PRESENT STATUS
OF
10TH MILE PIG AND POULTRY FARM

20th June, 1985

Present Status of 10th Mile Farms

(July 1985)

1. Introduction

Livestock Breeding Corporation 10th Mile Farm was one of the bilateral aid project from Japanese International Cooperation Agency in Burma. The project started in 1978 and terminated in March 1983. The following status of the farm is a continuation report of Dr. M. Hirose who was a team leader of the project during 1980 to 1983.

2. Pig Sector

During the project period, the imported breeds and number of the pig were four breeds and 185 heads. From the termination period of the project ie. 1983 to 1985 March and there were four breeds and 12 numbers of pig left. But from 1983 to 1985 period, the total pig breed in the farm were 1021 heads per month. From these pigs, the total distribution of the breeding stocks were 3279 and pork was 2594 heads. The annual distribution of pigs was shown in table (1).

During this period 541 sows farrowed 4016 piglets. The farrowing rate was 2.05. The litter size was 8.0 (Table 2). The conception rate was average 90.16 percent (Table 3). The mortality rate is 22.69% (Table 4).

In 1984 August there was an outbreak of foot-and-mouth disease in pig and the mortality rate was increased in that period seasonal changes of mortality and concerning causes were shown in table (5). It was noted that the previous mission recommend the introduction of new breed to Burma because the original stock imported from JAPAN was suffering from the inbreeding effects. From the four imported breeds, the Duroc breed is mainly suffering from this effect. The remaining breeds were also face to inbreeding very closely. Therefore the farm needs to introduce new station of Berkshire, Landrace, Large white and Duroc breeds.

3. Poultry Sector

After termination of the project, the Norin breed of chicken was so popular in Burma market. The distribution of Norin breed was shown in Table (17). Also the semi-broiler (commercial cross) chicken was so popular which was one of the product of this project. The pure strain of

RIR and white Leghorn introduced from JAPAN was suffering inbreeding effect. Being the semi-broiler production is increasing in the poultry industry in Burma, the project provided the poultry breeding technology such as cage management, chick sexing, Norin breed, semibroiler breed, Artificial Insemination technique and utilization of premix in the food.

Day old chicks production of the farm during the project period was about 1,091,134 and after the termination of the project to end of JUNE 1985 was 1,263,488. The selection of pure line RIR (06) WL(11) and WL(74) was also carried out in the farm.

The continuation of vaccination and medication programme was carried out as the project period. But sometimes, medicines and vaccines were insufficient in the farm. Other farms from the Corporation were followed to take blood test on their chickens. Hence the transfer of technology was spread out so forth.

4. Feed Sector

The feed analysis was done in the Nutrition Laboratory at the farm regularly. Being the quality of feed was sometime irregular, the normal routine analysis of feed was done. The analysis record was shown in Table ().

The formula feed production from the feed mill section was shown in table (18). Average feed production was 425 metric ton/year for the pig and 770 metric ton/year for the poultry. The premix production was also shown in the table (19). It was noted that the premix distribution was also increased year by year.

5. Hatchery Section

The total capacity of the setter and hatcher in 10th Mile Farm were 8 setters and 4 hatchers which can handle 76,000 eggs in the setters and 27,000 eggs in the hatchers. Being some machines were frequently out of order suffering from electrical falseness, the electrical motors had to be repaired. The bodies of the hatchers and setters were also needed to be repaired. Therefore the farm needs extra one pair of setter and hatcher.

6. Laboratories Section

There are two laboratories in the farm namely animal hygiene lab and nutrition lab. The shortage of chemicals sometime hindered the laboratory work. The equipments supplied by JICA were utilized in both laboratories and sometime it was very difficult to get some spare parts such as I.C for special electronic equipments.

7. Machine and Farm Implement Section

The difficulties of getting spare parts for some farm implements delay the production of the farm. The fully utilization of farm tractors, farm bulldozer and farm implements was hindered from the effect of spare parts difficulties. The supply of farm equipment was only Japanese origin and it was very hard to get the spares from the local market. Therefore the provision of spare part is urgently needed for the farm.

8. Conclusion

The transfer of technology for pig and poultry production is benefited for Burma livestock industry. During the project years and after termination of the project, the new techniques in pig and poultry husbandry and production was achieved. Although some difficulties were met in the project implementation period, the Japanese experts and Burmese counterparts took a great effort to achieve the objective of the project.

After project termination, Burmese counterparts also continued their great effort to achieve the objectives. But the present situation of the farm needs the follow-up implementation of some materials. Even some livestock should be introduced from Japan. However, we can say that the transfer of technology of pig and poultry development was successfully implemented in Burma by the aid of Japanese Government.

Table 1. Distribution of Breeding Stock & Pork Pig

Year	Breeding Stock			Pork Pig			Total		
	♂	♀	T	♂	♀	T	♂	♀	T

Blood Examination in Poultry

Period was separated as follows:

- (1) Mar. '83 - Mar. '84
- (2) Apr. '84 - Jun. '84
- (3) July '84 - Dec. '84
- (4) Jan. '85 - Jun. '85

(A) *Salmonella Pullorum*

No.	Tested No.	+vc	+vc rate
1	15512	84	0.54%
2	1386	160	11.54%
3	3686	228	6.18%
4	3009	8055	13.5%

(B) *Mycoplasma Gallisepticum*

No.	Tested No.	+vc	+vc rate
1	14608	1979	13.55%
2	556	468	84.17%
3	553	237	42.85%
4	606	195	32.17%

(C) Mycoplasma Synoviae

No.	Tested No.	+ve	+ve rate
1	4293	179	4.2%
2	479	63	13.15%
3	272	44	16.17%

New Castle Disease H.A.H.I. Titration

	Samples	Satisfactory titra	Ravaccination
Aug. '83	152		
Oct. '83	38		
Jan. '84	49		
Mar. '84	8		
Feb. '85	10		
May '85	20		

Blood Examination in Pig

(A) Brucellosis

(a) By Brucella Abortion and B. Sris Antigen

Date	tested no.	PAT		SAT	
		+ve (30 IU)	suspect (151U-301U)	+ve	Suspect
Mar. '83	244	11	8	15	4
Feb. '84	20	5		2	

(b) By B. Abortion Antigen (PAT and SAT test)

Date	Tested No.	+vc >36 IU	-vc <36 IU	+vc rate
Sept. '83	252	9	242	3.57%

RAT = Plate Agglutination Test

SAT = Standard Tube Agglutination Test

(B) Toxoplasmosis Test

(a) By Latax and SES Testing date = Sept. '83

	Latax	SES	No. of samples	%
Positive	64	256	711	44.4%
Doubtful	32	647	49	19.6%
Negative	32	64	90	
Total tested no.			250	

(b) By Screening test and standard

Testing date = Feb. '84

Total tested no. = 20

Standard positive titre = 1:256

Screening test positive no. = 4

Standard test positive no. = 4

* Screening test positive no. were confirmed by standard test.

Parasitological Examination

(A) Poultry

Period	Sample	+vc no.	+vc rate
Mar. '83 - Mar. '84	308	127	41.2%
May '84 - Jun. '85	192	42	21%

(Main parasite - Coccidiosis and Ascariasis)

(B) Pig

	Samples	+vc no.	+vc rate
Mar. '83	105	20	19%
Jun. '84	20	16	80%

Main Parasite

(OESOPHAGOSTONUM, COCCIDIOSIS, ASCARIASIS)

Post-Mortem Examination of Poultry

Period	Deed No.		
	Starter	Grower	Adult
March 1983 March 1984	6907	4655	5334
April 1984 July 1984	4360	3263	2273
August 1984 June 1985	3009	8055	8809

Cause

Starter	(1) Weakness	(2) Rat bite	(3) Omphalitis
Grower	(1) Cannibalism	(2) Coecidiocin	(3) C.R.D.
Adult	(1) Egg: Peritonitis	(2) Lymphoid	(3) A.P.
