PREFACE

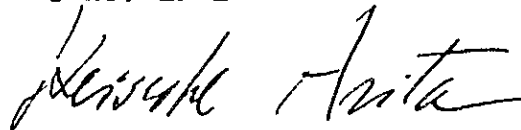

In response to a request of the Government of the Kingdom of Thailand, the Japanese Government decided to conduct a Road Development Study in the Northern Region of Thailand and entrusted the Study to the Japan International Cooperation Agency. The study consists of two phases: Phase I (Master Planning) and Phase II (Feasibility Study on Priority Projects). For Phase I, the JICA sent to Thailand a survey team headed by Mr. M. Tohi from June 26, 1980 to March 7, 1981.

The team exchanged views with the officials concerned of the Government of Thailand and conducted a field survey in the Northern Region. After the team returned to Japan, further studies were made and the present report has been prepared.

I hope that this report will serve for the development of the project and contribute to the promotion of friendly relations between our two countries.

I wish to express my deep appreciation to the officials concerned of the Government of the Kingdom of Thailand for their close cooperation extended to the team.

June, 1981

Keisuke Arita
President

Japan International Cooperation Agency

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

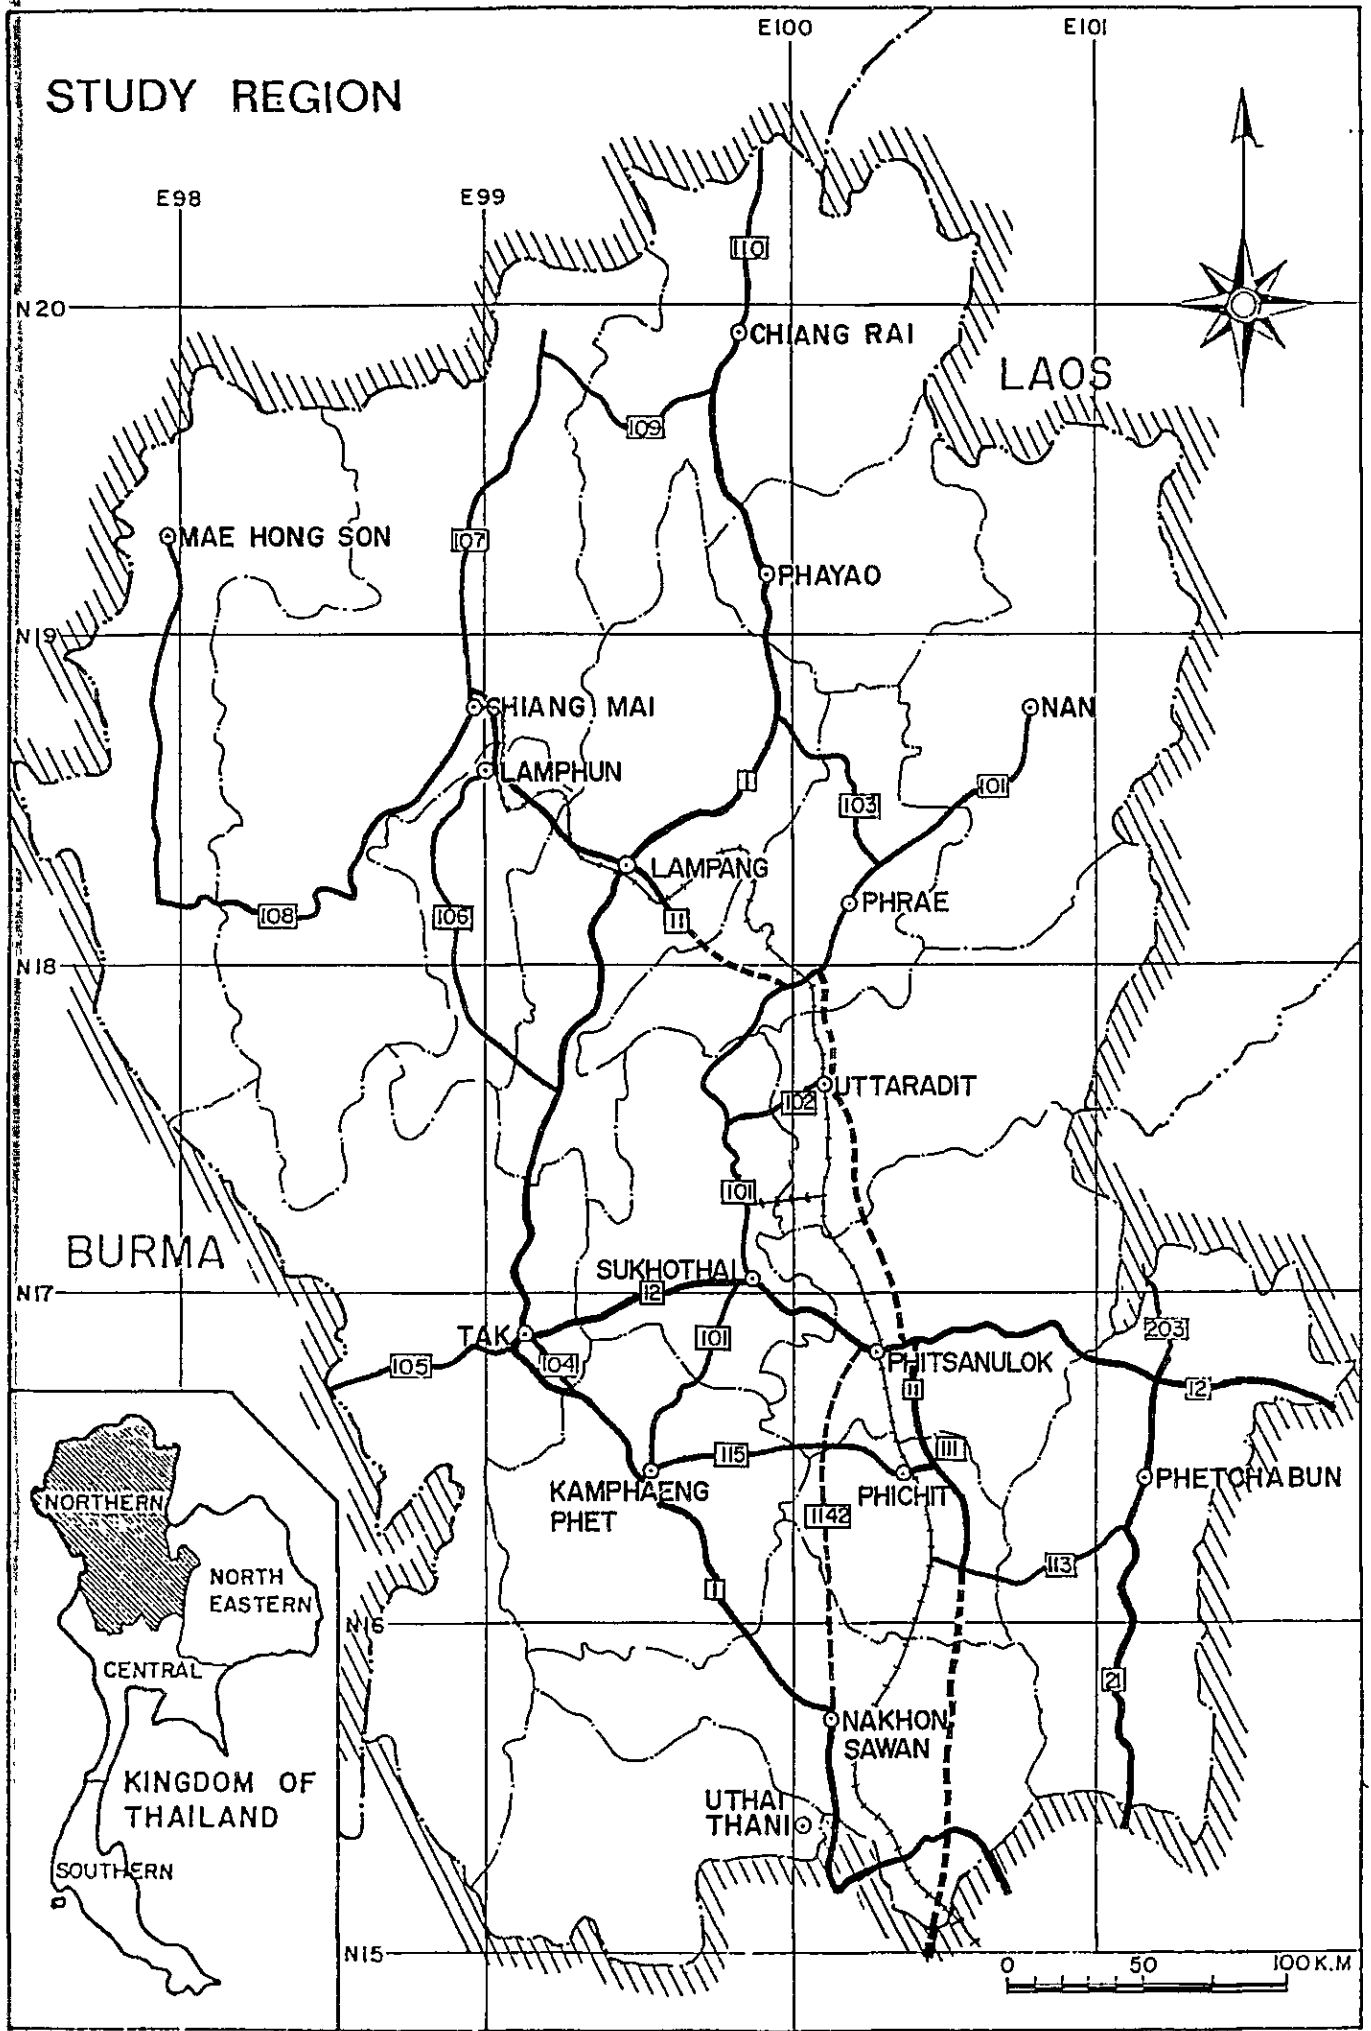

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent and reliable data collection processes to support effective decision-making.

3. The third part of the document focuses on the role of technology in modern data management. It discusses how advanced software solutions can streamline data collection, storage, and analysis, leading to more efficient and accurate results.

4. The fourth part of the document addresses the challenges associated with data management, such as data quality, security, and privacy. It provides strategies to mitigate these risks and ensure that data is used responsibly and ethically.

5. The fifth part of the document concludes by summarizing the key findings and recommendations. It stresses the importance of ongoing monitoring and evaluation to ensure that data management practices remain effective and up-to-date.

Route 1098
in Changwat Chiang Rai

Route 1048 in Changwat Lampang

Route 1174 in Changwat Chiang Rai

ARD road near Chon Daen
in Changwat Phetchabun

Timber bridge on Route 1048
in Changwat Lampang

Flood section on provincial road in Changwat Nakhon Sawan

Rural road in rainy season near Khlong Khlung
in Changwat Kamphaeng Phet

Light Bus

Vehicles for freight traffic

Maize transportation by waterway,
Taphan Hin in Changwat Phichit

Vertical line of text on the left margin.

Small text at the bottom left corner.

Paddy transplanting in Changwat Nan

Rice threshing by machine in Changwat Sukhothai

Paddy assembly market in Changwat Nakhon Sawan

Maize field in Changwat Uttaradit

Maize assembly market in Changwat Phitsanulok

Cotten assembly market and factory in Changwat Sukhothai

Assembling of agricultural product

SUMMARY AND RECOMMENDATIONS

SUMMARY AND RECOMMENDATIONS

1. The current national strategy puts emphasis on the decentralization of basic infrastructures in order to stimulate socio-economic activities in the less developed regions. In conformity with this strategy, the highway development policy has paid an attention to the improvement of highway networks at provincial level. Within this policy framework, the Department of Highways (DOH) of the Ministry of Communications requested the Japanese Government to carry out an overall study of the road development in the Northern Region. The study comprises two phases; master planning in Phase I and feasibility study in Phase II. This report presents a result of the Phase I study which has been carried out since June 1980. The objectives of the Phase I Study is to identify priority road routes and to recommend a phased program, especially a short term project package which is to be the subject of Phase II study. The study flow is shown in Figure 1-1 (page 5).

2. The Northern Region covers 170,000 square km or 33% of the national land and embraces the population of 9.5 million or 21% of the national total in 1978. Due

to its topography, the Region's cultivable land is only 42% of its total area, the lowest among four regions of the country. Nearly half of it, however, remains still uncultivated mainly due to the insufficient development of basic infrastructures.

3. The economy of the Region is predominantly agricultural. Out of its Gross Regional Product which accounts for 14% of Gross Domestic Product (GDP) of the Kingdom, the agriculture sector contributed 45% in 1978. In order to keep its economic stability, the agricultural diversification is one of the most vital importance. To support this, further investments to the sector of basic infrastructures are demanded.

4. The relatively lower rate, comparing with the national average, of population growth of the Region, 2.4% per annum, suggests that the Region is an out-migration area. One reason for this is a limited absorptive capacity of the land and another seems to be a low income level of the Region. Per capita income of the Region, 6,445 Baht in 1978, is low as 65% of the national average. In view of keeping off the out-migration especially from flocking into Bangkok, it is a crucial requirement to achieve the national strategy to reduce income disparities among regions by means of decentralization of infrastructures and social services.

5. Urbanization in the Region is still at a low level. The urban population of 630,000 in 24 municipal areas accounts for 7% of the total regional population. Although Chiang Mai and Phitsanulok are designated as growth centers in the national strategy on the regional development, the further demanded is to develop many other local centers simultaneously together with their hinterland development. In this context, the improvement of networks of rural-urban linkages, as well as inter-urban linkages, is important.

6. Out of total cultivated area of 24.4 million rai in the Region, rice ranks as primary crop followed by maize, beans, sugarcane, tobacco and other upland crops. Agriculture sector in the Region has shown relatively good performance in the crop production. In addition to the land expansion, increase of yields also has been so faster than national average to contribute to the production increase. Further challenges to be considered for the Region would be agricultural diversification as well as continuous efforts for yield increase. Emphasis is, therefore, to be laid on the diversification of infrastructures such as branch systems of roads, irrigation and power facilities. Improvement of linkages between farm and market and between production area and processing area is the requirement to the road sector.

7. Similarly with the other regions, the trunk transportation system of the Region has been developed in a manner to radiate from Bangkok. The Northern Line of the State Railway of Thailand extends from Bangkok to Chiang Mai in 751 km of total track-km. Inland waterways are maintained in the Chao Phraya river system. The major waterway is on its tributary Nan, about 370 km up to Uttaradit. Seven major riverside ports are located along the Nan and main stream of the Chao Phraya. Thai Airways connects 7 domestic airports of the Region with Bangkok by 24 flights a week. The total length of roads in the Region amounts at 16,000 km including 6,500 km of paved roads. Out of the total, 80% is under DOH and the remainings are managed by other agencies such as ARD, PWD and MDU. Among 3 primary national highways, Route 12 traverses in an east-west direction connecting Route 1 and 21. Another primary highway, Route 11, is under construction to serve also as an important artery. Among various modes of transport, land transport plays a predominant role in the Region. For example, more than 60% of commodity flow between the Region and Bangkok has depended on roads.

8. An analysis on the level of road development of the Region was attempted for inter-regional comparison in terms of road density related with various socio-economic indicators. The result reveals that the road density in the Regions is below the standard level from any view of indicators, comparing with other regions. Especially, if considered its level of economic production, urban activities and future land potential, the roads in the Region seem to be still insufficient.

9. Viewing that clear understanding of the area is of crucial importance for the identification of road development needs, this Study made an attempt to quantify area potentials, magnitude of socio-economic activities, at Amphoe level and Changwat level as well. Area potentials were assessed in normalized aggregation of figures of 17 indicators selected from the various aspects such as: future land potential, performance of major productive sectors, levels of urban activities and services, and population factor. The quantified area potentials, if ranked in the order of magnitude, reflect adequately the regional structures which is widely perceived. The estimated figures of area potential at Amphoe level were utilized in the analysis of some of key indicators for identification of priority links and areas.

10. Implicating the characteristics and background of the Region, the following major development objectives were set for the planning in this Study:

- a) To reinforce network of linkages between and within administrative, social and economic units of the region in order to encourage inter-urban/urban-rural interactions and establish a physical frame for a balanced development of the region; and

- b) To ensure access for the areas which are endowed with potential resources, including high productive lands, thereby attaining maximum utilization of the region's resources for national economic development as well as improving living standard of the people in such areas.

To make the identification of proposed roads consistent with the above development targets, the planning criteria for route identification were set as follows:

- Criteria 1 To link among:
- A. Centers of adjacent-Amphoe (Inter-Adjacent Amphoe Linkage),
 - B. Centers of adjacent Changwat (Inter-Changwat Linkage), and
 - C. Changwat centers and its Amphoe (Intra-Changwat Linkage).
- Criteria 2 To link centers of Amphoe within Marketing Zone with:
- D. Market center (Intra-Market Zone Linkage).
- Criteria 3 To link existing artery paved highways directly:
- E. With centers of neighbouring Amphoe (Amphoe-Artery Road Linkage), and
 - F. In an East-West direction (Lateral-Type Linkage).
- Criteria 4 To ensure access to high potential lands by:
- G. Improving existing unpaved roads with high development potential alongside (Improvement of DOH Unpaved Roads), and
 - H. Providing better access with isolated area of high development potentials, particularly in 8 Changwat in Lower North (Feeder Road Requirement).

11. Based on the planning criteria set forth, the identification of routes to be proposed was carried out according to the process shown in Figure 5-1 (page 79) and in the following 2 steps:

Step 1: The linkages or the road requirement areas to be analysed in the Step 2 were selected individually by each criterion mainly on a theoretical basis. The major indicators applied for the assessment are: i) the level of accessibility on each link and ii) relative importance of interaction between nodes of each link, which are expressed by inter-nodal gravity, commodity flow volume, road requirement index, etc.

Step 2: Technical possibility of the improvement of the links or areas selected in the Step 1 were examined based on topographic maps and the results of field reconnaissance. The routes thus determined were adjusted taking the DOH's comments into account and finally listed up separating into short/medium term program and long term program.

12. Priority links or areas were identified in the Step 1 as follows:

- a) Linkage among socio-economic centers, i.e. inter-adjacent Amphoe linkage, inter-Changwat linkage, intra-Changwat linkage;
Accessibility of each linkage, in terms of ratio and difference between travel time on existing road and that on ideal route, was checked at first. And then inter-nodal gravity, putting the area potential into one of the variables of the gravity model, for each

linkage was assessed. Among 492 links fallen into this category, links identified under the above indicators were 22 of inter-adjacent Amphoe linkage, 3 for inter-Changwat and 1 for intra-Changwat.

b) Intra-Market Zone linkage;

Accessibility was checked in the same manner as in the above a), and then volume of commodity flows on the pertained links were assessed. Thus, out of 256 links in this category, 8 links were identified as priority link.

c) Amphoe-Artery Highway Linkage;

Based on the concept that every Amphoe should be linked with artery highway by paved road in better connection, 8 links were identified.

d) Lateral-Type-Linkage;

In view of the insufficient development of east-west highways in the Region, minimum requirement of the lateral-type-roads which link north-south highways each other was examined, and 3 links were identified.

e) Improvement of DOH Unpaved Roads;

For 118 links, population and cultivable land influenced by each roads were assessed, and 13 links were selected for further analysis as they had higher values than averages both in population density and cultivable land.

f) Feeder Road Requirement;

Especially in 8 Changwat, i.e. Nakhon Sawan, Phichit, Phitsanulok, Uttaradit, Phrae, Lampang, Sukhothai and Kamphaeng Phet, influenced by the ongoing Route 11 and 1142, feeder road requirement index was assessed based on a mesh analysis. Index was estimated for each mesh in terms of the product of mesh potential and distance

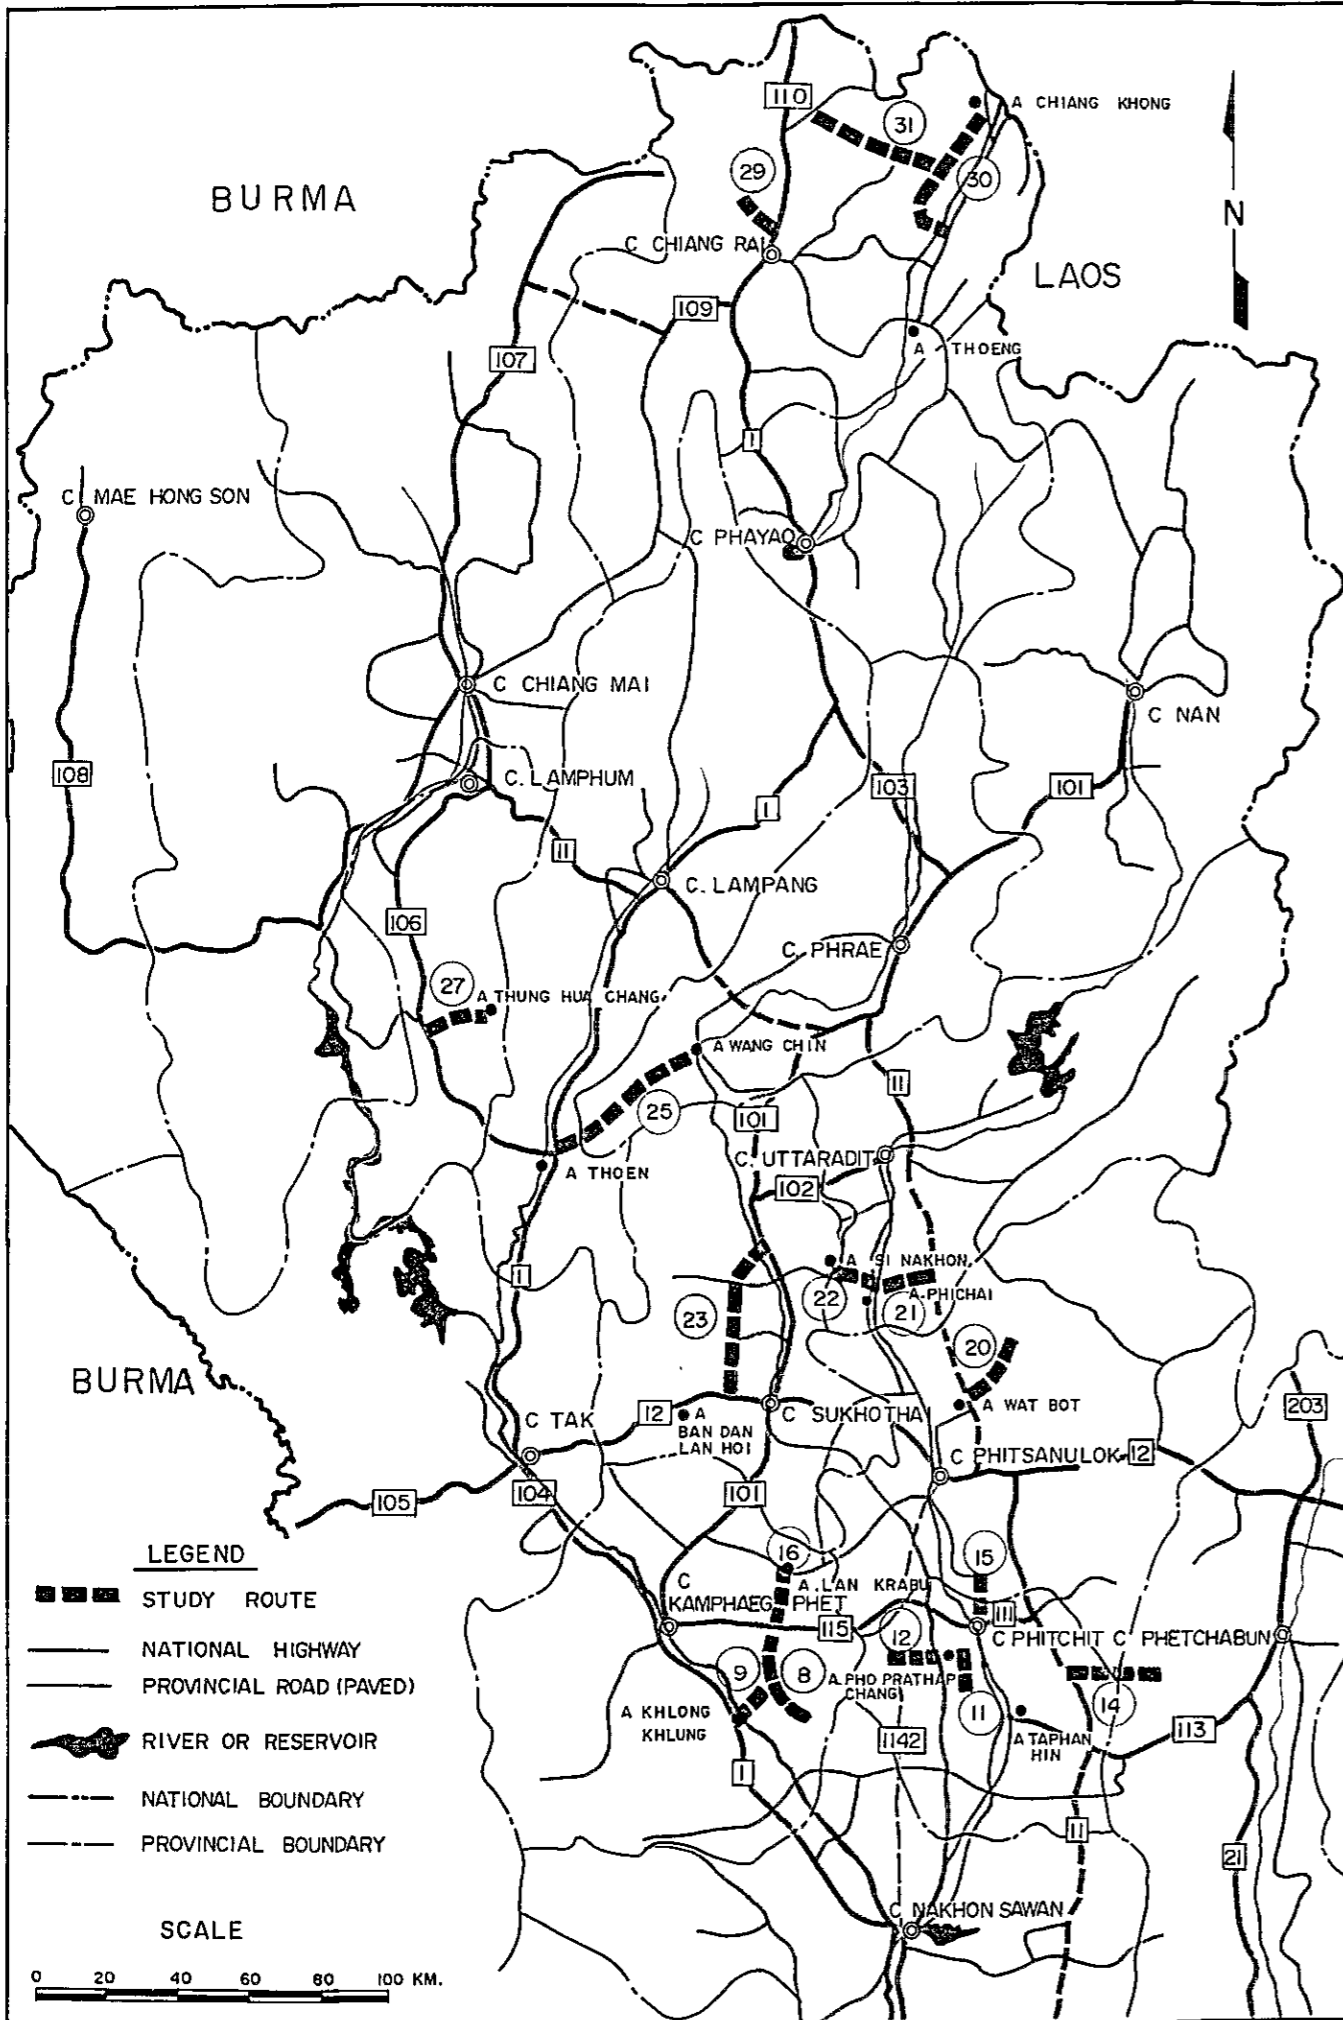

to the nearest existing road. Thus, the area with the agglomeration of meshes of large index value, 33 areas, were identified to be the road requirement area.

13. Priority links or areas, 58 links and 33 areas, theoretically identified in Step 1 were then examined in a practical manner based on topographic maps and the results of field reconnaissance. Routes planned practically with necessary adjustment were then screened under the discussions with DOH to avoid duplication with the existing roads of other agencies and with the routes already committed. As a result, 44 routes of 1,187.8 km in total were proposed to be considered. Further, among this 44 routes proposed, 31 routes of 862.1 km in total were selected, incorporating the DOH's policy, as routes for short/medium term program, for which further evaluation be proceeded with in this Study.

14. For the 31 routes separated for short/medium term, economic evaluation at pre-feasibility level was worked out in order to present a priority ranking for them, according to the process as shown in Figure 6-1 (page 88). With regard to the subject routes, road inventory survey, traffic survey and agro-economic survey have been conducted. Traffic forecasts were elaborated for each proposed route based on the analysis of the result of O/D survey. Construction quantities were estimated basing on the pre-design criteria determined, and construction costs in 1980 price level were estimated accordingly. Benefits were also estimated at 1980 price in terms of road user's cost savings, road maintenance costs savings and agricultural development benefit. Based on the costs and benefits thus estimated assuming 1986 the opening year, internal rates of return (IRR) were calculated for each route.

15. Priority ranking in terms of IRR was then scrutinized on a series of discussions among DOH, Study Team and its Steering Committee. As a consequence, 16 routes of 409.3 km in total were selected for a project package for feasibility study in Phase II. They are shown in the following list and chart.

16. Further actions recommended are to proceed with arrangement necessary for the earliest financing to the priority projects to be implemented during the next five-year-plan period. For this purpose, it is recommended to commence promptly feasibility studies on a project package, 16 routes, selected in this Study.

SUMMARY OF SELECTED ROUTES

Study Route No.	Changwat	Origin - Destination	Length (km)	Projected ADT			Construction Costs (10 ⁶ Baht)	IRR (%)
				1986	1992	2000		
22	Uttaradit/Sukhothai	A ^{1/} Pichai - A. Si Nakhon	13.2	1717	2341	3432	17.7	46.4
15	Phichit/Phitsanulok	B ^{1/} Wang Tham (R.1221) - B. Tha Makham (J.R.1114)	8.5	842	1167	1751	14.8	42.2

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that proper record-keeping is essential for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent data collection procedures and the use of advanced analytical techniques to derive meaningful insights from the data.

3. The third part of the document focuses on the role of technology in enhancing data management and analysis. It discusses the benefits of using data management systems and the importance of ensuring data security and privacy.

4. The fourth part of the document addresses the challenges associated with data collection and analysis. It identifies common issues such as data quality, data integration, and data security, and provides strategies to overcome these challenges.

5. The fifth part of the document discusses the importance of data governance and the role of data stewards. It emphasizes the need for clear policies and procedures to govern the use of data and the importance of assigning responsibility for data management to specific individuals or teams.

6. The sixth part of the document discusses the importance of data literacy and the need for training and education. It highlights the benefits of having a data-literate workforce and provides recommendations for developing data literacy programs.

7. The seventh part of the document discusses the importance of data ethics and the need for responsible data use. It highlights the potential risks of data misuse and provides guidelines for ensuring that data is used in a fair and ethical manner.

8. The eighth part of the document discusses the importance of data sharing and the need for interoperable data systems. It highlights the benefits of data sharing and provides recommendations for developing data sharing policies and procedures.

9. The ninth part of the document discusses the importance of data visualization and the need for effective data communication. It highlights the benefits of using data visualization tools and provides recommendations for developing effective data communication strategies.

10. The tenth part of the document discusses the importance of data security and the need for robust security measures. It highlights the risks of data breaches and provides recommendations for developing a comprehensive data security strategy.
