4.3 GENERATED TRAFFIC

Forest covers 35 % of the area influenced by the new road (4,300 km^2), according to the survey by a German Forestry Mission. The commercially exploitable timber of moist semi-deciduous and moist evergreen species are estimated as follows:

TABLE 4-6 TIMBER RESOURCES IN PROJECT AREA

	Moist Semi-deciduous	Moist Evergreen	Total
Commercially Exploitable area			
(%)	7	24	-
(km^2)	105	361	466
Exploitable timber			
(m^3/km^2)	1,343	1,930	-
(m^3)	141,000	696,700	837,700

On assumption that the production cycle is 25 years on an average, the annually exploitable timber volume is estimated at 33,500 m^3. Such volume of timber is presumed to be extracted at gradually increasing rates, and the volume of extraction and generated traffic is estimated as tabulated on Table 4-7.

TABLE 4-7 TIMBER EXTRACTION AND TRAFFIC

Year	Annual Commercial Potential (m^3)	Annual Extraction (%)	(m^3)	A D T
1984	33,500	20	6,700	3
85	33,500	25	8,375	4
86	33,500	30	10,050	4
87	33,500	35	11,725	5
88	33,500	40	13,400	6

94	33,500	70	23,450	10
95	33,500	75	25,125	11
96	33,500	80	26,800	12
97	33,500	85	28,475	12
98	33,500	90	30,150	13
99	33,500	95	31,825	14
2000	33,500	100	33,500	15
1	33,500	100	33,500	15
2	33,500	100	33,500	15
3	33,500	100	33,500	15

$$ADT = \frac{\text{Annual Extraction} \times 0.8}{\text{Truck Capacity (10 t)}} \times 1/365 \times 2$$

Development for agriculture in the area influenced by the new road will also be accelerated due to opening of the new road, for marketing, as well as improvement of such cultivation techniques as application of improved seed, and varieties, application of fertilizer and insecticide, agricultural extension services, etc. The area for cultivation of major crops is estimated as follows:

TABLE 4-8 CULTIVATION AREA

	Lofa County /1	Area Influenced by New Road /2
Total area (km^2)	23,570	4,300
Cultivated area:		
(%)	2.3	2.3
(Ha.)	55,200	9,890
Rice	33,200 (60.1 %)	5,940
Coffee	6,750 (12.3 %)	1,220
Cocoa	5,450 (9.9 %)	980
Others	9,800 (17.7 %)	1,750

/1 Ministry of Planning and Economic Affairs
/2 Rates assumed to be proportionate to that of Lofa Country

The area of cultivation and the production of major crops in the Project area under with- and without project condition is estimated as shown on Table 4-9 to Table 4-12.

On the assumption that all the products of coffee and cocoa and a half of rice production will be transported to Monrovia area by 5-ton trucks, the traffic induced from agricultural development in the area influenced by the new road is estimated as summarized in Table 4-13.

4.4 DIVERTED TRAFFIC

After the completion of the new Kpakuta - Wologisi - Bopolu road, a part of the traffic along the Kolahun - Voinjama road will be diverted to the new road. Although the detailed traffic survey (OD) has not been made, it is presumed that 10 % of passenger cars and 50 % of trucks along the Kolahun - Voinjama road have their origin or destination at Monrovia area, and that a half of such traffic will be diverted to the new road which is shorter than the existing road via Gbarnga by 150 km. The diverted traffic is estimated as tabulated on Table 4-14.

4.5 TOTAL ESTIMATED TRAFFIC

The normal traffic, generated traffic and diverted traffic forecasted under Chapter 4.1 to 4.4 are summarized and shown on Table 4-15.

CHAPTER V

PRELIMINARY DESIGN

CHAPTER V

PRELIMINARY DESIGN

5.1 BASIC DATA

5.1.1 Topography

The topographic map on the scale of 1/20,000 along the new Wollgisi - Bopolu road and the Kpakuta - Wologisi road has been prepared during the course of this study. Aerial photographs were taken to cover 2,400 km^2 (7 flying course with total length of 270 km). Ground control survey for mapping was made by applying the NNSS system, and 1/20,000 maps at contour intervals of 10 m were prepared to cover 340 km^2 (9 sheets).

The survey at six major river crossing points (Ziliba river, Maaso creek, Wenzia river, Butulu creek, Molu river, Mafu river) was made on the scale of 1/500 with contour intervals of 1 m.

The topographic maps thus prepared have been used to decide the final alignment of the new road and to prepare preliminary design and cost estimate.

5.1.2 Soils and Materials

Soils along the route are mainly composed of brown or raddish brown laterite, accompanied by clayed and sandy soils. Gravel beds are observed in some parts of the river beds, as well as on the ground surface of 0.5-1 m in thickness. In hilly region, granite and gneiss makes sporadic outcrops, which are partly weathered intensively. The surface soils have been checked and analysed as shown on Table 5-1 and Fig. 5-1. It was found that such soils may be utilized for base course at appropriate moisture content, and gravelly laterite of modified CBR **20** will be utilized as pavement materials. River gravel and granite or gneiss rocks may be used as concrete aggregate for the construction of bridges and other structures.

5.1.3 Hydrology

In estimating the river discharge for the preliminary design of the structures, it was provisionally applied to use the following formula and mean monthly precipitation:

$$Q = C \sqrt[4]{A^3} \quad \text{(Dicken's formula)}$$

where, Q : discharge (m^3/sec)
A : catchment area (km^2)
C : coefficient:
2.77 at flat land
3.46 at hilly region
4.15 at mountain region

5.2 DESIGN CRITERIA

On the basis of the traffic forecast in Chapter IV, it will be appropriate to design the new road as a secondary road under the Road Standard in Liberia. Accordingly, the design speed is adopted to be 40 km/hr, but it was considered desirable to design the alignment to be capable of future improvement for the design speed of 60 km/hr at minimum additional costs. The carriageway width of the road will be 5.5 m for the two lanes. The geometric design criteria are summarized on Table 5-4.

TABLE 5-4 GEOMETRIC DESIGN CRITERIA

Design speed	40 km/hr
Right-of-way	40 m
Carriageway width	5.5 m
Shoulder width	0.75 m
Sight distance	75 m
Min. curve radius	60 m
Max. longitudinal grade	7 %
Max. cross fall	5.0 %
Max. combined grade	8.0 %
Shoulder cross fall	4.0 - 5.0 %
Bridge design load	HS20 - 44
Bridge carriage width	7.0 m

5.3 PRELIMINARY DESIGN OF ROAD

The improvement required for the existing roads has been defined on the basis of the field investigation and the design criteria as noted in Chapter 5.2. For the section to be newly constructed, the alignment has been designed in view of the topographic and soil condition, as well as continuity of alignment. Where the construction cost is not substantially increased, the minimum horizontal curve radius of 140 m and maximum gradient of 6 % has been applied to enable future improvement at the least additional cost for the design speed of 60 km/hr. The alignment (Plan and Profile) of the new road and the improvement of existing roads are shown on the 1/20,000 scale map in ANNEX-II appended to this report.

Earthwork is, in principle, designed as summarized hereunder.

a) Slope: embankment 1:1.5
cutting 1:0.5

Slope protection for erosion control is made by coble stone facing, only at the required section.

b) Base course:

Sandy laterite or gravelly laterite soils. (In case clayey laterite is used, moisture content should be carefully controlled.)

c) Embankment: By side borrow system

d) Side ditch: Earth ditch

Pavement design is to be prepared on the basis of the laterite soil condition. Clayey laterite will have CBR value of 3-5 % under wet condition, while gravelly laterite will have CBR value of 20-45 %. It is designed that pavement is made by two layer of laterite: upper layer (10 cm) with CBR 20-45 % and lower layer (10 cm) with CBR 10-20 %. The laterite pavement will loose its strength and cause damages on surface

in wet season, while it will raise dusts in dry season. To protect such damages it is designed to overlay by prime coat which will be rehabilitated once every ten years.

The typical cross section of the proposed road, as well as preliminary design of pipe culverts, cross ditch and box culverts, are shown on the Drawings (Dwg. 18 to Dwg. 20) in ANNEX-II.

5.4 PRELIMINARY DESIGN OF BRIDGES

For the new road construction and improvement of the existing road, it is necessary to design bridges over Lofa river and other streams. The Lofa river has, at the crossing point, discharge of 2,107 m^3/sec., which will require flow area of 1,503 m^2. With the clearance at high water level plus 2 m, the bridge will have length of 120 m.

Three types of bridge structures have been comparatively studied: RC Box girder type, Steel Warren truss type and Prestressed concrete box girder type. In view of the fact that the temporary river closure for bridge construction is practicable in the dry season, and that transportation of construction materials should be minimized for difficult access to the bridge site, and that the construction cost should be minimized as far as possible, it was selected to adopt RC Box girder type bridge for Lofa river crossing, as illustrated in Fig. 5-4.

For design of smaller bridges, it was designed to apply, in principle, following types of super and sub-structures:

	Span Length or Height	Type
Superstructure	L ≦ 10m	RC slab
	10m < L ≦ 25m	RC T beam
Sub-structure	H ≦ 4m	Gravity
	4m < H ≦ 10m	Adverse T type
	10m < H	Counterfort type

The outline of the proposed bridges on the new road is summarized on Table 5-5. The Drawing No. 21 and 22 in ANNEX-II illustrate the standard bridge design.

Table 5-5 LIST OF PROPOSED BRIDGE

Station	Name of Bridge	Type of Bridge	Bridge Length	Carriageway Width	Remarks

CHAPTER VI

CONSTRUCTION PLAN

CHAPTER VI

CONSTRUCTION PLAN

6.1 CONSTRUCTION QUANTITY

On the basis of the inventory survey of the existing road and preliminary design for the improvement and new road construction, the quantity of the construction works for the Kpakuta - Wologisi - Bopolu road have been estimated. The estimate of the quantities for each work has been made on the following basis:

a) Clearing and grubbing:

10 m in width on an average along the entire route

b) Common excavation:

to be made on the basis of horizontal alignment, corss section, road width and soil conditions

(For new road section, work quantity was estimated by electronic computer.)

c) Borrow excavation:

designed by side borrow system in principle, but at some sections, required borrow excavation has been estimated

d) Side ditch excavation:

estimated for excavation of unlined earth ditch

e) Prime coat: twice at 0.7 l/m^2 each

f) Cross ditch (CD):

CD 0.8 x 0.8 = 0.512 m^3/sec

0.512 m^3/sec CD 1.0 x 1.0 = 0.80 m^3/sec

g) Pipe culvert:

0.512 m^3/sec. ø 1.0m = 0.628 m^3/sec.

0.628 m^3/sec. ø 1.5m = 1.410 m^3/sec.

1.410 m^3/sec. ø 1.5 x 2 = 2.820 m^3/sec.

h) Box culvert:

2.82 m^3/sec 3.0 x 3.0 = 7.2 m^3/sec

7.2 m^3/sec 4.0 x 4.0 = 12.8 m^3/sec

12.8 m^3/sec (4x4) x 2 = 25.6 m^3/sec

i) Short-span bridge:

Span 10 m : RC slab type

Span 20-25 m : RC T beam type

Abutment : H = 4m or H = 6m

j) Long-span bridge (Lofa river bridge):

RC box girder type

4-span x 30m = 120 m

The work quantities estimated for each item of work are summarized in Table 6-1. The quantities for work section between Kpakuta and Lofa river bridge (Section-I) and between Lofa river bridge and Bopolu (Section-II) are also tabulated in Table 6-2 and 6-3.

6.2 CONSTRUCTION PLAN

The construction of the new Kpaluta - Wologisi - Bopolu road will involve new road construction of 75 km and improvement of existing road for about 107 km. The work is provisionally divided into two sections: Section-I from Kpakuta to Lofa river bridge and Section-II from Lofa river bridge to Bopolu.

TABLE 6-4 SUMMARY OF WORK FOR EACH SECTION

	Section I	Section II	Total
Length (km)	77.9	103.7	181.6
Earthwork (km)			
Improvement	57.270	49.565	106.835
New Road Const.	20.465	53.940	74.405
Total Length	77.735	103.505	181.240
Bridges (km)	0.165 (10)	0.195 (7)	0.360 (17)
Box Culvert (each)	6	17	23
Pipe Culvert (each)	36	70	106

Section I : From Kpakuta to Lofa river (STA 0 - STA 77+900)
Section II : From Lofa river to Bopolu (STA 77+900 - STA 181+600)

The earth work should be scheduled to be done during the dry seasons. It is provisionally planned to use buldozers of 21-ton class for the earth work of 180 m^3 per day. On condition that workable days in dry season are 23 days a month, it will require 22 buldozers for 24 months to complete all the earth work of 2.2 million m^3.

For the pavement work, it is scheduled to carry out the work in dry season and to prepare and store pavement materials of 254,000 m^3 in wet season.

For construction of the Lofa river bridge, it is required to construct, at the earliest, a pilot road for access to the bridge site. For construction of the RC box girder type bridge of 120 m in length, the construction period is estimated to be about 26 months. For smaller bridges, construction will take about 4.5 months per each site (2.5 months for substructure and 2 months for superstructure). To complete 16-bridge construction, it will take 27 months if bridge construction is carried out at three sites at one time.

For other structures, it is estimated to take the construction period as follows:

	Box Culvert	Pipe Culvert	Cross Ditch
Standard period of work per each structure	45 days	20 days	16 days
Total month required to complete all the works	18 months	21 months	21 months

On the basis of the above construction plan, the construction schedule for the project has been worked out as illustrated in Fig. 6-1 to Fig. 6-3.

Fig 6 – 1 IMPLEMENTATION SCHEDULE

Section I (STA 0 - STA 77+900) From Kapakuta to Lota River

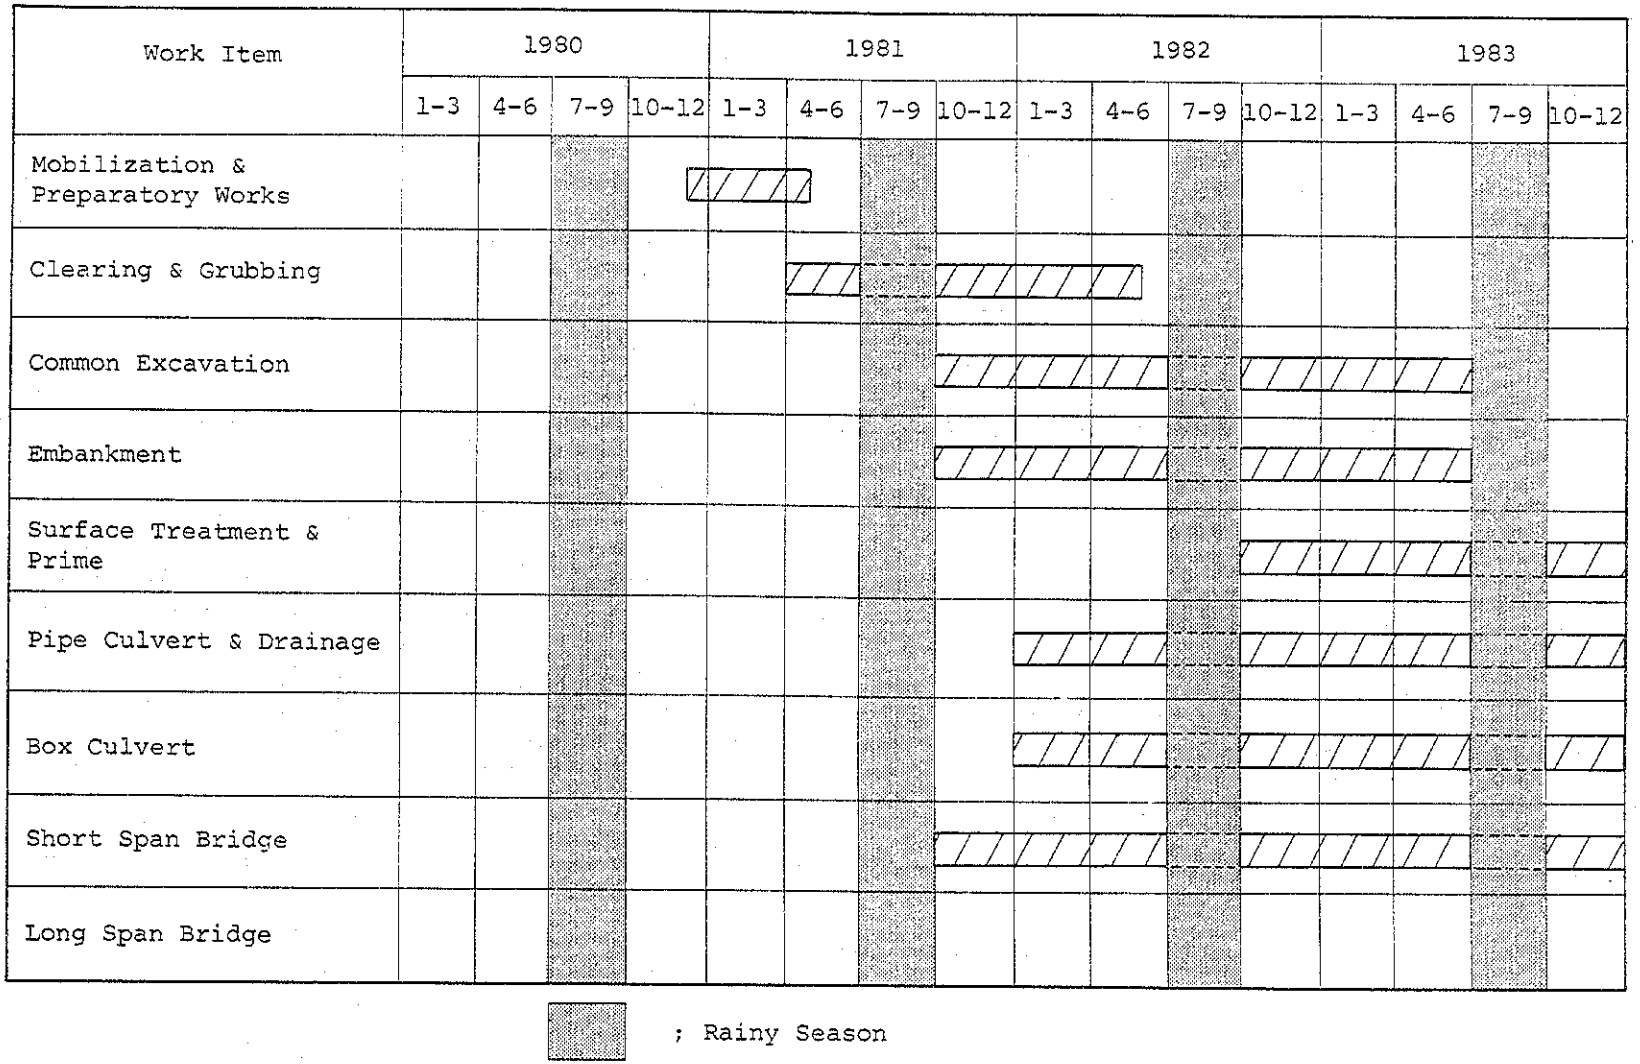

Fig 6 – 3 WORK SCHEDULE (II)

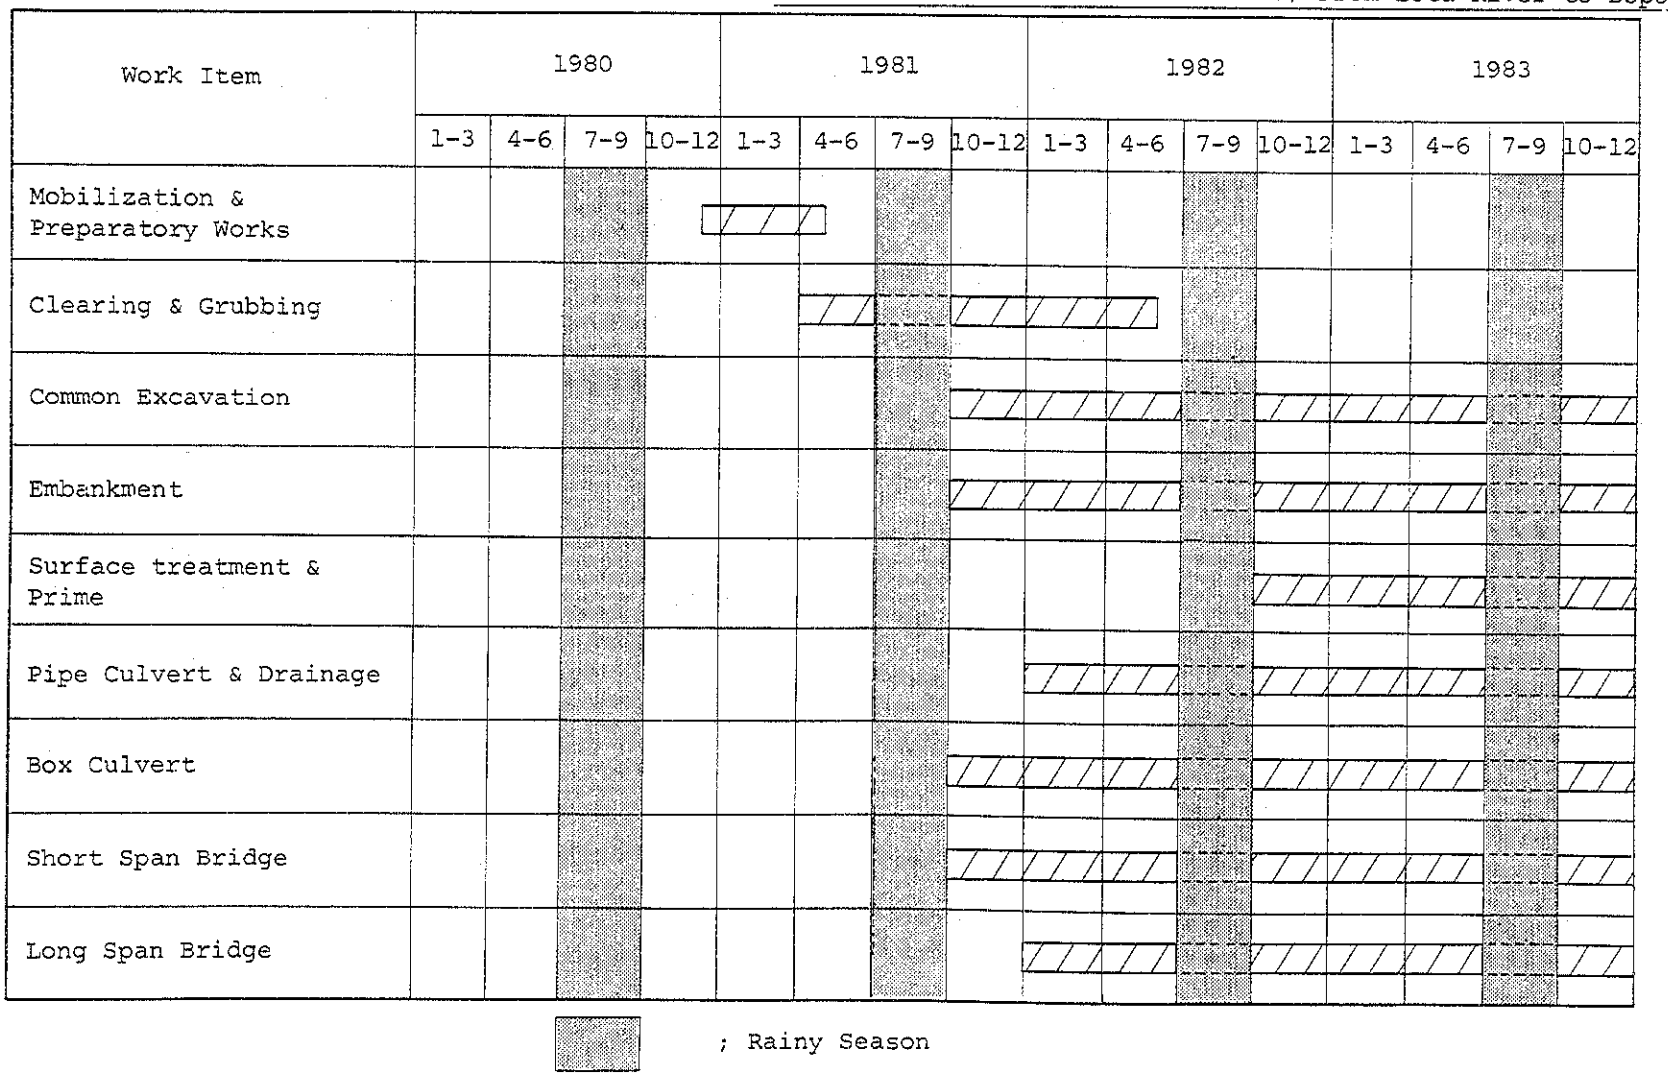
Section II (STA77+900 - STA181+600) From Lota River to Bopolu



6.3 CONSTRUCTION COST

On the basis of the work quantities estimated under Chapter 6.1 and the field survey of construction cost, the preliminary estimate of the construction cost of the project has been made as summarized in Table 6-5.

In total, the construction of the new Kpakuta - Wologisi - Bopolu road will cost about US$25.7 million.

6.4 MAINTENANCE COST

Periodical maintenance and repair of the new road should be carried out, covering of pot-holes, cleaning of culverts and ditches, repair of slope erosion and maintenance of major structures. In addition, overlay of prime coat will have to be made once every 10 years. Such cost of maintenance and repair works is estimated as summarized hereunder.

	Unit Rate	Estimated Cost
Periodical maintenance	$ 1,100/km	$199,000/year
Overlay after 10 years	$17,000/km	$3,077,000

TABLE 6-5 SUMMARY OF CONSTRUCTION COSTS

Unit: 1000 US$

Description /1	Estimated Cost		
	Local Cost	Foreign Cost	Total
1) Site Clearance	217	509	726
2) Earth Works	2,039	4,758	6,797
3) Pavement Works	642	1,870	2,512

Physical Contingency	671	1,645	2,316
Price Contingency	1,173	2,878	4,051
Total Estimated Cost	7,430	18,230	25,660

/1 Excluding cost of land acquisition

TABLE 6-6 BREAKDOWN OF CONSTRUCTION COSTS

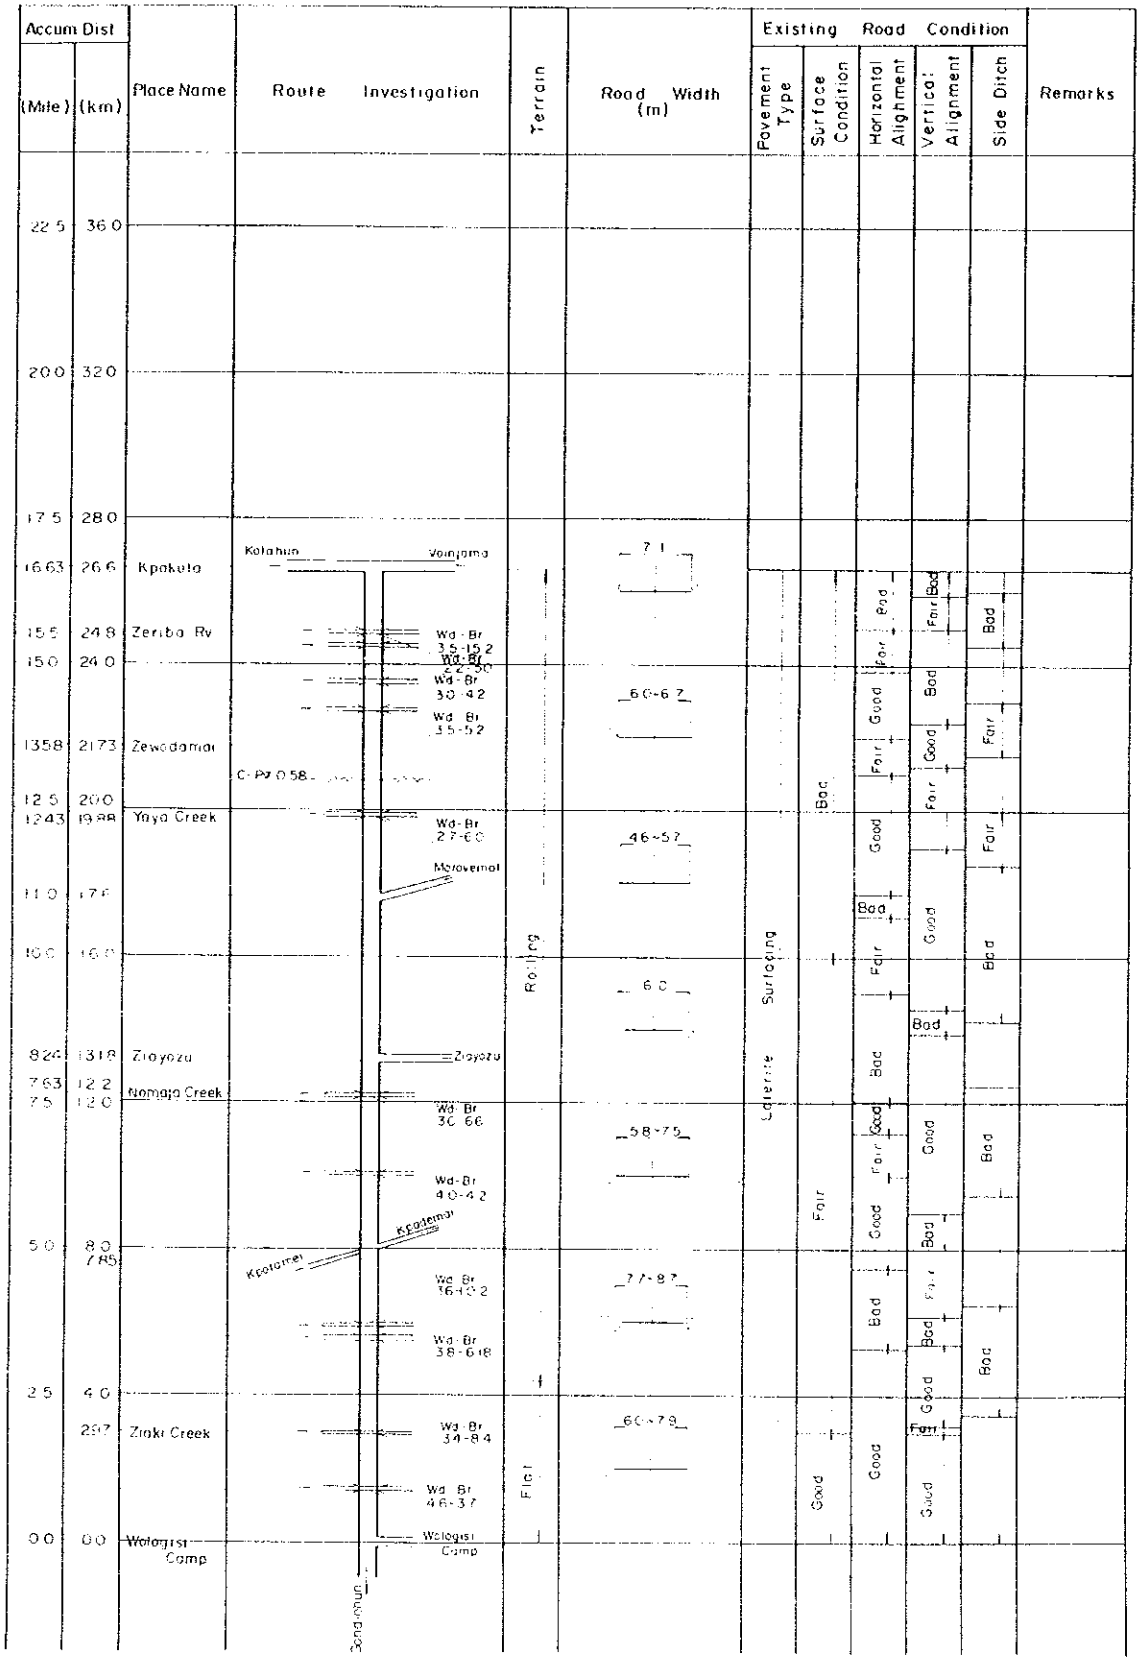
Work Item	Unit of Q'ty	Q'ty	Unit Price	Total Costs
1) Site Clearance:				
- Clearing & Grubbing	ha		4,000	726,400
2) Earth Works:				
- Common Excavation	m^3	1,506,200	2.50	3,765,500
- Borrow Excavation	m^3	600,000	4.60	2,760,000
- Side Drain Excavation	m^3	90,500	3.00	271,500
3) Pavement Works:				
- Surface Treatment	m^3	254,200	5.80	1,474,400
- Prime Coat 85 - 100	kg	978,800	1.06	1,037,500
4) Drainage:				
- Cross Ditch (0.80 x 0.80)	ℓ.m	1,020	415.00	423,300
- Cross Ditch (1.00 x 1.00)	ℓ.m	290	482.00	139,800
- Corrugated Steel Pipe ø1.0 M	ℓ.m	190	265.00	50,400
- Inlet Outlet for Pipe ø1.0 M	each	28	2,224.00	62,300
- Corrugated Steel Pipe ø1.5 M	ℓ.m	967	480.00	464,200
- Inlet & Outlet for Pipe ø1.5 M	each	184	3,115.00	573,200
- Corrugated Steel Pipe 2 x ø1.5M	ℓ.m	179	960.00	171,800
- Inlet & Outlet for Pipe 2 x ø1.5M	each	36	4,785.00	172,300
- Barrel of Box Culvert (3.0 x 3.0)		101	2,365.00	237,800
- Headwall "	each	22	8,761.00	192,700
- Barrel of Box Culvert (4.0 x 4.0)	ℓ.m	74	3,731.00	276,100
- Headwall "	each	18	11,820.00	212,800
- Barrel of Box Culvert 2 x (4.0-4.0)	ℓ.m	24	6,491.00	155,800
- Headwall	each	6	20,410.00	122,500
- Demolition of Wooden Culvert	ℓ.m	90	60.00	5,400
5) Bridges:				
- Abutment H=4m	each	16	17,890.00	286,200
- 10 m R.C. Clab	each	7	39,120.00	273,800
- 20 m R.C. T-Beam	each	4	92,930.00	371,700
- 25 m R.C. T-Beam	each	5	134,020.00	670,100
- 30 m Box - Girder	each	4	172,730.00	690,900
- Piers	each	3	97,510.00	292,500
- Abutment H=6m	each	18	30,380.00	546,800
- Rip Rap	m^3	1,099	38.00	41,800
- Demolition of Wooden Bridges	ℓ.m	373	75.00	28,000
6) Miscellaneous:				
- Traffic Signs, Roadmarking, km Post Guardrail, etc.	ℓ.m	181,600	3.17	575,700
Sub-Total				17,073,200
Engineering/Supervision				2,220,000
Physical Contingency (12 %)				2,316,000
Price Contingency (21 %)				4,051,000
Total Estimated Cost				25,660,000

ANNEX-I

INVENTORY OF EXISTING ROADS

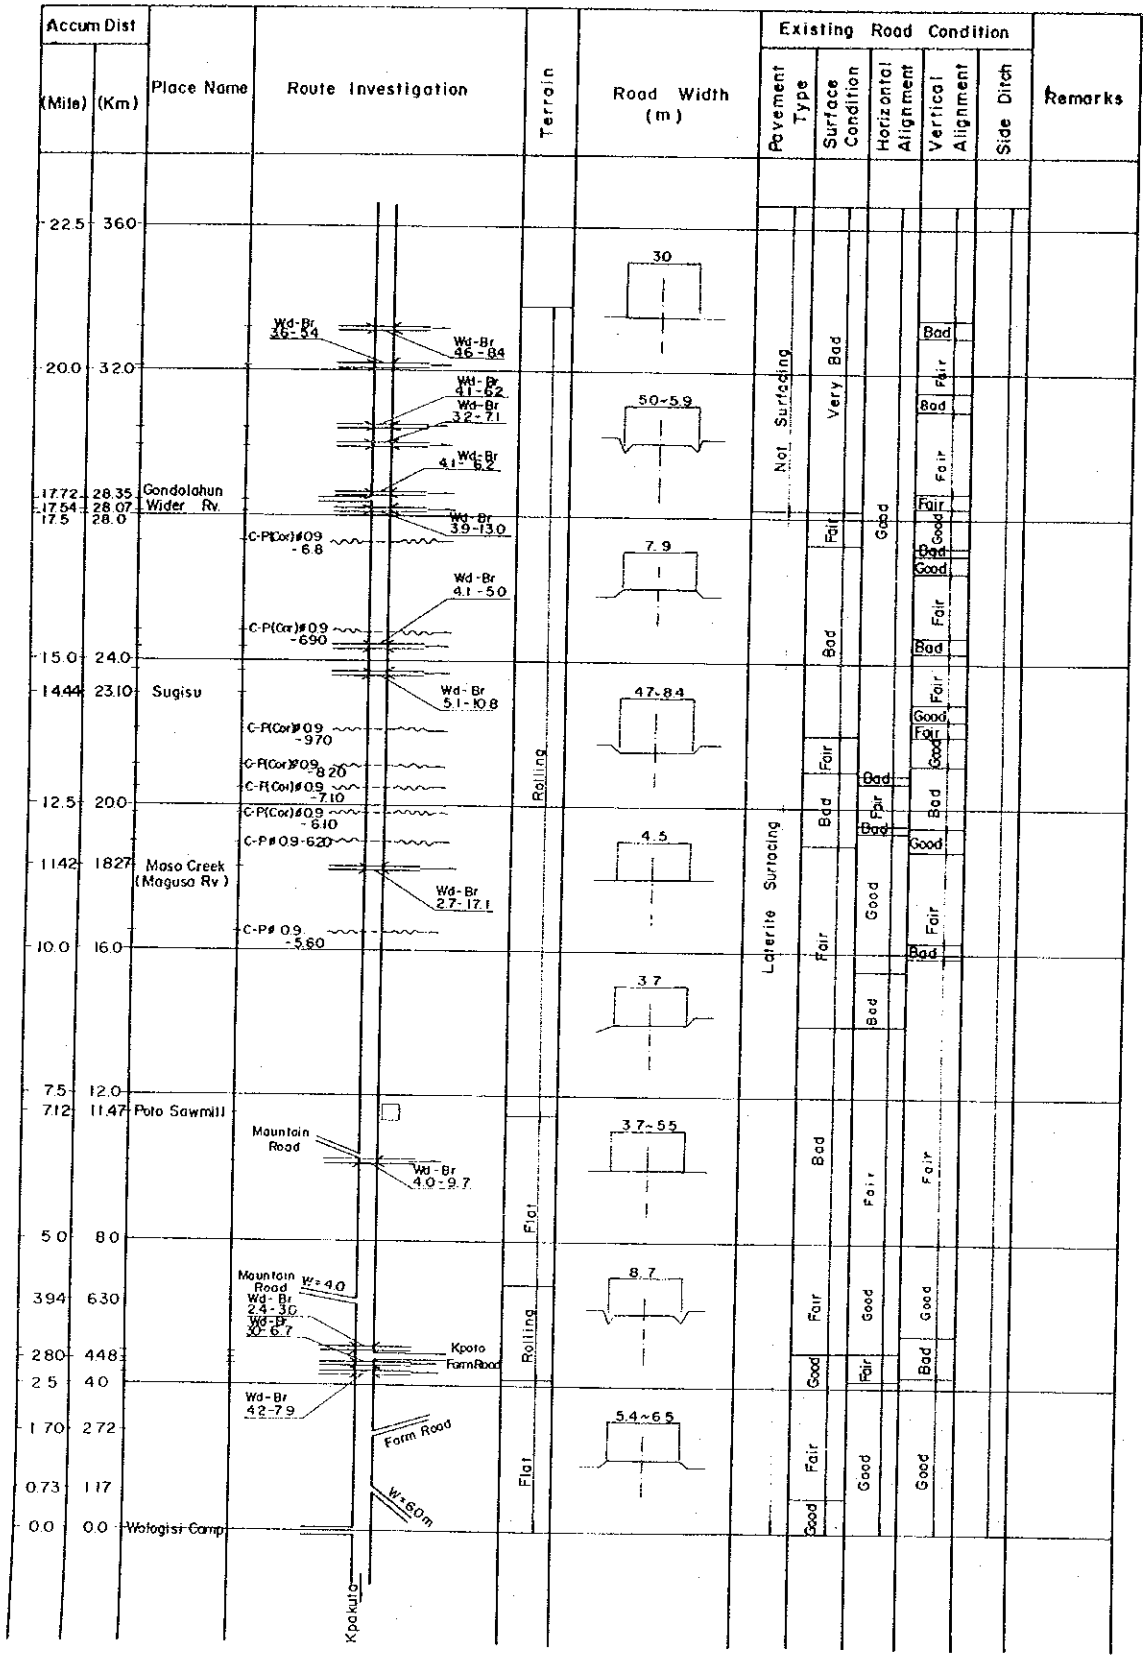
ROAD INVENTORY - FEEDER ROAD

Wologisi Camp ~ Kpakuta



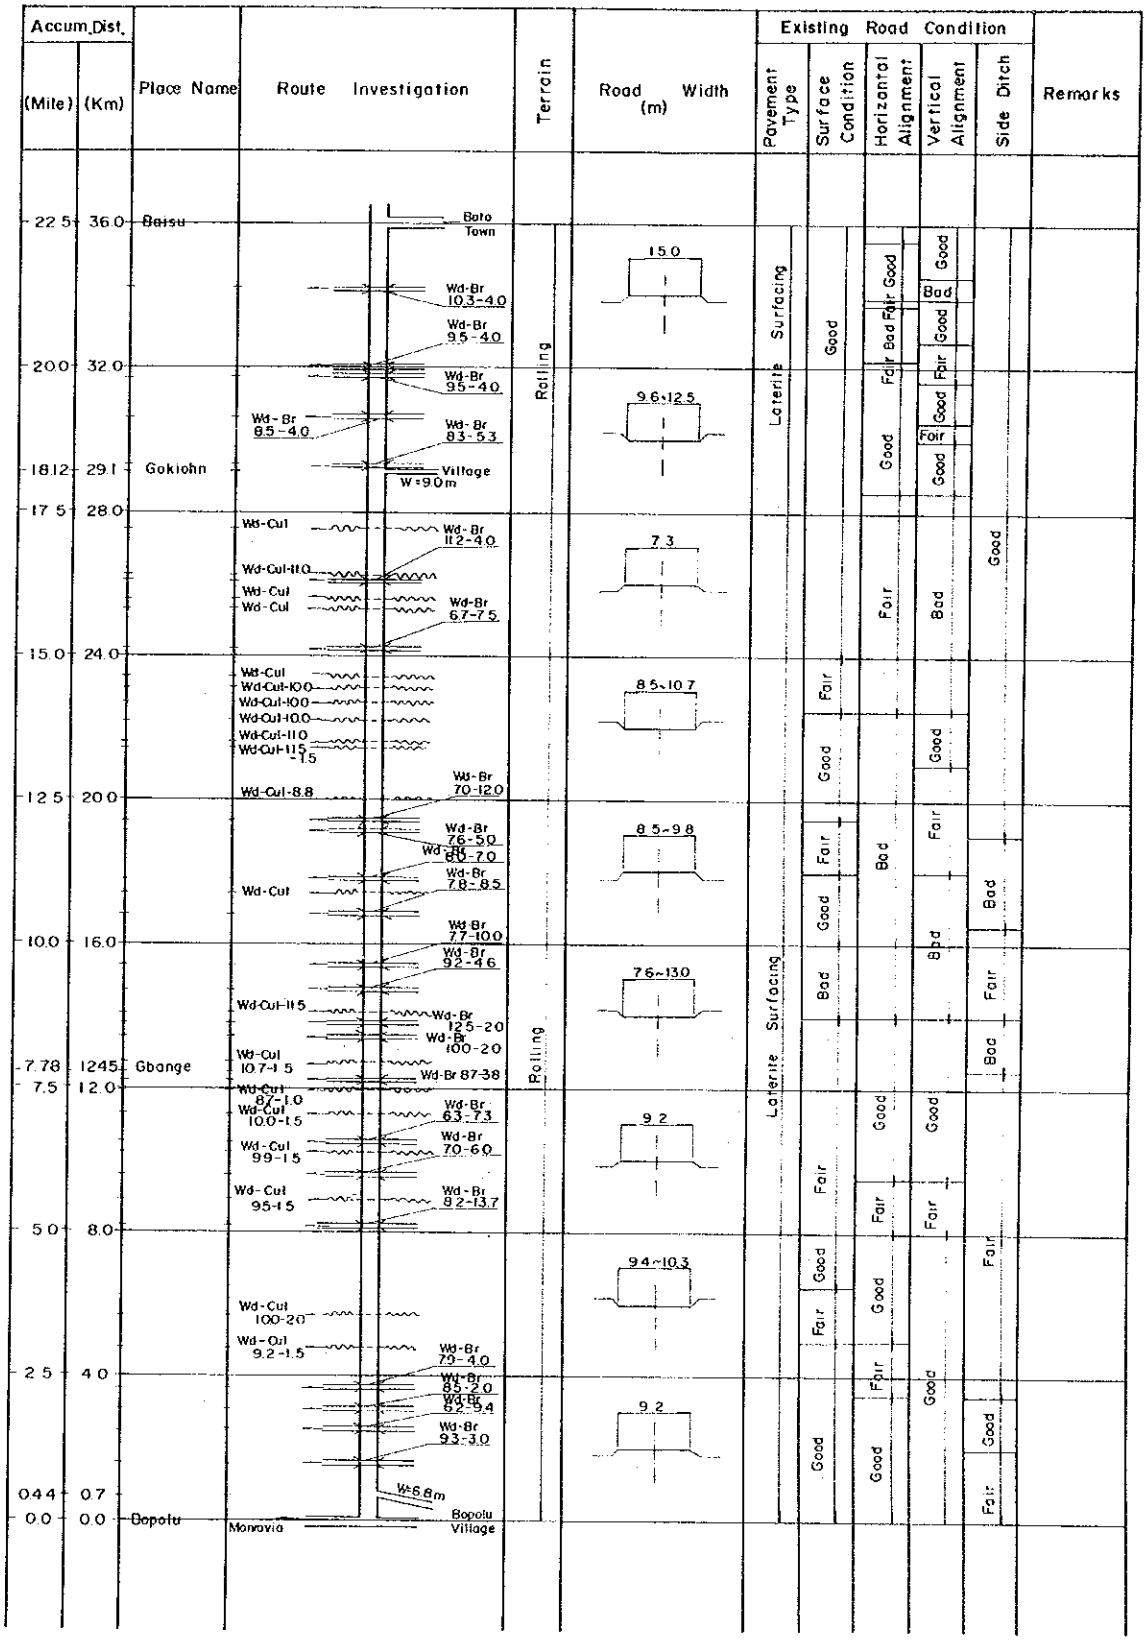
ROAD INVENTORY - FEEDER ROAD

Wologisi Camp ~ Gondolahun ~ Yaselehun



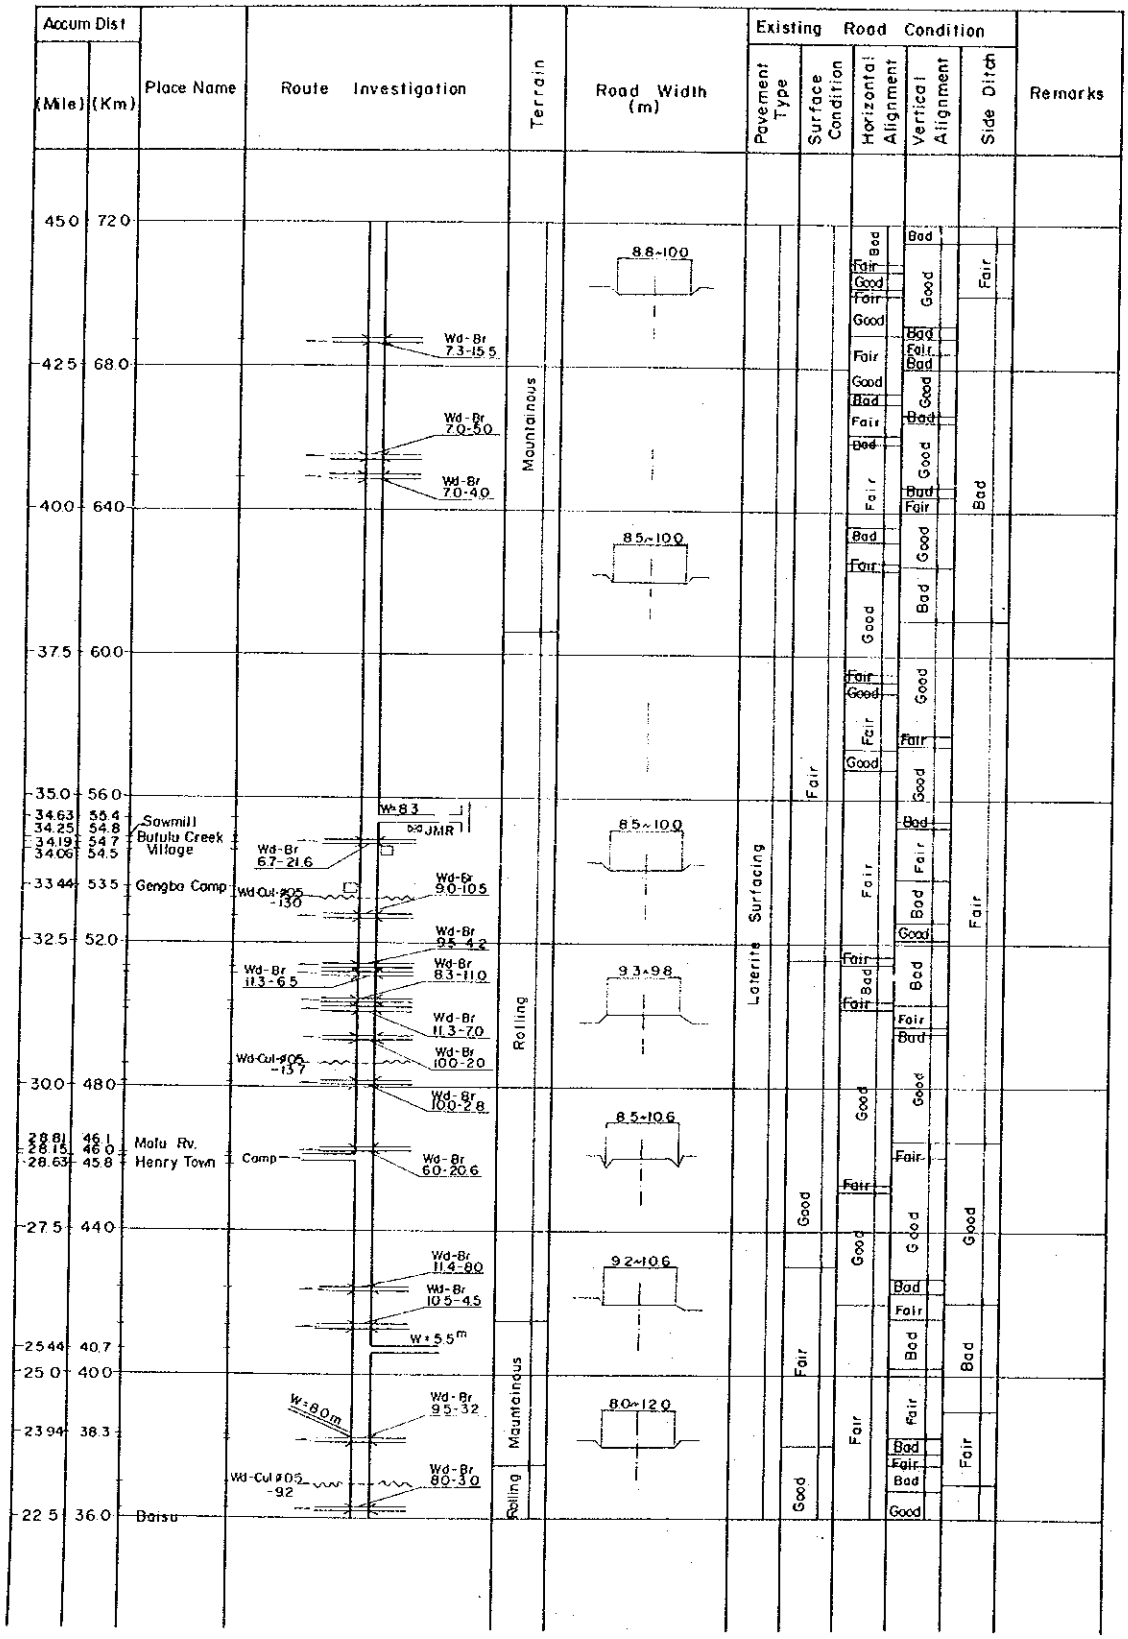
ROAD INVENTORY-PRIVATE ROAD

Bopolu ~ T.F.C ~ Kpelle National Forest (1)



ROAD INVENTORY – PRIVATE ROAD

Bopolu ~ T.F.C ~ Kpelle National Forest (2)



ROAD INVENTORY – PRIVATE ROAD

Bopolu ~ T. F. C ~ Kpelle National Forest (3)
