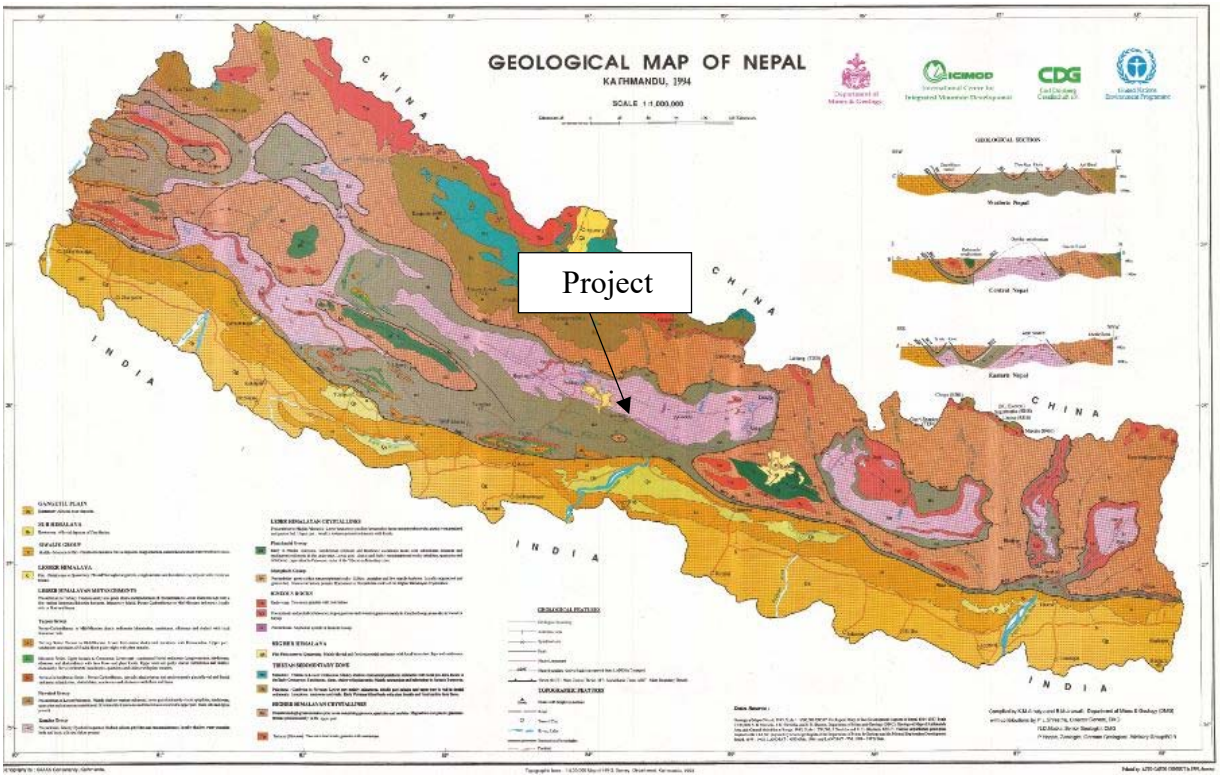

Figure 2.1 Geological map of Nepal including project area

2.2 Geological background of the area

The area comprises of Higher Himalaya, Lesser Himalaya along the sections. The area falls under the Central Nepal with most of the rocks from the Kathmandu complex. The rocks of central Nepal are differentiated into the Nawakot Complex, representing the Lesser Himalayan sequence and the physically overlying Kathmandu Complex (Stöcklin and Bhattarai 1977; Stöcklin 1980), belonging to the Higher Himalayan crystallines and Tethyan Himalayan sequence. The two complexes differ basically in their lithostratigraphic characteristics and are separated from each other by the Mahabharat Thrust, which is the southern continuation of the Main Central Thrust (Stöcklin et al. 1982). On the other hand,

the Lesser Himalayan rocks are thrust over the Siwaliks along the Narayani alias Main Boundary Thrust.

Hagen (1969) incorporated the elevated terrain north of Kathmandu into his Gosaikunda tectonic bridge, which has survived erosion from two mighty rivers: the Trishuli on the west and Sun Koshi on the east (Fig. 10.1). The region also contains to the south, a large doubly plunging megafold, called the Mahabharat Synclinorium. It has a well-developed west closure and a narrow and elongated east wing (Stöcklin 1980). Paleozoic granites preponderate in this region, especially within the synclinorium. Arita et al. (1973) made fairly detailed descriptions of the Higher Himalayan metamorphic mineral assemblages. Nadgir (1976) separated his Kathmandu Group into the Bhimphedi, Chitlang, and Chandragiri formations. He envisaged the Sheopuri Gneisses as intrusive and, contrary to Auden (1935), did not favor their correlation with the Darjeeling Gneiss.

The Lesser Himalayan rocks of this region compose a relatively wide portion of the Great Midland Antiform in the inner zone between Nuwakot and Dhunche. The rocks reappear in the Okhaldhunga tectonic window, which is separated from the inner zone by the Gosaikunda tectonic bridge. A narrow and discontinuous Lesser Himalayan strip stretches along the foothills of the Mahabharat Range, and a few of its slivers crop up amid the Siwaliks in the Bagmati River and north of the Marin Khola. In the Bagmati–Gosaikunda region too, the grade of metamorphism steadily increases from the foreland to the hinterland (Beyssac et al. 2004). As a result, the black slates of the outer zone pass into the inner zone as graphitic schist

2.3 Surface Geology

The area around the bridge location is covered by river deposit mostly of Quartzite, dolomite, granite and schist. The rock around the area is schist and quartzite. Quartzite is blueish grey, medium to fine grained, intercalated with schist. The Schist is intercalated in quartzite but as we move towards upstream the proportion of schist at Bhyakure Khola increases whereas at Ghyampe Khola the nearby area is dominated by quartzite. At Bhyakure Khola small stream is available all year round but during monsoon the khola is flooded. Ghyampe Khola is dry during winter whereas at monsoon the river has water with occasional debris flow. The photo of outcrop of Bedrock exposed in field is shown in Figure 2.2. The photo at the upstream of Bhyakure khola is shown in Figure 2.3.

Figure 2.2: Exposed outcrop on the hill side at Ghyampe khola.

Figure 2.3: Gravel with Boulder at the upstream Bhyakure Khola.

2.3.1 Surface Geology around Bhyakure Khola

The riverbed of the Bhyakure River is covered by alluvial deposits and bedrocks of Schist and quartzite. The place where the bridge is to be constructed consist of alluvial deposit which are mostly gravel with boulder and cobbles. Sand is light grey medium to coarse with angular to sub angular. Boulders are of Dolomite, granite, quartzite and schist. The river is extensively mined for aggregates in the locality.

2.3.2 Surface Geology around Ghyampe Khola

The riverbed of Ghyampe Khola is covered by alluvial deposit. The place where the bridge is to be constructed consist of alluvial deposit which is mostly gravel with boulder and cobbles. Sand is light grey to dark grey, fine to coarse grained with 5% silt. Boulders are of dolomite, calc quartzite, metasandstone, and schists.

Chapter 3: **GEOTECHNICAL INVESTIGATION METHODOLOGY**

Geological condition/stratum at the test site is important aspect to determine the depth, size and types of foundation. Drilling can define the characteristic and strength of soil and rock in both unstable and stable zones. Standard Penetration Tests and Dynamic Cone Penetration Tests carried out in different depths can give appropriateness of the densification of the soil strata.

The proposed drilling site area is known to have overlain by gravelly and boulder area from preliminary site visits. Therefore, the drilling team mobilized a rotary drilling rig for undertaking the drilling of the proposed drill holes. A site specific safety protocols were developed for technical team and workers working at site including compulsion uses of safety helmets, boots and safety gloves while working.

3.1 Drilling

Boring investigation was performed in the subsoil to abstract information of soil state, thickness and depth of layers etc. The subsoil distribution, fractured zone and soft ground shall be grasped for the foundation design of structures depending on boring test results. In addition, in-situ tests, sounding, and underground water level measurement were performed using bore-holes.

The drilling works were carried out using Rotary Drilling Rig. The diameter of 75mm borehole at all the locations of the site used was used at the locations of the drill sites. The boreholes were logged continuously in the field. The borehole logs included visual classification of soil, records of SPT for penetration of 450 mm, records of DCPT for penetration of 300mm and position of water table. The borehole logs for site are presented in Annex-1 including general ground water table.

Table 3-1: Location of Boreholes

SINDHULI ROAD PROJECT										
S.N.	BORE HOLE	LOCATION	COORDINATES			START DATE	END DATE	DEPTH	TESTS NO	WATER TABLE
			NORTHING	EASTING	ELEVATION (m)					
1	B1	Bhyakure Khola (Nepalthok side)	27.469377	85.750832	691	9/15/2019	9/19/2019	16 m	7	12.5 m

3.2 Soil Sampling

Due to presence of gravelly and boulder strata no samples of soil were obtained from the site for lab testing. The rock samples obtained in the barrel and casing of the equipment along with wash samples obtained through flow of return water during drilling was collected and analyzed visually and recorded in bore logs.

Only barrel and wash samples were obtained and collected in core boxes to have general idea of the strata.

3.3 Field Test

The field test conducted at the site consists of Standard Penetration Test (SPT) and Dynamic Cone Penetration Test (DCPT). They are the method for measuring soil characteristics of relative density and strength simply and quickly by penetrating resistance into the ground and pulling out it onto the ground.

Figure 3.1 Field photograph of DCPT test

3.3.1 Standard Penetration Test (SPT)

A standard split barrel sampler was used in the test. The SPT tests were conducted in all the boreholes of the site at a depth interval of every 1.5 m. The driving of split-spoon barrel was recorded at first 150 mm and then after at every 150 mm of penetration till the total penetration was 450 mm. The number of blows recorded for the first 150 mm of penetration is disregarded. The number of blows recorded for the last two 150 mm intervals are added and expressed as SPT N-value. The records of the SPT values obtained are presented in borehole logs in Annex-1.

The recorded SPT values are without any correction of overburden pressure and water table. The test was conducted without using liner.

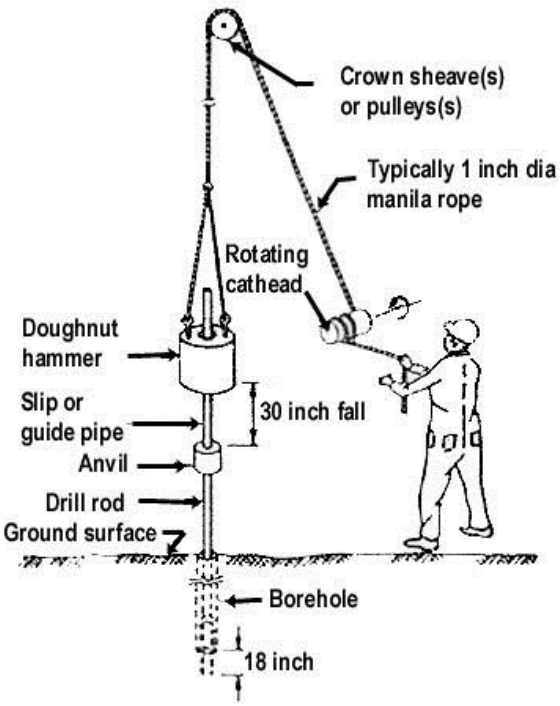

Figure 3.2: Schematic Description of Standard Penetration Test/Dynamic Cone Penetration Test

3.3.2 Dynamic Cone Penetration Test (DCPT)

It consists of driving a cone by blows of hammers. The number of blows for driving the cone through a specified distance is a measure of the dynamic cone resistance. Dynamic Cone Penetration tests are performed by a 50-mm solid cone. The driving energy is given by a 63.5 kg monkey hammer falling freely through a height of 750 mm onto the drive head. First of all, the cone is driven 100 mm into the soil at the bottom of the bore hole. It is then driven further 200 mm and the number of blows (N_{cbr} values) required to drive this distance is recorded.

The result i.e., N_c values first corrected to the Standard Penetration Test (SPT) value (N) and that provides and estimation of degree of compaction of soil strata, values of angles of internal friction (Φ) and allowable bearing capacity. The dynamic cone resistance is correlated with the SPT (N) as given below.

N_c = 1.5 N for depth up to 3 m

= 1.75 N for depth 3 to 6 m

= 2 N for depth greater than 6 m

The records of the DCPT values obtained are also presented in borehole logs in Annex-1

3.4 Ground Water Table Monitoring

The position of ground water table was measured at each borehole from the ground surface. The water level observed in the boreholes at the end of a 24 hours long period after completion of boring work was taken as the position of ground water table. The depth to ground water table observed are recorded in the borehole logs presented.

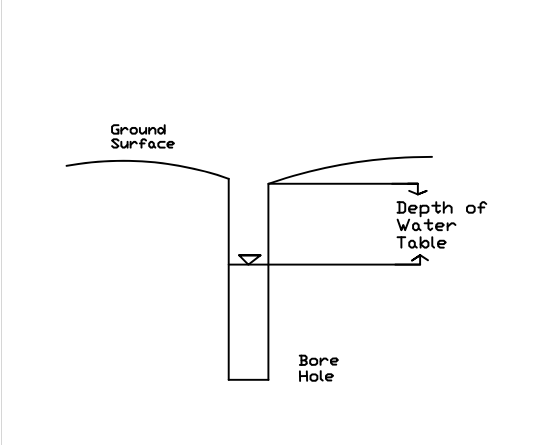

Figure 3.3 Reference point for measuring water level

3.5 Laboratory Testing

No undisturbed samples and representative samples could be collected for laboratory tests due to presence of gravelly and boulder strata. Only boulders/gravels stuck in the barrel of the drilling equipment and wash materials are kept layer wise to have the general idea of the strata at the borehole location. Some of the core samples kept in the core box are shown below:

Chapter 4: **FINDINGS ON GEOTECHNICAL INVESTIGATIONS**

4.1 Bhyakure Khola

4.1.1 At the location of B-1

This core drill is conducted along the riverbed of the Bhyakure Khola, on left bank, from top layer to bottom up to 16 m depth boulder mixed soil can be found. The field photograph at Bhyakure site is shown in figure 3.4. Boulders and gravel are of quartzite (white to bluish grey, coarse grained), dolomite (Bluish grey, fine grained). Clasts are angular to sub-angular. The DCPT value shows that the strata is very dense. The core box, in-situ test and site photographs are attached at Annex-2, Annex-3, and Annex-4

Figure 4.1 panorama photograph of Bhyakure site

4.1.2 At the location of B-2

This core drill is conducted along the riverbed of the Bhyakure Khola, on right bank, from top layer to bottom up to 7 m depth the area seems to be filled by artificial method but after 7m the area is boulder mixed soil. Boulders and gravel are of quartzite (white to bluish grey, coarse grained), dolomite (Bluish grey, fine grained); granite. Clasts are angular to sub-angular. The DCPT value shows that the strata are very dense. The field photograph at Bhyakure site is shown in figure 3.5. The core box, in-situ test and site photographs are attached at Annex-2, Annex-3, and Annex-4.

Figure 4.2 Site photograph at Ghyampe khola.

4.2 Ghyampe Khola

4.2.1 At the location of G-1

This core drill is conducted on the right bank of the Ghyampe khola, from the top layer is boulder dominated with gravels. The borehole was drilled up to 16 m. Boulders and gravel are of calc quartzite (white to bluish grey, coarse grained), siliceous dolomite (Bluish grey, fine grained). Clasts are angular to sub-angular. The DCPT value shows that the strata are very dense. The core box, in-situ test and site photographs are attached at Annex-2, Annex-3, and Annex-4.

4.2.2 At the location of G-2

Drill hole G-2 is conducted on the left bank of Ghyampe khola up to 16m deep. The core reviles that the strata are boulder mix soil. Most of the boulder are of siliceous dolomite, calc quartzite, metasandstone and schist. Boulder and gravel are angular to sub angular. The DCPT values shows that the strata are very dense. The core box, in-situ test and site photographs are attached at Annex-2, Annex-3, and Annex-4.

Chapter 5: **RESULTS**

5.1 Geotechnical Domain Identification

The following sub-soil materials (up to 16m from existing ground level), has been deduced from the drilling of the borehole and geological site inspection:

5.1.1 Borehole B1

- Sub soil profile observed was pebbly sand up to 0.5 m. Beyond 0.5 m, predominantly boulder with gravel and cobble was observed along the excavated depth.
- Water table was encountered at the depth of 12.5 m from the existing ground level.
- DCPT was performed along the depth 10-16 m from existing ground level and mostly, medium dense to very dense soil strata was observed. A relatively weak stratum was observed at a depth of 15 m.

5.1.2 Borehole B2

- Sub soil profile observed was gravel with cobble up to the depth of 0.5 m. Up to the depth of 5.5 m, predominantly sand was obtained with boulders at certain depths. Beyond 5.5 m, gravel and boulders were observed mostly, with sand at certain depths up to the explored depth.
- Water table was encountered at the depth of 12.5 m from the existing ground level.
- DCPT was performed from the depth of 10 m to 16 m from existing ground level and mostly, medium dense to very dense soil strata was observed.

5.1.3 Borehole G1

- Sand was observed up to the depth of 0.4 m. Beyond this, mostly boulder with gravel was seen along the depth of excavation i.e. up to 16 m.
- Water table was encountered at the depth of 6.9 m from existing ground level.
- DCPT was performed from the depth of 10 m to 16 m from existing ground level and mostly, dense to very dense soil strata was observed.

5.1.4 Borehole G2

- Sub soil profile observed was sand up to the depth of 0.6 m. From 0.6 m to the explored depth, boulder and gravel was observed predominantly.
- Water table was encountered at the depth of 5 m from the existing ground level.

- DCPT was performed from the depth of 10 m to 16 m from existing ground level and very dense soil strata was observed.

The final bore logs from the field in is presented in ***Annex B***. From these, DCPT N-value can be obtained, which is converted to equivalent SPT N-value as presented in the table below. Please Refer ***Annex C*** for DCPT-SPT conversion of all the bore holes.

Table 5-1: Sample DCPT-SPT conversion

Depth	Elevation	Test Method for N-value	1st drive		2nd drive		3rd drive		DCPT N-value (for 20cm penetration)	DCPT N-value (for 30cm penetration)	Coefficient to convert DCPT to SPT	SPT N-value
			No. of blows (N1)	Penetration	No. of blows (N2)	Penetration	No. of blows (N3)	Penetration				
m	m		blows	cm	blows	cm	blows	cm	blows	blows		blows
10	681	DCPT	13	10	26	10	37	10	63	95	1	95
11	680	DCPT	25	10	30	10	42	10	72	108	1	108
12	679	DCPT	37	10	50	4	Refusal*		100	375	1	375
13	678	DCPT	35	10	40	10	55	10	95	143	1	143
14	677	DCPT	15	10	21	10	29	10	50	75	1	75
15	676	DCPT	5	10	18	10	27	10	45	68	1	68
16	675	DCPT	5	10	22	10	37	10	59	89	1	89

It is recommended that the SPT values obtained in Table 5-1 be corrected for energy, borehole diameter, sampling method, rod length and overburden.

$$N_{60} = C_E C_B C_R C_S N$$

Table 5-2: Recommended corrections for SPT blow count values, taken from Robertson and Wride (1997), as modified from Skempton (1986)

Factor	Equipment Variable	Term	Correction
Energy Ratio	Donut Hammer	C_E	0.5 to 1.0
	Safety Hammer		0.7 to 1.2
	Automatic Hammer		0.8 to 1.5
Borehole Diameter	65 mm to 115 mm	C_B	1.0
	150 mm		1.05
	200 mm		1.15
Sampling Method	Standard Sampler	C_S	1.0
	Sampler without liners		1.1 to 1.3
Rod Length	3 m to 4 m	C_R	0.75
	4 m to 6 m		0.85
	6 m to 10 m		0.95
	10 m to 30 m		1.0
	>30 m		<1.0

Taking C_E = 0.5 (for Donut Hammer), C_B = 1 (for borehole diameter 65 mm), C_S = 1 (for standard sampler) and C_R = 1 (for rod length >10 m), N_{60} value is obtained, which is then corrected for overburden pressure as per IS: 2131-1981. Correction for dilatancy is not required as the strata consists of gravel and boulders.

Table 5-3: Correction of SPT N-value

Depth	Elevation	SPT N-value	N_{60}-value	Correction of N-value for Overburden as per IS: 2131-1981					
				Saturated Unit weight	Total stress	Pore water Pressure	Effective Overburden Pressure (P)	C' =0.77[log(2000/P)]	N' value
m	m	blows	blows	KN/m^3	KPa	KPa	KPa		blows
10	681	95	71	17	170	0.00	170.00	0.824347427	58
11	680	108	81	17	187	0.00	187.00	0.79247506	64
12	679	375	281	17	204	0.00	204.00	0.763377868	215
13	678	143	107	20	224	4.91	219.10	0.739506097	79
14	677	75	56	20	244	14.72	229.29	0.724303851	41
15	676	68	51	20	264	24.53	239.48	0.70976	36
16	675	89	66	20	284	34.34	249.67	0.695827696	46

Now, underlying geotechnical domain and soil properties are determined using the corrected N’ value.

Table 5-4: Geotechnical Domain Identification

Depth	Elevation	N' value	Soil properties as per Meyerhof 1956			IS: 6403-1981		Underlying Geotechnical Domain
			Soil Packing categorization	Relative Density	Friction angle φ	Friction angle φ	Soil Packing categorization	
m	m	blows		%	°	°		
10	681	58	Very Dense	88	47	42	Very Dense	L1 - Very Dense
11	680	64	Very Dense	94	49	43	Very Dense	
12	679	215	Very Dense	245	86	45	Very Dense	
13	678	79	Very Dense	109	52	45	Very Dense	
14	677	41	Dense	71	43	39	Dense	L2 - Dense
15	676	36	Dense	66	41	38	Dense	
16	675	46	Dense	76	44	40	Dense	

Tentative subsoil profile of Bhyakure and Ghyampe Khola obtained is presented below.

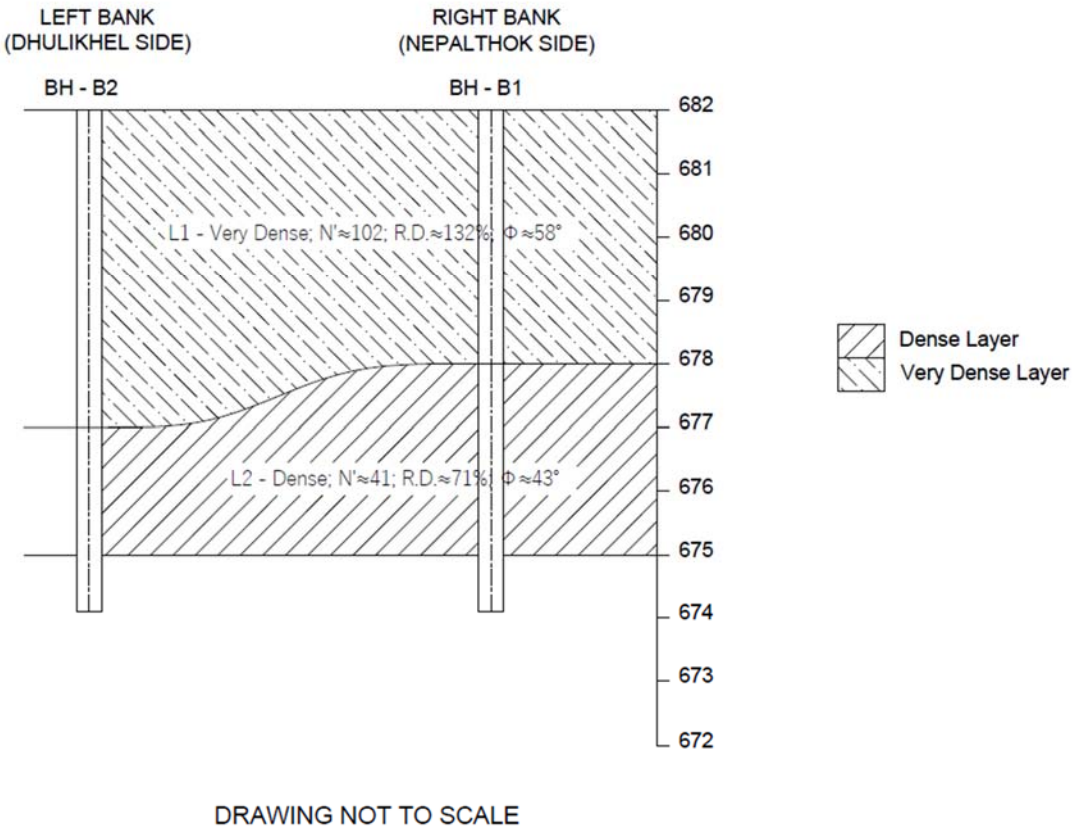

Figure 5.1: Subsoil profile - Bhyakure Khola

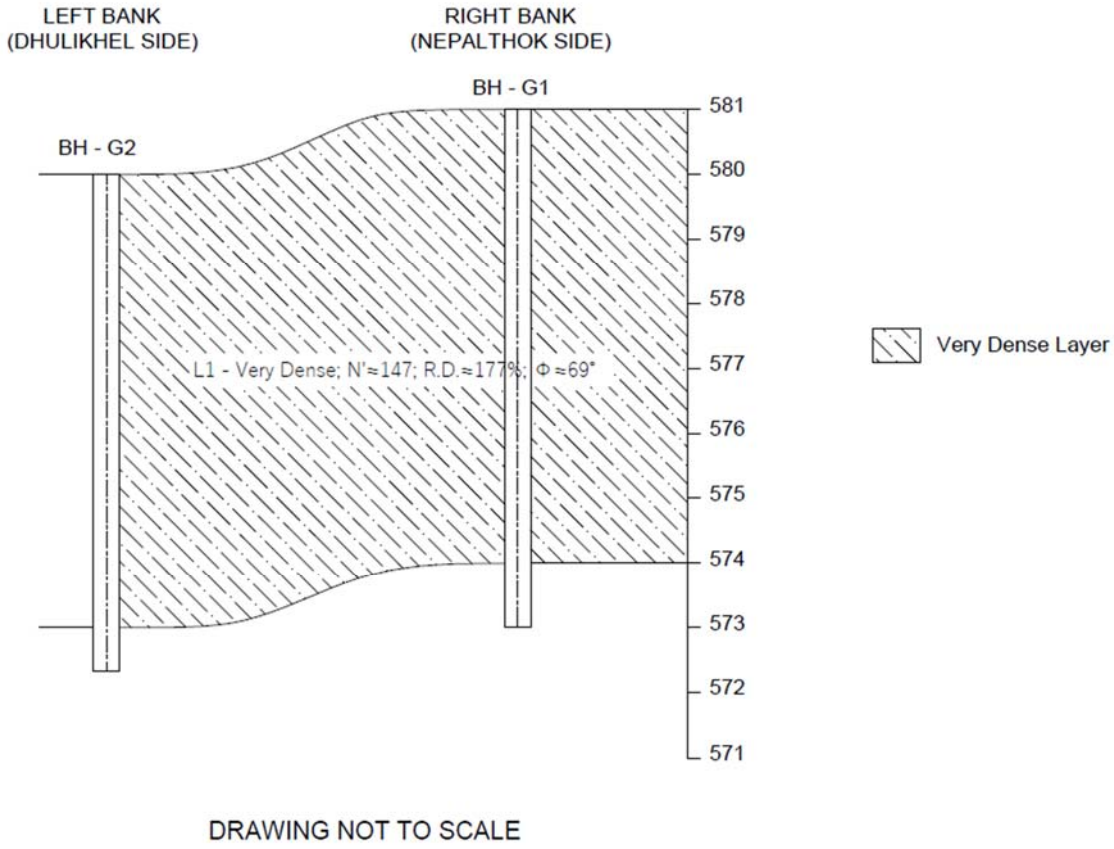

Figure 5.2: Subsoil profile - Ghyampe Khola

Chapter 6: **CALCULATION OF ALLOWABLE BEARING CAPACITY**

Any geotechnical design deals with various loads. The design criteria should satisfy both strength and serviceability criteria as per the loads applied to the soil. To satisfy the strength criteria, adequate factor of safety is applied to ultimate net bearing capacity to obtain net safe bearing capacity. Ultimate safe bearing capacity is the maximum pressure the foundation can apply to the soil before it undergoes shear failure. Again, allowable bearing capacity is calculated based on the permissible settlement to satisfy the serviceability criteria. Allowable bearing capacity is determined as minimum of the allowable pressures obtained from strength and serviceability criteria.

Allowable bearing capacity values are calculated for following foundation parameters.

Table 6-1: Foundation Parameters

Type of footing	Foundation Size
Square footing	4.0 x 4.0 m
Square footing	5.0 x 5.0 m
Square footing	6.0 x 6.0 m
Square footing	7.0 x 7.0 m
Square footing	8.0 x 8.0 m
Square footing	10.0 x 10.0 m
Rectangular footing	10.0 x 11.0 m

6.1 Shear Failure Analysis

Bearing Capacity of the foundation is determined as per IS: 6403-1981.

Net ultimate bearing capacity in case of general shear failure:

$$q_{nu} = cN_c s_c d_c i_c + q(N_q - 1)s_q d_q i_q R_{w1} + \frac{1}{2}B\gamma N_\gamma s_\gamma d_\gamma i_\gamma R_{w2}$$

Net ultimate bearing capacity in case of local shear failure:

$$q_{nu} = \frac{2}{3}cN_c' s_c d_c i_c + q(N_q' - 1)s_q d_q i_q R_{w1} + \frac{1}{2}B\gamma N_\gamma' s_\gamma d_\gamma i_\gamma R_{w2}$$

As recommended by the IS code, net ultimate bearing capacity is calculated by general shear when soil condition is dense, by local shear when soil condition is loose and by interpolating between the two values when soil condition is medium.

Table 6-2: Determination of method of analysis for net ultimate bearing capacity calculation

Depth from existing G.L (m)	Depth of foundation D_f (m)	Elevation (m)	Friction angle φ (°)	Mobilized Friction angle φ' (°)	Soil Condition	Method of Analysis for q_{nu}
10	2.78	681	42	-	Very Dense	General Shear
11	3.78	680	43	-	Very Dense	General Shear
12	4.78	679	45	-	Very Dense	General Shear
13	5.78	678	45	-	Very Dense	General Shear
14	6.78	677	39	-	Dense	General Shear
15	7.78	676	38	-	Dense	General Shear
16	8.78	675	40	-	Dense	General Shear

The shape factors (s_c, s_q, s_γ), depth factors (d_c, d_q, d_γ) and inclination factors (i_c, i_q, i_γ) are determined as follows as per the code.

Table 6-3: Shape Factors

S. No.	Shape of base	Shape Factors		
		s_c	s_q	s_γ
1	Continuous strip	1	1	1
2	Rectangle	1+0.2B/L	1+0.2B/L	1-0.4B/L
3	Square	1.3	1.2	0.8
4	Circle	1.3	1.2	0.6

Depth factors:

$$d_c = 1 + 0.2\frac{D_f}{B}\tan\left(\frac{\pi}{4} + \frac{\phi}{2}\right)$$

$$d_c = d_\gamma = 1 \text{ for } \phi < 10°$$

$$d_c = d_\gamma = 1 + 0.1\frac{D_f}{B}\tan\left(\frac{\pi}{4} + \frac{\phi}{2}\right) \text{ for } \phi > 10°$$

Inclination factors:

$$i_c = i_q = \left(1 - \frac{\alpha}{90}\right)^2$$

$$i_\gamma = \left(1 - \frac{\alpha}{\phi}\right)^2$$

Water Table factors:

$$R_{w1} = 1 - 0.5\frac{a}{D_f} \leq 1$$

$$R_{w2} = 0.5 + 0.5\frac{b}{B} \leq 1$$

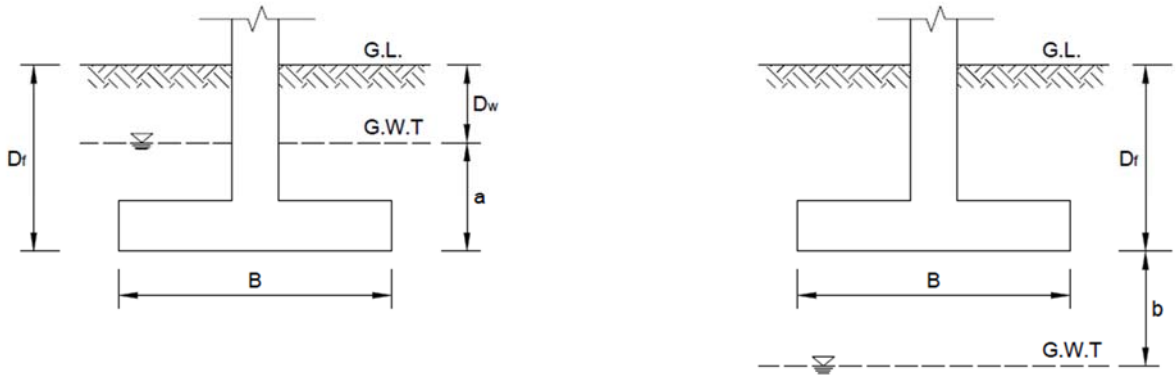

Figure 6.1: Location of water table above and below the base of footing

Table 6-4: Determination of Bearing capacity factors, shape factors, depth factors, inclination factors and water table correction factors

Bearing Capacity Factors						Shape Factors			Depth Factors			Inclination Factors			Water table correction factors	
N_c	N_q	N_γ	N_c'	N_q'	N_γ'	S_c	S_q	S_γ	d_c	d_q	d_γ	i_c	i_q	i_γ	R_{w1}	R_{w2}*
104.9	97.1	184.9	-	-	-	1.182	1.182	0.636	1.126	1.063	1.063	1	1	1	1.00	0.50

138.9	134.9	271.8	-	-	-	1.182	1.182	0.636	1.231	1.115	1.115	1	1	1	1.00	0.50
144.2	142.5	292.0	-	-	-	1.182	1.182	0.636	1.281	1.140	1.140	1	1	1	0.96	0.50
68.1	56.6	94.3	-	-	-	1.182	1.182	0.636	1.283	1.141	1.141	1	1	1	0.89	0.50
61.5	49.6	80.3	-	-	-	1.182	1.182	0.636	1.32	1.16	1.16	1	1	1	0.84	0.50
75.1	64.0	109.1	-	-	-	1.182	1.182	0.636	1.376	1.188	1.188	1	1	1	0.80	0.50

** Water table correction R_{w2} is taken as 0.5 for safety as there is a possibility that the water table may rise to the surface of foundation*
*Here, calculations are done for trial footing size 11 m * 10 m.*

Net ultimate bearing capacity is now calculated as mentioned in above equation.

Table 6-5: Calculation of net safe bearing capacity by shear failure criteria

Depth from existing G.L (m)	Depth of foundation D_f (m)	Elevation (m)	Cohesion c (KN/m^2)	Unit weight of soil γ (KN/m^3)	Surcharge at the base of the footing q (KN/m^2)	Net ultimate bearing capacity from general shear failure criteria q_{nu} (KN/m^2)	Net ultimate bearing capacity from local shear failure criteria q_{nu} (KN/m^2)	q_{nu} (KN/m^2)	FOS **	Net safe bearing capacity q_{ns} (KN/m^2)
10	2.78	681	0	17	47.26	11020	-	11020	2.5	4408
11	3.78	680	0	17	64.26	15375	-	15375	2.5	6150

16	8.78	675	0	20	149.26	16567	-	16567	2.5	6627

*** Factor of safety 2.5 is adopted*

6.2 Settlement Analysis

Bearing capacity of the foundation to satisfy serviceability criteria is calculated considering the permissible settlement as 50 mm; referring to Clause 16.3.4 of IS: 1904-1986.

Settlement of a footing of width B under unit intensity of pressure with known SPT N-value is calculated from IS: 8009 (Part1)-1976, Fig 9. Pressure for settlement of 50 mm is then computed by assuming that the settlement is proportional to the intensity of pressure.

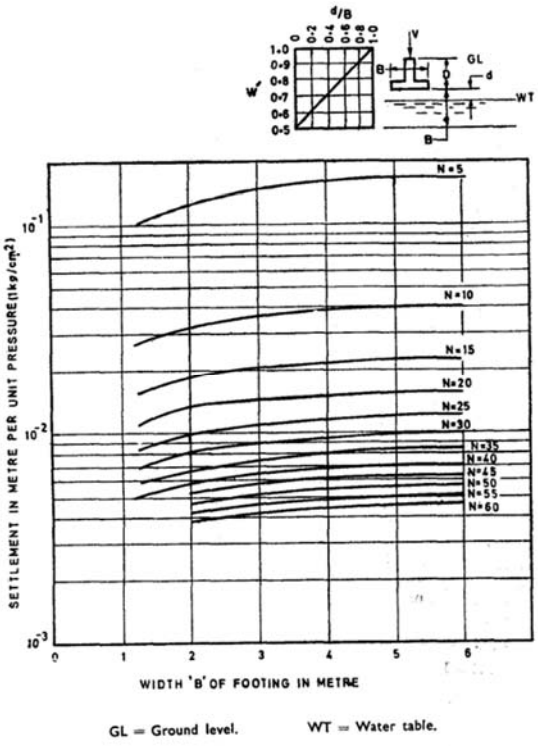

Figure 6.2: Settlement per unit pressure from SPT N-value as per IS:8009 (Part I)-1976

Table 6-6: Calculation of bearing capacity by settlement criteria

Depth from existing G.L (m)	Depth of foundation D_f (m)	Elevation (m)	N' value	Settlement (m per 1kg/cm^2) *using graph, FIG 9 - IS 8009 (Part I) - 1976*	W'	Settlement after water table correction	Settlement (mm) *for reinforced concrete structures*	Reduced safe bearing capacity q_{ns} (KN/m^2)	Gross safe bearing capacity q_s (KN/m^2)	Existing Soil/Rock Description
10	2.78	681	58	0.0044	0.5	0.0089	50	552	599	Gravel with cobbles and boulders, greater boulder percentage
11	3.78	680	64	0.0039	0.5	0.0078	50	627	691	Gravel with cobbles and boulders, greater cobble percentage
12	4.78	679	215	0.0010	0.5	0.0020	50	2453	2534	Gravel with cobbles and boulders, greater cobble percentage
13	5.78	678	79	0.0025	0.5	0.0051	50	962	1078	Gravel with cobbles and boulders, greater cobble percentage
14	6.78	677	41	0.0068	0.5	0.0137	50	359	494	Gravel with cobbles and boulders, greater boulder percentage
15	7.78	676	36	0.0094	0.5	0.0188	50	262	417	Gravel with cobbles and boulders, greater boulder percentage
16	8.78	675	46	0.0058	0.5	0.0115	50	426	602	Gravel with cobbles and boulders, greater boulder percentage

Calculation of bearing capacity is done for various foundation sizes and at various depths by shear failure criteria as well as settlement criteria.

Detailed calculation for different various footing size is presented in ***Annex D***.

6.3 Foundation Recommendations

Net safe bearing capacity from both shear failure and settlement criteria, and gross safe bearing capacity for various foundation sizes can be summarized in the table below.

Table 6-7: Bearing capacity from shear failure and settlement criteria for **Borehole B1**

Depth of foundation D_f (m)	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s	Net safe bearing capacity q_{ns}	Reduced safe bearing capacity from settlement criteria q_{ns}	Gross safe bearing capacity q_s
	Width of Foundation B = 4 m			Width of Foundation B = 5 m			Width of Foundation B = 6 m			Width of Foundation B = 7 m			Width of Foundation B = 8 m			Width of Foundation B = 10 m			Rectangular Footing; L = 11 m, B = 10 m

Chapter 7: **RIVER BED SAMPLING**

To determine the size of materials on the bed of river at Bhyakure, Mamti and Ghyampe, representative sample from each site was extracted and then sieve analysis was performed at the laboratory. The primary objective is to obtain the particle size distribution curve.

In order to extract representative sample, test pit of size 1m x 1m was excavated and soil sample up to depth 50 cm was removed. Below the depth of 50 cm, pit of size 50 cm x 50 cm was dug and soil sample from this excavation was taken. Sample of about 50-100 kg was extracted for sieve analysis in the lab.

Some boulders of larger size were also encountered, which was not feasible to be carried for lab test. In such case, dimensions of those boulders were taken to determine its weight and then the weight was added to the weight of sample retained in respective sieve sizes.

The calculation and result of sieve analysis i.e. particle size distribution curve and particle size corresponding to % of fines 10%, 30%, 60% and 90% is presented in ***Annex E.***

Table 7-1: Particle size corresponding to various % of fines at Bhyakure, Mamti and Ghyampe site

Bhyakure Khola soil sample size	Mamti Khola soil sample size	Ghyampe Khola soil sample size
D_{10} = 2.32 mm	D_{10} = 2.27 mm	D_{10} = 3.92 mm
D_{30} = 38.60 mm	D_{30} = 20.44 mm	D_{30} = 37.38 mm
D_{50} = 149.11 mm	D_{50} = 151.47 mm	D_{50} = 175.64 mm
D_{60} = 216.01 mm	D_{60} = 203.78 mm	D_{60} = 232.58 mm
D_{90} = 331.39 mm	D_{90} = 318.85 mm	D_{90} = 320.16 mm

Chapter 8: **CONCLUSION**

The following recommendations are made based on the analysis undertaken in this report.

It is recommended that the rectangular footing of size 11 m x 10 m is selected based on this geotechnical analysis undertaken at this phase for reporting. Nevertheless, the bridge designers can optimize the design as per requirements for design criteria of the bridge incorporating our geotechnical analysis.

Table 8-1: Option Recommendations of base level of foundation, corresponding gross safe bearing capacity and settlement at location of Ghyampe and Byakhure

Site Area	Borehole No.	Depth of foundation D_f (m)	Elevation of base of foundation (m)	Allowable Bearing Capacity	
				Net safe bearing capacity from shear failure criteria (KN/m^2)	Gross safe bearing capacity from settlement 50mm criteria (KN/m^2)
Bhyakure Khola	**B1**	5.78	677	4989	494
	B2	6.78	677	12377	952
Ghyampe Khola	**G1**	4.62	575	5495	645
	G2	6.62	575	8771	2605

The gross safe bearing capacity obtained is further checked with suggested allowable bearing values for average condition from IRC: 78-2000.

Table 8-2: Presumptive bearing capacity values for average condition as per IRC: 78-2000

Types of Rock/Condition	Suggested Allowable Bearing Values for Average Condition
Hard Rocks	2.0 to 3.0 MPa
Soft Rocks	1.0 to 2.0 MPa
Weathered Rocks, Conglomerates and Laterites	Not more than 1.0 MPa

CALCULATION OF BEARING CAPACITY – BHYAKURE KHOLA

CALCULATION OF BEARING CAPACITY FOR VARYING DIMENSION OF FOUNDATION - BHYAKURE KHOLA

Project:	**Sindhuli Road Project**	**Drilling mothod:**	**Rotary**	**Hole Inclination:**	**Vertical**	**Surface Elevation:**	**691 m**	**Bore Hole No.:**	**B1 (Nepalthok side)**
Location:	**Bhyakure Khola**	**Drilling Machine:**	**XUL 100**	**Bit Name:**	**Impregnated Diamond Bit**	**Ground Level:**	**0 m**	**Easting (m):**	**85.750832**
		Casing Depth:	**HX 6m, NX 12m, BX 16m**	**Bit Condition:**	**Good**	**Depth of Exploration:**	**16 m**	**Northing (m):**	**27.469370**

Shape of footing considered: Square footing

Surface Elevation: 691 m

Ground Level: 0 m

Surface Elevation of starting of bore hole 681 m

Surface Elevation of end of bore hole 675 m

Depth of Exploration: 16 m

Level of Excavation: 683.8 m

Depth of Water Table from existing ground level: 12.5 m

Surface elevation of water table: 678.5 m

Depth of Water Table from excavated level: 5.3 m

Trial 1 **Width of footing B: 4 m**
