

quantities of vegetables excluding tomatoes exported to Arab, Eastern Europe and Western Europe Countries, 1981.

Tomatoes exported from Egypt show the highest CIF prices. It is not clear why. One of the main strategies to develop exports is to keep the international marketing standardisation of goods to be exported. Table O-2-15 is the common standards in connection with "marketing" of tomatoes in the international market.

2-4 Marketing Channel

The marketing of agricultural products in the Project area will be made through the marketing system or marketing channels which is presently predominant in Egypt.

In Egypt, government control is executed in the marketing of agricultural products through the obligatory marketing commitments and with controlled prices.

Governmental marketing control is made to different extents according to commodity. Some are completely controlled, some moderately, and others only slightly.

In this sense, the products in the Project Area will be grouped as follows:

<u>Governmental Control</u>	<u>Products</u>
Completely	Sugar beet
Moderately	Rice and soybean
Slightly	Milk, meat and vegetables

The recommended marketing channels for vegetables, and for milk and dairy products are shown in Figures O-2-1 and O-2-2 respectively.

Table O-2-15

Summary Comparative Table of Requirements
Laid Down by The Standard on Tomatoes

REQUIREMENTS	CLASSES		
	"EXRTA" Superior quality	I Good quality	II Minimum requirements
I. Minimum requirements (all classes)	-intact -fresh looking -sound -clean -free of abnormal external moisture -free of foreignsmell and/or moisture -appropriate degree of development		
II. Classification			
-appearance	-all typical characteristics of the variety	-all typical characteristics of the variety	-in keeping with minimum requirements
-shape	(a) "round" (including "cherry") -spherical -descoid (b) "ribbed" (c) "oblong"	(a) "round" (including "cherry") (b) "ribbed" (c) "oblong"	-may be slightly irregular
-fresh	-firm	-reasonably firm	-fairly firm
-greenbacks	-excluded	-excluded if visible	
-defects	-exempt, except for very slight superficial damage to the skin	-unhealed cracks excluded	-unhealed cracks excluded
		Defects allowed: -Slight defects in shape and development -slight defect in skin colouring -slight skin defect -very slight damage from machine handling	Defects allowed: -defect of shape and development -defect of colouring -skin defects, damage from machine handling and bruises which do not seriously affect the fruit

(Cont'd)

REQUIREMENTS	CLASSES		
	"EXTRA"	I	II
		-very slight bruises -healed cracks not more than 1 cm long, in the case of "ribbed" tomatoes	-healed cracks not more than 3 cm long
III. Sizing	-compulsory (excluding "cherry" tomatoes) -minimum diameter: "round" and "ribbed": 35mm "oblong": 30mm	-compulsory (excluding "cherry" tomatoes) -minimum diameter: "round" and "ribbed": 35mm "oblong": 30mm	-optional -unsized minimum diameter: "round" and "ribbed": 35mm "oblong": 30mm
IV. Tolerances			
-quality (in number or weight)	5%	10%	10%
-size	-10% with a minimum of 33mm for "round" and "ribbed", and 28mm for "oblong"	-10% with a minimum of 33mm for "round" and "ribbed", and 28mm for "oblong"	-10% with a minimum of 33mm for "round" and "ribbed", and 28mm for "oblong"
V. Packaging and Presentation			
-uniformity	-origin -commercial type or variety -shape -ripeness -colouring -uniform length for "oblong" -quality	-origin -commercial type or variety -shape -ripeness -colouring -uniform length for "oblong" -quality	-origin -variety or commercial type -quality
-packaging	-some form of protection compulsory -packages must be free from any foreign bodies

P. IMPLEMENTATION

I Implementation Organization

1-1 General Framework

See Fig. P-1-1 Organization Chart of The Project Management Body

1-2 Sectional Functions

(1) Promotion Section

The jobs assigned to this Section include: (i) orientation to the project as a whole at its very outset; (ii) establishment of guiding principles for attaining its tasks; (iii) identification of definite courses for promoting agriculture development in the project area; (iv) appropriate adjustment to such development courses as and when necessary, and (v) constant effort to maintain the project at a position of outstanding significance among various agricultural development projects in Egypt. The works to be taken up by this Section from the outset, and along with the progress of the project, will be as follows:

- (i) Since this project will see itself properly implemented through the co-ordinated approaches in the engineering, social, and economic spheres, it is imperative to pre-decide the procedures and programmes for constructing the physical facilities and consolidating the non-physical (socio-economic) infrastructure required in each sphere and also to make posting of personnel at their respective duties to run the machinery designed for smooth operation of each sphere. Equally important is the arrangement for synchronization and coordination of sphere-wise activities, phase after phase, to bring at an earliest opportunity as wide an area as possible under overall agricultural development activities.

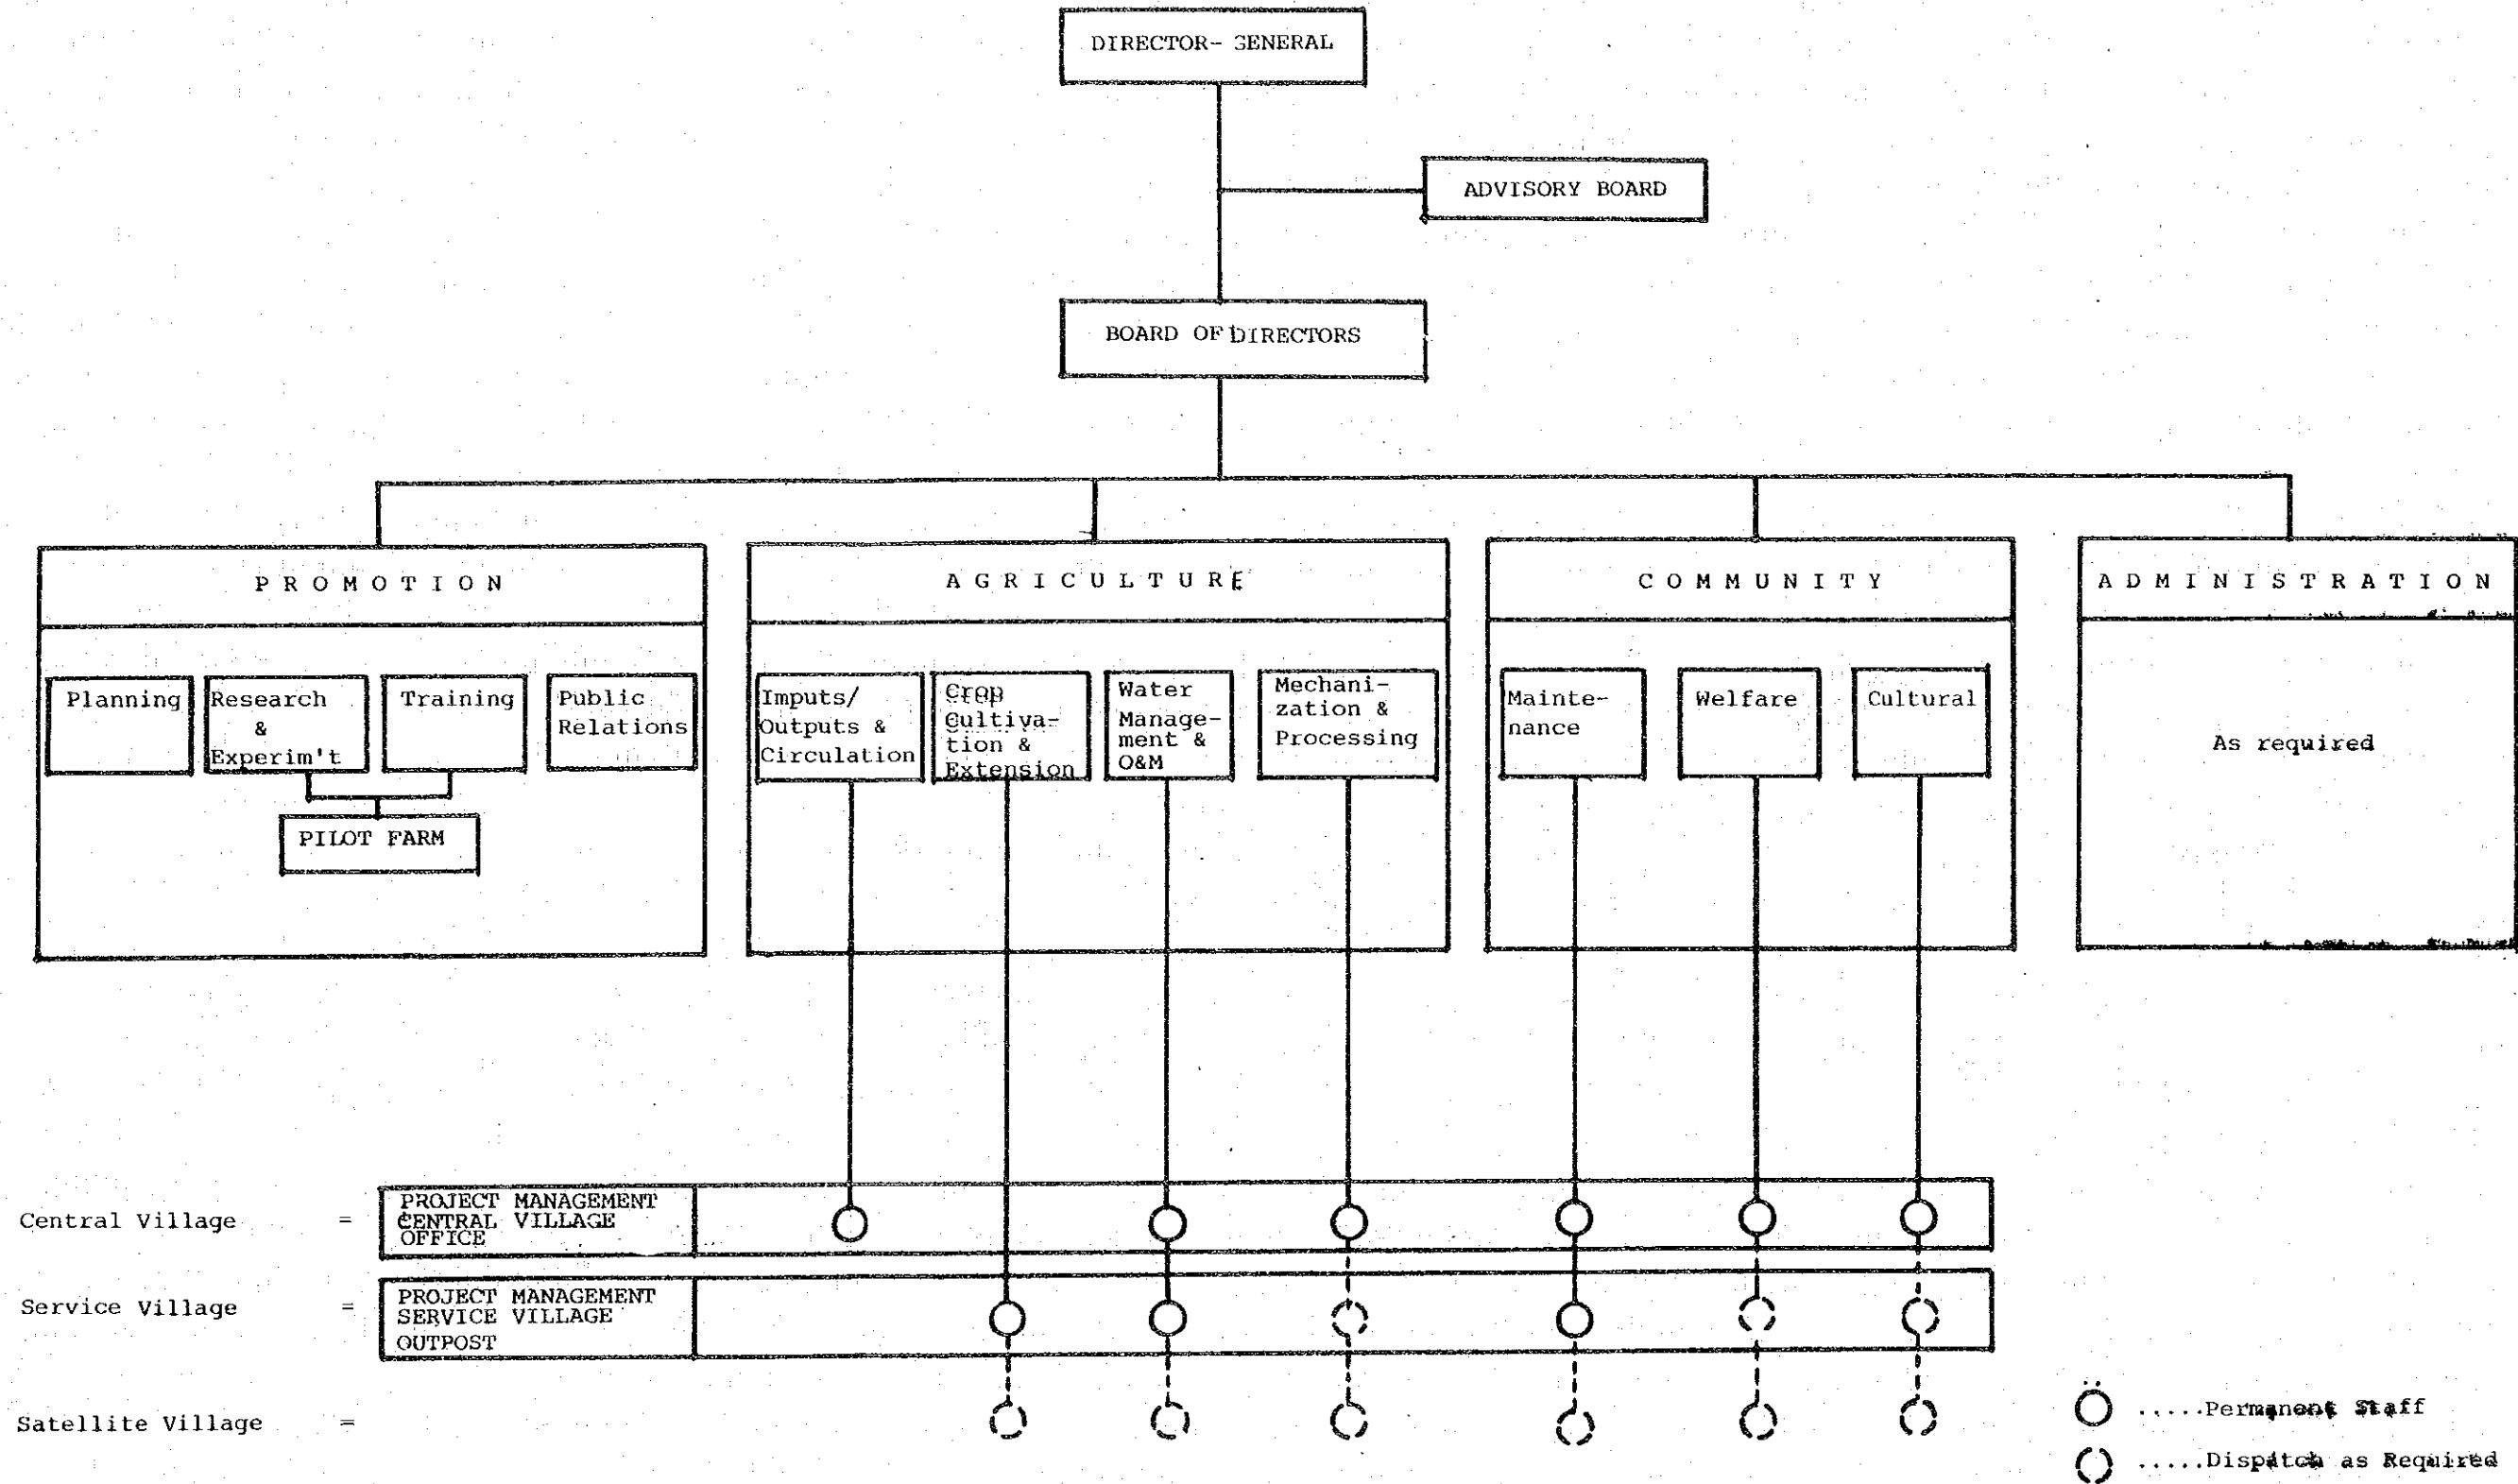

Fig. P-1-1. Organization Chart of the Project Management Body

(ii) As soon as the decision has been made to implement this project, the Pilot Farm shall be constructed at the most strategically advantageous site so that it may start on its assigned work to prepare the cropping patterns and crop rotation systems to be officially adopted in each part of the project area. This should preferably be done before the conclusion of the trial cropping which succeeds land reclamation work. Determination of such cropping patterns and crop rotation systems shall be made by taking into consideration the inter-relationships among the following four items: (i) input/output and circulation; (ii) crop cultivation and extension; (iii) water management and O&M, and (iv) mechanization. Since animal husbandry, vegetable cultivation, and fruit growing is also covered, the decision arrived at through experimental studies in the Pilot Farm will have the full implication of being a master plan for agricultural development which expects due establishment and provision of the facilities, institutions, and personnel prior to its implementation.

(iii) The substance of the original agricultural and agroindustrial production plan referred to in (ii) above would consist primarily of the outcome of full co-operation of the Agriculture Section, but the planning staff of Promotion Section needs to work very hard as coordinator and driving-force to give a proper form or shape to the master plan. Upon completion of the master plan, it will be further checked and finally approved by Agriculture Section; this procedure is unavoidable as its implementation through the agricultural co-operative systems, extension service network, and agroindustrial-ventures depends to a large extent on allout support by Agriculture Section.

The Promotion Section will also take over responsibility of training the extension workers attached to Agriculture Section on cultivation techniques, plant protection, and veterinary services in its Pilot Farm.

(iv) Various problems would be raised on such aspects as technical, institutional, and administrative aspects, once the master plan is introduced and widely implemented. The Promotion Section will diligently attend at solving all these problems and difficulties to improve the original master plan. Even when the required amendment or improvement remains local or fractional, such would not fail to give more or less influence on the entire plan. Technical aspects of crop cultivation, animal husbandry, and poultry may be adequately handled by the Pilot Farm but problems concerning the circulation of inputs and outputs through agricultural co-operative systems and others still remain to be solved simultaneously. Hence improvement or amendment of the master plan naturally calls for the good co-operation of Agriculture Section.

(v) It will be both desirable and necessary for the project to keep the decision-makers of the Government as well as the leaders of various agricultural development projects in the country, informed of the spadework made for emergence of the project, as well as its concrete action taken to achieve highly productive agriculture and decent livelihood environments, the net results obtained so far, the goals set in the near future and the methodology for reaching them, and all the relevant information of the project, from time to time, throughout its historic development. Through such public relations activities, the project itself will benefit immeasurably from constructive comments and suggestions given by them and, at the same time,

learn something valuable. Such public relations activities will also be necessary towards all the Sections and Departments of the project management body, co-operatives, PBDAC, and the common residents in the project area to strengthen the recognition of the progress being made by the project and to reawaken the sense of 'participation' among them.

(2) Agriculture Section

The Agriculture Section will provide very active services from the stage where the agricultural development master plan will have to be formulated on the basis of experimental studies undertaken in the Pilot Farm. This Section will consist of experts on the following four subject-matters and who cooperate with Promotion Section in their respective capacities for the formulation of the master plan, its implementation and improvement:

- (i) Input/Output and Circulation;
- (ii) Crop Cultivation and Extension;
- (iii) Water Management and O&M, and
- (iv) Mechanization and Processing.

(i) Input/Output and Circulation

Crop cultivation ultimately aims at obtaining the best outputs in both quantity and quality through optimal combination of the appropriate inputs and suitable farming technology, and at its beginning and end has to be attended by the two circulation processes of purchasing (procurement of input supplies) and marketing (including collection of agricultural and animal husbandary products of high quality and their delivery to the agro-industrial plants and factories in good quality and timing.)

The circulation processes are planned to be channelled through the agricultural co-operative systems of PBDAC - Multipurpose Agricultural Co-operative route and the Specialized Agricultural Co-operative route.

Agricultural re-production is constantly enlarged from one stage to the other in the project area and can be assured by smooth flow of input and output in opposite directions through these channels. Therefore, this field of work will need to be attended by agricultural economists well versed with farmer organization operation. They shall be held responsible for guidance in organization and operation of the agricultural co-operative systems, in full co-ordination with the Government co-operative officers and PBDAC authorities.

(ii) Crop Cultivation and Extension

Naturally, agronomists will occupy the core of this work and they take up research and experiment works by full use of Pilot Farm facilities on the technical aspects of crop cultivation and their application among grass root farmers. Since the crops range in a wide scope, animal husbandry, vegetable cultivation, and fruit growing will have to be taken care of at the same time, participation of the respective experts is indispensable. They will have under their command extension workers who will be put in circuit in their given territories for extension services on crop cultivation, animal husbandry, poultry, vegetable cultivation, and fruit growing and be constantly ready to be dispatched anywhere as and when necessary for plant protection and veterinary services. The training of these extension workers will be given in the Pilot Farm.

(iii) Water Management and O&M

Not a few difficulties will be faced in adequately meeting the demand for leaching, irrigation and drainage because of the peculiar nature of the land having been made through reclamation and the restrictions imposed upon supply of irrigation water both quantitatively and qualitatively.

The water management plan to keep irrigation and drainage in a good balance will have to be put into practice under these circumstances, and this will depend on perfect operation and management of the network of water management installations and facilities. This heavy responsibility will need to be executed by groups of highly qualified engineers and well trained personnel who will have to be fully equipped and given adequate mobility.

(iv) Mechanization

The problems handled here will cover those concerning the mechanical farming and processing of farm products. This does not mean that mechanical engineers are all who are wanted. To adequately solve the problem of "mechanization" of farming, labour requirements stemming from the area-farmers' adherence to the prescribed cropping patterns and crop rotation systems will have to be analyzed, crop by crop, and the entire processes of farming from land preparation to post-harvest operations will need to be studied in detail in order to identify when and where the labour requirements may exceed that mobilizable on a family basis, what kind of machinery and equipment in which quantities and capacities will be required to overcome labour shortages, and in what manner.

In this respect, the experts attached to (i) Crop Cultivation and Extension will have to be consulted upon. As the farm machinery and equipment are put in the custody of the agricultural co-operative, as a rule, for joint-use among their member-farmers, the problems of mechanization would naturally involve the necessities for subsidization, financial assistance, and technical guidance towards the agricultural co-operative systems. In these matters, (i) Inputs/Outputs & Circulation staff, PBDAC authorities and others would have to be consulted upon.

To inaugurate agricultural processing industries, again, such problems as the procurement of raw materials, the availability of processing technique, the mobilization of operational and managerial skills, and the marketing will need to be taken into consideration, side by side with the mechanical aspect of plant layout and construction. Full co-operation must, therefore, be obtained from the experts working under (i) Inputs/Outputs & Circulation and (ii) Crop Cultivation & Extension, as well as a thorough discussion with the "specialized" agricultural co-operative system and PBDAC.

(3) Community Section

This Section will be dealing with maintenance and promotion of the people's welfare in general. (i) Maintenance will look after supplies of electricity and potable water, waste disposals, telecommunications, road network, etc. (ii) Welfare will be held responsible for adequate provision of public health services through the Township hospitals, the central village clinics, and the satellite village health centers. (iii) Cultural will attend at

maintenance of primary and secondary educational facilities and enforcement of adult education.

Recreational programmes on behalf of the residents will also have to be worked out.

2. Construction Mechanization

2-1 General

Major Civil works and their quantities proposed for the project are as follows:

i) Drainage Pumping Station	2 places
ii) Drainage Canal	
- Main drainage canal	109.4 km
- Secondary drainage canal	218.5 km
iii) Irrigation Canal	
- Main irrigation canal	106.2 km
- Secondary irrigation canal	264.7 km
iv) Dykes	80 km
v) Reclaimed land	110,000 feddan

Almost all the construction works are accounted for earthwork except for drainage pumping stations and bridges. Therefore heavy equipment needs to be introduced. The type and number of construction equipment required for the civil works are estimated based on the work quantity, construction schedule, and natural conditions of the Project Area.

2-2 Bearing Capacity for Construction Equipment

The bed of Manzala Lake is covered with sludge. This stratum is about 70 centimeters thick. In the area under such condition, it is impossible to use heavy equipment immediately after land drainage work because of the poor bearing capacity of the land. Deployment of heavy equipment will become possible within several months during which the surface soil will dry up. At the other area which has already been dried up, the trafficability for medium-size equipment will be secured. The result of bearing capacity survey (Corn Penetration Test) in the Project area and its location map are shown in Fig. P-2-1 and Fig. P-2-2.

2-3 Equipment for Construction Work under Water

As mentioned in the next clause "3. Implementation Schedule", earthwork required for the construction of a pump station and main drainage canal will involve underwater excavation work. Therefore drag-lines and micro-dredgers will need to be introduced.

2-4 Necessary Units of Construction Equipment

Necessary units of various construction equipment required for construction works in the Project Area are listed in Table P-2-1.

Minimum Corn Index for Heavy Equipment

DESCRIPTION	MINIMUM CORN INDEX
Bulldozer (Swampy - type)	< 4
Bulldozer (Midium - sized)	5 ~ 7
Bulldozer (Large - sized), Scraper (Tractive - type)	7 ~ 10
Scraper (Mounted - type)	10 ~ 13
Dump Truck (6 ~ 25 t)	> 15

Fig. P-2-1 Results Corn Penetration Test

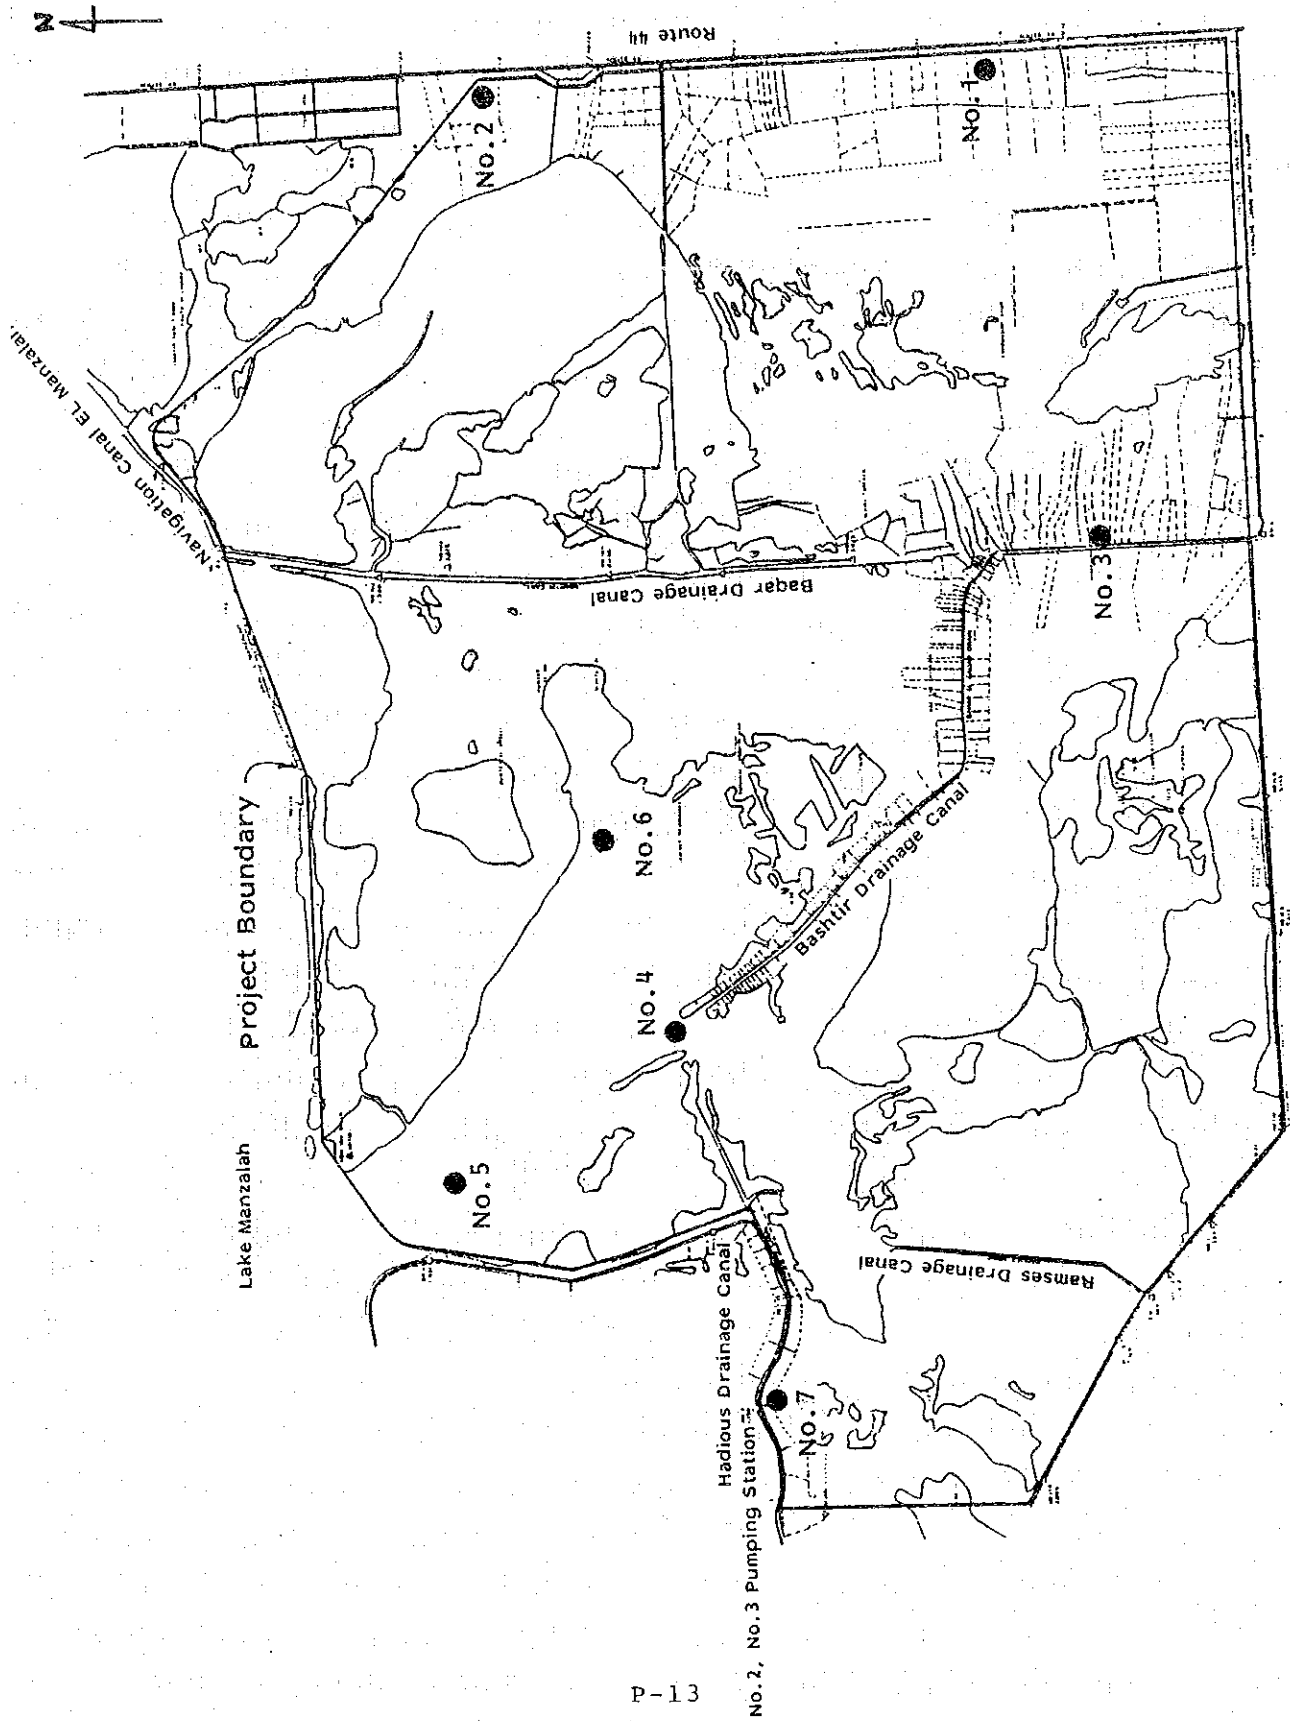

Fig. P-2-2 Location Map of Corn Penetration Survey

Table P-2-1 Necessary Units and Cost of Construction Equipment (L E ' 000)

Name of Equipment	Specification	Nos.	Unit Price (FC)	Cost (FC)
Bulldozer	21 ton 183 ps	123	90	11,070
" (Swampy)	18 ton 108 ps	5	51	255

Car Wagon		9	17	153
Motorcycle	90 cc	36	1	36
Sub-Total				53,420
Spare Parts (10% of above)				5,342
Total				58,762

3. Implementation Schedule

3-1 Basic Idea of Construction Schedule

Basic Idea of the construction schedule is defined as follows;

- (1) Apart from the limited amount consumed by evaporation, most of the closed water needs to be drained by use of pump and construction of main drainage canal to avoid accumulation of salt in the reclaimed soil. Hence, the boundary of each block is composed of a main drainage canal and dykes.

Final closure of the tidal dykes will have to be done at the next stage of construction works of main drain and pumping station, and blocks whose land consolidation work may not have yet been started at that time will need to be left under water.

- (2) Consequently, the facilities which will have to be completed at first are dykes, pumping stations and main drains. Therefore the earthwork required for construction of these facilities involves excavation work under water.

Futhermore, coffer-dams have to be constructed around the pumping station in North Hussinia.

- (3) In spite of the above discussions, in any part or parts of 4 blocks (NH-2, NH-3, PS-1, and PS-2) where is near El Salam Canal and has already been dried up it is possible to start the construction work of irrigation facilities, drainage facilities, and land consolidation.

3-2 Phasing Blocks for Construction Schedule

The Project, both North Hussinia Valley and South Port Said, consists of 110,000 feddan of inundated and up-land area as a huge Agricultural Development Project.

The construction works would be executed on the basis of the phasing by blocks which are separated by the proposed main drainage canals as shown in Fig. P-3-1.

Fig. P-3-1 Construction Phasing Blocks

3-3 Drainage and Drying-Up of lake Water

As mentioned before, the lake water enclosed by dykes will be diminished of its volume partly through natural evaporation but a major part of it will need to be drained by use of drainage pumps to avoid accumulation of salt on the reclaimed land. The volume of lake water enclosed by dykes is assumed to be about 70 million m³. Drainage of this-much water by use of pumps will take about one month. Another 4.5 months' period will be spent for drying-up of the lake bottom to improve trafficability of heavy construction machinery. Thus, the total period spent for drainage and drying-up will be 5.5 months.

3-4 Alternatives for Implementation Schedule

Project implementation schedule can be divided into the following 6 phases:

(A) Preparatory Works

They comprise such kinds of works as the detail design, the tender procurement, the tendering and the financial arrangement. This phase usually takes about 2 years.

(B) Dyke, Pumping Station and Main Drainage Canal

Enclosure of the reclaimed land by dykes and construction of pumping stations and main drainage canals can be undertaken simultaneously; the period of time required for such work will

be either shortened or lengthened depending on construction performance of pumping stations and installation of pumps. the time required for this kind of work will be minimum 1.5 years.

(C) Drainage and Drying-Up

Drainage of the lakewater from the enclosed area and drying-up of such land takes minimum 0.5 year.

(D) Irrigation Canal, Secondary Drainage Canal and Land Consolidation

This phase of project implementation involves the largest or heaviest work-load and the time spent for it will largely influence the total length of project implementation. . .

(E) Primary Leaching

Primary leaching will take 2 years upon completion of land consolidation work.

(A) through (E) above comprise Stage I Construction Work.

(F) Tile Drain

3-4 years after completion of Stage I Construction Work, open-ditches will be replaced by tile drains as Stage II Work.

By taking into consideration the conditions pertaining to each phase of Stage I Construction Work, 3 alternative construction schedules have been visualized as per Fig. P-3-2.

Non-Flexibility of Phase D Work

Since Works involved in Phase D would largely influence the period of time required for completion of the entire construction work covered by Stage I Construction Work, the degree or extent of flexibility of its components will be discussed in the below:

- 1) The entire Project area is divided into 9 blocks as per Fig. P-3-1. These 9 blocks can be further split into several "sub-blocks" in such a manner that each sub-block consists of the put between 2 secondary drainage canals, or of each command area of every village whose average size would be 2,157 feddan. Construction schedule in each sub-block is shown in Fig. P-3-3.

(1) 5 Year Schedule

Stage I					Stage II
5 year period					
2.0	1.5	0.5	2.0	1.0	3.0 - 4.0
A	B	C	D	E	F

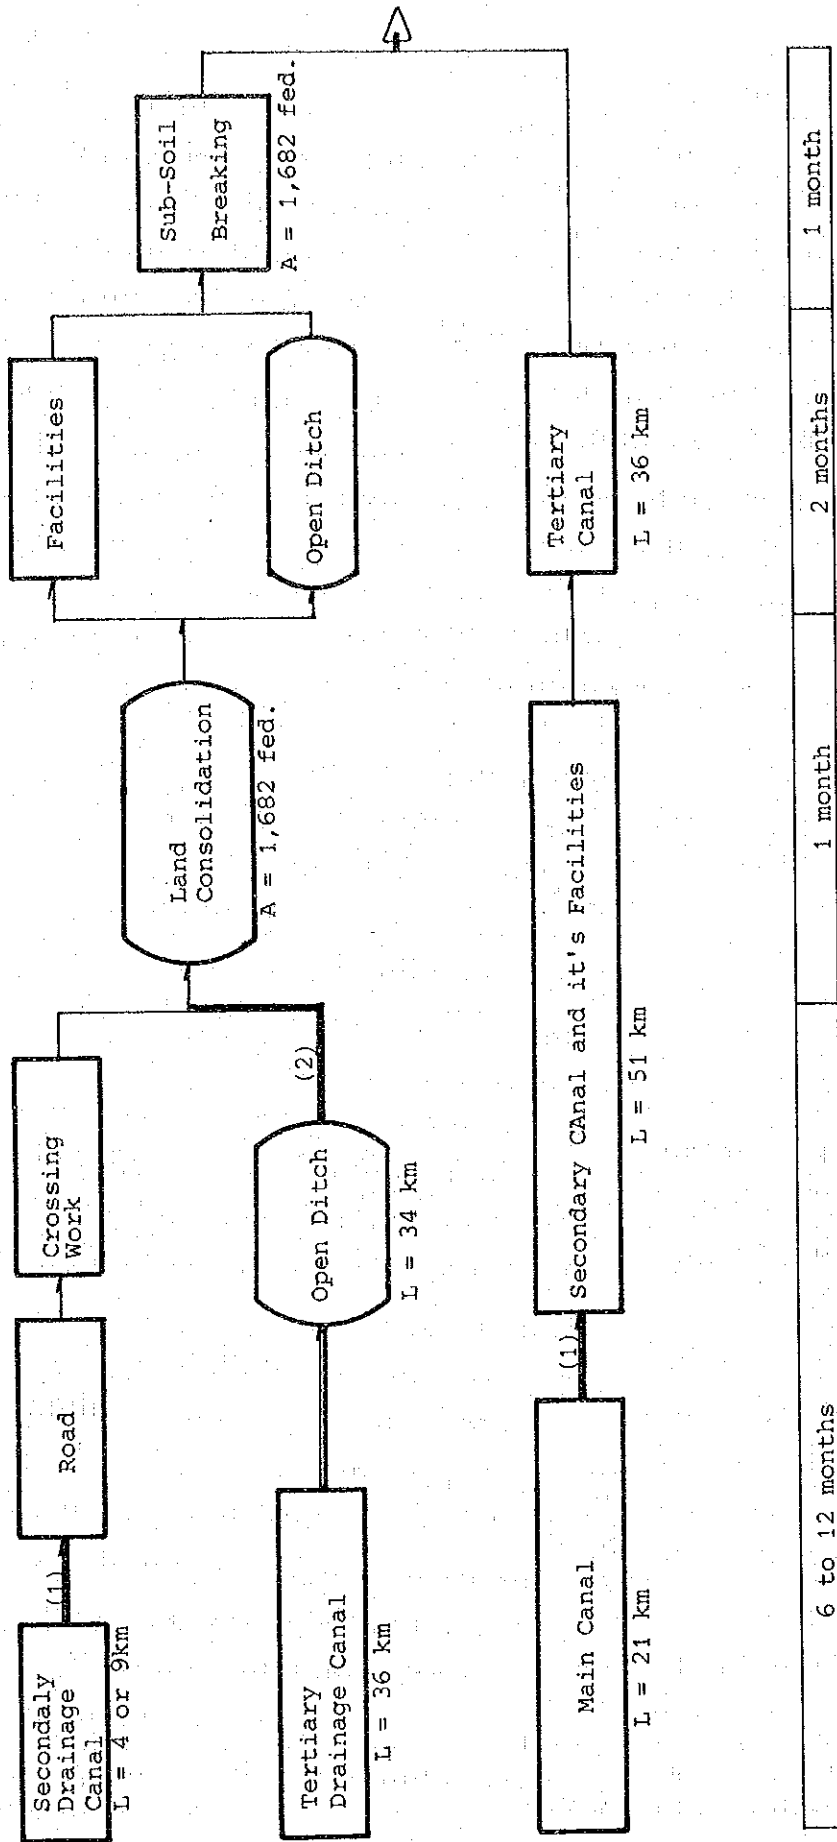

(2) 7 Year Schedule

Stage I					Stage II
7 year period					
2.0	1.5	0.5	4.0	1.0	3.0 - 4.0
A	B	C	D	E	F

(3) 9 Year Schedule

Stage I					Stage II
9 year period					
2.0	1.5	0.5	6.0	1.0	3.0 - 4.0
A	B	C	D	E	F

Fig. P-3-2. Three Alternative Construction Schedules

(1) : Dry-up period for Roads (2 - 6 months)

(2) : Dry-up period for Land Consolidation (2 - 6 months)

Average size of Sub-block is a 2,157 feddan.

Fig. P-3-3 Construction Schedule in each sub-block

- 2) The length of time required for Phase D work, the most time-consuming part of the entire work, ultimately depends on the number of machinery and labor which can be put into each work. However, as will be known from Fig. P-3-3, the work load in this phase has 2 critical passes, the one is the earthwork part including canal construction and land consolidation, and the other is drying-up of roads and field surface.

The earthwork problem can be theoretically solved by the quantum of construction machinery and trucks to be used for the purpose. But such earthwork can be properly undertaken on the condition that the roads and field surface should have been adequately dried up. Now, drying process is a natural process entirely depending on climate and weather. For drying the ground surface to the depth of 40 - 60 cm, it will take 2-3 months (4-4.5 mm/day) during summer season and 4-6 months (1.5 - 2.0 mm/day) during winter season.

On and above this, percolation of subsoil moisture must be added. Therefore, Phase D work in each sub-block would take 1 - 2 years.

- 3) In such blocks or sub-blocks which are situated nearer to El Salam Canal and which have more dryland than submerged area, Phase D work can theoretically be commenced side by side with Phase B work or Phase C work; otherwise, earth work involving cutting and embankment cannot be properly undertaken since construction machinery and trucks cannot be adequately deployed.
- 4) The optimal volume of construction work of this nature has been identified at about 2,000 feddan per year from such practical considerations as the provision of numerous construction materials, the mobilization of labor, the deployment of construction machinery and equipment, and the organization and training of farmers.
- 5) Taking the entire Stage I Construction Period, the smaller blocks whose dryland percentage is larger may complete the entire work within 5 years, but other blocks will require 9 years. ^{/1}

/1 : Taking NH-1, NH-2, NH-3 and NH-4 blocks, for instance, the number of sub-blocks where Phase D work will need to be commenced simultaneously is as follows:

- 3 - 8 sub-blocks under 5-Year Construction Schedule
- 2 - 4 sub-blocks under 7-Year Construction Schedule
- 1 - 3 sub-blocks under 9-Year Construction Schedule

- 6) Under this Project, 9 Year Construction Schedule has been adopted, and 5 Year and 7 Year Construction Schedules have been worked out for comparison.

3-5 Project Implimentation Schedule

From view point of 9 Year Construction Schedule which is mentioned above, the 9 Year Construction Plan has been given as Fig. p-3-4, and finally, the Project Implementation Schedule has been composed as shown Fig. P-3-5.

Fig. P-3-4 9 Year Construction Plan

Q. ECONOMIC EVALUATION AND FINANCIAL ANALYSIS

1. General

The components of the Project consist of three plans, viz, agricultural development plan, land reclamation plan, and rural development plan. The Project aims to contribute to the Five Year Plan for Economic and Social Development, especially, the delta region development strategy. The gross Project Area totals 110,000 feddan or 46,200 ha. The net cultivated area is projected at 85,800 feddan. The farmlands will be cultivated by newly settled farmers of about 12,400 households. Successful attainment of the Project benefits depends upon the timely execution of these components.

It is reported that since the early 1950's, approximately 1.1 million feddan of land have been reclaimed in Egypt, but less than 60% of this land is actually under cultivation and possibly as little as 35% is being cultivated with Project ^{1/}. The major reasons for this are inadequate soil studies made before reclamation started, inadequate reclamation works, breakdown in irrigation pumping systems, failure to provide adequate drainage and shortage of funds. Implementation of this Project shall never repeat the failure of this kind.

^{1/} The Appraisal Report, New Land Development Project, West Nubariya, Oct. 1980, World Bank

2. Price Analysis

2-1. Conversion Factors

There are two market systems in Egypt with different prices of inputs and outputs; that is, the cooperative marketing system and the free marketing system. The major export or import substitution crops and cotton are sold only through the cooperative system. Amount of these crops exceeding the quota and the other crops might be sold in either market system. Reportedly, the compulsory prices in the cooperative market system were lower than the average prices in the free market in the 1960s by 50 to 20 percent. According to the World Bank Report entitled Agricultural Price Management in Egypt, 1980, the subsidized percent to traded inputs were as follows :

Subsidy as percent of border price - Egypt, 1975

Price	54%
Wheat	54%
Cotton	48%
Maize	44%
Meat	48%

These price systems mean that the prices received by farmers do not represent the real prices. Hence, it is necessary to estimate the economic or shadow prices for economic evaluation.

- Standard Conversion Factor (SCF)

A standard conversion factor is given by the following formula;

$$SCF = (Im + Ex) / (Im + Ex + TIm - TEx + SEx)$$

where;

SCF	: Standard Conversion Factor
Im	: Total Amount of Import (C.I.F.)
Ex	: Total Amount of Export (F.O.B.)
TIm	: Total Amount of Import Duties and Taxes
TEx	: Total Amount of Export Duties and Taxes
SEx	: Total Amount of Export Subsidy

Table Q-2-1 shows the Standard Conversion Factor of 0.8 in Egypt.

- Other Conversion Factors

According to "Shadow Price for Trade Strategy and Investment Planning in Egypt", World Bank Staff Working Paper No. 521, 1982, the following conversion factors on agricultural inputs and outputs are calculated;

Agricultural Machinery	1.159
Agricultural Machinery Spares	1.021
Agricultural Implements	0.992
Bags	1.280
Fertilizer (wtd average)	1.663

Pesticides	1,976
Seeds	1,149
Maize	1,313
Onions	4,259
Rice	2,043
Soybeans	0.992
Sugar	0,969
Wheat	1,591
Non traded agriculture	1.000

2-2. Economic Cost of Farm Labor

On the basis of the field investigation in the Project Area, market wage rate of rural unskilled labor is LE 5.00 per man-day. Although conversion factor of rural unskilled labor is 0.22 according to the World Bank Report, using the results of labor balance study, shadow wage rate is estimated at LE 2.5 per man-day. (See Table Q-2-2).

2-3. Farm Gate Prices

In the price analysis, economic prices of the Project input and output are computed on the basis of the World market prices and their projected ones as far as data are available, and the rest are referred with those figures obtained from the field investigation and the data provided by GARPAD as well as the relevant reports.

Table Q-2-3 gives the farm gate prices of the Project inputs and outputs.

2-4. Foreign Exchange Rate

Exchange rate of Egyptian Pound (LE) and Japanese Yen are estimated by data sources in Appendix Q-1. In this report the exchange rate is estimated at LE 0.82 per US\$. The exchange rate of Japanese Yen per US\$ is estimated at Yen 288 per LE. This is the average value for the last three months.

2-5. Price Escalation Factor

Since the project cost has been estimated on the basis of the 1983 price level, the expected price increase due to future inflation is calculated by applying the following rates which are based on OECF guideline;

	<u>Foreign Currency</u>	<u>Local Currency</u>
Annual Inflation Rate	5%	12%

3. Economic Benefit

3-1. Net Production Value without Project

At present, about 6,000 feddans are under cultivation by using drain water of Bahr el Baqar, Ramsis Drain and Hadous Drain, of which net production value is estimated at LE 160 per feddan. The low productivity is mainly due to water quality of these drains as well as lack of enough extension services on modern agricultural techniques.

3-2. Net Production Value with Project

(1) Cropped Area

Although total project area covers 110,000 feddans, net cultivable area is estimated at 85,800 feddans after completion of tile drain construction, and the rest is considered to be those areas for canals, roads, new villages and so on. According to the implementation schedule the first cropping would stand in 13,798 feddans of South Port Said Project area at the 8th Project year and full utilization of total net cultivable area of 85,800 feddans would be expected at the 15th project area. (See Appendix Q-4).

Cropped area after full development stage
is summarized below :

(Unit : feddan)

<u>Crop</u>	<u>North Hussinia</u>		<u>South Port Said</u>		<u>Total</u>	
	<u>Summer</u>	<u>Winter</u>	<u>Summer</u>	<u>Winter</u>	<u>Summer</u>	<u>Winter</u>
Rice	17,940	-	10,660	-	28,600	-
Soybean	17,940	-	10,660	-	28,600	-
Sorghum	16,599	-	8,602	-	25,201	-
Sugarbeet	-	17,940	-	10,660	-	28,600
Vegetable	1,341	17,940	2,058	10,660	3,399	28,600
Berseem	-	17,940	-	10,660	-	28,600
<u>Total</u>	<u>53,820</u>	<u>53,820</u>	<u>31,980</u>	<u>31,980</u>	<u>85,800</u>	<u>85,800</u>

Thus, cropping intensity after full development is 200 percent against the net cultivable area.

(2) Economic Profitability

Tables Q-3-1 and Q-3-2 show economic profitability of crop cultivation per feddan and livestock breeding per feeding unit, respectively. While various vegetables are introduced in the proposed cropping patterns, net production values of them are represented by that of tomato cultivation.

Tables Q-3-3 to Q-3-5 indicate gross production value, production cost and net production value of crop cultivation during gestation period, respectively, and Table Q-3-6 shows benefit stream arising from crop cultivation. Table Q-3-7 gives number of livestock to be bred by the project, and Table Q-3-8 gives benefit stream arising from livestock breeding.

4. Economic Cost

The economic initial investment cost which is based on the national economic point of view, is calculated by re-valuing fuel costs and costs for common labor in the land reclamation component and by applying the standard conversion factor for the other local currency portion in the land reclamation component as well as the whole local currency portion in the infrastructure component after deducting price escalation cost from the financial initial investment, the economic cost of the initial investment is estimated at 430.3 million LE as shown below ;

	<u>Land Reclamation</u> (LE 1,000)	<u>Infrastructure</u> (LE 1,000)	<u>Total</u> (LE 1,000)
F/C	97,314	110,276	207,590
L/C	88,932	133,759	222,691
<u>Total</u>	<u>186,246</u>	<u>244,035</u>	<u>430,281</u>

Tables Q-4-1 and Q-4-2 show cost stream of initial investment for the land reclamation project of North Hussinia and South Port Said, during construction period, respectively, and Tables Q-4-3 and Q-4-4 do that for the whole project area in case of construction period of 5 years and 7 years, respectively.

5. Economic Internal Rate of Return (Land Reclamation)

In calculating an economic internal rate of return, the following premises are taken into consideration;

- a) In order to decide the project life, it must be considered that there are various project facilities which have respective durable life. In this project, it is assumed that most of all project facilities except pumping equipment has enough durable life to evaluate the project over 50 years as far as maintenance works for these facilities will be sufficiently implemented.

For pumping equipment, the required replacement costs are taken into account in the operation and maintenance cost.

- b) The gestation period for attaining the full project benefit shall be 8 years after completion of primary leaching, taking development of crops yield into consideration.
- c) The negative benefit arising from the fishery sector will occur after the 4th project year when the Bashtir canal and the Bahr el Baqar are connected.

Table Q-5-1 shows both stream of project cost and benefit over 50 years based on which the present worth values of project cost and benefit in different discount rates are calculated as indicated in Table Q-5-2. According to Table Q-5-2, the economic internal rate of return for the land reclamation project is calculated at 13.8 percent.

6. Farm Budget Analysis

6-1. General

Since Baladi cattle would be finally replaced by either Friesian cattle or buffalo, farm budget analysis has been carried out for the following farm size and farm type;

<u>Farm Size (feddan)</u>	<u>Farm Type</u>	
	<u>Friesian</u>	<u>Buffalo</u>
Smallholder	5.0	5.0
Largeholder A	15.0	15.0
Largeholder B	20.0	20.0

In the livestock breeding plan, 80% of total production of berseem and sorghum has been taken into consideration, and it could be expected that the remaining 20% can feed a couple of sheep per farm but the benefit arising from sheep breeding is

not counted in this farm budget analysis.

6-2. Net Farm Income

Table Q-6-1 and Q-6-2 give financial crop budget per feddan and financial profitability of livestock breeding, respectively. Tables Q-6-3, Q-6-4 and Q-6-5 show gross income, farm cost and net income per feddan during gestation period, respectively. On the other hand, Tables Q-6-6, Q-6-7 and Q-6-8 indicate feedable unit of livestock for 5.0, 15.0 and 20.0 feddans farms, respectively. Tables Q-6-9 thru Q-6-20 show net farm income of the respective farm during gestation period with both cropping patterns of No. 1 and No. 2.

6-3. Annual Amortization

General conditions of calculating annual amortization on land and house as well as cattle loan are as follows;

	<u>Land and House</u>		<u>Cattle Loan</u>
	<u>Smallholder</u>	<u>Largeholder</u>	
Repayment Period (Year)	25	25	5
Interest Rate (%)	none	1	6
Grace Period (Year)	3	3	none

On the basis of the above conditions, Table Q-6-21 and Q-6-22 give annual amortization amounts on cattle loan and land and house, respectively.

Other assumptions applied for the farm budget analysis are given below :

	<u>Smallholder</u>	<u>Largeholder</u>
Living Cost (LE)		
Subsistence level	1,200	1,440
Desirable level	2,040	2,400
Other Annual Charges	50	100
Irrigation Water Charge	LE 22 per feddan	
Land Tax	LE 5 per feddan	

6-4. Financial Cash Flow

Tables Q-6-23 thru Q-6-34 show financial cash flow of the respective farm during 10 years after primary leaching. In this cash flow analysis, every farm would require some private loan during the beginning stage after settlement of which conditions are assumed as repayment period of 1 year with interest rate of 12% per annum. In case any settler would have his own capital at the time of settling, the burden depending upon the private loan would decrease considerably.

Table Q-2-1 Calculation of Standard Conversion Factor

(Unit : LE 1,000)

	<u>1978</u>	<u>1979</u>	<u>1980</u>	<u>1981</u>	<u>Average</u>
1. Import (c.i.f., total)	2,632,191	2,686,213	3,402,000	6,187,497	3,726,975
2. Export (f.o.b., total)	679,754	1,287,813	2,132,178	2,262,982	1,590,682
3. Import Duties and Taxes	1,009,505	961,844	1,153,958	2,175,256	1,325,141
4. Export Duties and Taxes	2,142	1,119	1,030	1,182	1,368
5. Export Subsidy	-	-	-	-	-
6. (1 + 2)	3,311,945	3,974,026	5,534,178	8,450,479	5,317,657
7. (1 + 2 + 3 - 4 + 5)	4,319,508	4,934,751	6,687,106	10,624,553	6,641,450
8. SCF (6 ÷ 7)	<u>0.766</u>	<u>0.805</u>	<u>0.827</u>	<u>0.795</u>	<u>0.800</u>

Note: Refer to Appendix Q-2

Table Q-2-2 Economic Cost of Farm Labor

	<u>Jan.</u>	<u>Feb.</u>	<u>Mar.</u>	<u>Apr.</u>	<u>May</u>	<u>Jun.</u>	<u>Jul.</u>	<u>Aug.</u>	<u>Sep.</u>	<u>Oct.</u>	<u>Nov.</u>	<u>Dec.</u>
1. Labor Days of 5 Feddan												
Requirement	31.7	23.7	22.6	31.8	16.9	35.0	22.8	15.3	14.8	13.3	16.1	20.0
Available	52.0	48.0	52.0	50.0	52.0	50.0	52.0	52.0	50.0	52.0	50.0	52.0
2.	$\frac{31.7 + 22.6 + 16.9 + 22.8 + 15.3 + 13.3 + 20.0}{52.0} + \frac{31.8 + 35.0 + 14.8 + 16.1}{50.0} + \frac{23.7}{48.0} = 5.18 \text{ days}$											
3.	$\frac{5.18 \text{ day} \times 5 \text{ L.E./day}}{12 \text{ month}} = 2.16$											
4.	$\frac{2.16 \times 1.070 \text{ (Conversion factor of Consumption)}}{5} = 0.46 \approx 0.5$											
5.	$\text{Shadow wage} = 5.0 \times 0.5 = 2.5 \text{ L.E.}$
