1. Location of Towns and Industrial Estates in 2005

1. INTRODUCTION

The socio-economic study was carried out to give future perspective of socio-economic conditions of the Region, i.e., southern part of the state of Johor in 1985, 1990, 1995, 2000 and 2005, as a basic framework for the other sectoral studies including Domestic and Industrial Water Supply, Flood Mitigation Plan and Evaluation of the proposed projects. To serve for this purpose, projection was made for the following socio-economic variables:

- (1) Population,
- (2) Gross domestic product (GDP) of Malaysia and per capita GDP,
- (3) Gross regional product (GRP) of the State of Johor and per capita GRP,
- (4) Gross value added of manufacturing sector of the State of Johor, and
- (5) Gross value of manufacturing output by commodity group of the State of Johor.

This Study should be understood in this context and should not be considered as a proposal for future socio-economic planning.

2. PRESENT CONDITION OF SOCIO-ECONOMY IN MALAYSIA AND THE REGION

2.1 Malaysia

2.1.1 Geographical features and administrative division

Malaysia covers an area of 330,080 km², comprising Peninsular Malaysia, Sabah, and Sarawak. The States of Sabah and Sarawak occupy the north-western part of Borneo Island. Peninsular Malaysia, bordered on Thailand to the north, covers 131,930 km², while Sabah covers 73,700 km² and Sarawak 124,450 km².

Malaysia consists of 13 states including the State of Johor, which covers the Region of this Study. Each state is subdivided into districts in Peninsular Malaysia and divisions in Sabah and Sarawak.

2.1.2 Population and GDP

Population of Malaysia was 14,811 x 10³ in 1983. The population size had grown at 2.5% per annum from the figure in 1970 which was recorded to be 10,777 x 10³. In 1983, almost 83% of the Malaysian population or 12,284 x 10³ lived in Peninsular Malaysia while Sabah had the population of 1,121 x 10³ and Sarawak had 1,406 x 10³ (Table 1).

Population density in the whole Malaysia in 1983 was 44.9 persons/km² while these in Peninsular Malaysia, Sabah and Sarawak were 93.1 persons/km², 15.2 persons/km² and 11.3 persons/km², respectively.

Urbanization in Peninsular Malaysia is remarkable. The urban population ratio of 29% in 1970 increased upto 38% by 1980 (Table 2).

GDP of Malaysia was M\$38,810 million in 1983 in factor cost at 1970 price. The contribution of agricultural sector including forestries to GDP was estimated at 23%, while manufacturing sector shared 18% (Table 3). Per capita GDP was M\$2,080 in 1983 in factor cost at 1970 price and Malaysia was ranked in one of the upper middle-income country in the world. The annual growth rate of GDP and per

capita GDP during the period from 1971 to 1983 was 7.7% and 5.2%, respectively (Table 4).

In Peninsular Malaysia in 1983, GRP was M\$26,661 million. From 1971 to 1983, average annual growth rate was 7.7%. Per capita GRP of Peninsular Malaysia in 1983 was M\$2,170 with the growth rate of 5.4% per annum.

2.2 The Region

The State of Johor of 19,140 km² is located in the Southernmost part of Peninsular Malaysia. Population of the state was 1,756,000 in 1983.

GRP of the State was M\$3,523 x 10⁶ and per capita GRP was M\$2,007 which was slightly lower than the national average of M\$2,080 in 1983 in factor cost at 1970 price. The annual growth rate of GRP and per capita GRP during the period from 1971 to 1983 was 7.7% and 5.5%, respectively (Table 4). Agriculture sector shared 32% and manufacturing sector shares 22% in GRP in 1983 (Table 3).

The South Johor Region (the Region) of 7,350 km² is a southern part of the State of Johor, facing the Singapore across the Strait of Johor. Administratively, the Region covers whole part of Johor Bahru, Kota Tinggi and Pontian districts and a part of Kluang and Mersing districts.

The population of the Region was 798,000 and the population density was 108.6/km² in 1983. The region is characterized by the industrial area culminated by Johor Bahru, which is 5th largest town in Malaysia with 300,000 population in 1983. There are 6 towns including Johor Bahru, which have more than 10,000 population each in 1983 in the Region. In addition to towns, industrial estates are centers of manufacturing activities. There are 4 major industrial estates in the Region represented by Pasir Gudang Industrial Estate situated about 24 km east of Johor Bahru city (Table 5). Location of towns and Industrial Estates is given in Fig. 1.

Major agricultural products in the Region are rubber and oil palm. Paddy cultivation is limited unlike in other areas.

Federal government established a special organization, KEJORA, to develop the northern area of Kota Tinggi district and southern area of Kluang district. KEJORA plays an important role to the economic development of the Region particularly in agricultural and agro-based industries as well as FELDA, RISDA and private firms.

Johor Bahru city is connected with Singapore by a causeway. A road, railroad and water pipeline are mounted on the causeway. Therefore, the State has physical special relationship with Singapore with population of 2.5 million in 1983 and per capita GNP of \$5,910 in 1982.

3. NATIONAL ECONOMIC DEVELOPMENT PLAN

3.1 New Economic Policy

New Economic Policy (NEP) was enunciated in the Mid-Term Review of the Second Malaysia Plan, 1971 to 1975, in order to promote national unity through eradicating poverty irrespective for race and restructuring society to eliminate the identification of race with economic functions.

3.2 Outline Perspective Plan

Outline Perspective Plan (OPP) was initiated in 1971 to achieve the goals of NEP by 1990. The targets set for the 1971-1980 period or the first decade of OPP period was almost achieved and Fourth Malaysia Plan (4MP) was formulated for further attainment of the goals of NEP.

3.3 Fourth Malaysia Plan

The economy of Malaysia was expected to undergo further expansion and diversification during 4MP period, 1981 to 1985.

Characteristics and strategies for sectoral development contemplated in 4MP are summarized as follows (Ref. 1).

(1) Agriculture, forestry and fishing sector

- (a) slower growth of the major commodities such as rubber and palm oil,
- (b) declining of the sawlog output according to the National Forest Policy in Peninsular Malaysia and the conservation policy of Sabah and Sarawak,
- (c) continuation of the encouragement of the dominant tree crops at present,
- (d) production promotion of cocoa, pepper, tobacco, vegetables

and fruits,

- (e) expansion of rubber output by the Government's Dynamic Production Policy through replanting and opening new planted areas,
- (f) development of new land and replanting program for oil palm, and,
- (g) continuation of self-sufficiency policy in paddy production.

(2) Mining sector

- (a) increase of crude petroleum exploitation from the present output of 280×10^3 barrels/d in 1985,
- (b) bright prospects of LNG including 6×10^6 tonnes by Bintulu LNG project, and
- (c) decrease of tin production and copper output because of the limited availability of existing resources.

(3) Manufacturing sector

- (a) stimulating the expansion of the manufacturing sector from both external and domestic demand,
- (b) strengthening of the export-oriented industries such as timber products, electronics, textiles and rubber products,
- (c) promotion of the agro-based industries including processing of cocoa and palm oil, production of specific rubber products and high value timber-based products,
- (d) import-substitution policy including the production of processed food, intermediate goods such as oils and fats, industrial chemicals, chemical products and cement, and
- (e) encouragement of capital-intensive industries such as aluminium, cement and steel by the Heavy Industries Corporation Malaysia Berhad.

3.4 Mid-Term Review of 4MP

The worldwide economic recession had continued during the first half of the 4MP period, 1981 to 1985, and it had adversely affected on Malaysia's economy. Accordingly, the original targets of 4MP were revised downward in the Mid-Term Review (MTR) of 4MP, i.e., annual growth rate of GDP during the 4MP period was revised from 7.6% in 4MP to 6.7% in MTR (Ref. 2). In MTR, following policies were strongly recommended.

- (1) Developing the export-oriented industries, especially heavy manufacturing sector.
- (2) Minimizing the Governmental expenditure and developing private activities.
- (3) 70 million population policy. (To achieve the population growth upto 70 million by 2100)
- (4) Look east policy.

4. POPULATION PROJECTION

4.1 Basic Data and Assumption

Basic data for the population projection are as follows:

- (1) 4MP, MTR and data provided by EPU, and
- (2) Population and Housing Census of Malaysia 1970 and 1980 (Refs. 3, 4, 5, 6).

Population of each state were projected based on the national and state population available in 4MP for 1970, MTR for 1980, 1983 and 1985. And the projected national population for 1990, 1995, 2000 and 2005 was obtained from EPU. Population of each district and each town, which were available in the Censuses in 1970 and 1980 were so adjusted as total population of them is consistent to the figures in 4MP and MTR.

The existing regional development plans in the Region such as Johor Bahru Metropolitan, Johor Timur (East), Johor Barat (West) and KEJORA, were also referred in this projection (Refs. 23 to 27).

In this Study, urban population is defined that in the towns which have larger population than 10,000 each year.

4.2 Projection Procedure and Methodology

4.2.1 Projected population of whole Malaysia

The national population estimated for the years of 1980, 1983 and 1985 were obtained from MTR and the projected population for the years of 1990, 1995, 2000 and 2005 were also obtained from EPU. EPU made a historical trend projection upto 2005 as shown in Table 6. EPU also started working of target population growth based on "70 million population policy", however, the figures estimated by Macro section of EPU was very preliminary ones. Therefore, in this Study, projected

population based on "70 million population policy" was shown only as reference in Table 6.

4.2.2 Projection of population by state

The state population estimated in 4MP for the year of 1970 and estimated and projected in MTR for the years of 1980 and 1985 were adopted. In order to project the state population thereafter up to 2005, it is assumed that the population of each state has hiperbolic relationship against national population and a hiperbolic function shown below was assumed.

$$Y = aX^2 + bX + c$$

where, Y: Population in each state

X: Population in whole Malaysia

The population figures in 1970, 1980 and 1985 estimated as above were applied to the equation and the values of coefficients a, b, and c were determined for each state. Thereafter, projected population from 1990 to 2005 for each state were adjusted so that the total of them equal to the national population each year.

4.2.3 Projection of urban and rural population

Population in urban and rural areas for Malaysia were estimated applying urbanization ratio, the ratio of sum of the population in the towns which have larger population than 10,000 to the total population for each year. The ratio was estimated applying following functional relationship between the ratio and the per capita GDP, which was projected in advance (Cf. section 5.2).

The function applied here is shown below.

$$Y = 100 - a \times b^X$$

where, X = per capita GDP (M\$)

Y = Urbanization ratio (%)

The value of coefficients a and b were determined applying X obtained from 4MP and MTR for 1970 and 1980 and Y calculated based on the data from the population census for 1970 and 1980. The projected urban and rural population is shown in Table 7.

On the other hand, first approximation of population in each town and district rural, rural population in district except towns, were made as follows.

The ratios of the population in each town/district rural to the population in the relevant state to which the town/district rural belong are herein called the population shares of the town/district rural. The towns/district rural were classified into the following three groups and different mathematical equations were assumed to express the relationship between the population shares and the population of a state as follows;.

Group 1: Town/district rural in which population share increased between 1970 and 1980.

$$Y = 1 - 1/(aX+b)$$

where, Y: Population share of town/district rural
X: Population in the whole state

Group 2: Town district rural in which population share decreased between 1970 and 1980.

$$Y = 1/(aX+b)$$

Group 3: Town/district rural in which population share was constant between 1970 and 1980.

Future population share of the town/district rural was estimated to be equal to that in 1980.

The value of coefficients a and b for each town or district rural were estimated applying the values of X and Y in 1970 and 1980 to each equation mentioned above.

Finally, the population of each town derived as the first approximation was so adjusted that total of them coincide with the urban population projected through urbanization ratio for whole Malaysia.

State rural population was obtained by deducting population of towns in the state from state population projected in 4.2.2. Each district rural population was so adjusted that total of them coincide with the state rural population.

4.2.4 Projection of district population

District population was derived by summing the district urban population and district rural population projected in section 4.2.3.

4.3 Projected Population

The projected population in the State of Johor and that in the Region are summarized in Tables 8 to 10. The projected population of the State of Johor are also marked in Table 8. Population within the Region in 1985 is estimated to be 860,000 or 47% of state population of 1,834,000. Out of this, urban population in the Johor Bahru district is 389,000, being 85% of urban population in the Region of 459,000. Average annual growth rate of regional population will be 3.2% between 1985 and 2005 which is higher than 2.0% both for the national population and the population of the State of Johor. This higher growth rate of the population in the Region was projected mainly from concentration of State population in Johor Bahru. Population in the Region in 2005 will be 1,600,000, or 59% of state population of 2,729,000, consisting of urban population of 1,315,000 and rural population of 285,000. Urban population in Johor Bahru district will be 1,030,000 in 2005.

The projected population of the State of Johor in 2000 is 2,490,000, which is about 300,000 less than total of the projected population of the 4 regional development plan as mentioned in section 4.1.

According to the State EPU, the population of the State will be around 2,400,000 in 2000 and the 4 regional development plans are not well coordinated. While, Draft Structure Plan for Johor Bahru Metropolitan Area (Refs. 26 and 27) estimated that the total population of the Johor Bahru district in 2000 would be 1,000,000. Both of these figures are almost close to the projected population of this Study of 2,490,000 and 925,000, respectively.

5. GDP AND GRP PROJECTION

5.1 Basic Data and Assumption

Basic data for the GDP and GRP in 1980, 1983 and 1985 are from MTR, in 1971 from 4MP and the growth rates of GDP up to 2005 were assumed as follows: Once respective annual GDP growth rates for consecutive five years period from 1980 to 2005 were assumed to be 6.7, 7.5, 7.0, 6.5 and 6.0% after the discussion with EPU Macro Section. The government of Malaysia, then requested to use a figure between 5 to 7% for the period of from 1985 to 1990. Finally the GDP annual growth rates well assumed as follows:

GDP Annual Growth Rates

				Unit : %
<u>1980-85</u>	<u>1985-90</u>	<u>1990-95</u>	<u>1995-2000</u>	<u>2000-2005</u>
6.7	7.0	7.0	6.5	6.0

The assumed growth rate of 6.7% for 1980-85 period was given in MTR.

In this study, GDP and GRP are expressed at factor cost at 1970 constant price.

5.2 Methodology for GDP and GRP Projections

5.2.1 Projection of GDP of Malaysia

GDP of Malaysia was estimated by means of the assumed growth rates for each 5 year period.

5.2.2 Projection of GRP of the State of Johor

Per capita GRP for each state was projected assuming a functional relationship between per capita GRP and per capita GDP.

The relationship applied here is as shown below:

$$Y = X + a/X + b/X^2 + c/X^3$$

where, Y: Per capita GRP of the objective state

X: Per capita GDP of Malaysia

The values of coefficients a, b and c were determined for each state based on the values of X and Y for the year of 1971 given in 4MP and those of 1980 and 1985 given in MTR.

The GRP estimates thus obtained were adjusted with the control total of GDP.

5.3 Projected GDP and GRP

5.3.1 GDP of Malaysia

GDP of Malaysia in 1985 is estimated to be M\$35,254 in MTR. Thereafter, GDP will grow to M\$127,160 by 2005 at factor cost at 1970 constant price.

The projected GDP of Malaysia is shown in Table 11.

5.3.2 Per capita GDP of Malaysia and per capita GRP of the State of Johor

Per capita GDP of Malaysia was obtained by dividing the GDP by total population of Malaysia. Per capita GDP in 1985, M\$2,267, will increase at the average annual rate of 4.5%, reaching M\$5,470 in 2005 in terms of factor cost in 1970 constant price.

Per capita GRP of the State of Johor in 1983 is estimated at M\$2,007, which is slightly lower than the per capita GDP, M\$2,080. As the result, per capita GRP of the State of Johor is projected to increase at the same growth rate with the per capita GDP from M\$2,171 in 1985 in MTR to M\$5,190 in 2005.

The projected per capita GDP and per capita GRP of the state of Johor are shown in Table 11.

5.3.3 GRP of the State of Johor

GRP of the State of Johor will grow from M\$3,983 in 1985 to M\$14,170 in 2005 in terms of factor cost in 1970 constant price (Table 11).

The projected GRP of each 13 state in Malaysia are also shown in Table 12.

6. PROJECTION OF GROSS VALUE OF MANUFACTURING OUTPUT

6.1 Basic Data and Assumption

Basic data for the projection of gross value of output in manufacturing sector were obtained from the followings:

- (1) 4MP and MTR,
- (2) Survey of Manufacturing Industries by DOS, 1974, 1978 and 1982 (Refs. 8, 9 and 11),
- (3) Directory of Approved Companies in Production, 1982, MIDA (Ref. 14),
- (4) Economic Report 1983/84, MOF (Ref. 13).

In this Study, manufacturing sector was classified into 11 commodity groups for the projection of industrial water demand. The correspondence of the classification with the one adopted by DOS is shown in Table 13.

6.2 Projection Methodology

6.2.1 Projection of value added of manufacturing sector in Malaysia by State

Projection methodology of value added (VA) of manufacturing sector in Malaysia and by state is shown below:

- (1) Target share of manufacturing sector in GDP in 2000 and 2005 was assumed to be 30% and 33%, respectively, taking into account the figures in advanced countries and those in Malaysia in 1970s.
- (2) Following equation was assumed and values of a and b were determined based on the values of X and Y in 1985 obtained from MTR and X in 2005 projected in Section 5.3.2 with 33% mentioned above for Y value in 2005.

$$Y = aX + b$$

where, Y: Share of manufacturing section in GDP

X: Per capita GDP of Malaysia

- (3) The share of manufacturing sector in GRP of each state was projected using the same equation as above-mentioned and the same "a" value determined for Malaysia. Then, using the X and Y values in 1985, "b" value was determined for each state.

This methodology assumed that the share of manufacturing sector in GRP for each state will increase with the same elasticity as for Malaysia with regard to per capita figure.

6.2.2 Projection of share of VA by commodity groups in Peninsular Malaysia

The share of VA by 11 commodity groups in the VA of manufacturing sector in Peninsular Malaysia was projected according to the following steps:

- (1) VA of manufacturing sector in Peninsular Malaysia was obtained by deducting VA of manufacturing sector in Sabah and Sarawak from that in whole Malaysia.
- (2) The share of VA by 11 commodity groups in the VA of manufacturing sector in Peninsular Malaysia in 1980 was obtained from the data of 1974 and 1978 industrial census by using ratio method.
- (3) Based on thus estimated share by commodity group in 1980, the share in 1985 was obtained by applying the growth rate of each commodity group for 1981-85 available in MTR.

The estimated share of 11 commodity groups in 1980 and 1985 is presented in Table 14.

- (4) The share of 11 commodity groups after 1985 was projected by applying the following relationship:

If the share of a commodity group in 1985 is less than that in 1980:

$$Y = 1 - 1/(aX+b)$$

If the share of a commodity group in 1985 is less than that in 1980:

$$Y = 1/(aX+b)$$

where, Y: Share of VA of a commodity group to
total VA of manufacturing sector
X: Total VA of manufacturing sector

If the share of VA of a commodity group in 1985 is equal to that in 1980, the share of the commodity group after 1985 as assumed to be equal to those in 1980 and 1985.

The value of coefficients a and b for each commodity group were estimated applying the values of X and Y in 1970 and 1980 to each equation mentioned above. The share of VA of each commodity group was so adjusted that total of it is to be 100%.

6.2.3 Projection of VA of manufacturing sector by state by commodity groups in Peninsular Malaysia

VA of manufacturing sector by State and by commodity groups were estimated by "Frater Method" using the data of VA by state estimated in Section 6.2.1 and share of VA by commodity groups estimated in Section 6.2.2.

6.2.4 Projection of gross value of manufacturing output

The gross value of output in manufacturing sector was projected by VA in manufacturing sector projected in Section 6.2.3 divided by VA ratio which is defined as the ratio of VA to gross value of manufacturing output.

VA ratio was assumed to be 30% in manufacturing section in whole Malaysia taking into consideration the experience of Peninsular Malaysia as well as USA, Japan and Korea (Tables 15 and 17).

VA ratio by commodity group in 1974 as shown in Table 15 was adopted for all the years after adjusting by the control total of 30% in total manufacturing sector as mentioned above.

6.3 Projected Gross Value of Manufacturing Output of the State of Johor

Share of manufacturing sector in GRP and VA of manufacturing sector for the State of Johor were estimated as shown in Table 18.

Projected gross value of manufacturing output of the State of Johor is shown in Table 19.
