## 7.1 TRAFFIC

### 7.1.1 Method Employed in Traffic Forecasting

The growth rate method was employed in forecasting because no diverted traffic after improvement is expected on this study route.

### 7.1.2 Assumed Road Link

### 7.1.3 Traffic Forecast

- 1) Items necessary for forecasting traffic were:
  - Traffic volume in base year
  - Passenger and freight movements in base year
  - Growth rates of passenger and freight movement
  - Rate of induced and developed movements
  - Traffic composition

## **7.2 AGRICULTURAL DEVELOPMENT**

### **7.2.1 Present Condition**

Paddy and upland fields make up 46% in the influence area respectively. Many old paddy fields are affected by salinity and the average yield of rice is comparatively low. Among the major crops planted in the upland field in 1983 crop year, sugarcane ranks first followed by cassava and kenaf. There is a large sugar factory in Amphoe Muang Kumphawapi. Sugarcane is transported to the plant via Routes 2316 and 2023.

Land use and capability conditions in the area are shown in Table 7.2.1 and Figure 7.2.1. A typical cropping calendar in the area is shown in Figure 7.2.2.

### **7.2.2 Development Projection**

Future agricultural development in the area of influence was projected for both cases of "with and without project". The projected planted area, unit yields by crop, and the consequent production amount are shown in Table 7.2.2.

Based on the above projected production amount, farmgate prices and production costs estimated separately, net production value (NPV) was obtained as shown in Table 7.2.3. The difference in NPV between the two cases is deemed to be the development benefit of the study route.

### 7.3 VOC SAVINGS

In accordance with the concept and data given in Section 3.4 of the Text Report, VOCs on the road link concerned were calculated in the two cases of "with and without project".

Road length by road class is shown in Table 7.3.1. Data for additional VOCs are shown in Table 7.3.2.

VOC savings, obtained as the balance of total link VOCs between the two cases, were calculated as shown in Table 7.3.3.

Design Standard	:	F4
Geometric Design Criteria	:	DOH (Provincial Highway)
Typical Cross Section	:	as shown in Figure 7.4.2
Minimum Height of Embankment in Flooding Section	:	0.7 m above flood level
Pavement Structure		
DBST	:	2.5 cm
Crushed Aggregate Base	CBR $\geq$ 80%	: 15.0 cm
Soil Aggregate Subbase	CBR $\geq$ 25%	: 10.0 cm (minimum requirement)
Selected Materials	CBR $\geq$ 6%	: as required
Pipe Culvert		
Standardized type	:	80, 100, 120 & 150 cm in diameter
Location	:	as required
Standard intervals		
Paddy area	:	200 m
Others	:	500 m

Box Culvert		
Standard size	:	1.5 $\times$ 1.5, 2.4 $\times$ 2.4 & 3.0 $\times$ 3.0 m
Location	:	as required
Bridge		
Reinforced concrete standard type	:	Width 9.0 m
Substructure	:	Pile-bent type

The existing and designed plan and profile are shown in Drawings 7-1/7-5.

**7.4.2.2 Special Conditions in Designing**

**Employment of Higher Road Standards**

About half the route had been improved according to F6 standards by DOH (RT 2313 L=17.8 km). In this design, widening and paving with DBST surfacing were included.

**7.4.2.3 Pavement Design**

1) Cumulative number of ESA in one direction

- ESA conversion factors

- Heavy bus : 0.50
- Medium truck : 0.76
- Heavy truck : 1.24

- Forecasted ADT by vehicle type

- Cumulative number of ESA in one direction by road link

**7.4.3 Quantities and Construction and Road Maintenance Costs**

The required construction costs were estimated based on the results of the preliminary design as shown in Table 7.4.2. Financial costs with breakdown into local and foreign currency portions, economic costs and residual values were estimated as follows and in 7.4.4:

IM-7	L=40.7 km	(baht)
Financial cost	: 65,041,000	
Economic cost	: 54,647,000	
Residual value	: 22,223,000	

The required road maintenance cost savings are shown in Table 7.4.3.

## 7.5 EVALUATION

### 7.5.1 Economic Evaluation

The yearly distribution of the economic costs and benefits and the calculated economic indicators for evaluation are given in the table below.

The results indicate that the improvement of this study route is feasible by employing the F4 standard with DBST surfacing.

### 8.1.1 Method Employed in Traffic Forecasting

The growth rate method was employed in forecasting because no diverted traffic after improvement was expected on this study route.

### 8.1.2 Assumed Road Link

### 8.1.3 Traffic Forecast

- 1) Items necessary for forecasting traffic were:
  - Traffic volume in base year
  - Passenger and freight movement in base year
  - Growth rates of passenger and freight movement
  - Rate of induced and developed movement
  - Traffic composition
