ATTACHMENT-1 STUDY OF HUAI KONG DAI INTAKE

AT1-1. Objectives

Appendix 7 discussed three alternatives taking water from Laem Chabang Receiving Well, to supplement raw water shortage of the present Pattaya water supply in meeting the increased demand.

Of the three alternatives, Alternative A differs from B and C, in that it transmits raw water from the Receiving Well to the Mab Prachan Reservoir.

The alternative studied herein resembles Alternative A in that, after taking raw water at the Huai Kong Dai Intake, a proposed new source, it transmits and stores water in the Mab Prachan Reservoir, as shown in Fig-7.6. The pipeline of the alternative studied herein and Alternative A are as shown in Fig-7.7.

Technical and economic feasibility of the proposed alternative will be studied to be compared with the three alternatives in Appendix 7.

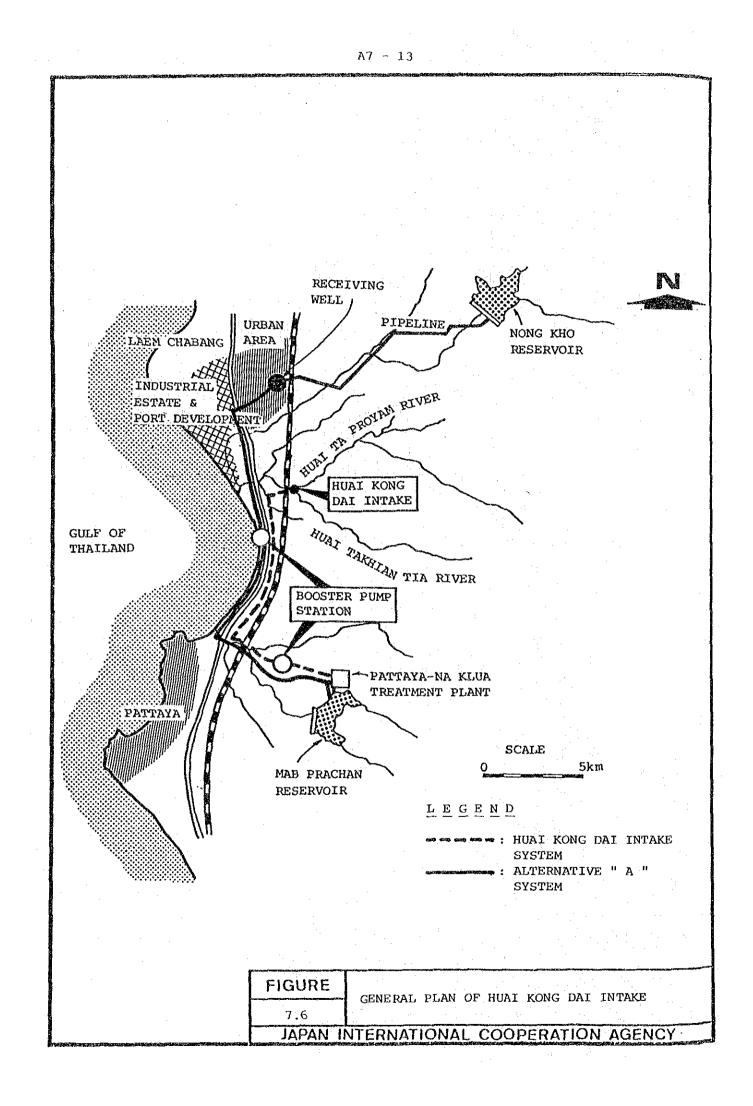

In this study, cost of Huai Kong Dai system will be compared with that of Alternative A which also uses Mab Prachan Reservoir for storing water, and also with that of Alternative B which is the recommended plan in Appendix 7.

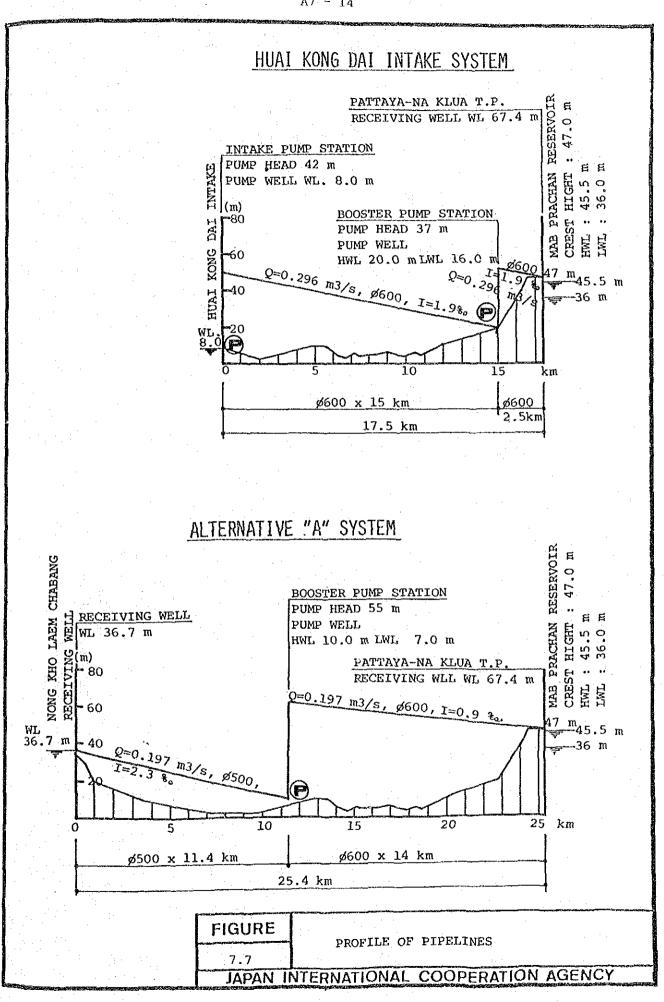

AT1-2. Physical Conditions of Huai Kong Dai Intake

The proposed Huai Kong Dai Intake will be located at the confluence of the Huai Ta Prayam River and Huai Takhian Tia River, to take in the both rivers' flow.

Constructing a dam in the flat area to store a sufficient volume of water will need a huge investment as it involves acquiring a large land area, compensating the people for relocation, moving voluminous earth and watersealing the soil. A realistic solution will be constructing a small dam (barrage) to facilitate intake of the flow. Corresponding to the pattern of rainfall, the river flow is high in the rainy season and low in the dry season.

The flow condition, together with the condition of lacking storage, will make the intake flow unsteady.

A7 - 14

AT1-3. Demand of Raw Water Flow

As shown in Fig-7.4 previously, the raw water demand to be fed to the Mab Prachan Reservoir is 17,000 cu m/d or 6.2 MCM/year or 0.197 cu m/sec in 2000 on the average.

AT1-4. Runoff and Intake Flow of Huai Kong Dai

Runoff at Huai Kong Dai was estimated by applying the same data used in estimating the runoff of the Mab Prachan reservoir. Details of it are described in Appendix 3.

Of the data from covering the period 1968 to 1984, results of the estimation are shown in Table-7.2.

When the monthly runoff figures listed in Table-7.2 are compared with 0,197 cu m/sec, the average required intake rate to meet the 2000 demand, the runoff is less in some months and more in other months, than the required 0.197 cu m/sec.

Taking surplus water in the water-rich months to balance the water-poor months' deficit shall be the practical solution. However, from the economic angle, the intake of surplus will have to be made evenly in the waterrich months, to avoid oversizing the facility.

Calculation was made to determine the required intake in the water-rich month, using the data in Table-7.2. The simulation results are shown in Attachment-2.

The simulation results demonstrate that if 0.78 MCM/month (0.296 cu m/sec) is transmitted from Huai Kong Dai to Mab Prachan, the storage in Mab Prachan may satisfy not only the 2000 demand but also 2010 demand, the reason being that the simulation was made with the 18 year's climatical cycle (cf. Appendix 3) according to which a period after 2000 is character-ized as a water rich part of the cycle where inflow into the Reservoir increases.

MONTHLY RUN-OFF AT HUAI KONG DAI INTAKE

Table-7.2

Catchment Area 117 sg km

DATA: Based on Bang Phra Run-off Model (1968-1984), RID

△ : Less than 0.197 cu m/sec needed for 2000

AT1-5. Major Facilities

Major facilities included in this alternative are featured in Fig-7.6.

Close to this intake barrage, a grit chamber and a pump station are constructed at Huai Kong Dai. The raw water transmission pipeline, from the pump station to the receiving well of the Pattaya-Na Klua Treatment Plant is laid and on the way, a booster pump station built at the site shown in Fig-7.6 boosts the pipeline. Similar to Alternative A, a 15,300 cu m/d treatment plant is constructed in the same premises of the existing plant.

Requirements of the facilities are as follows:

			and the second secon
1)	Intake Barrage	Site :	: Huai Kong Dai
		Intake Flow :	: 0.296 cu m/sec
		Auxiliaries :	: gates, access bridge
2)	Grit Chamber	Site :	: Huai Kong Dai
		Detention Time:	: 10 min.
		No. :	: 2
		Effective	
		Volume :	: 100 cu m x 2 chambers

			removing device
3,)	Intake Pump Station	Site :	: Huai Kong Dai
		Pump :	: 3 units (incl. 1 standby)
			300 mm dia. x 9 cu m/min
•			x 50 m H x 132 kW
		Auxiliaries :	pump house, staff's quarters
4)	Booster Pump Station	Site :	as indicated in Fig-7.6
		Pump :	3 units (incl. 1 standby)
			300 mm dia, x 9 cu m/min
			x 55 m H x 160 kW
		Auxiliaries :	pump house, staff's quarters

5) Raw Water Pipeline

6):

From Huai Kong Dai to Booster Pump station : 600 mm dia. x 15 km From Booster Pump Station to Pattaya~Na Klua Treatment Plant

: 600 mm dia. x 2.5 km Capacity : 15,300 cu m/d Intake Pump : 3 units (incl. a standby) 5.5 cu m/min x 37 kw

Pipeline : 400 mm dia. x 0.3 km

AT1-6. Construction Costs

New Treatment Plant

For the purpose of facilitating cost comparison with the three alternatives mentioned above, the cost of the distribution pipeline from the new plant to the connecting point on the Sukumvit Highway, is combined with those of the facilities itemed as Nos.1 to 6 below.

The following are the construction costs of the seven items:

· ·			
No.	Description	Construction Cost	Remarks
		(x 1,000 Baht)	
1	Intake Barrage	15,500	
2	Grit Chamber	4,600	· .
3	Intake Pump Station	6,700	
4	Booster Pump Station	7,200	
5	Raw Water Pipeline	81,700	: · · ·
6	New Treatment Plant	47,800	
7	Distribution Pipeline	31,300 600 mm	dia. x 6.7 km
			:

Total

194,800

AT1-7. Operation and Maintenance Cost

No substantial differences were observed among the personnel and chemical costs of Huai Kong Dai System, and Alternatives A and B. In electricity costs, Huai Kong Dai System ranks the largest, followed by Alternative A and Alternative B.

Only the electricity costs by pumping are compared. They are:

- a) Huai Kong Dai Intake
 - Intake and booster pump : 8.2 months (from the simulation study in Attachment-2)

- Mab Prachan intake pump : 12 months

- b) Alternative A
 - Booster pump : 12 months
 - Mab Prachan intake pump : 12 months

c) Alternative B

- Distribution pump : 12 months

The estimated costs per annum are shown below :

	Huai Kong	Alternative	Alternative
	Dai System	A	В
		- <u> </u>	
Personnel Cost	15,839	15,839	14,399
Electricity Cost	7,104	4,960	3,590
Chemical Cost	751	751	995
_ ~ * * • •	·		
TOTAL	23,694	21,550	18,984

(Unit : x 1,000 Baht/yr)

AT1-8. Summary of Costs

To simplify the estimation, it is assumed that the construction costs are depreciated evenly for 45 years period. From the depreciation and the annual O/M cost, the unit (cubic meter) water cost is counted.

In case of Alternatives A and B, the raw water charge payable to the use of raw water from Nong Kho - Laem Chabang Pipeline is added to the unit cost shown below.

The following table shows construction costs and yearly depreciation allowances, O/M costs and unit water costs of Huai Kong Dai and Alternatives A and B:

	:	Huai Kong	Alternat	ive Alternative
Item	Unit	Dai System	A	В
Construction Cost	\$1,000	194,800	192,800	146,100
Yearly Depreciation	\$1,000/yr	4,329	4,284	3,247
0/M Cost	\$1,000/yr	23,694	21,550	18,984
Yearly Production	1,000 m ³ /yr	4,307	4,307	5,658
Raw Water Charge	ø/m ³	-	1,50	1.50
Water Cost	ø/m ³	6.51	7,50	5.43

AT1-9. Comparison and Conclusion

Huai Kong Dai System and Alternative A almost equal in construction costs and O/M costs. Alternative B which needs not pump up water to Mab Prachan Reservoir, is less expensive in these costs.

As to the unit cost of water, Alternative A is highest, and the difference between Huai Kong Dai System and Alternative B is not so much.

As already repeated, practically no solid data are available concerning such basic items as climatological, topographical, geological and hydrological features of the Huai Kong Dai area. For determining the viability of constructing intake facilities in this area, a thorough study is required on these problems to clarify the effects of such construction on the surrounding areas. In view of the length of time required for the study, the problem of developing Huai Kong Dai is considered as an issue to be materialized in the next stage.

Alternative B delineated in Appendix 7 is recommended as a suitable solution for Pattaya System in Stage I of the project.

ATTACHMENT-2

SIMULATION STUDY ON WATER BALANCES

OF HUAI KONG DAI AND MAB PRACHAN SYSTEM

TABLE OF CONTENTS

••••• A7 - 24 Introduction AT2-1. Employed Conditions for Water Balance Simulation A7 - 24 AT2-2. A7 - 25 Water Balance Simulations AT2-3. A7 = 25 Simulation Results AT2-4.

AT2-1. Introduction

In view of the increasing water demand for Pattaya Waterworks which cannot be met by Mab Prachan Reservoir alone, Appendix 3 of the Report "Study on Water Sources", cited two alternatives to supplement Mab Prachan source, i.e., Nong Kho Reservoir and Huai Kong Dai, and recommended Nong Kho Reservoir as the most reliable source.

Huai Kong Dai, on the other hand, can be an important alternative, subject to further study based on solid data collectable on the features of the source.

The present study simulates future water balances of Mab Prachan Reservoir if supplemented by water pumped from Huai Kong Dai to inquire into whether demand after 2000 could be met by such supplementation.

AT2-2. Employed Conditions for Water Balance Simulation

In view of the mentioned absence of basic data, the water balance simulations of Huai Kong Dai and Mab Prachan System shown in the attached table were made on the assumption that the run-off and flow conditions of Huai Kong Dai be the same as those of Bang Phra.

An 18 year's climatical cycle (cf. Appendix 3) is applied in simulating run-offs. Other main conditions applied in simulation are as follows.

 Water transmission from Huai Kong Dai to Mab Prachan Reservoir: 0.78 MCM/month, provided that the actually taken-in volume will be transmitted, in case the Huai Kong Dai flow becomes below this level.

2) Drafts:

a) Intake volume of Pattaya-Na Klua T.P.:

(Average day demand) + (Loss in T.P.)

- b) Industrial water : 0.9 MCM/yr (2,466 m3/day)
- c) River Maintenance: 0.9 MCM/yr (2,466 m3/day)

AT2-3. Water Balance Simulations

The starting month of water balance simulations was selected to be November 1986, when the Reservoir was filled to capacity. The terms representing the figures of respective columns in the simulations are defined as follows:

Prachan Reservoir in the Reservoir
in the Reservoir
in the Reservoir
the Mab Prachan
nth)
e pumped up from
month)
P. raw water) +
+ (River maintenance
e Reservoir surface
ecords
ored water, (MCM)
pacity
increases in storage
onths
decreases in storage
onths

AT2-4. Simulation Results

The simulation results shown in the attached table reveal the possibility that the Mab Prachan Reservoir, with an increase in its capacity as scheduled by RID up to 16.5 MCM and with supplemental water pumped up into the Reservoir, will be able to supply enough water to meet demand up to the year 2010.

The volume of transmission from Huai Kong Dai to Mab Prachan to satisfy the 2000 demand is simulated to suffice the demand after 2000 to 2010, as this

A7 - 25

period of time coincides with the phase of the mentioned 18 years climatical cycle where Mab Prachan's water balance increases yearly.

As already repeated, a thorough study is yet to be made to determine the technical feasibility of the Huai Kong Dai development.

Appendix 8 PRELIMINARY DESIGN

8.1 Rehabilitation and Modification Works

The objectives for the rehabilitation and modification works, which are 1) to update the present deteriorated equipment and obsolete pipelines and 2) to uprate the present production of the Pattaya-Na Klua Treatment Plant, by some improvements for covering insufficient supply till completion of the expansion works.

The possible increase of production capacity is studied on the Pattaya-Na Klua Treatment Plant. Each of the facilities in Paton system is examined for its capacity whether it meets with the proposed increase as follows:

- Present capacity	: 24,000 cu m/d
- Proposed incremental	: 9,600 cu m/d
	(40 % to the present capacity)
- Proposed production	: 33,600 cu m/d
- Proposed treatment capacity	: 36,300 cu m/d
	(the proposed production plus 8 %
	treatment loss)

8.1.1 Intake pump and Raw Water Transmission Pipeline

1) Capacity

All the existing intake pumps are as follows:

- Motor drive, 18.4 cu m/min (26,500 cu m/day) x 41 m H x 2 Nos.
- (1 standby)
- Motor drive, 6.7 cu m/min (9,600 cu m/day) x 35 m H x 1 No.
- Engine drive, 18.4 cu m/min (26,500 cu m/day) x 41 m H x 1 No.

(emergency use)

Each of the pump units is found sufficiently operable, and the combined capacity of the 18.4 and 6.7 cu m/min pumps (36,144 cu m/d) nearly equals the proposed treatment capacity of 36,300 cu m/d.

There are 600 mm and 250 mm diameter raw water transmission mains of 600 m each operated. For transmitting water to the treatment plant, these two mains are adequate hydraulically and structurally. Therefore the intake pumping facilities and the raw water transmission mains are considered to meet the proposed treatment capacity up to 1991.

2) Necessary Works

The 6.7 cu m/min pump has been installed recently outdoors, and it shall be relocated to the pump house of the intake tower for long-run use.

For recording daily water amount of intake and determination of chemical dosages, flow meters and recorders should be installed. A flow meter and a recorder should be installed for the 250 mm dia, raw water transmission main. Replacement will be needed for a flow meter and a recorder of the 700 mm raw water transmission main due to malfunctioning. These new flow meters should be of differential pressure type.

•	8.1.2	Treatment	Facilities

1) Major Facilities

a) Capacity

Item O		Modification	Design Criteria (Appendix 6)
Production Capacity	. 24,000	33,600	
(cu m/d)		(40 % increase)	
Treatment Capacity	25,920	36,300	, .
(including treatment			
loss, cu m/d)			
Flocculation Basins			lan di Agentin di J
Detention Time (min)	52	37	20 - 40
Sedimentation Basins	en e		
Detention Time (hr),	4.7	3.4	1.5 - 3
Flow Velocity (m/min)	0.19	0.27	0.3 - 1
Filters			
Filtration Rate (m/hr)	3.2	4.4	7
(of 8 beds, one standby included)			

Except for the detention time of Sedimentation Basins the parameters of the proposed production are almost consistent with the design criteria of the present study, so it is concluded that the production capacity of the Pattaya-Na Klua Treatment Plant can be increased technically to 33,600 cu m/d, within reasonable investment of capital.

b) Necessary Works

As recommended in Chapter 5 EXISTING WATERWORKS, repair/replacement of filter media and underdrain is urgently required to attain efficient filtration.

2) Chemical Feeding Equipment

The existing chemical feeding equipment for alum and lime is housed in a room of the chemical building which is also used for chemical storage. The equipment is composed of solution tanks, stirrers, and feeding pumps but no flow meter is provided. In the next room, chlorine containers and a chlorinator are placed without container scale.

To meet the proposed treatment capacity, the additional chemical feeding equipment will be needed as follows:

Alum feeding pump with flow meter	, piping and valves	1 Unit
Lime feeding pump with flow meter	, piping and valves	1 Unit
Chlorine gas container scale		1 Unit

In addition to the equipment above, a chemical storage house should be newly constructed, since the existing chemical building will become undersized due to the proposed installation of additional equipment.

3) Instrumentation

As reported in CHAPTER 5, the malfunctioning instrumentation should be replaced by:

- the raw and treated water meters; and

- water level gauges in clear water reservoir and elevated tank.

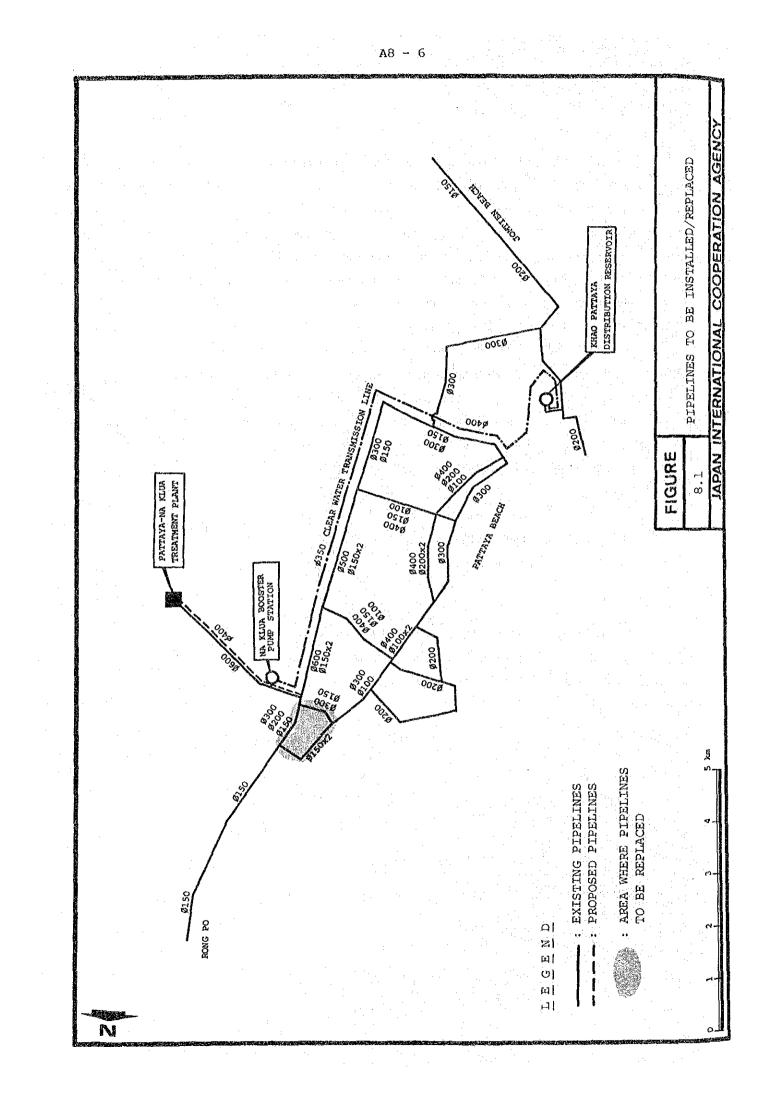

8.1.3 Distribution Pipeline

Immediate replacement is proposed for obsolete and defective pipes. The waterworks also requested the relocation of those pipes installed under rain sewers or in a drive way where heavy traffic is maintained. In addition to the replacement, a 400 mm dia. distribution main is also proposed for installation to convey the incremental production capacity of the Pattaya-Na Klua Treatment Plant and to reinforce the existing 600 mm dia-meter main as shown in Fig-8.1, and Table-8.1.

Table-8.1 LIST OF PIPELINES TO BE INSTALLED OR REPLACED

PIPE	· · ·	LENGTH		
Dia. 400		6,700 LM		
Dia. 200	mm	380 LM		
Dia. 150	mm	3,090 LM		
Dia. 100	mm	1,760 LM		

(NOTE)	LM	:	Linear	Meters
--------	----	---	--------	--------

8.2 Expansion Works

8.2.1 Condition of the Preliminary Design

The design flow of each facility in the Stage I Expansion Works is as follows:

- Intake and Raw Water Transmission Pipeline : 21,700 cu m/d (Max Day Demand + Treatment Loss) - Thung Sukla Treatment Plant Facilities (Max Day Demand + Treatment Loss) : 21,700 cu m/d - Clear Water Transmission Pipeline to Rong Po : 20,100 cu m/d Distribution Pump Station (Max Day Demand) - Clear Water Transmission Pipeline to Kao Pattaya 4,600 cu m/d Distribution Reservoir (Max Day Demand) - Distribution Facilities from Pattaya-Na Klua : 29,000 cu m/d Treatment Plant (Peak Hour) - Distribution Facilities from Rong Po : 24,100 cu m/d Distribution Pump Station (Peak Hour)

8.2.2 Intake and Raw Water Transmission Pipeline

The proposed 400 m length raw water transmission pipe of 700 mm diameter will be connected with the 600 mm outlet of the Laem Chabang Receiving Well located in Ban Thung Sukla for diversion to the Pattaya Basin.

The proposed transmission pipe is equipped with a flow meter for measuring the raw water flow and a branch pipe for the Stage II Expansion.

8.2.3 Thung Sukla Treatment Plant

Water quality of Nong Kho Reservoir is found acceptable for water supply except for the probable eutrophication as described in Appendix 4. The proposed treatment plant will incorporate the following processes:

pre-chlorination, coagulation, flocculation and sedimentation, rapid sand filtration, alkali dosage and post-chlorination.

The capacity, dimensions and features of the facilities proposed for the plant's unit processes and operations are described below:

- 1) Flash Mixing Well (Fig-8.2)
 - hydraulic mixing by adjustable cone type for instance, W 1.3 m x L 1.3 m x D 2.0 m, 1 well
 - G Value : 650 sec^{-1} (average in well)
 - Mixing Time : 1 3 sec, Detention time : $16 \sec (V/Q)$
- 2) Flocculation Basin (Fig-8.2) hydraulic flocculation by baffled channels, 3 stages, Volume : 260 cu m/basin, Detention Time : 34 min, 2 basins, G Value : 25 - 70 sec⁻¹
- 3) Sedimentation Basin (Fig-8.2) rectangular, one direction horizontal flow, Volume : 960 cu m/basin, 2 basins, W 8.0 m x L 40.0 m x D 3.0 m, Detention Time : 2.1 h, hydraulic loading : 1.4 m3/m2/h, flow velocity : 0.3 m/min, manual desludging
- 4) Rapid Sand Filter (fig-8.3) declining rate filtration, filtration rate : 130 cu m/sq m/d in average,
 6 filter beds including 1 stand-by, 33 sq m/bed, backwashing together with surface washing
- 5) Clear Water Reservoir for in-plant water consumption including backwashing, and transmission Volume : 450 cu m/reservoir, 2 reservoirs

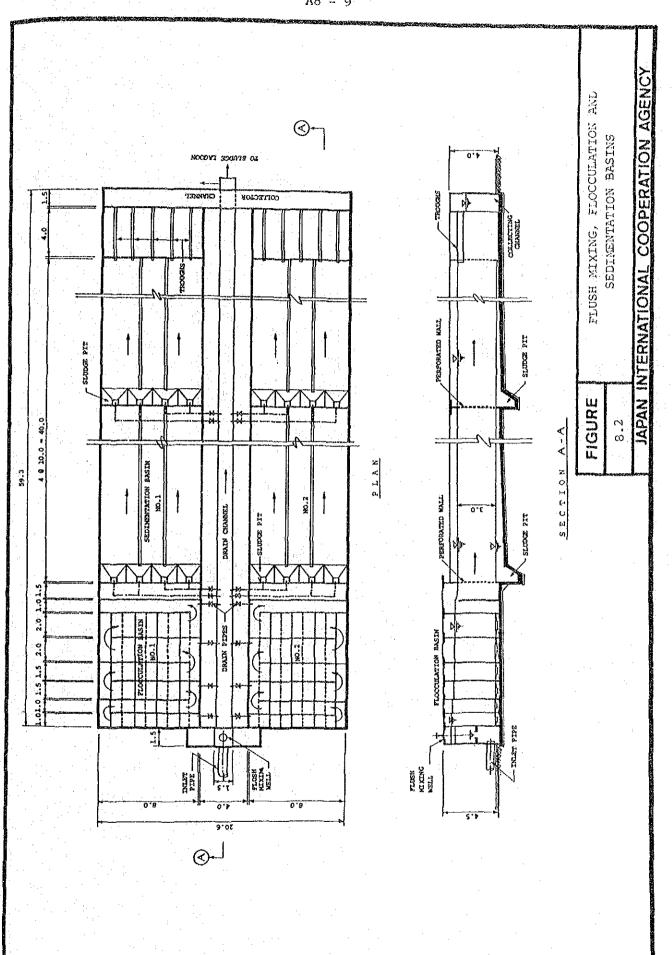

6) Elevated Tank

for backwashing of filter bed, Volume : 250 cu m/tank, 1 tank

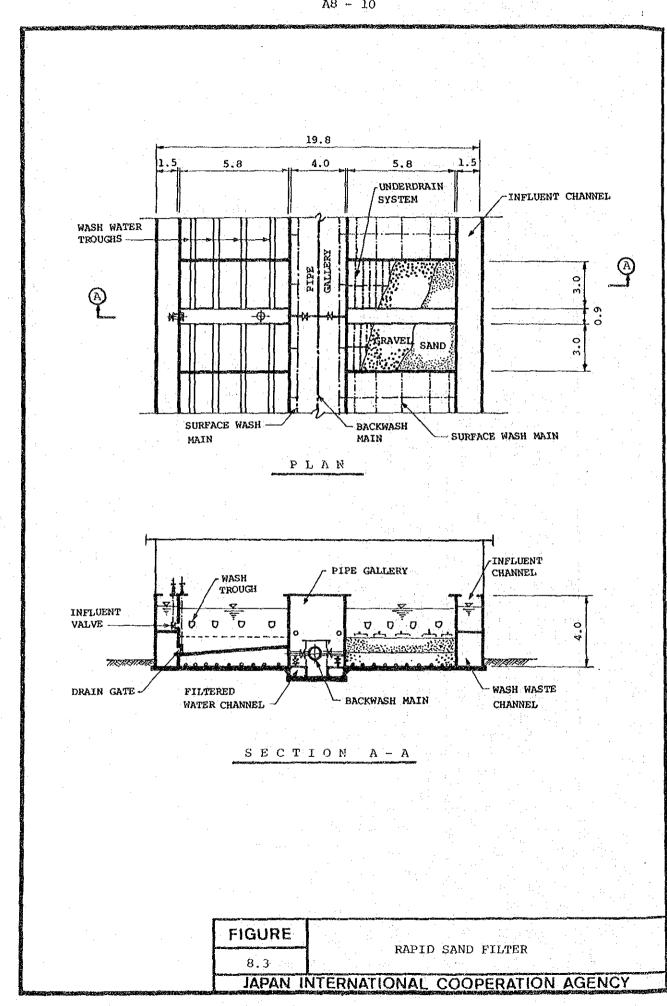

7) Wastewater Basin

for wastewater from filters,

Volume : 250 cu m/basin, 2 basins

A8 - 9

A8 - 10

8) Sludge Lagoon

for settling sludge dewatering

Surface area : 2,000 sq m

9) Chemical Feeding Equipment

- Alum

solution tanks with mixers, feeding pumps, elevated header

tanks, and appurtenances

- Lime

hopper, solution tanks with mixers, feeding pumps, header tank, saturation tanks and appurtenances

- Pre and Post Chlorination

container scale, evaporator, chlorinator and appurtenances

- 10) Instrumentation
 - flow meter and controller
 - flow and level indicator and recorder
- 11) Power Substation

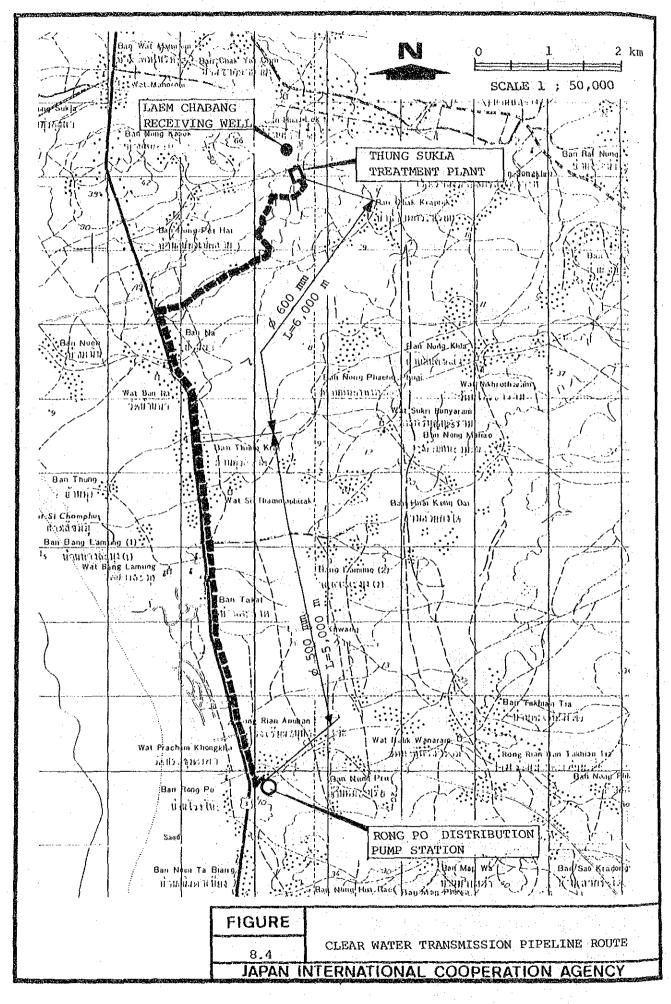

12) Buildings

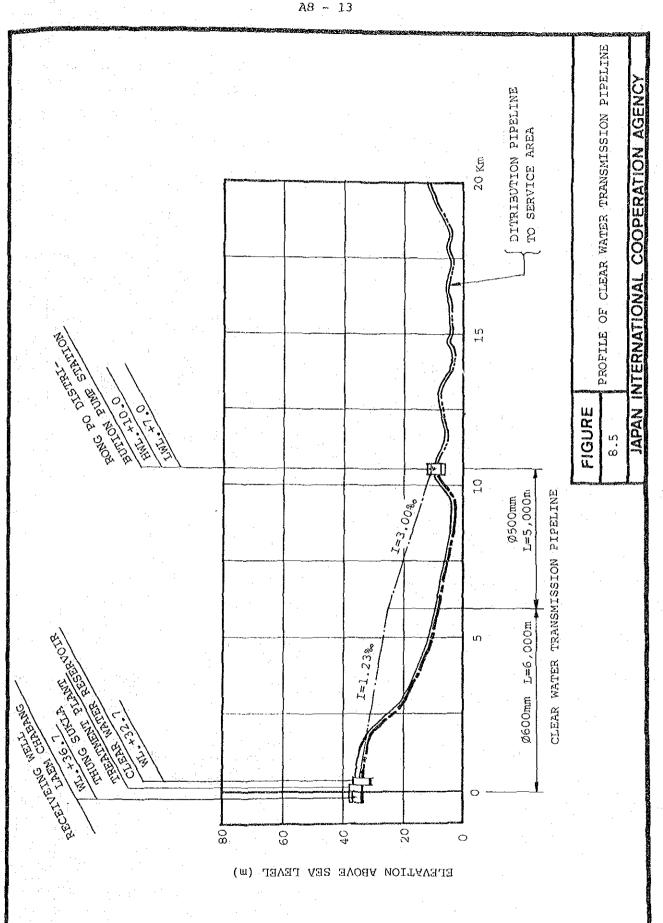

- administration building
- chemical building
- staff houses
- warehouse

8.2.4 Clear Water Transmission Pipeline

A new clear water transmission pipeline comprising 600 mm and 500 mm diameter of 6,000 m and 5,000 m lengths respectively will be constructed during the Stage I to deliver treated water to Rong Po Distribution Pump Station.

The general plan and topographic profile of the transmission route from the Thung Sukla Treatment Plant to the Rong Po Distribution Pump Station are shown in Fig-8.4 and Fig-8.5.

A8 ~ 13

8.2.5 Rong Po Distribution Pump Station

The proposed Rong Po Distribution Pump Station is composed of two reservoirs with a total capacity of 5,000 cu m, pumps, a pump house, chlorination equipment, a power substation and staff houses. Features of the facilities are summarized below:

- Distribution Reservoirs (Fig-8.6)
 2 reservoirs
 Volume: 2,500 cu m each
 Detention Time: 6.0 h storage of the maximum day demand
- 2) Distribution Pump and Pump House (Fig-8.6) large pumps : 2 units (one standby) 11.2 cu m/min x H 45 m small pumps : 2 units (one standby) 5.6 cu m/min x H 45 m

The pumps are systematicable operated to immediately respond the daily fluctuation of demand.

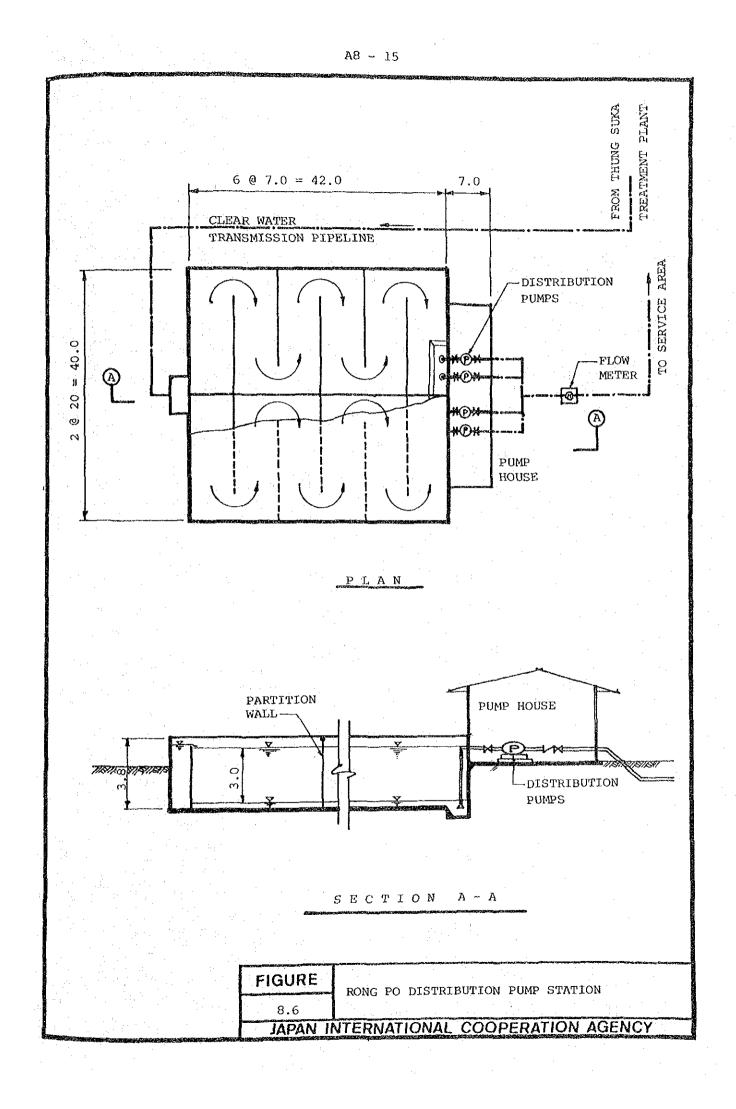

3) Chlorination Equipment

container scale, evaporator, chlorinator and appurtenances

- 4) Power Substation
- 5) Staff Houses

8.2.6 Distribution Pipeline

The distribution system will be divided into two separate pressure zones allowing similar pressure ranges at different elevations of the service area. (See Fig-8.8 for division of zones)

The hydraulic analysis of the distribution system incorporating proposed pipelines and the existing ones was carried out by means of computer-aided network analysis. Table-8.2 presents results of the analysis. Fig-8.7 shows the land use plan on which areawise water demands are computed.

The routes of distribution pipeline for the target year of 2000 were determined in due consideration of the planned service area and future road planning envisaged in the City Development Plan, and through exchange of views with the officials concerned.

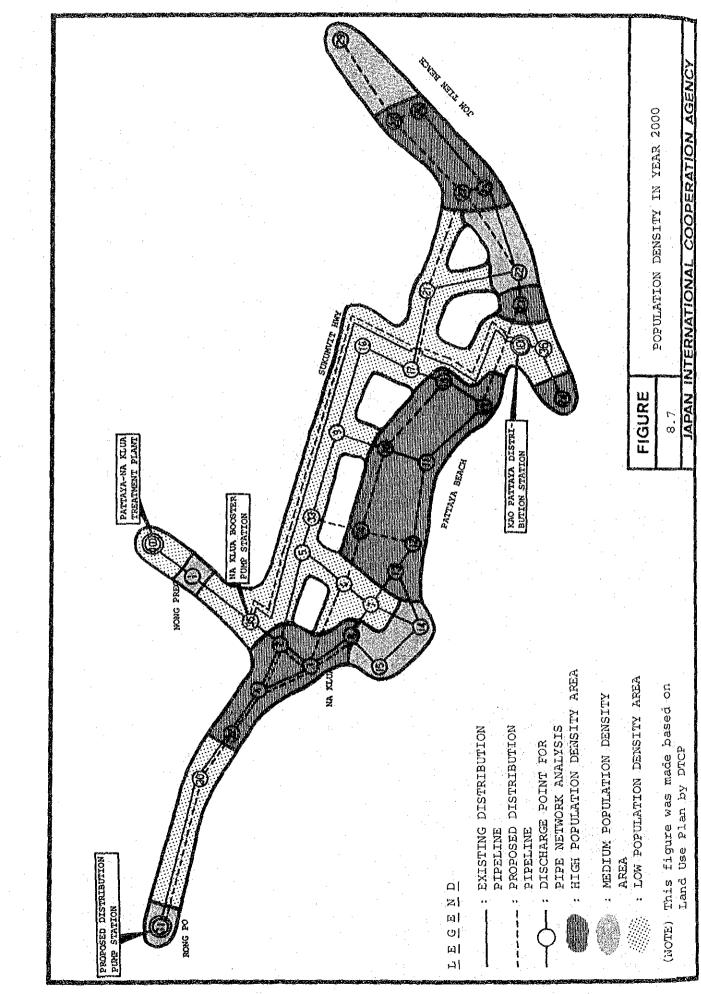

Table-8.3 shows the summary of proposed distribution pipelines based on the results of hydraulic analysis.

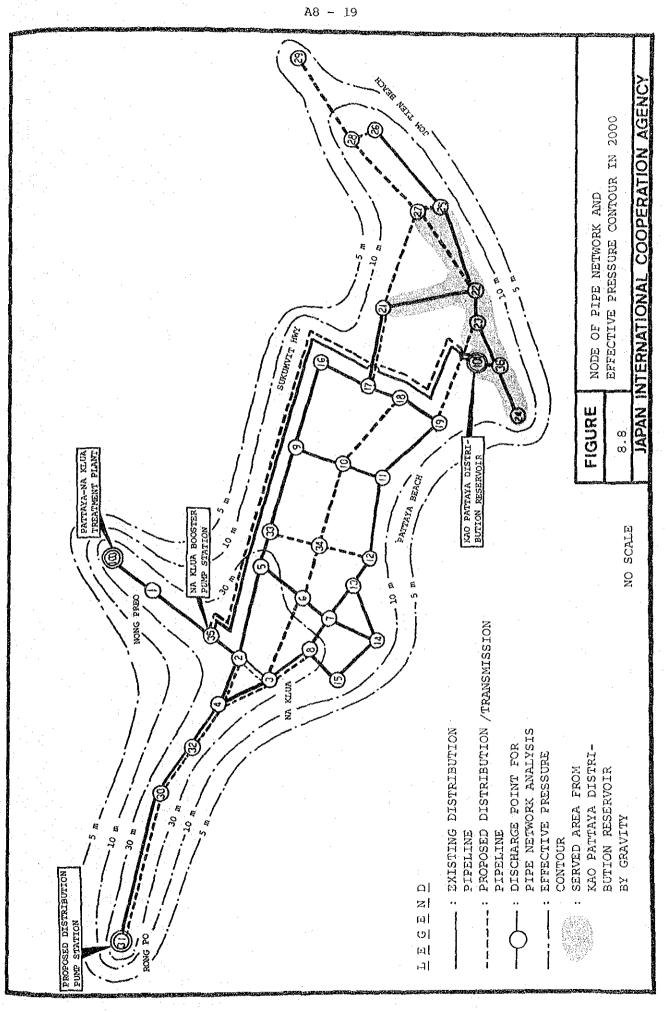

Table- 8.3	PROPOSE	D DISTRIBUTION
· · ·	PIPELIN	ES
DIAMETE		LENGTH
(mm)	· . ·	(m)
600		4,200
500	.** 	1,800
400		7,400
300		15,750
200		1,000
150	· · ·	11,000
100		37,200
Total		78,350

As a result of hydraulic analysis of the distribution network, the area will be served with 1 to 3 kg/sq cm service pressure except the node 29 where during the peak hour, the service pressure is expected to decrease to 0.75 kg/sq cm as shown in Fig-8.8. This is considered due to hydraulic disadvantages of the locality: the node 29 is 5 m higher than nodes 26 and 28 in ground elevation and the node 29 located at the end of the distribution networks. A particular measure will not be provided to increase the service pressure at the node 29 since the pressure drop is considered not critical.

APPENDIX 9

9.1 Cost Data

9.1.1 Cost Data Collection

PWA has its own standard price list of materials, products and works. In this estimate, the prices of listed items were quoted directly.

Regarding unlisted items, estimation was made by illation from related prices in the list.

Market prices of the materials and products to be used in the estimation were collected and quoted when found applicable reasonably.

Prices of some products and equipments were quoted by the suppliers and manufacturers were used in the estimation.

9.1.2 Pipelaying Cost

As pipelaying constitutes major part of this project, the cost is detailed in this sub-section.

Three assumptions are made in estimating pipelaying.

The first is that the 20 and 80 % of the total length of a pipeline are allocated to ductile-iron and asbestos-cement pipe respectively.

The second is that 10 % of the estimated cost including pipes, fittings and laying works is counted for railroad crossing, riverbed crossing and pipe bridge additionally.

The third is that 15 % of the estimated cost as above is counted for installation of valves, concrete thrust blocks and other miscellaneous works.

	. •			(Unit: 18/m)

1,200	1,125	15,175	16,300	504	16,804

Table-9.1 (a) and (b) show the cost of unit length (meter) of pipelaying for asbestos-cement and ductile-iron pipes including pipes, fittings, labor and pavement restoration.

9.1.3 Treatment Plant, Buildings and Others

In estimating approximately the construction cost of treatment plant and buildings used for administration and others in the plant site, the cost function graphs shown in Fig-9.1 are used.

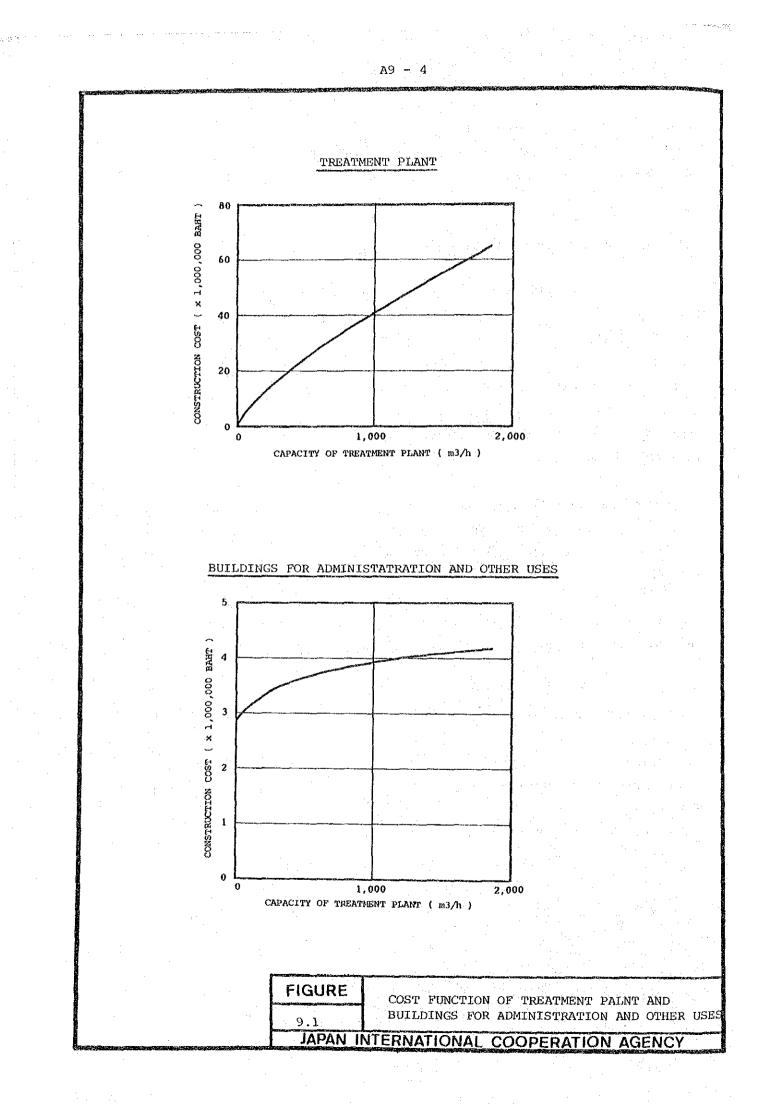

To prepare the cost function curves, production capacities and construction costs of seven PWA treatment plants plotted and the curves are drawn as most appropriate. Similar data made by other consultants were also referred for comparison.

The approximately estimated costs were checked with the costs prepared by calculating, item by item, components of the whole construction work involved in the PWA standard design and the both were found close satisfactorily.

For other construction works like deep well, available data were studied and modification was made by illation from them.

9.1.4 Land Acquisition

Land price of the prospective sites of treatment plants, pump stations and other facilities under this plan were estimated based on the contacts with PWA local officials.

9.2 Classification of Works

Every work involved in the project is to be classified into either one of the following six:

1. Pipelaying works : laying pipes above- and under-ground

2. Civil works : construction of barrage, grit chamber, clear water reservoir, intake tower, and earthwork, groundwork

3. Treatment plant construction

: inclusive of 1, 2 and 5

4. Pump station construction

: inclusive of 1, 2, 5 and architectural works

5. Equipment/machinery installation

6. Purchase of equipment/machinery

This classification is used in making allocation of foreign and local currency portion in the following section and in Table-9.2 listed later.

9.3 Cost Allocation of Foreign and Local Currency Portions

All of the estimated costs are allocated to two currency portions, foreign and local, and to each of the six works classified before an appropriate ratio is to be applied.

9.3.1 Basic Conception

Those products which are imported as finished and do not need further processing in Thailand are considered to be of 100 % foreign currency portion.

Labor, both skilled and unskilled, and services locally procured are considered to be 100 % local currency portion.

In between the above two extremes, a certain appropriate ratio is applied upon consideration of the characteristic of item.

Even the majority of domestically made materials and products contain foreign currency portion. Cement and steel are made by consuming imported fuel and electricity, generated by imported fuel. Equipments and machineries producing these materials are imported sometimes. The asbestos-cement pipe, a local product, is made of imported asbestos.

Earthwork and concrete mixing and casting made by laborers in former days are worked by machineries, using foreign currency partly.

9.3.2 Foreign and Local Currency Elements

The foreign currency elements are imported raw and processed materials, equipments and machineries, consumable goods including fuel, etc.

The local currency elements are local raw materials, skilled and unskilled labors used directly or indirectly, for instance, further processing of imported goods, etc.

9.3.3 Combination of Foreign and Local Currency Elements

Of the six classified works, Fig-9.2 (1) to (6) shows how the foreign and local currency elements are combined to construct them.

The six figures are then summarized and shown in Table-9.2.

Seen in the table are:

1) The foreign currency portion increases in the order of the item number.

- 2) The locally processed portion is largest in treatment plant construction and smallest in equipment/machinery installation, as it involves installation of imported goods finished to higher degree.
- 3) The skilled labor portion is also highest in treatment plant construction and civil works.
 - 4) The unskilled labor portion decreases in the order of the item number.
 - 5) The sum of labor portions also decreases in the order of the item number, corresponding the labor-intensitiveness of those works.

Table~9.2 ALLOCATION OF FOREIGN AND LOCAL CURRENCY PORTIONS

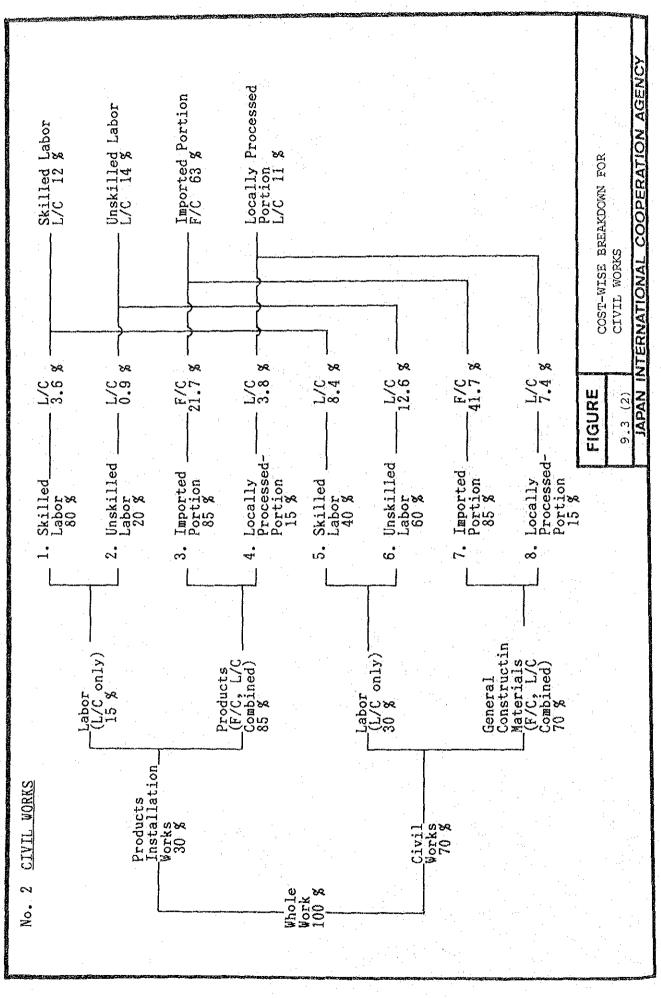

A9 - 8

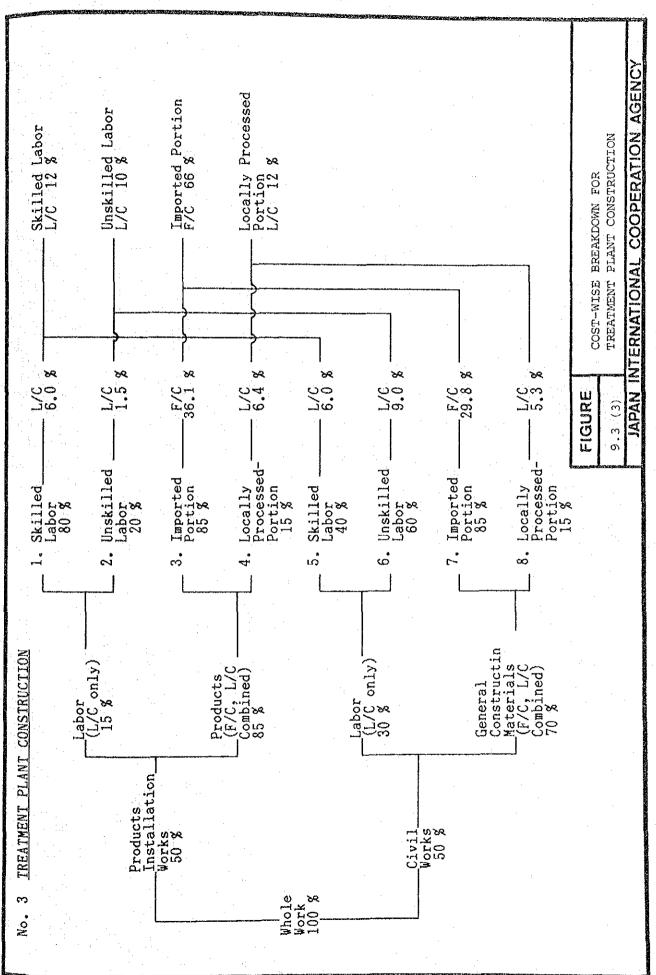

Using the cost data mentioned in 9.1, estimation was made on Rehabilitation and Modification Works and Expansion Works planned for Stage I.

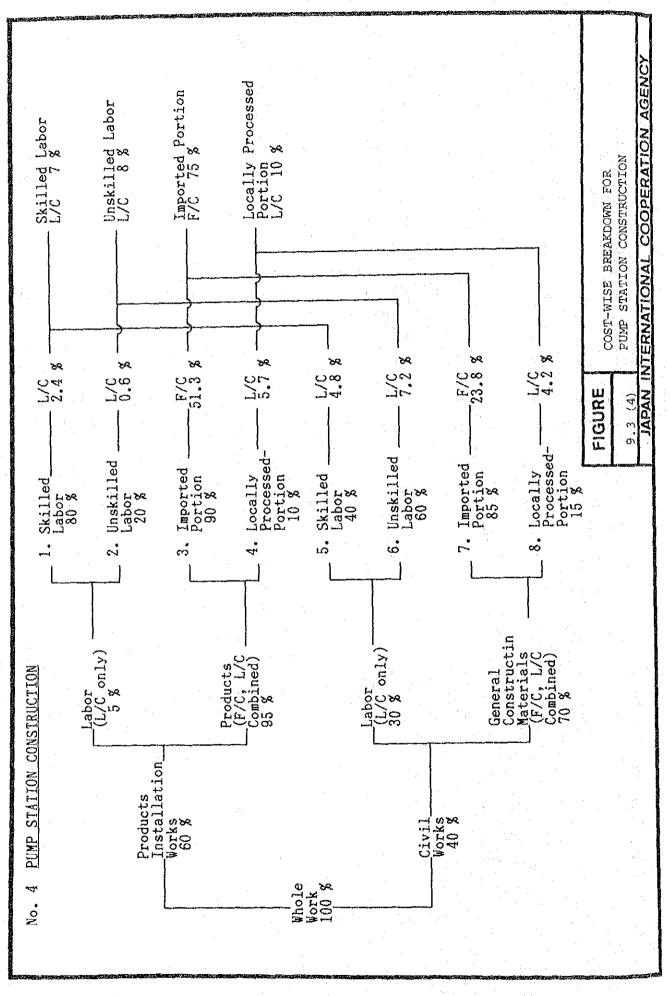

It is shown in Table-9.3.
