# THE STUDY ON THE DEVELOPMENT PROJECT OF THE PORT OF MANZANILLO IN THE UNITED MEXICAN STATES

FINAL REPORT

NOVEMBER 1985

国際協力事業団 愛科 '86. 5.15 615 72.8 登録No. 12658 以DF

### **PREFACE**

In response to a request from the Government of the United Mexican States, the Government of Japan decided to conduct a study on the Development Project of the Port of Manzanillo and entrusted the study to the Japan International Cooperation Agency (JICA). JICA sent to Mexico a study team headed by Dr. Kazuo Kudo, Adviser of the Overseas Coastal Area Development Institute of Japan, several times from September 1984 to October 1985.

The team exchanged views on the Project with the officials concerned of the Mexican Government, conducted field surveys and collected reference materials. After the team returned to Japan, further studies were made and the present report has been prepared.

I hope that this report will serve to assist the development of Manzanillo Port and contribute to the promotion of friendly relations between our two countries.

I wish to express my deep appreciation to all the officials concerned of the Government of the United Mexican States for their close cooperation extended to the team.

November, 1985

Keisuke Arita

President

Japan International Cooperation Agnecy

### LETTER OF TRANSMITTAL

November 1985

Mr. Keisuke Arita
President
Japan International Cooperation Agency

Dear Mr. Arita:

It is my great pleasure to submit herewith a report on the Development Project of the Port of Manzanillo, the United Mexican States.

The Japanese study team, headed by myself, conducted a survey on the Project in Mexico for 45 days from september 17, 1984, at the request of the Japan International Cooperation Agency. The findings of this study were discussed to make the Master Plan and to study the feasibility of the Development Project of the Port of Manzanillo, and were then compiled into this report. The study shows that the Project is extremely important, so I hope the Project is executed promptly.

On behalf of the Japanese study team and myself, I would like to express my deepest appreciation to the Government of the United Mexican States and to the various organizations concerned with the Project for the unlimited cooperation and assistance, and the warm hospitality they extended to the team during our stay in Mexico.

I am also greatly indebted to the Japan International Cooperation Agency, the Ministry of Transport, the Ministry of Foreign Affairs and the Japanese Embassy in Mexico for giving us valuable suggestions and assistance during the field survey and the preparation of this report.

Sincerely yours,

Kazuo Kudo

Head

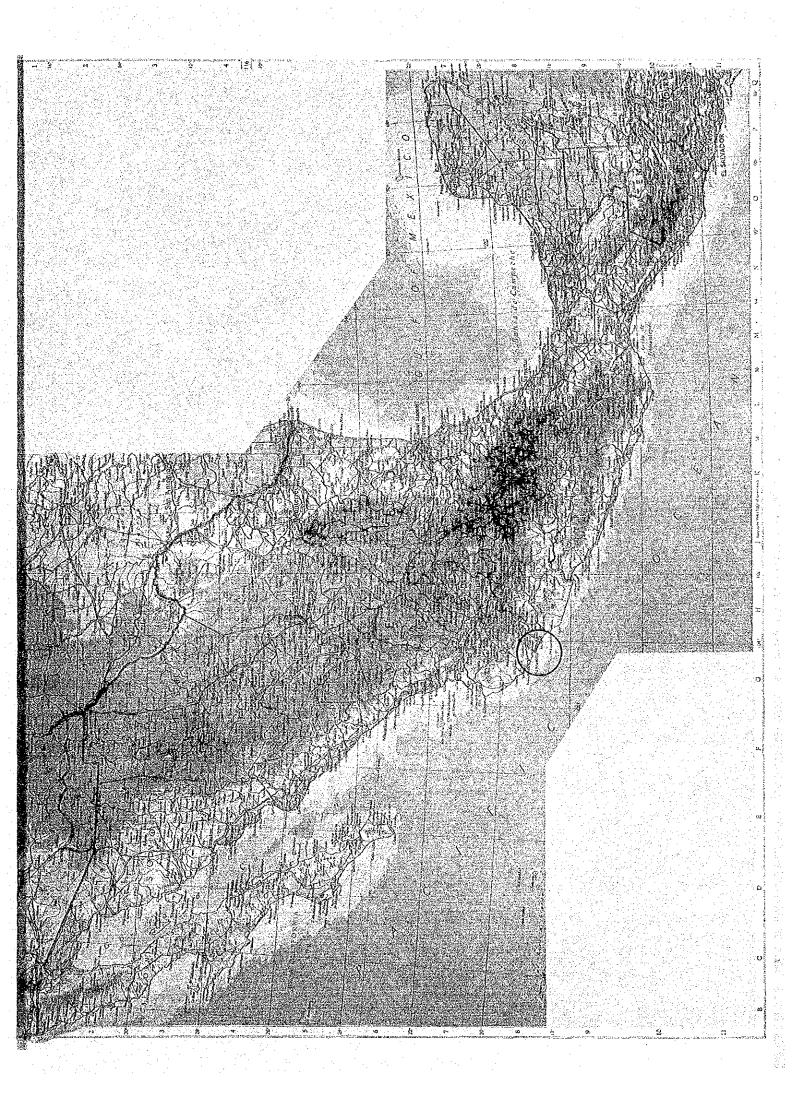

Japanese Study Team for the Development

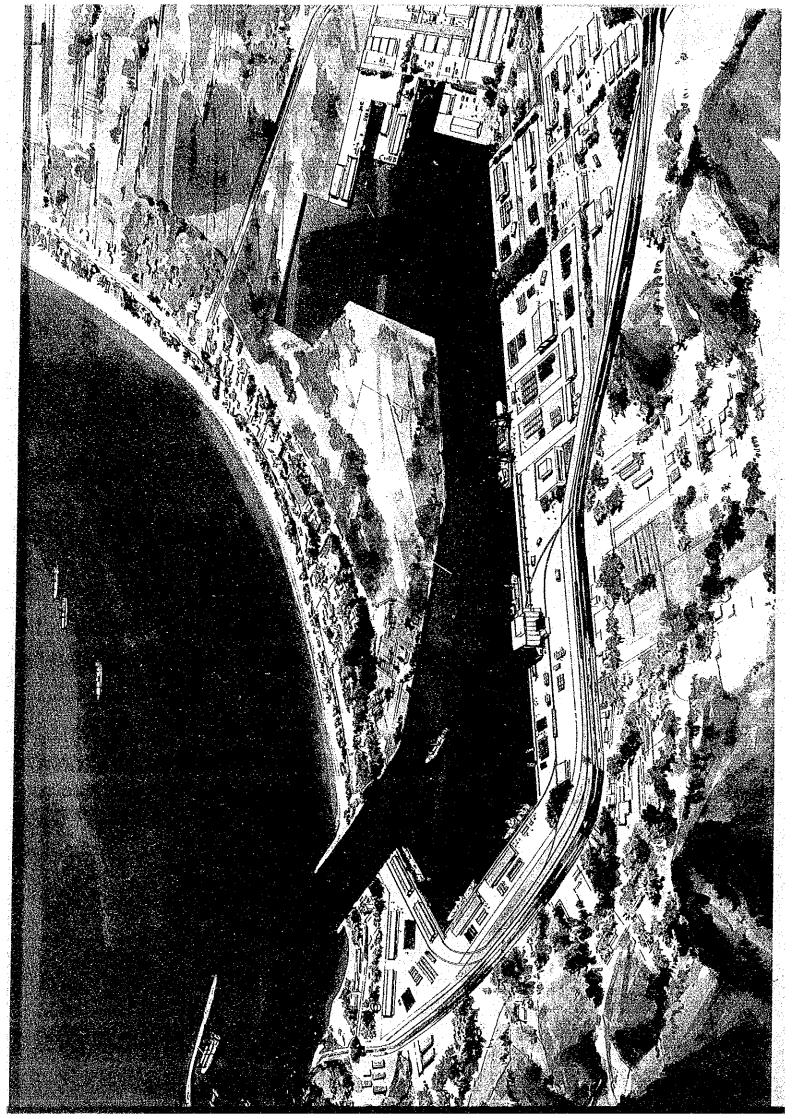

mo Kudos

Project of the Port of Manzanillo

(Adviser, the Overseas Coastal Area

#### CONCLUSIONS

# 1. Necessity for the Development of the Port of Manzanillo

The economy of the United Mexican States grew favorably from 1976 to 1981 as shown by the  $4\% \sim 9\%$  annual growth rate in the GDP. However, from the middle of 1981 through 1983 Mexico entered into an economic crisis, and consequently the annual GDP growth rate became negative.

Since 1983, however, the Mexican economy has recovered to some extent. Owing to the government efforts, overall economic and social activities have been returning to the line indicated in the "Plan Nacional de Desarrollo 1983  $\sim$  1988".

Since the GDP of Mexico is highly dependant on future oil prices, long range GDP forecasts are inevitably somewhat uncertain.

Mexico suffers from an extreme concentration of population, commerce, and industry in the central region around Mexico City. The Mexican government has been promoting a more balanced development through decentralization of population and commercial and industrial activities based on regional development plans:

One of the best ways to achieve further regional development is creating new productive centers along the coasts. The regional development of the Manzanillo area triggered by the development of Manzanillo Port will play an important role in this policy.

Overall, a comprehensive development plan for the port of Manzanillo should be considered, and adequate and timely action should be taken by the government.

# 2. Master Plan

The Master Plan is formulated with a target year of 2000. The cargo volume expected for the port of Manzanillo in the target year is estimated as about 3,000,000 tons considering national and regional long term development plans, and the trends of the socio-economic activities in the Port's hinterland including Guadalajara and in the Port's influence area including Mexico City.

To meet the projected increase in cargo movement, the Master Plan proposes twelve berths (seven new berths and five existing berths), on the assumption that existing commercial activities in the outer port will be transferred to the inner port. Five of these berths are for general cargo (three 12m deep, two 11m deep), one for container cargo (13m), two for agricultural bulk (13m), two for mineral bulk (13m and 12m), and two for domestic trade (11m and 9m). Further, related on-shore storage facilities will be constructed in the form of warehouses and transit sheds. Additionally, the plan provides a container yard with two gantry cranes and a container freight station.

The construction cost is roughly estimated at about 19.9 billion pesos (prices as of the end of 1984).

The plan also includes provisions for the construction of fishery port facilities, a related

processing-marketing complex, and an industrial park. Further, it provides some space which is reserved for the future expansion of port facilities.

Naturally, the development of ports must take place in conjunction with urban development plans. In the case of Manzanillo, the proposed port development, namely shifting commercial activities from the outer to the inner port and creating a pleasant waterfront area centering on the rehabilitated pier for cruising vessels, is consistent with the municipal policy regarding the development of the port.

# 3. Short-term Development Plan

The Short-term Development Plan is aimed at the year 1990, and covers the construction and improvement of port facilities which are considered urgently needed. The estimated cargo volume for 1990, on the basis of which the Short-term Plan is formulated, is about 2,300,000 tons.

Facilities to be newly constructed under the Short-term Development Plan include two berths for agricultural bulk (12m deep), and one berth for container and general cargo (12m). Related cargo handling equipment and facilities include one gantry crane for container cargo and two warehouses.

The construction cost is estimated at about 6.3 billion pesos (prices as of the end of 1984) including the cost of related facilities in the port area such as port roads and railways. About 2.3 billion pesos of the cost, approximately 36%, will come from foreign loans. The construction period is about five years.

Commercial port activities which presently take place in the outer port will gradually be shifted to the inner port in accordance with the port development plan.

In view of the topographical conditions of the inner port, with its single entrance, due consideration shall be paid to maintaining good water quality. To this aim, a scheme to control the discharge of waste water into the port area, including installation of sewerage treatment plants, shall be introduced.

#### 4. Economic and Financial Analyses of the Short-term Development Plan

# (1) Economic Analysis

The Short-term Development Plan is evaluated using the Internal Rate of Return (IRR) which is calculated based on cost-benefit analysis from the viewpoint of the national economy. Benefits considered are the reductions, in ships' staying cost, cargo handling cost, and time cost, while costs are the construction, maintenance and administrative costs. The internal rate of return, using 30 years as the period of economic calculation, is 16.04%. This shows that the Short-term Development Plan is advantageous from the viewpoint of the national economy.

#### (2) Financial Analysis

The port finances are analyzed using projected financial statement from the standpoint

of the port management body, that is the financial situation of the project authority in the event the project is executed. The profitability of the project itself is analyzed based on the Financial Rate of Return (FRR) using the Discount Cash Flow Method. Domestic funds are assumed to come from government funds, and foreign funds from soft loans (annual interest rate: 4.75%, term of repayment: 25 years, grace period: 7 years). Revenues are assumed as port dues, wharfages and stevedoring charges according to the current Mexican tariffs.

The analysis shows that the body will maintain its financial viability throughout the entire period of the project life, including the construction period. The port body will be able to pay all expenditures and will have a surplus even after appropriating funds for the repayment of the foreign loans including interest. As to the profitability of the project itself, a FRR of 7.21% can be expected. This well exceeds the weighted average interest rate of the procured funds (1.2%).

Judging from the above, it is concluded that the Short-term Development Plan with the target year of 1990 is feasible both economically and financially.

Concerning the financial feasibility of converting the outer port from a commercial port to a touristic port, analysis shows that the financial break-evenpoint is port calls of about 100 cruising vessels per year.

# RECOMMENDATIONS

Planning, fund raising, detailed design and construction for this project will hereafter be conducted in accordance with the plans presented in this report. The recommendations below concern various matters we noticed while conducting this survey and drafting the plans.

- 1. The cargo volume at the port of Manzanillo is expected to increase along with the development of national and local economic activities. On the other hand, as the existing port facilities are not satisfactory, the existing commercial functions in the outer port should be transferred to the inner port to spur local economic development. Thus, it is important to implement this plan at the earliest possible time.
- 2. The Master Plan (target year 2000) was formulated based on the socio-economic frame of the "Plan Nacional de Desarrollo 1983 ~ 1988".
  However, the economy is subject to constant flux, and the demand at the Port is greatly influenced by changes in the domestic and world economy. Before implementation, the Master Plan should be reviewed considering current regional and national economic development.
- Ports cannot function efficiently only by the construction of mooring, storage and other
  physical facilities. The development of various port controlling and operating systems is
  also essential.
  - Based on the site investigation and interviews, various deficiencies were pointed out including the lack of proper handling equipment, and inadequate use of storage facilities. The single most important item, however, is the large amount of time loss due to unnecessary interruptions of cargo handling operations.
  - In order to overcome such deficiencies, recommendations presented in this report should be implemented, and then an additional in-depth study should be carried out focusing on the further improvement of port operations.
- 4. The following proposals mentioned in this report must be fully implemented in order to ensure safe and smooth port operations:
  - ① To secure the proposed width of the entrance channel
  - 2 To secure the proposed distance between the wharf face of the container terminal and the planned reclamation line of the Naval Base.
  - To remove immediately the shoal which is located near the entrance channel in the anchorage.
- 5. To complete the plan, it will be necessary to take care of following matters when executing the detailed design:
  - 1 The number and the depth of bore holes are not sufficient for the detailed structural design of main facilities and the study of the base soil stability. A more detailed

- boring survey is needed at the locations where the main structures and facilities are planned.
- When the dredged sand is used for the reclamation of the wharf, the possibility of liquefaction must be considered, based on the obtained soil data.
  An appropriate survey and study will be necessary.
- (3) When reconstructing the old wharf at the outer port as the terminal for crusing vessels, surveys of the soil conditions and of the conditions of the piles and steel bars will be necessary to determine the extent of the rehabilitation work.
- 6. To complete the project effectively, the following additional works will be necessary:
  - (1) Reconfirm the relation between port and city development plans
  - Establish control over the disposal of waste water into the port area and construct sewage treatment plants
  - 3 Adjust the access road and railway
  - Survey water resources to ensure a sufficient water supply for the industrial and seafood products industrial zones
  - (5) Relocate the distribution facilities of PEMEX to the suburbs of Manzanillo City

# SUMMARY

# CHAPTER I INTRODUCTION

# 1. Background

The economy of the United Mexican States grew favorably from 1976 to 1981 as shown by the  $4\% \sim 9\%$  annual growth rate in the GDP. This growth was mainly due to increased exports of petroleum and industrial products.

From the middle of 1981 through 1983 the Mexican economy stagnated. Mexico entered into an economic crisis, and consequently the annual GDP growth rate became negative.

Since 1983, however, the Mexican economy has recovered to some extent. The rate of inflation has dropped, employment has increased, and the GDP has been growing. Overall, economic and social activities have been expanding under "Plan Nacional de Desarrollo 1983  $\sim$  1988."

Mexico suffers from an extreme concentration of population, commerce, and industry in the central region around Mexico City. The Mexican government has been promoting a more balanced development through decentralization of population and commercial and industrial activities based on regional development plans.

One of the best ways to further regional development is by creating new productive centers along the coasts. The regional development of the Manzanillo area based on Manzanillo Port plays an important role in this policy.

#### Objectives

This study aims at formulating a Master Plan of the port of Manzanillo with a target year 2000, as well as preparing a Short-term Development Plan of the Port up to 1990, including a feasibility study.

# CHAPTER II PRESENT SITUATION OF MEXICO

#### 1. Natural Conditions

# 1-1 Geography and Topography

Mexico is mountainous, and more than 50% of the total area is highland from 1500m to 2000m in altitude. Almost 71% of the land lies above 400m above sea level, and the main portion of Mexico's administration, economy, culture and industry are located in the plateaus. Mexico's mountains are bounded by narrow plains along the coasts. Manzanillo lies in the central portion of the Pacific coastline in the state of Colima. This area is within the belt of high volcanic activity which surrounds the Pacific.

In the state of Colima, highlands approach the coastline and form narrow coastal plains, and there are few suitable areas for ports. Manzanillo is one of most suitable areas. It has good bays, Manzanillo and Santiago Bays, and lagoons, the San Pedrito and Cuyutlan which can be developed as port and industrial areas.

#### 1-2 Climate

The climate of Mexico is diversified. This wide variety is due not only to latitudinal differences but also to varied altitude.

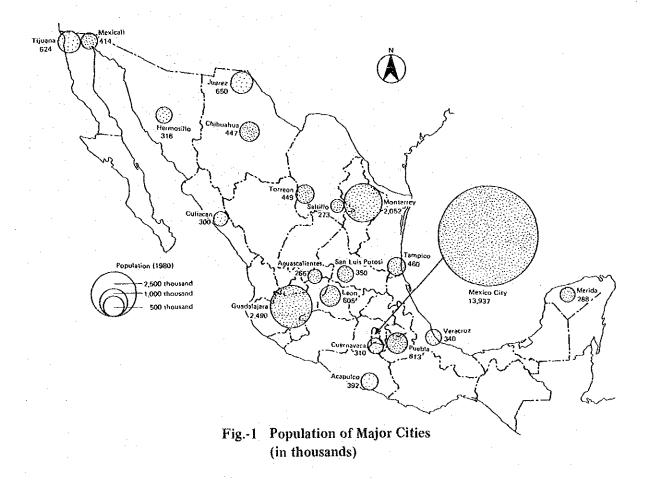

The principal characteristics of the climate are listed below.

- (1) There is a wide variety of vegitation
- ② Climatic differences influence human activity, and as a result, population is concentrated on the plateaus.
- (3) The coastal area from Mazatlan to the southern border of the Pacific coast, which is classified as tropical savanna, has a dry and a rainy season.
- 4 Cyclones appear in summer and autumn.

# 2. Socio-Economic Conditions

The population of Mexico grew at an annual rate of about 3% from 1950 to 1980, and reached 67 million in 1980. The explosive increase in population, however, induced serious social and economic problems such as over-crowding, insufficient housing, and poor supply-demand adjustment.

In addition, due to the topographic and climatic conditions of Mexico as well as to historical trends, the population is concentrated in the central regions, especially in the urban areas. For reference, Fig.-1 shows the location and population of major cities.

Thanks to rich oil resources, Mexico maintained a high level of economic growth, with an annual GDP growth rate of over 8% from 1978 through 1981, as shown in Table-1. However, the GDP became negative in 1982 and 1983 because of decreased oil demand, and the resultant decreased export income seriously impeded Mexico's economic growth. In 1984 a gradual recovery of economic activities took place, and the growth is expected to become positive.

Economic activities are also concentrated in central Mexico. Table-2 shows that in 1980 34.4% of the population and 41.6% of the GDP are concentrated in the central area which represents only 4.4% of the total land area of Mexico. In order to prevent excessive concentration, the Mexican government is aggressively promoting decentralization.

# 3. Transportation

The total freight volume of Mexico reached about 488 million tons in 1983, and the modal split of cargo traffic in 1983 is 57.0% by road, 12.7% by railway and 30.3% by ship. For foreign trade, the share of marine transportation is especially high. Marine transportation accounts for about 65% of import, 95% of export and 90% of total foreign trade.

As for roads, the road network linking the principal cities in the central region and the highway running longitudinally from the border of U.S.A. to the central region are well developed, but there are few roads running horizontally across Mexico. On the other hand, the existing railway network is also well developed with numerous arteries which connect the

principal cities of the central region with U.S.A. as its main frame.

As for marine transportation, 148 million tons of cargoes which include 103 million tons of foreign trade were handled in 1983. Fig.-2 shows the volume of cargo handled during the last eight years. The main shipping cargoes are petroleum and its derivatives (78% of total tonnage in 1983) and agricultural and mineral bulk cargoes (16%).

In 1983, the Pacific coast ports handled about 41 million tons of cargo, 27.8% of the national total, of which 15.6 million tons were for foreign trade and 25.5 million tons were for domestic trade. There are six major ports on the Pacific coast. These six major ports handled most of the foreign and domestic cargoes other than salt. Fig.-3 shows the foreign cargo handling volume other than petroleum and its derivatives at the six major Pacific coast ports from 1978 to 1983.

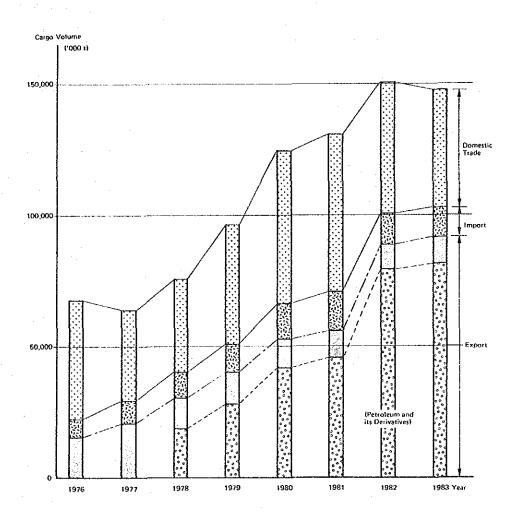

Fig.-2 Cargo Volume Handled at the Mexican Ports

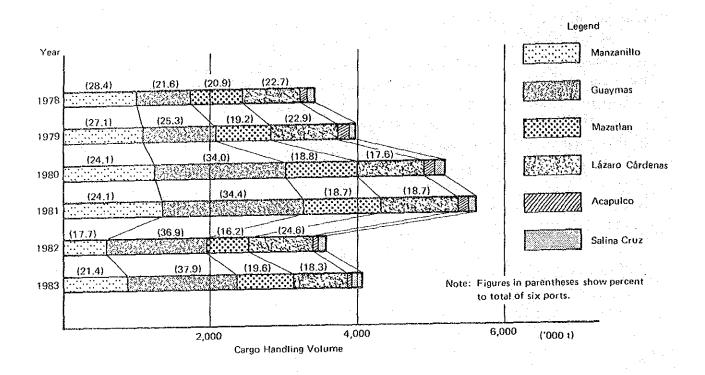

Fig.-3 Foreign Cargo Handling Volume other Petroleum and its Derivatives at the Six Major Pacific Coast Ports

# CHAPTER III PRESENT SITUATION OF THE PORT OF MANZANILLO

# 1. Natural Conditions

# 1-1 Topographical and Geological Features

# 1-1-1 Topography and Geography

In and around the port of Manzanillo, the coastal plains under 20 m in altitude are not large, and the naturally benign areas are narrow and restricted. Steeply sloped hills and highlands lie behind the narrow plain areas.

The urban portion of Manzanillo lies on a slope backed by hills on a peninsula between Manzanillo Bay and Cuyutlan Lagoon, and there is no room for further urban development in this immediate area,

A topographical map of the inner and outer ports is shown in Fig. 4. The outer port of Manzanillo has very suitable natural conditions, and has been developed making use of these favorable conditions. The urban area was developed in the narrow area near the port. Due to the geographical limitations, it would be difficult to further extend the outer port. The inner port is located in San Pedrito Lagoon and is under construction.

# 1-1-2 Geology

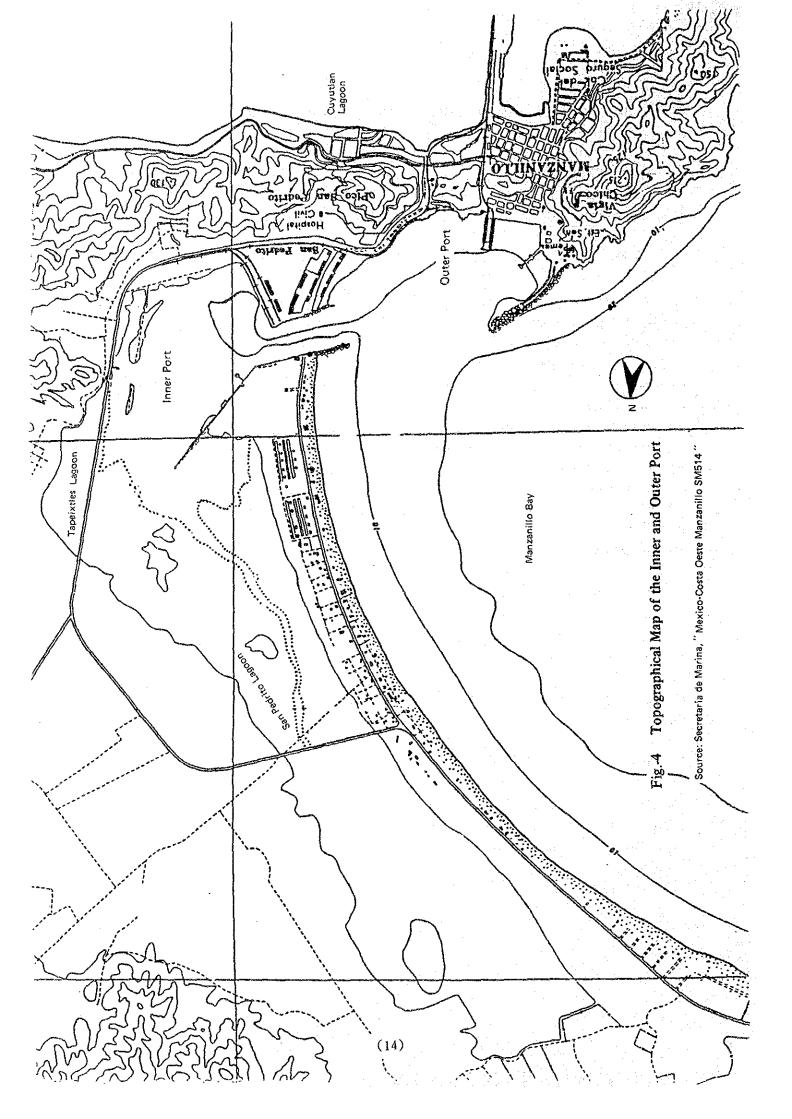

The geology in and around the port of Manzanillo can be classified as follows:

- Acid Intrusion, Plutonic Rock
- ② Acid Intrusion, Volcanic Rock
- ③ Alluvial Deposit
- 4 Swampy Soil

Alluvial deposit is distributed in the area of the outer port and swampy soil is distributed in the area of the inner port.

# 1-2 Meteorological Conditions

The mean annual rainfall at Manzanillo is about 900 mm. It rains heavily from June to October. Mean temperature at Manzanillo in July and August is hot  $-28.5^{\circ}$ C and from December to April the mean is the lowest  $-25^{\circ}$ C. The seasonal change of temperature at Manzanillo is small.

# 1-3 Seismicity

Manzanillo is located in the narrow earthquake belt surrounding the Pacific Ocean. Therefore, there is a high possibility of earthquake risk.

A maximum horizontal acceleration of 0.15g is recommended for the design of port facilities at Manzanillo Port.

# 1-4 Oceanographical Conditions

#### 1-4-1 Tide and Current

The clearance between high tide and low tide is about 70 cm. Ocean and tidal current can be estimated as small.

#### 1-4-2 Waves

The significant wave height  $(H_{1/3})$  at the entrance of the inner port is estimated as about 1.5 m, and the wave height in the inner port will be less than half of this height.

# 1-4-3 Littoral Drift

Serious trouble from shoaling at Manzanillo Port and in the entrance channel will not take place.

# 1-4-4 Tsunami

It will be necessary to prepare countermeasures to tsunami.

# 1-5 Soil Conditions

Soil conditions in the inner port are examined using the collected data from 138 points of boring. From them, the typical soil profile, which is shown in Fig.-5, includes the following 4 types of soil.

From the ground surface, the subsoils are as follows:

- ① Soft organic soil or clay

  This layer underlies the entire area from 5 m to 20 m in depth. From the engineering point of view, this soil is not useful.
- Clayey sand or sandy clay
  This layer underlies most of the area and its thickness ranges from 0.3 m to 10 m. This soil has various mechanical characteristics from soft to stiff soil.
- 3 Sand
  This layer underlies almost the entire area, but in the northwest portion of the San
  Pedrito Lagoon this layer is less than 2 m thick. Therefore, this layer can not always be

considered as a bearing stratum.

(4) Complex layer of sandy, silty and clayey soils

This layer underlies almost the entire area
beneath the sand layer.

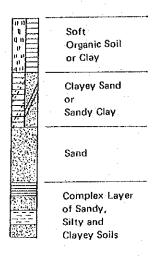

Fig.-5 Typical Soil Conditions in San Pedrito Lagoon

# 2. Manzanillo City

The population of the Municipality of Manzanillo is 73,290 (37,255 Men and 36,035 Women) from "X censo de Población y Vivienda 1980."

The primary products of the region are:

Agricultural products

Maize, Sesame, Rice, Sugar cane, Coconut, Lemon, Banana

Animal products

Beef, Park, Milk, Honey

Marine product

Tuna

Mineal products

Iron pellets, Salt

As for the transportation around Manzanillo City, the main road through Manzanillo City is route MEX-200 connecting with the other cities on the Pacific coast. In recent years a four-lane national road (Manzanillo~Colima~Guadalajara) has been under construction. The rail-way passes from Manzanillo through Colima and Guadalajara to Mexico City. There is an international airport in Playa de Oro which is about 50 km west of Manzanillo City by road.

The built-up area in the Manzanillo Metropolitan Zone is estimated at 1,760 ha. of which 60% are classified as residential, 25% as touristic and 15% as industrial and port. Currently, the total supply of potable water for the city is 524 l/second. The electric energy service is provided by CFE through a thermo-electric plant situated south of the city with a capacity of 1,200 MW. which will satisfy the present and future demand of the development area.

#### Port Facilities 3.

The existing port facilities at the port of Manzanillo are located in both the outer and inner ports. The inner port can be divided into the commercial port and the fishery port.

#### 3-1 Commercial Port

As for large mooring facilities, there are 10 public berths and 3 private berths excluding the naval facilities, as shown in Table-3. Furthermore, a new large berth with a water depth of 12 m is under construction in the inner port.

Most of the small facilities, with a water depth of less than 4.5 m, are located in the outer port. The -14 m channel leading to the inner port has a length of 600 m and a bottom width of 100 m.

**Table-3 Mooring Facilities** 

# (Large Facilities)

| Name of Facility      | Length of Berths (m) | Water<br>Depth of<br>Berths<br>(m) | Number<br>of<br>Berths | Structural<br>Type | Year<br>Constructed | Public<br>or<br>Private |

2) DGODP, "Sistema Estadístico Operacional Indicadores de Rendimiento 1983"

Other existing port facilities include breakwaters, the turning basin and storage facilities. As for storage facilities, there are four sheds in the outer and inner port, and the total area of these facilities is about 18,500 m<sup>2</sup>.

# 3-2 Fishery Port

A fishery port has been developed on a large scale at the north end of the San Pedrito Lagoon since 1980, and deep sea fishery berths of about 670 m long are now completed.

# 4. Cargo and Vessel Movement

# 4-1 Handling Volume and Commodities

4,025,000 tons of cargo including 871,000 tons of foreign trade were handled at the port of Manzanillo in 1983. Table-4 shows the volume of cargo handled in the last eight years.

The volume of cargo other than petroleum and its derivatives in 1983 was 1,091,000 tons, almost the same as in 1979, of which 854,000 tons (about 80% of the total volume) was foreign trade. The outstanding feature of foreign trade cargo movement at Manzanillo is that most of it is import cargo. The volume of imports is roughly ten times the volume of exports.

Table-4 Volume of Cargo Handled at Manzanillo

(Unit: '000 t)

|      | Grand   | nd Foreign Trade |         |         | Domestic Trade |       |       |
|------|---------|------------------|---------|---------|----------------|-------|-------|
| Үеаг | Total   | Export           | Import  | Total   | Out            | In    | Total |
| 1976 | 1,302   | 100              | 783     | 883     | 138            | 281   | 419   |
|      | (853)   | (100)            | (672)   | (772)   | (130)          | (79)  | (81)  |

|      | (757)   | (62)             | (571)   | (633)   | (23)           | (101) | (124) |
| 1983 | 4,025   | 76               | 795     | 871     | 597            | 2,557 | 3,154 |
|      | (1,091) | (76)             | (778)   | (854)   | (44)           | (193) | (237) |

Note: Figures in parentheses show the volume except for petroleum and its derivatives. Source: DGODP, "Estadísticas del Movimiento Portuario Nacional de Carga y Buques"

As for foreign trade cargoes by major items, imported agricultural bulk cargo takes a big share, 63% of total foreign trade volume, and imported general cargo accounts for 20% of total foreign trade. On the other hand, petroleum and its derivatives is the most important item for domestic trade, amounting to 92% of total domestic cargo volume.

The principal commodities of foreign trade cargo in 1983, as shown in Table-5, include exports of metallic zinc, lead, ammonium sulfate and sodium sulfate, and imports of maize, sorghum, sugar and steel plate.

Table-5 Principal Commodities for Foreign Trade (1983)

(Unit: t)

| Export           |         | Import             |         |  |
|------------------|---------|--------------------|---------|--|
| Commodity        | Tonnage | Commodity          | Tonnage |  |
| Metallic Zinc    | 17,230  | Maize              | 409,249 |  |
| Lead             | 13,049  | Sorghum            | 124,062 |  |
| Ammonium Sulfate | 9,036   | Sugar              | 111,256 |  |
| Sodium Sulfate   | 6,450   | Steel Plate        | 25,997  |  |
| Auto Parts       | 3,531   | Potassium Chloride | 21,474  |  |
| Polyester        | 3,189   | Ammonium Phosphate | 20,675  |  |
| Molasses         | 3,030   | Wheat              | 19,992  |  |

Source: DGODP, "Estadísticas del Movimiento Portuario Nacional de Carga y Buques"

The total volume of container cargoes reached about 23,000 tons, or 9% of general cargo in 1983. The principal commodities of containerized cargo are auto parts, electric articles, machinery parts and chemical industrial products.

# 4-2 Vessel Movement

As for the number of vessels calling at Manzanillo, 175 ocean going vessels and 226 vessels for domestic trade called in 1983.

As for foreign trade, about 80% of the vessels were general cargo carriers and for domestic trade about 90% were oil tankers.

# 5. Administration and Operation

#### 5-1 Administration

The following agencies are concerned with the administration and operation of the port of Manzanillo.

- ① Comisión Nacional Coordinadora de Puertos, SCT
- ② Dirección General de Obras Maritimas, SCT
- ③ Dirección General de Operación y Desarrollo Portuario, SCT
- 4) Servicios Portuarios de Manzanillo, S.A. de C.V.

# 5-2 Operation

Cargo handling at Manzanillo is carried out in three shifts. The ordinary working hours are  $8:00\sim13:00$  and  $15:00\sim18:00$  from Monday to Saturday. Extra working hours for night work are  $20:00\sim6:00$ .

Table-6 shows the average working efficiency by type of cargo in 1983.

Table-6 Working Efficiency by Type of Cargo (1983)

| Type of Cargo          | Number<br>of Ships | Discharging/<br>Loading<br>Volume (t) | Ton/<br>Hour•Worker | Ton/<br>Hour•Gang | Ton/<br>Hour Ship |
|------------------------|--------------------|---------------------------------------|---------------------|-------------------|-------------------|
| Broken General Cargo   | 111                | 113,937                               | 3.1                 | 32.7              | 60.3              |
| Unitized General Cargo | 52                 | 202,147                               | 4.3                 | 44.8              | 91.4              |
| General Cargo          | 163                | 316,084                               | 3.8                 | 39.5              | 77.1              |
| Agricultural Bulk      | 28                 | 571,572                               | 14.6                | 42.1              | 145.8             |
| Mineral Bulk           | 13                 | 230,412                               | 26.2                | 70.2              | 153.9             |
| Liquid                 | 1                  | 4,204                                 |                     |                   | 177.0             |

Note: These figures indicate the working efficiency during actual operational time. Source: DGODP, "Sistema Estadístico Operacional Indicadores de Rendimiento 1983"

# 5-3 Port Dues

As for port investment, the basic port facilities such as civil structures, storage facilities and cranes installed on quaywalls are constructed by the federal government.

Cargo handling equipment, tug boats and other movable machines are provided by Servicios Portuarios.

Therefore the port charges are divided into two parts: dues for use of port facilities, which are given to the federal government, and charges for port services.

# 6. Fishery Activity

# 6-1 Fishery Production

In the last five years, national fishery production has increased favorably, and totaled about 1,502 thousand tons in 1982. The fishery production in the Manzanillo region was officially recorded as 3,500 tons in 1983, but the volume in the last six years has fluctuated from year to year, as shown in Table-7.

Table-7 Fishery Production by Region (1978–1983)

(Unit: t)

|   | Area                     | 1978    | 1979      | 1980      | 1981      | 1982      | 1983  |
|---|--------------------------|---------|-----------|-----------|-----------|-----------|-------|

Note: 1) - indicates no available data.

2) This table is based on the fishermen's association statistics.

Source: PESCA

# 6-2 Fishing Boats

In 1980, the nation's fishing boats numbered about 36 thousand, most of which were small boats below 1 t.

In 1982, 269 boats were registered to the Manzanillo fishery office, but most of these boats were based at other fishery ports because of the insufficient landing and processing facilities at Manzanillo.

#### 6-3 Others

The major destinations of the fishery products in the Manzanillo region are the Federal District, Jalisco State and Aguascalientes State. On the other hand, the Manzanillo region has several small companies with fishery processing facilities located some distance from the port.

#### 7. Tourism

# 7-1 Tourists Visiting Manzanillo

In 1983, about 480 thousand tourists, which includes about 140 thousand foreign tourists, visited Colima State. More than 50% of these tourists visited the Manzanillo region.

# 7-2 Cruising Vessels

As for cruising vessels moving along the Pacific coast of Mexico, a total of 36 vessels anchored at Manzanillo Port with about 14 thousand passengers in 1983. This number of vessels and passengers is very small compared with other calling ports.

Six of these vessels periodically anchored at Manzanillo Port in 1983. Of these, representative vessels are the "Pacific Princess" and the "Cunard Princess" with a gross tonnage of 20 thousand tons, which come every fourteen days on route to Acapulco.

# CHAPTER IV BASIC CONCEPT FOR THE DEVELOPMENT

# 1. National and Regional Development Plans

The Port of Manzanillo Development Plan should be written after reviewing the National Development Plan as well as functional and regional development plans so as to take the spirit of these plans into ensideration.

# 1-1 National Plan

"Plan Nacional de Desarrollo 1983 ~ 1988" published in 1983 includes national economic targets, and two main policies for economic reconstruction and structural reformation. Based on this program, concrete execution programs such as "Programa Nacional de Communicaciones y Transportes 1984 ~ 1988" and regional development plans such as "Plan Colima" have gradually been published.

# 1-2 Regional Plans

The latest regional development plans which directly concern the development of the port of Manzanillo are "Plan de Desarrollo Urbano de Manzanillo", "Plan Colima" and "Plan Parcial de Zones de Crecimiento".

The development area and the land use plan are shown in Fig.-6.

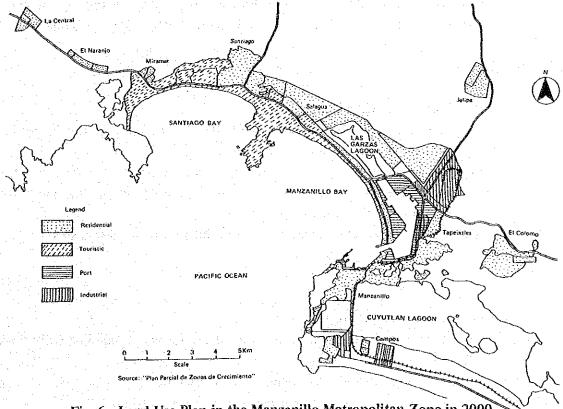

Fig. 6 Land Use Plan in the Manzanillo Metropolitan Zone in 2000

# 2. Development Policy

The purpose of the development of Manzanillo Port is to help realize various national and regional goals described in the previous section, especially to assist in controlling the future expansion of Mexico City by promoting production and population growth in the Manzanillo area. Manzanillo Port will serve as a key port to facilitate cargo flow throughout the nation.

# 2-1 Roles of Manzanillo Port

The roles of Manzanillo Port are as follows:

- (1) From a historical viewpoint, the port of Manzanillo has been one of the most important ports on the Pacific coast. The port is connected by roads and railways with Guadalajara, the second largest city in Mexico, and with other principal cities throughout the country.
- ② The port of Lázaro Cárdenas has consolidated its position as the primary industrial port and as the key port for grain imports on the Pacific coast. Nevertheless, Manzanillo Port will continue to be of prime importance to its hinterland of Colima, Jalisco and Aguascalientes State and to its influence area as described in Chapter V. 1.

# 2-2 Development Strategy

# 2-2-1 Overall Planning

The planning must be in harmony with land use planning around the object area, and with the Manzanillo City development plan. The plan should minimize environmental damage.

# 2-2-2 Outer Port

The concepts of the outer port are as follows:

- (1) Existing commercial activities other than PEMEX in the outer port will cease. The outer port will become exclusively a tourist port.
- ② Because commercial cargo will no longer be handled in the outer port, the railways running to this area and some of the warehouses located behind the wharf will be removed and the space changed to a public use area.
- The existing PEMEX oil facilities on land and in the sea will not be changed.

#### 2-2-3 Inner Port

The concepts of the inner port are as follows:

- (1) Fishery and commercial port functions other than petroleum handling will take place within the inner port.
- ② The Tapeixtles Lagoon will be reclaimed for industrial use.
- 3 The largest possible area should be reserved for future expansion.

# 2-2-4 Port Planning

The main planning concepts are as follows:

- ① To cope with modernization of marine transportation.
- ② To improve traffic flow.
- 3 To ensure port safety.

# CHAPTER V SOCIO-ECONOMIC FRAME FOR DEMAND FORECAST

# 1. Hinterland of the Port

The hinterland of the port of Manzanillo is determined from the data on the origin and destination of cargoes passing through the port, and the inland transportation situation. In conclusion, we may consider the following two categories of hinterlands for the port of Manzanillo as shown in Fig.-7.

Direct Hinterland: Colima, Jalisco, Aguascalientes

Influence Area: D.F., Guanajuato, Michoacan, Nayarit,

Queretaro, Mexico

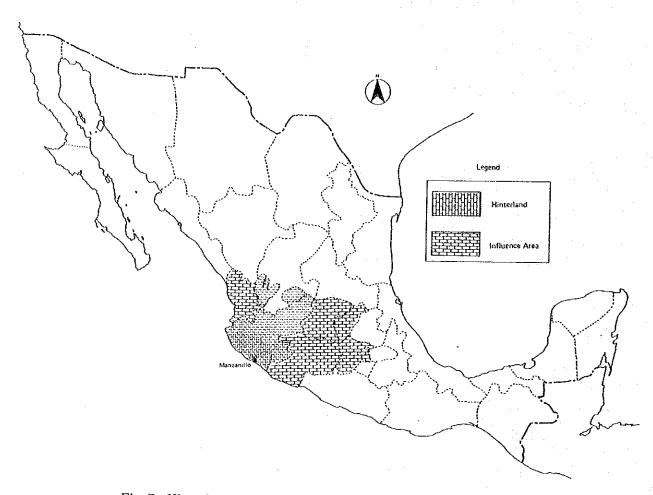

Fig.-7 Hinterland and Influence Area of the Port of Manzanillo

# 2. Future Socio-Economic Conditions

The forecast population for 1995 was estimated by CONAPO of SPP, and that for 2000 is calculated based on the 1995 estimate. As a result, the population is estimated as 86.4 million in 1990, and 103.0 million in 2000, as shown in Table-8.

As for the economic activities, the growth rate of the GDP in 1984 recovered to 3.5%, exceeding the government's goal (0  $\sim$  2.5%) for that year. A powerful recovery is expected in the future. The forecast GDP for the target years, considering the recent improvement in the Mexican economy and the planned growth rate at the 15th Meeting of the Mexico-Japan Businessmen's Committee, is given in Table-9.

Table-8 Population Forecast

(Unit: '000,000 persons)

|            | 1980 | 1990 | 2000  | Annual Rate of Increase (%) |           |  |
|------------|------|------|-------|-----------------------------|-----------|--|
|            | 1900 |      | 2000  | 1990/1980                   | 2000/1990 |  |
| Population | 67.3 | 86.4 | 103.0 | 2.5                         | 1.8       |  |

| Other Service                  | 212  | 273         | 382   | 1.29       | 1.81     |

#### CHAPTER VI DEMAND FORECAST

#### 1. Commercial Port Cargo

# 1-1 Methodology

Two methods will be used to forecast the commercial cargo volume handled at the port of Manzanillo. One is a macro forecast which is a method to estimate the cargo volume groups including many commodities, regardless of the volume of each commodity. The other is a micro forecast, which is a method to estimate the cargo volume of each commodity individually.

Petroleum and its derivatives are excluded from the cargo forecast. This is because they are handled mainly at the PEMEX oil pier located in the outer port of Manzanillo, and the loading and unloading facilities for petroleum seem sufficient to handle possible future increases of volume.

#### 1-2 Macro Forecast

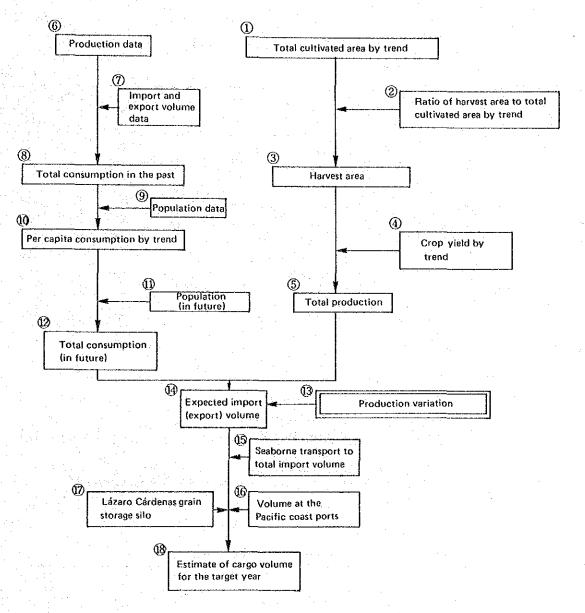

Two methods are used for the macro forecast. One is to grasp the trend of cargo handling volume from the past data and forecast the volume by a time series analysis. The other is to relate the past cargo handling volume at Manzanillo Port to national social or economic indices such as population or GDP, and to forecast the future cargo volume using future estimates of these national figures.

#### 1-3 Micro Forecast

For this forecast, cargo handled at Manzanillo Port is classified according to package type: general cargo, agricultural bulk cargo, mineral bulk cargo and others. Micro forecasts are executed for major commodities individually. The remaining cargo items are estimated by package type.

Two methods are used for the micro forecast. One is to grasp the cargo handling volume from the balance of demand and supply in the future. The other is to relate the past cargo handling volume at Manzanillo Port to national social or economic indices.

As agricultural bulk cargo is the largest item handled in terms of volume at Manzanillo Port after petroleum and its derivatives, the methods of forecasting the volume of each crop are shown as a flow chart in Fig.-8.

Note:  $\textcircled{6} \sim \textcircled{9}$ , 15, 6 are past data. Except these, all data are forecast for the target year.

Fig.-8 Methodology of Agricultural Bulk Cargo Volume Forecast

Although some cargoes show a big discrepancy between macro and micro forecasts, total cargo volumes seem to be within an allowable difference.

Herein, the cargo volumes handled at the port of Manzanillo for the target year will be forecast as those obtained by the micro forecast method.

As a conclusion, the total cargo forecast at the commercial port of Manzanillo is about 2,300 thousand tons in the year 1990 and about 3,080 thousand tons in the year 2000. Table-10 shows a summary of the cargo forecast for the commercial port.

Table-10 Cargo Forecast Summary

(Unit: '000 t)

# 2. Fish Catch

# 2-1 Forecast Method

The forecast of the fish catch at Manzanillo Port is carried out using the following procedure:

| (First Step)          | Forecasting the fish catch of all Mexico for the target year.   |
|-----------------------|---|
| (Method-A)            | The forecast volume for direct consumption is calculated through<br>time-series analysis and that for industrial use is calculated through  |
| and the second second | GDP correlation analysis.   |
| (Method-B)            | The forecast volume for industrial use is calculated in the same way as in Method-A. The forecast volume for direct consumption is determined considering estimated per-capita fish consumption as a variable factor. |
|                       |   |
| (Second Step)         | Forecasting the landing volume at Manzanillo Port.  |
|                       | The forecast volume is calculated using the dependence rate of Colima, Jalisco and Aguascalientes State on Manzanillo Port. Popula-   |
|                       | tion and GDP are used as variables.   |

# 2-2 Forecast of Fish Catch at Manzanillo Port

Using the above method, the fish catch at Manzanillo Port in 1990 and 2000 is forecast as shown in Table-11.

Table-11 Forecast of Fish Catch at Manzanillo Port

(Unit: '000 t)

| Year | Total | Direct Consumption | Industrial Use |
|------|-------|--------------------|----------------|
| 1990 | 70    | 36                 | 34             |
| 2000 | 156   | 77                 | 79             |

# 3. Tourists

Assuming that the percent of tourists who will come to the Manzanillo region to the total number of tourists visiting Colima State will be 50% in 1990 and 60% in 2000, the number of tourists who will visit the Manzanillo region in 1990 and 2000 are forecast as 320 thousand persons and 480 thousand persons.

Further, assuming that the ratio of tourists engaging in coastal leisure activities to the total number of tourists visiting the Manzanillo region is 50%, the number of these tourists in 1990 and 2000 are 160 thousand persons and 240 thousand persons.

# CHAPTER VII MASTER PLAN

# 1. Land Use

# 1-1 Planning Concepts

The port area is divided into two main regions, the outer port and the inner port. The functions of each region are:

Outer port

Port (Touristic port), Tourism, and Others

Inner port

Port (Commercial port, Fishery port), Industry, and Others

#### 1-2 Industrial Location

The industries to be located in the industrial zone around the port of Manzanillo are:

- Seafood products
- ② Food industry complex
- ③ Soap and detergents

# 1-3 Transportation

Road transportation in the year 2000 will be sufficient to handle all the port cargoes which travel by road smoothly: the four-lane highway which is presently under construction will connect Manzanillo with Guadalajara via Colima, and the port road will be expanded to four lanes under the Master Plan.

As for railways, in order to avoid transportation confusion in Manzanillo City, the railway within the central zone will be removed and new lines connecting Cuyutlan, El Colomo, Tapeixtles, "Peña Colorada" and the inner port will be established. Further research is needed to decide the exact location of the new lines and the scale of the marshalling yard.

#### 2. Scale of Port Facilities

# 2-1 Planning Concepts

The concrete concepts for the port planning in accordance with the overall development policy are as follows:

- ① Port development to cope with modernization of sea transportation
  - Development of the container terminal
  - Development of large scale mooring facilities
- ② Port development to improve traffic flow
- (3) Port safety

- Port development reserving space for future development
- 5 Port development in harmony with the adjacent urban area

#### 2-2 Commercial Port

# 2-2-1 Present Port Capacity of Manzanillo Port

The present port capacity of Manzanillo Port is estimated using the total cargo volume converted into general cargo.

Assuming that the berth occupancy ratio is 100%, the port capacity of Manzanillo Port is estimated as 1,983 thousand tons of converted cargo volume. For reference, the converted cargo volume in 1990 is estimated as 1,659 thousand tons with a berth occupancy ratio of 84%. This shows that the cargo handling volume forecast for 1990 will almost reach the limit of the present facilities capacity of Manzanillo Port.

# 2-2-2 Methods to Determine the Number of Berths

The following two methods are used to determine the required number of berths at Manzanillo Port.

- (1) Method considering the frequency of ship entry and cargo handling capacity.
- 2 Method of simulation by queuing theory.

The procedure of determining the number of berths using the above two methods is as follows:

- (1) First, the number of berths required for the target year is estimated by type of cargo using method-(1).
- 2) Next, the simulation test is conducted for the overall plan.

# 2-2-3 Kind of Wharves to be Improved

The kind of wharves to be improved by 2000 are determined based on the type and handling volume of cargoes forecast in Chapter VI, as shown in Fig.-9.

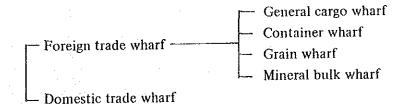

Fig.-9 Kind of Wharves to be Improved

# 2-2-4 Ship Size and Berth Size for the Master Plan

Table-12 shows the ship size and berth size for the Master Plan
