CHAPTER IX

ECONOMIC COSTS

1. Construction Costs.

The financial construction costs of the project were estimated at about Tk 11,212 million (equivalent to US\$ 862 million) in total, consisting of Tk 2,138 million for the domestic currency portion and Tk 9,073 million (equivalent to US\$ 698 million) for the foreign currency portion (see Table 7-1 of CHAPTER VII).

For the purpose of making the economic analysis, the economic costs were estimated using the financial costs mentioned above through the following procedure:

- (1) The costs were classified into such five categories as equipment, materials, skilled and unskilled labour, and land acquisition, by domestic and foreign exchange components.
- (2) Taxes, consisting of import duties for the foreign exchange component, sales taxes for the equipment and materials, and income taxes for the labour, were deducted from the financial costs. As mentioned in the previous Chapter, since it was assumed that the import duties and sales taxes would not be imposed on the equipment and materials to be procured from abroad at the construction stage, these prices will here be left as estimated in CHAPTER VII. Similarly, costs for land acquisition will also be left as estimated in CHAPTER VII because it was assumed that the tax would not be imposed.
- (3) After deducting the taxes, the shadow rate of 1.75 times the official foreign exchange rate was applied to the equipment, materials and services to be procured from abroad, and also the shadow wage of 0.5 times the actual wage was applied to the unskilled labour to be employed locally.

Table 9-1 shows a comparison between the financial costs and the economic costs for the implementation of the project. As shown in the table, the economic costs were estimated at about Tk 17,887 million in total including contingency costs of Tk 2,333 million, or higher than the financial costs by Tk 6,675 million. They consist of the domestic currency component of Tk 2,008 million and the foreign exchange component of Tk 15,879 million, and as given in Table 9-2, they are composed of the following six items; equipment of Tk 5,672 million, materials of Tk 5,912 million, skilled labour of Tk 3,792 million, unskilled labour of Tk 72 million, land acquisition of Tk 107 million, and contingency of Tk 2,333 million.

2. Maintenance Costs.

والجنبي ليعدد المجار

2

.

As shown in CHAPTER VII, the total financial costs for maintenance amount to Tk 1,226 million including contingency costs of Tk 58 million during the project life period. Among them, the amount of Tk 905 million corresponds to the domestic currency component and that of Tk 321 million corresponds to the foreign exchange component. In the last year of construction stage (1989), an amount of Tk 57 million is required for initial procurement of the equipment and materials for the maintenance, after which an amount of about Tk 40 million per annum is required on the average for the maintenance taking into consideration procurement of equipment and materials at need. The maintenance costs are shown by year in Table 7-5 of CHAPTER VII.

In calculating the economic costs, the maintenance costs were also classified into such four categories as equipment, materials, and skilled and unskilled labour. Successively, in the same manner as the construction costs, adjustments were made by eliminating the taxes and by multiplying the shadow rate. Thus the calculated economic costs for the project life period were estimated at about Tk 1,169 million slightly less than their financial costs, or the average annual cost for maintenance amounts to Tk 38 million. Table 9-3 shows the economic maintenance costs by year.

CHAPTER X ECONOMIC BENEFITS 的现在分词 计分子分子 动于外系

from the self in a set of a most star of the self of the

0.016

1. General Description.

The economic benefits which arise by executing the project amount to about Tk 31,133 million in total, during its construction period of 13 years and its economic life of 30 years. They consist of direct benefits of Tk 22,530 million and indirect benefits of Tk 8,603 million.

12 5 12 1

The direct benefits are represented by reduced transport costs for passengers and freight and time savings for passengers, and average annual direct benefits were estimated at around Tk 750 million during the project life, while the indirect benefits consist of reduced ferry facilities and salvage values of equipment, materials and land after finishing the construction works. Among them, the reduced ferry facilities including their maintenance and operating costs were estimated at Tk 7,431 million in total during the project life, or around Tk 250 million per annum on the average. Other indirect benefits, i.e. the salvage values amount to about Tk 1,172 million.

As described in VOLUME VII TRAFFIC AND ECONOMIC BENEFITS, the following procedure was taken for estimating the future population and traffic to be required for calculating the economic benefits of the 是在中國國家 建固定的 网络拉拉 project mentioned above.

(1) Future population of Bangladesh to be required for estimating the future traffic volume was forecasted under the conditions as indicated below:

- 1) Population of Bangladesh in 1974 was assumed at 76,002 thousand in accordance with a result of 1974 census made by the Census Commision of Bangladesh.
- 2) An intermediate estimate between two rates of population growth was adopted for the population forecast in consideration of the population control policy of the Government; one is a value estimated by (3, 0, 0)the Census Commission of Bangladesh and the other is the lowest value among three estimates by the IBRD (see APPRAISAL REPORT OF A POPULATION PROJECT IN BANGLADESH, IBRD, 1975).
 - 3) For years up to 1978, however, estimates made by the Census Commission were applied to the rate of population growth. ्रते छन्। Sha Willow 言語の登録

Table 10-1 Future Population and Rate of Its Growth

5) Figures indicated in Table 10-1 were used for control of total in estimating the future population of each district.

its the host 6) It was assumed that the future population of each district would be proportioned to the ratio of population of each district to the total population of Bangladesh as, of 1974.

- (2) The future passenger traffic was estimated based on the future population of the districts forecasted above through the following procedure.
- 1) First, the passenger traffic in 1993 and 2020 was estimated. Next, the passenger traffic in years from 1990 to 2020 other than the above two years was calculated by means of the methods of linear interpolation and extrapolation. 138893
- 2) Inter-district passenger trip was assumed to 0.0077 per person a day on the basis of data in Japan because of lacking in avilable data in Bangladesh. As a result, annual generated passenger trip turns out 288 million in 1993 and 429 million in 2020 in the whole country. The generated passenger trip in each district will be given distributing the above-mentioned total trip in proportion to the population estimated by district (see Table 3-2 of VOLUME VII).
- 3) Origin-destination distribution (0-D distribution) of passenger traffic for all of the pairs among the 19 districts was established by making use of the generated passenger trip in each district, taking into account the future railway and road networks as well as their existing networks. In this case, the future networks were set on reference to the Bangladesh Transport Survey Report and the time table of the railways. And also a formula of gravity model and the Fratar's method were applied to calculate the O-D distribution and to adjust. its convergence, respectively. Time distance between every two districts in the gravity formula was calculated by assuming the average traveling speed at 30 km per hour for vehicles and 40 km per hour for trains.
- 4) In calculating the future O-D distribution of the passenger trip by transport modes of railway and road across the Jamuna bridge, adjustments were made as follows; based on the results of traffic survey carried out by the present feasibility study team, it was assumed that the rates of water-borne passenger trips in future would be 10

- 86

percent of the total passenger trips for the trips between Rajshahi and Dacca divisions, 50 percent for between Rajshahi and Chittagon divisions, 20 percent for between Khulna and Dacca divisions, and 80 percent for between Khulna and Chittagong divisions. Where, these divisions consist of 4 through 6 districts, respectively (see Table 3-2 of VOLUME VII). The passenger trips other than water-borne 1.e. the railway and road passenger trips were divided at the ratio of both time-distances of railway and road in the inter-district routes. As a result, the passenger trips across the Jamuna bridge in 1993 and 2020 were estimated as shown below;

	e Unit	: Million	persor	is per	year
				Year	
Mode	of trans	sport -	1993		2020

> 在出身一切。

(3) The future freight traffic across the Jamuna bridge after its construction was estimated on the basis of the following conditions and assumptions, using data obtained by the traffic survey in 1974 by the Japanese Study Team. Provide Station

- 1) Economic growth of Bangladesh to be used for forecasting the future freight traffic was estimated on the basis of THE FIRST FIVE-YEAR PLAN of Bangladesh.
- 2) The freight traffic by railway and road transports in 1993 was calculated based on the rates of agricultural, industrial and population growths, taking into account general economic and social conditions of Bangladesh. 1.20
- 3) To calculate the freight traffic in years after 1993, it was assumed that average annual rates of railway and road traffic growths would be 4.0 and 0.5 percent, respectively. The following table shows the freight traffic across the Jamuna bridge in 1993 and 2020.

Unit: Thousand tons per year

- (4) The passenger and freight traffic estimated in the above (2) and (3) respectively were further expressed in numbers of vehicles and trains in accordance with the following conditions.
- 1) For the passenger traffic, the conditions were set as below:

- i. For railway transport
 numbers of passengers per car : 70 persons,
 numbers of cars per train : 20 cars, and
 operating days of trains : 365 days a year.
- 11. For vehicles transport

ratio of passenger cars to buses in traffic on the Jamuna bridge : 1:1,

numbers of passengers per car : 3.5 persons, and numbers of passengers per bus : 40 persons.

2) For the freight traffic, the conditions were set as below:

i. For railway transport

capacity per freight car	: 20	tons,						1
numbers of freight cars per		/ · ∮ c		nta Agintiya				Ì
train	: 60	cars,						
rate of loading per freight		an a				i. Den ser se		ę,
car		perce			cap	acity	', and	đ
operating days of trains	: 36	5 days	a ye	ar.				ļ

37.199.211、199.2431.111.24A

ii. For truck transport

capacity per truck : 5 tons, and rate of loading per truck : 80 percent of its capacity.

- 3) Under the above-mentioned conditions, first, the traffic which would cross the Jamuna bridge in 1993 and 2020 was calculated for each of passenger cars, buses, trucks, passenger trains and freight trains. Next, the traffic in years other than 1993 and 2020 was estimated by means of the methods of linear interpolation and extrapolation on the basis of the traffic in both the above years. The results are shown in Table 10-2.
- (5) The traffic shown in Table 10-2 consists of three categories as follows; (a) traffic to be diverted from ferry traffic on the Sirajganj route crossing the Jamuna river (normal traffic), (b) traffic to be diverted from ferry traffic other than the Sirajganj route (diverted traffic), and (c) traffic to be induced newly after construction of the Jamuna bridge (induced traffic). (see Table 3-21 of VOLUME VII). Among them, for the induced traffic, it was assumed that unit benefit which arises from the induced traffic would be taken to be one-half of that from the normal traffic or diverted traffic. As indicated in Table 3-21 of VOLUME VII, the induced traffic for passengers turns out around 13 percent of the total passenger traffic. However, the induced traffic for freight has not been calculated because it is difficult to estimate with a reasonable degree of accuracy. , merreless, hirfarle, bein ders seinen aus all sullige

The values shown in the above table were calculated on the assumptions:

- 1) Time-saving cost per hour for passenger was assumed to be one-half of its wage per hour.
- 2) Passengers which have time-saving benefits were assumed to be 80 percent of the total for the car passengers and 70 percent of the total for the bus and train passengers.
- (6) In making the economic evaluation of the project, the economic benefits were given by making the adjustments for taxes and shadow rates in the same manner as those for the economic costs in the previous section.
- (7) Table 10-4 shows the economic direct benefits by mode of transport in 1993 and 2020 which are represented by the reduced transport costs and time-savings. According to the table, the annual economic direct benefits are Tk 538 million in 1993 and Tk 1,038 million in 2020.
- (8) The annual direct benefits in each year between 1990 and 2020 were calculated by means of the method of linear interpolation and extrapolation using those of 1993 and 2020 as shown in Table 10-5. According to the table, it is expected that the economic direct benefits amount to around Tk 483 million in the opening year of the Jamuna bridge (1990), and approximately Tk 22,530 million in total during the project life of 30 years from 1990 to 2019.

3. Indirect Benefits.

Constant all a second that be the second at the second second second Among many indirect benefits expected by executing the project, tangible benefits to be taken up in the present project consist of ferry facilities and their maintenance and operating costs to be reduced by opening the Jamuna bridge, and salvage values of equipment, materials and land for construction bases after completion of the construction works. For some indirect benefits other than those mentioned above, discussions will be made in the succeeding chapter.

د. ۱۰۰۰ میلید کنید کنید کار در ۱۰۰۰ ۱۰۰۰ میلید کنید کمیکیو کرد در ۱۰

(1) Reduced ferry facilities.

Traffic between the eastern and western regions of the Jamuna river is being held mainly at three points; Aricha, Sirajganj and Bahadurabad, using the ferryboats. After construction of the Jamuna bridge, it is expected that most of the traffic would be diverted from ferryboats to the bridge. As shown in Table 3-21 of VOLUME VII, daily traffic to be diverted to the bridge by opening the Jamuna bridge in 1990 was estimated at 2,810 vehicles of passenger cars, 246 vehicles of buses and 126 vehicles of trucks for the road traffic, and 27,717. persons of train passengers and 5,427 tons of train freight for the railway traffic. The ferry facilities on the Jamuna river which are proportionated to the diverted traffic mentioned above should be reduced after construction of the bridge.

To calculate the costs of reduced ferry facilities including reduced their maintenance and operating costs, the conditions were set as shown below.

1) The following matters were assumed concerning the ferry capacity and its operation:

1. Car ferry

Loading capacity : 35 cars per boat. Operating hour : 7 hours a round trip. Service times : two round trips a boat per day. One pontoon needs per boat and can deal with four boats per day. A large-sized car such as bus and truck is evaluated to be equal to 2.5 passenger cars. . 301. del die Gebeure

About 1997 Sugar

1) Passenger ferry

gesch für Ballen seine Bergereiter er ber Loading capacity : 1,000 persons per boat Operating hour : 6 hours a round trip. Service times : 3 round trips a boat per day. Accordingly, available transport volume is estimated at about 5,400 persons per day assuming the carrying rate of 90 percent of its capacity. Two pontoons need per boat and can deal with five boats per day.

11) Freight-car ferry

One set of ferry consists of one tugboat and three barges, but the tugboat deals with only one barge during operation. Aspell Comme Loading capacity : 25 freight-cars a barge. Service times : 4 round trips a ferry set per day. 전 전자 관리에서 Tonnage of freight-car : 8.56 tons a car. Accordingly, available transport tonnage is estimated at about 1,540 tons per day assuming the carrying rate of 90 percent of its capacity. nar bil sédal

2) To calculate the economic costs of ferry facilities to be reduced, the following matters were assumed:

i. The economic life will be 18 years for such ferry facilities as ferryboat, tugboat, barge and pontoon.

ii. Prices of the ferry and pontoon to be procured newly will be as follows:

Prices	of ferry		Prices of p	ontoon	
	Unit: Mi	111ion Tk	Ŭ	init: Millio	n Tk
Car	Railway	Ferry		lar	lway Pontoon
ferry	Passenger	Car	pon	toon Passe	nger Car

Barge -		12.00	for berth-	ya gerik terdek ter Terdek terdek	- 1.2

Note: The above values are net of taxes.

成時度10月 iii. Annual costs for the maintenance and operation of ferry boats would be 20 percent of their purchase prices including the costs of spare parts equivalent to 5 percent of the ferryboat prices, and those for pontoons would be 10 percent of their purchase prices.

- iv. The ferryboat, its spare parts and pontoon will be procured from abroad.
 - v. All of costs mentioned above will be expressed as economic costs with the shadow prices of 1.75 times the CIF prices for the foreign exchange component.

Based on the above conditions, reduced costs of the ferry facilities including their maintenance and operating works were estimated at TK 654.39 million in the opening year of the Jamuna bridge (1990). These are negative costs, or benefits for the project. Table 10-6 shows annual reduced costs during the project life of 30 years from 1990 to 2019.

However, residual values of the ferry facilities to be reduced in the last year of project life will be given as negative benefits in 2020.

(2) Salvage values. ; († 行為教育,最高高的同志的自己的公司。因此有法定

1) Salvage value of land for construction bases.

An allowance will be made for the salvage value of land which has been used for the construction bases, excepting land to be used for maintenance works after completion of the construction works. As shown in Table 5-1 of APPENDIX B, area of land to be acquired for the construction bases was estimated at about 362.8 ha in total of both lands for the main and branch bases, consisting of areas of 124.4 ha for job settlement, 76.0 ha for dwelling settlement, 102.0 ha for stone storage yard, 39.5 ha for temporary road and 20.9 ha for temporary railway. Among them, area of land to be valuated for salvage value are 152.4 ha, comprising 81.8 ha out of the job settlement and

他也能够能够有效的。

70.6 ha out of the dwelling settlement. Such a land, in its function, would be nearly equal situations with that in the urban area since the public facilities to be required for civic life are already well-equipped.

According to the survey in July 1975, the prices of land ranged from Tk 200,000 to Tk 900,000 per acre in the urban area nearby the construction bases. Referring to such prices, we adopted intermediate value of Tk 500,000 per acre (equivalent to Tk 1,236,000 per ha) in calculating the salvage value of land for the construction bases. As a result, the salvage value was estimated at Tk 188,351 thousand in the last year of construction period (the thirteenth year). .

68.801

5.9

 \mathcal{T} 22

26

10

Shi l

2) Salvage values of equipment and materials.

 $\tilde{P}(1)$

The total economic costs of the equipment and materials to be 3.0 procured for the construction works were estimated at Tk 11,585 million as shown in Table 9-2. Allowances will however be made for the salvage values of these equipment and materials after completion of the works.

Table 10-7 shows the economic costs of their salvage values which any were calculated in consideration of the period of economic life of each equipment and material. In this calculation, it was assumed that their values would decrease linearly with year and that for equipment and materials which exceed the period of economic life fixed, the values would be 10 percent of the purchase prices at the end of the last year of each use. As a result, the total salvage values were estimated at about Tk 984,100 thousand or 8.5 percent of their total purchase prices.

1. Comparison of Costs and Benefits.

SEA LESS

All of the economic costs and benefits estimated in CHAPTERS IX and X are tabulated in Table 11-1: According to the table, the total economic costs of the project amount to around Tk 19,057 million including the economic maintenance costs of around Tk 1,169 million. On the other hand, the total economic benefits amount to around Tk 31,133 million including the salvage value of around Tk 1,172 million, during the economic life of 30 years. Therefore, for both values not discounted, the economic benefits exceed the economic costs by Tk 12,076 million. 一部 在市场上在

18-549 To make the economic comparison between the costs and benefits, i se i se i they have to be discounted at certain rates. Table 11-2 shows a comparison between the costs and benefits discounted at each rate of 12, 6, 3 and 2 percent, taking the beginning of 1977 as the base of calculation. 受けること 935

7.5

. .

The net present costs of the project exceed the net present benefits by Tk 6,117 million when the both are discounted at 12 percent, the benefit-cost ratio of which works out at 0.24, and the internal rate of return is 2.6 percent. Table 11-2 means that the benefits will never exceed the costs so far as the discount rate to be used is larger than 3 percent, while the benefits exceed the costs in case of 2 percent, the benefit-cost ratio of which works out at 1.11. Therefore, the project appears to be of doubtful justification so far as the analyses mentioned here are concerned.

The costs and benefits discounted at rates ranging from 2 to 12 percent are shown in Tables 1 to 11 of APPENDIX C. 승규는 것 같은 것 05668

Note: Economic costs and benefits shown in the table were calculated off using, the shadow, rates, of 1.75 times, the official rate for foreign 1 11 exchange component and 0.5 times the actual wages for unskilled labour.

- 98 -

Circle in the management of the be higher (or lower) than the estimated because the traffic which directly affects the benefits will increase with increase in population. to complete the emotion works and the economic till of the economic states with the complete the set in the second states and the second states and the second states and the second states are states and the second states are stat As stated at the beginning of the preceding chapter; for the population forecast, an intermediate estimate between the two rates of population growth; the rate by the Census Commission of Bangladesh and the lowest rate among three estimates by the IBRD, has been used in the presentistudy: (If, for example, the relatively, high rate of population growth which were forecas ted by the Census Commission of Bangladeshie and is applied to the estimation of traffic, the traffic across the Jamuna . bridge will increase by about 5 percent in the opening year of the second bridge (1990) and by about 17 percent in 2020. As a result, it is expected that the project benefits will be higher than the estimated of by about 10 percent during the period of the project life. Therefore, although the ratio of benefits and costs discounted at the rate of or all 12 percentaincreases slightly from 0.24 to 0.26 and the internal rate a of return also increases from 2.6 to 2.8 percent, the net present value is still negative. This means that change in population forecasted is not noticeably sensitive to the conclusion of the economic evaluation. ents as inducated of any erana consultation on the stiller is the second

(2) Foreign exchange rate. As mentioned in CHAPTER IX and X, the shadow prices of 1.75 times the CIF prices have been applied to the foreign exchange component in estimating the economic costs and benefits. The rate of 1.75 was determined with reference to the actual foreign exchange rate for the last one year and the opinion of the Planning Commission of Bangladesh.

Information for the last one year indicates the fluctuation of actual foreign exchange rate in the range of Tk 32 to Tk 20 to the U.S. dollar. Namely, it means that the ratio of actual rate to official rate has ranged from 2.5 to 1.5. The rate, 1.75, that has been used in the present study lies nearly in the middle of the above range. As against this, if the lowest shadow rate of 1.5 is used instead of 1.75, it is naturally expected that the net present value of the project is improved. However, even if the shadow prices of 1.5 times the CIF prices are applied, the benefits of the project will still remain less than the costs so far as both are discounted at 12 percent. Actual calculation indicates that the benefit-cost ratio is slightly improved to 0.26 in comparison with 0.24 calculated previously, and the internal rate of return is also slightly improved to 3.0 percent in comparison with the previous 2.6 percent (see Tables C-12 to C-17 ot APPENDIX C). As is obvious from these results, change in the shadow rate for the foreign exchange component is also not noticeably sensitive to the conclusion coftevaluation. It is not ad top the north and top the second state of the second stat

While, according to information from the Planning Commission of Bangladesh, the shadow rate for the foreign exchange component has not been used by the Planning Commission to find out the economic costs and benefits. In other words, the official rate has been applied to the foreign exchange component. In this case, the benefit-cost ratio of the present project works out to be 0.33 in the case of the discount rate of 12 percent, and the internal rate of return works out to be about 4.5 percent (see Tables C-18 to C-24 of APPENDIX C).

(3) Project timing.

the attract one consists from the construction of the construction of the second second second second second se It is assumed in this study that the present project needs 13 years to complete the construction works and its economic life will continue for 30 years after the construction. In calculating the economic benefits, we further assume that the construction works will be started in 1977 and, consequently, the Jamuna Bridge will be opened in 1990. Dig (e po so por contra contra so sur sur so anterio da contra contra contra contra contra contra contra contra cont

On this assumption, the traffic across the Jamuna Bridge will gradually increase at an annual rate of about 2% as is shown in Table 10-2. If the traffic growth will further continue in the future, it is expected that the railway traffic across the bridge will reach to its capacity of 74 trains per day by 2040 and the road traffic will reach to its capacity of 9,800 cars per day by 2050. That is, the undiscounted benefits which accrue from the traffic across the bridge will have an annual increase with the traffic growth until about 2040 for the railway transport and until about 2050 for the road transport. the state of the second state of the second seco

On the other hand, the huge capital amounting to about Tk 17,887 million is to be invested in the construction during the first thirteen years. In addition, the maintenance costs are to be expended at the average rate of about Tk 37 million per annum during the project life of 30 years without such increase as shown in case of benefits. Judging from these conditions, the net present value of the project is expected to increase if commencement of the project is postponed.

Arma (Susae Substantian Substantian Substantian Substantian Substantian Substantian Substantian Substantian Su 2000 In order to find out the optimum time of the project, benefits due to postponement i.e. reduction in discounted costs must be compared with costs of delay i.e. loss of benefits due to postponement.

1128 ALBERT

승규는 여 김 씨의 이상을 얻었다. On the assumption that the project life will continue for thirty years with no salvage value thereafter, postponement of one year, for example, will reduce the present costs discounted at the rate of 12 % from Tk 8,076 million to Tk 7,213 million, or by Tk 866 million, including the main tenance costs discounted. On the other hand, the postponement will affect the benefits in two aspects that the benefit in the first of year (1990) of the project life will be lost, while another benefit will accrue in the year (2020) following the end of the project life. This will result in reducing the present value of the benefits from Tk 1,962. million to Tk 1,779 million including the salvage value discounted. The net loss in benefits will thus be only Tk 183 million, while the reduction in costs is Tk 866 million.

Such calculations were conducted in regard to postponement up to the fortieth year and are summarized in Table 11-3. The table indicates that the optimum time of the project will not be found in the near future but postponement more than about 40 years will not be profitable although the longer the postponement, the more the profit is.

and a contract of the second states and the Next, relations between benefit-cost ratio and postponement of the project were examined. Table 11-4 indicates that the benefit-cost ratio will not exceed 1.0 so far as both the benefits and costs are discounted at a rate higher than 6.% even if the commencement of the project was postponed within 40 years. This implies that the project is of doubtful justification.

3. Conclusion.

the summit in the summary of the second second states and the second second second second second second second Economic evaluation of such national project should ultimately be made by comparing the total capital costs to be invested with the increase in net national income to be brought by it. In this case, an input-output analysis, for example, is regarded as one of the most effective measures, provided that reasonable data required for the analysis are given. But in the present study, the economic benefits were evaluated, for lack of such data, by making use of the method of common direct measurement as described in the preceding chapter.

illing the scale of antiputer each start These benefits will be only a part of the entire profits to be brought by the project because most of them were excepted from the benefit estimation as intangible ones. In this section, therefore, such major intangible benefits as increase in employment, time-savings in freight transportation and increase in agricultural and industrial productions must be discussed. Stational Call Final Andrews S. M. E. S. H.

ed 2. Contaille (14) (1) Increase in employment.

০০১ ইনা চেইনি চাই

6 . A .

The present project requires as many local laborers as about 1,200 thousand man-days per annum on the average during the construction period of 13 years. After the construction, laborers of about 200 thousand man-days per annum must be further employed for the maintenance works during the project life.

1.1.1

5.3 62

(ICH)

In view of large unemployment prevailing in the country, it is obvious that this project will bring increase in income of a large number of laborers. Some of this effect has already been incorporated in the economic evaluation as a reduced cost of unskilled laborers by applying the shadow wages of 0.5 times their actual wages. But this is not all of the benefits of increase in employment. Other benefits still remain uncounted because there must be a multiplier effect that the increase in their income will increase their consumption which, in なられたなななななない。 turn, will give rise to income and consumption.

Furthermore, we must notice another effect of training laborers in a wide range of technics to be involved in the present construction works which are to be executed with high-grade technics over thirteen years. The technical training should greatly contribute to growth in economy of the country as well as growth in engineering.

(2) Time-savings for freight transport.

法法的任何 Time-savings for freight transport should also be taken up as one of the direct benefits of the project as well as those for the passenger. transport, but we had to abandon to measure it in monetary terms because there were no available data on the nature of commodities to cross the bridge. 18 E - 6 S

As the freight tied up during transit is in fact capital, the timesavings may be given as reduced costs of capital or reduced interest of capital. In addition, equipment costs and charges for custody will be reduced to make possible lower inventories by faster delivery of the freight after the opening of the bridge.

(3) Increase in agricultural and industrial productions.

主要的有关的 计分子的 计分子的 化合金合金

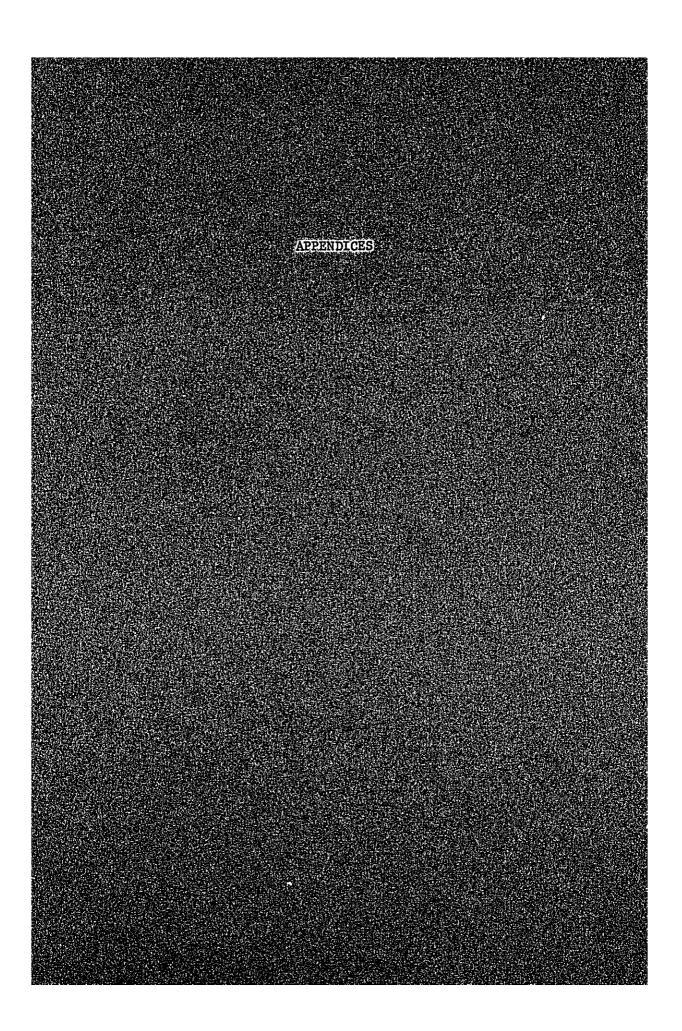

noist Conga C Opening of the Jamuna Bridge has an important significance for economic development of Bangladesh in improving the communications between the capital, Dacca and the north-western part of the country, a central region of agricultural production. The bridge, if completed, is expected not only to smoothen the traffic flow between the regions. on both sides of the Jamuna River, but also to dissolve the interruption of traffic due to floods. The bridge, therefore, will greatly contribute to prompt supply of perishable vegetables and fruits produced in the sec

a result, the project will lead to increase in agricultural production in the north-western region and reduction in prices as well. In this aspect, the net value of increased agricultural production will become a development benefit to be brought by the project.

Similarly, another development benefit in industry can also be expected from the project. In addition, the investment of huge capital at the construction stage will give a stimulas to development of allied industries and consequently will give increase in industrial production and employment. It is expected that the national income will ultimately increase by the multiplier effect which, in turn, will give rise to income and consumption.

In conclusion, there can be no doubt as to the national importance of this project when we consider the above-mentioned intangible benefits together. In this sense, the project will surely be realized in course of time. But, at present, it does not seem to be economically feasible to implement it immediately. Until the time comes, improvement or strengthening of the ferry facilities will have to be considered for promoting the economic development of the country.
