## CHAPTER 1 INTRODUCTION

### 1-1 Study Background

The Burmese economy is administrated through the Four Year Plan, based on the Twenty Year Plan established in 1974.

The objectives of the Twenty Year Plan are as follows:

- To double the standard of living of all nationalities of the Union and to fulfil, to the maximum extent, food, clothing, shelter and social needs of all the people.
- To transform smoothly and by planning the Burmese economic structure from an agricultural country to an agriculture-based industrial country.

Up to the end of the Third Four Year Plan, the economic growth rate has been high enough compared with the guideline of the Twenty Year Plan. In the Fourth Four Year Plan period, the growth rate fell down due to the repercussion of the recession of world economy. According to the Fifth Four Year Plan, this severe tendency will continue for at least several more years.

| Period of<br>Four Year Plan               | Second<br>'74/75 -<br>'77/78 | Third<br>'78/79 -<br>'81/82 | Fourth<br>'82/83 -<br>'85/86 | Fifth<br>'86/87 -<br>'89/90 | Sixth<br>'90/91 -<br>'93/94 |
|---|------------------------------|-----------------------------|------------------------------|-----------------------------|-----------------------------|
| Growth Rate Target<br>of Twenty Year Plan | 4.0                          | 5.0                         | 6.0                          | 7.0                         | 7.6                         |
| Actual                                    | 4.7                          | 6.5                         | 5.4                          | (4.5) <sup>1/</sup>         |                             |

Note: <sup>1/</sup> Target of Fifth Four Year Plan

In order to realize the expected economic growth under such conditions, it is necessary to carry out many measures such as diversification of export goods and improvement of quality of goods. And also, it is very important to improve transportation conditions. The present transport capacity of the public sector is relatively small in meeting the increasing traffic demand, and this causes production inefficiency and high production cost due to the usage of private means of transportation.

The Burma Railways Corporation (hereinafter referred to as BRC) has some plans to introduce more diesel locomotives, wagons, and carriages in order to increase its transport capacity.

However, if the investment is made only for rolling stock, and ground facilities are left in a deteriorated condition as they are, smooth, safe, and efficient train operation cannot be achieved. Consequently, much cannot be expected from the effect of such investment only.

Accordingly, it is necessary to improve track, telecommunication and signalling facilities in order to restore the inherent functions of the railways.

The feasibility study to improve track, telecommunication and signalling on the Mandalay line has been conducted as a step of a short-term improvement project based on the long-term modernization programme.

#### 1-2 Objective of the Study

The feasibility study is carried out to establish a short-term improvement project for track, telecommunication and signalling on the Mandalay line whose selection is based on the first priority given in the long-term modernization programme.

This report covers traffic demand forecast, transport and rolling stock plan, facility improvement plan, maintenance management and training plan, estimated project cost, economic and financial analysis, and overall evaluation and execution plan.

Aims of the facility improvement and the main subject of technology transfer are as follows:

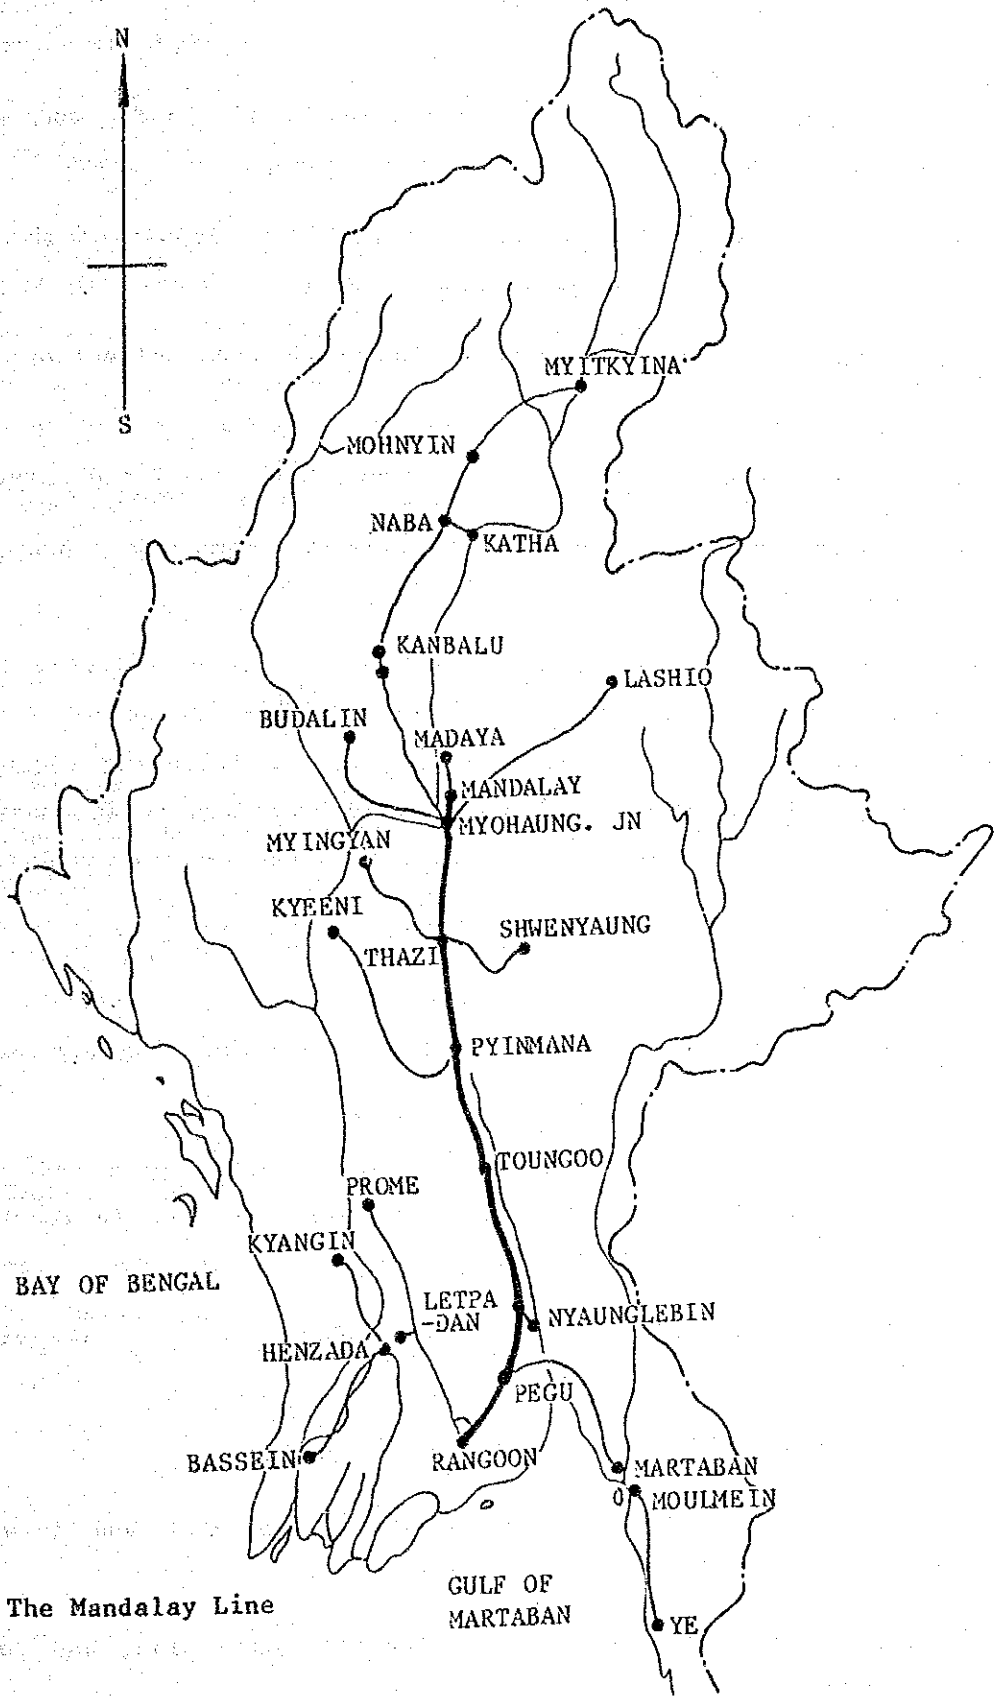

##### (1) Aims of the Facility Improvement

- 1) To increase train speed
- 2) To enhance safety
- 3) To improve punctuality
- 4) To increase track capacity

##### (2) Technology Transfer

- 1) Prestressed concrete sleeper (hereinafter referred to as PC sleeper) production
- 2) Rail welding

Key Map of Burma Railways

### 1-3 Study Schedule

The Study was carried out through the following phases.

#### (1) Phase I Field work

The field work was conducted for a month and a half, from July 23 to September 5, 1986 mainly through the following phases:

- 1) Presentation, and explanation of the Draft Report of the long-term modernization programme and discussion on it
- 2) Discussion with authorities concerned and collection of their opinions
- 3) Collection of related data and information, and field survey
- 4) Discussion on premises of the short-term improvement project and on the facility standards

#### (2) Phase II Work in Japan

The work in Japan was carried out from the beginning of September, 1986 to the beginning of February 1987 in the following sequence. The Interim Report and Draft Final Report were presented in November 1986 and January 1987, respectively. The report was completed in February 1987.

- 1) To forecast the transport demand up to the year 2015/16 on the Mandalay line.
- 2) To sum up and grasp the transport, the facility and maintenance problem.
- 3) To establish the transport and rolling stock plan and the ground facility improvement plans on the Mandalay line, and to roughly design the related facility standards.
- 4) To prepare maintenance management and training plans suitable for the improved ground facilities.
- 5) To conduct an economic and financial analyses.
- 6) To make an overall evaluation of the project and establish its implementation schedule up to 1995/96.
- 7) To duly consider the coordination with each plan, and to complete the Report.

#### 1-4 Outline of the Short-term Improvement Project

The short-term improvement project has been established on the basis of the following concepts.

- (1) On the basis of the social and economic structure in Burma as well as the transport demand, the social role of the Mandalay line is defined.
- (2) The ground facility improvement plan along with the transport and rolling stock plan is drawn up to improve transport on the Mandalay line by restoring the inherent function of railway transport such as higher train speed, greater punctuality, higher degree of safety, and capability for mass transport, based on the traffic demand forecast of the line.
- (3) Technology transfer plan is drawn up on the following items required for the facility improvement.

- 1) PC sleeper production

Pretension and post-tension methods of PC sleeper production are studied and a proposal made.

- 2) Rail welding

Rail welding method and training of workers are studied and a proposal made.

- (4) Regarding maintenance and training of workers, the optimum maintenance method and staff training plan required for the improved facilities are studied and a proposal made.

#### 1-5 Study Organization

OF THE AREA SERVED BY THE MANDALAY LINE**

**RESTRICTED**

CHAPTER 2 SOCIO-ECONOMIC SITUATION AND PRESENT TRANSPORT  
CONDITIONS OF THE AREA SERVED BY THE MANDALAY LINE

2-1 Socio-economic Situation

2-1-1 Scope of Affected Area

The affected area is classified into two, namely, the directly affected area and the indirectly affected area. The former consists of those areas being directly served by the Mandalay Line, while the latter includes those which are indirectly served by means of other railway branch lines connected with the Mandalay Line.

The classification of the affected area is shown in Table 2.1.1.

This paper deals mainly with the present socio-economic situation of the directly affected area, inasmuch as a comprehensive study on the BRC-served area is already prepared in the Report on the Long-term Modernization Programme (hereinafter referred to as LTMP).

Table 2.1.1 Classification of the Area Served by the Mandalay Line

|                                | Name of Region  | Administrative Scope of Region  |
|--------------------------------|-----------------|---|
| Directly<br>Affected<br>Area   | Rangoon         | Rangoon Division  |
|                                | Pegu (East)     | 14 townships of Pegu Division located in the east side of the Pegu Mountains  |
|                                | Mandalay (Main) | Mandalay Division except 4 townships of Kyaukpadaung, Taungtha, Nyaung-U and Myingyan   |
| Indirectly<br>Affected<br>Area | West Region     | 8 townships of Magwe Division located in the east side of the Irrawaddy River and 4 townships of Mandalay Division of Kyaukpadaung, Taungtha, Nyaung-U and Myingyan |

|                                | Region          |   |

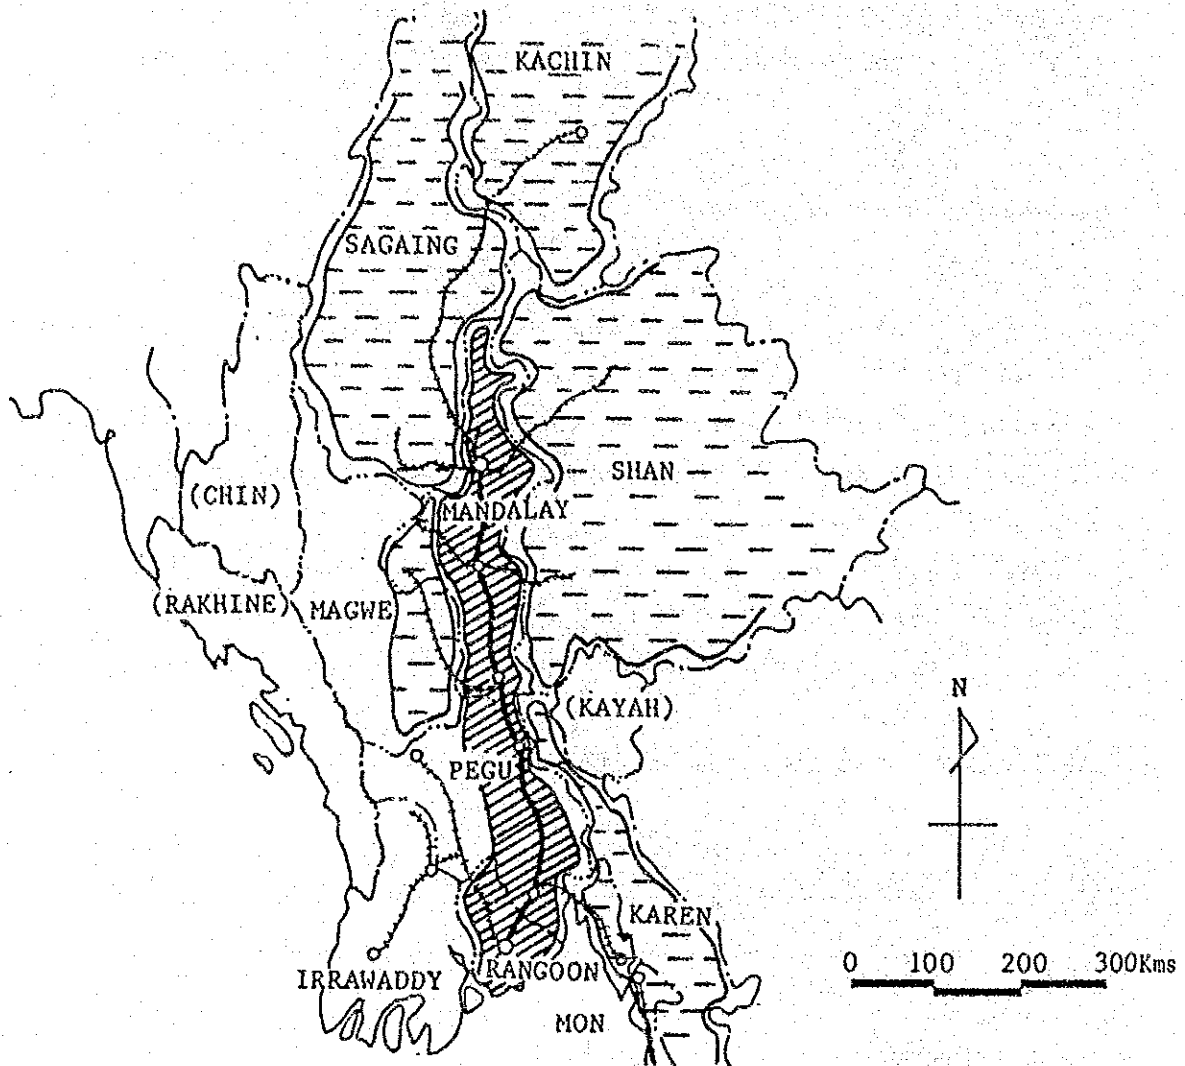

Fig. 2.1.1 The Area Served by the Mandalay Line

#### 2-1-2 Population and Land Use

The present population in each region together with their forecasting is shown in Table 2.1.2.

The directly affected area has a population of 10,278 thousand in 1985/1986, of which Rangoon has 4,197 thousand, Pegu (East) 2,209 thousand, and Mandalay (Main) 3,872 thousand, according to an estimate based on two recent censuses. The present annual increase rate is estimated at 2.14 percent, of which Rangoon is 2.16 percent, Pegu (East) 1.94 percent, and Mandalay (Main) 2.22 percent.

Table 2.1.2 Population Forecasting

(Population Forecasted: in thousand)

| Year    | Directly Affected Area |             |                 | Indirectly Affected Area |                 |                |                      |
|---------|------------------------|-------------|-----------------|--------------------------|-----------------|----------------|----------------------|
|         | Rangoon                | Pegu (East) | Mandalay (Main) | Western Region           | Northern Region | Eastern Region | South-eastern Region |
| 1985/86 | 4,197                  | 2,209       | 3,872           | 2,349                    | 5,010           | 3,873          | 2,903                |
| 1993/94 | 4,980                  | 2,576       | 4,615           | 2,767                    | 5,873           | 4,470          | 3,390                |
| 1997/98 | 5,422                  | 2,780       | 5,031           | 3,002                    | 6,351           | 4,798          | 3,659                |
| 2005/06 | 6,414                  | 3,235       | 5,957           | 3,526                    | 7,396           | 5,509          | 4,239                |

(Annual Increasing Rates: percent)

| Year              | Rangoon | Pegu (East) | Mandalay (Main) | Western Region | Northern Region | Eastern Region | South-eastern Region |
|-------------------|---------|-------------|-----------------|----------------|-----------------|----------------|----------------------|
| 1986/87 - 1993/94 | 2.16    | 1.94        | 2.22            | 2.07           | 2.01            | 1.81           | 1.96                 |
| 1994/95 - 1997/98 | 2.15    | 1.92        | 2.18            | 2.06           | 1.98            | 1.78           | 1.93                 |
| 1998/99 - 2005/06 | 2.12    | 1.91        | 2.13            | 2.03           | 1.92            | 1.74           | 1.86                 |
| (Ref. 1974 - 83)  | 2.22    | 1.99        | 2.31            | 2.13           | 2.13            | 1.58           | 2.35                 |

Source: Study Team

Relative estimates on Pegu (East) and Mandalay (Main) are likewise presented in Table 2.1.3. A noticeable characteristic is that Thazi zone in Mandalay (Main) and Nyaunglebin zone in Pegu (East) have relatively moderate increase rates.

Table 2.1.3 Estimation of Population in 1985/86 and Present Annual Increasing Rates by Traffic Zone in Pegu (East) and Mandalay (Main)

|                  | Population in 1985/86 | Present annual increasing rate |
|------------------|-----------------------|--------------------------------|
| Pegu zone        | 805 (thousand)        | 2.0 (%)                        |
| Nyaunglebin zone | 575                   | 1.7                            |
| Toungoo zone     | 829                   | 2.0 - 2.1                      |
| Pegu (East)      | 2,209                 | 1.94                           |
| Pyinmana zone    | 800                   | 2.2 - 2.3                      |
| Thazi zone       | 1,012                 | 1.9                            |
| Mandalay zone    | 2,060                 | 2.3 - 2.4                      |
| Mandalay (main)  | 3,872                 | 2.22                           |

- Note: 1. Pegu zone: 4 townships around Pegu township  
Nyaunglebin zone: 4 townships around Nyaunglebin township  
Toungoo zone: 6 townships around Toungoo township  
Pyinmana zone: 4 townships around Pyinmana township  
Thazi zone: 5 townships around Meiktila township  
Mandalay zone: 16 townships except Mandalay (West), Pyinmana zone and Thazi zone
2. Those figures are based on a rough estimation, so figures have to be understood with some ranges.

Population density of Mandalay (Main), comprising 25 townships, is 117 persons per square kilometre, of which 21 townships have densities of approximately 105. Pegu (East) has 86, which is lower than that of Pegu (West), the area served by the Prome Line. These figures are in conformity with the land use pattern in each region.

Table 2.1.4 shows land use pattern and population density by region.

Table 2.1.4 Population Density and Land Use by Region

|                    | Population Density<br>(Persons per Km <sup>2</sup> ) | Percentage Distribution of Land Utilization (%) |                       |                 |             |         | Net Area sown per 1,000 Population (Km <sup>2</sup> ) |
|--------------------|--|---|-----------------------|-----------------|-------------|---------|---|
|                    |  | Net Area Sown                                   | Other Cultivable Land | Reserved Forest | Other Lands | Total   |   |
| Rangoon            | 391  | 53.8  | 12.7                  | 11.9            | 21.5        | 100.0   | 1.3   |
| Pegu (East)        | 86   | 22.9  | 8.5                   | 32.4            | 36.2        | 100.0   | 2.5   |
| Mandalay (Main)    | 117  | 25.3  | 11.7                  | 30.8            | 32.1        | 100.0   | 2.0   |
| West Region        | 130  | 32.3  | 15.7                  | 10.4            | 41.6        | 100.0   | 2.8   |
| North Region       | 26   | 7.6   | 15.3                  | 15.6            | 61.5        | 100.0   | 2.8*  |

| South-east Region  | 64   | 13.2  | 8.4                   | 14.4            | 64.0        | 100.0   | 1.9   |
| (Ref. Pegu (West)) | (119)  | (30.2)  | (12.5)                | (36.8)          | (20.5)      | (100.0) | (2.5)   |

Note: Population density for 1983  
Land use for 1984/85  
\* 3.0 for Sagaing Division and 1.7 for Kachin State

Source: Documents provided by the Planning Department

Rangoon has a high net area sown ratio, while the reserved forest ratio is relatively low. Conversely, the net area sown ratios of Pegu (East) and Mandalay (Main) are less than half that of Rangoon, and their reserved forest ratios are 2.6 - 2.7 times as high. The ratios of Pegu (East) and Mandalay (Main) are less than those of Pegu (West) in both net area sown and reserved forest, and ratios of other lands, that is, economically under-used areas except those of the urban area, are more than those of Pegu (West).

Considering population, population density, and net area sown per population, the directly affected area may be aptly described as follows: It has two urban area (Rangoon and Mandalay), and all the remaining ones are predominantly agricultural areas.

### 2-1-3 Present Economic Conditions

The overall economic situation of BRC-served area has been taken up in Section 3, Chapter 2 of the LTMP, so only the present characteristics of the directly affected area will be discussed here.

Gross regional product (GRP)\* of the directly affected area accounts for 34.8 percent of the GDP in 1985/86. Table 2.1.5 shows a detailed percentage distribution of the GRP of the area by region and by sector.

Per capita GRP of the area is higher than the average of the whole country. This phenomenon is attributed to active service and trade activities in the area in which Rangoon plays a major role. Similarly, Pegu (East) and Mandalay (Main) also have higher per capita GRP than the national average.

Present economic situation by region is as follows:

#### (1) Rangoon

Per capita GRP is estimated at 156 in 1985/86 (national average = 100). The region specializes in service and trade activities accounting for shares of 27.9 percent and 33.0 percent, respectively, in the whole country.

Rangoon is the capital of the Union of Burma and is the national business center. For this reason, the national administrative functions, as well as the national distribution functions, concentrate in the region. Moreover, high population density and per capita GRP encourage service and trade activities. To meet consumption demands, processing and manufacturing establishments have developed, centring on consumer goods production.

#### (2) Pegu (East)

Per capita GRP is estimated at 107 as against 116 in Pegu (West).

Pegu (East) specializes in goods production, specially agriculture, livestock, and forestry. The share of agriculture in the whole country is 8.4 percent in 1985/86, as against the 6.4 percent share of the GRP. The main crop is paddy and vegetable oil seeds, such as groundnut, sesame, and sunflower, rank next. Sugar cane is also mentioned. Livestock and forestry are other spheres of active economic activities.

---

\* Gross regional product is defined as the gross value added originating from the territorial sphere of the region defined.

Table 2.1.5 Gross Regional Product in 1985/86 (at 1985/86 prices)

(1) Percentage Distribution by Region (percent)

|                                      | Directly Affected Area |             |                    |             | Indirectly Affected Area |             |                   |           |      |
|--------------------------------------|------------------------|-------------|--------------------|-------------|--------------------------|-------------|-------------------|-----------|------|
|                                      | Rangoon (East)         | Pegu (Main) | Mandalay Sub-total | West Region | North Region             | East Region | South-east Region | Sub-total |      |
| Agriculture                          | 5.5                    | 8.4         | 11.8               | 25.7        | 8.8                      | 16.5        | 7.3               | 5.3       | 37.9 |
| Livestock, Fishery and Forestry      | 12.9                   | 7.3         | 9.2                | 29.4        | 7.1                      | 12.5        | 5.1               | 4.7       | 29.5 |
| Mining, Processing and Manufacturing | 18.2                   | 6.7         | 9.8                | 34.7        | 7.2                      | 11.3        | 8.0               | 5.1       | 31.6 |
| Other Goods                          | 18.8                   | 5.9         | 11.0               | 35.8        | 6.5                      | 12.5        | 7.9               | 6.1       | 33.0 |
| Transportation                       | 22.9                   | 6.0         | 9.8                | 38.7        | 6.2                      | 11.8        | 7.0               | 5.3       | 30.4 |
| Other Services                       | 27.9                   | 3.9         | 9.5                | 41.3        | 4.6                      | 10.9        | 8.4               | 6.3       | 30.3 |
| Trade                                | 33.0                   | 3.9         | 10.8               | 47.7        | 3.7                      | 9.5         | 7.5               | 6.2       | 27.0 |
| Gross Divisional Product             | 17.7                   | 6.4         | 10.8               | 34.8        | 6.6                      | 13.0        | 7.4               | 5.6       | 32.6 |

(2) Percentage Distribution by Sector (percent)

|                                      |       |       |       |       |       |       |       |       |       |
|--------------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Agriculture                          | 12.2  | 50.9  | 42.6  | 28.7  | 51.6  | 49.4  | 38.5  | 36.7  | 45.2  |
| Livestock, Fishery and Forestry      | 6.6   | 10.2  | 7.6   | 7.6   | 9.6   | 8.6   | 6.2   | 7.6   | 8.1   |
| Mining, Processing and Manufacturing | 11.4  | 11.7  | 10.1  | 11.0  | 12.0  | 9.6   | 12.0  | 10.2  | 10.7  |
| Other Goods                          | 2.4   | 2.1   | 2.3   | 2.3   | 2.2   | 2.1   | 2.4   | 2.4   | 2.3   |
| Transportation                       | 4.5   | 3.3   | 3.1   | 3.8   | 3.2   | 3.1   | 3.3   | 3.3   | 3.2   |
| Other Services                       | 17.7  | 6.8   | 9.9   | 13.3  | 7.8   | 9.4   | 12.8  | 12.7  | 10.4  |
| Trade                                | 45.3  | 14.9  | 24.4  | 33.3  | 13.5  | 17.8  | 24.8  | 27.1  | 20.1  |
| Gross Divisional Product             | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |

(3) Differential by Region (Average of the whole country = 100)

|                |     |     |     |     |     |    |    |    |    |
|----------------|-----|-----|-----|-----|-----|----|----|----|----|
| Per Capita GRP | 156 | 107 | 103 | 126 | 105 | 96 | 71 | 71 | 86 |
|----------------|-----|-----|-----|-----|-----|----|----|----|----|

- Note: 1. Refer to Table 2.1.1 on the definition of the regions.  
 2. Gross regional product means the gross value added originated from the territorial sphere of region defined.  
 3. Totals may not be consistent as the amounts of each component are rounded off.

In processing and manufacturing, agriculture-based industrial establishments, such as rice mills, sugar mills, canning and alcohol factories are operating. On the other hand, service and trade activities are relatively under-developed.

Reflecting the economic situation, 50.9 percent of GRP comes from agriculture, and another 10.2 percent from livestock, fishery, and forestry. These figures are confirmed to be in accordance with a low ratio of labour forces engaging in non-primary industries.

### (3) Mandalay (Main)

Per capita GRP is estimated to be 103 compared with the national average of 100 in 1985/86.

The region has a relatively large share in agriculture due to the predominantly agricultural zones of Thazi and Pyinmana. Main crops are vegetable oil seeds such as sesame and groundnut; commercial crops such as sugar cane, tobacco, and cotton; and pulses.

In processing and manufacturing, the region has several foods processing factories, as well as beverage, textile, marble, brick and steel billet producing factories and establishments. Various non-metallic minerals and gem stones are also produced in the region.

The trade share in the whole country concurs with the GRP share. This is so because a high level of activity in Mandalay zone on the one hand, and underdevelopment in Thazi and Pyinmana zones on the other, cancel out.

### (4) Conclusion

Present economic situation is better in the area directly affected by the Mandalay Line according to the population and land use pattern.

## 2-1-4 Forecasting Regional Economy

### (1) Forecast method

Gross regional product by region is forecasted to divide the GRP (each division) by sector using indicators estimated by several statistical data. Those data is as follows: ① population and its increasing rate by township in 1983 census, ② land utilization pattern by township group for 1984/85, ③ classified labour force excluding agriculture, forestry and fishery by township group in 1984, and ④ existing regional development projects by location.

Data ① and ② above mentioned are mainly utilized for the primary industries, while data ①, ③ and ④ for the secondary industries and data ① and ③ for services except transportation. Trade is forecasted as a function of the primary and secondary industries by region. Transportation is forecasted as functions, which are adjusted with co-efficients by economic sector, of all other economic activities.

## (2) Forecast results

Table 2.1.6 and 2.1.7 show the summarised results.

### 1) Growth rates

The growth rates of the directly affected area are higher for Mandalay (Main) and lower for Pegu (East) through all forecast periods. But their differentials have reductive trends in course of the forecast period. The differential between Mandalay (Main) and Pegu (East) is, for example, forecasted by 0.8 percentage points for 1986/87 - 1993/94 period, while it will reduce by 0.5 percentage points for 1998/99 - 2005/06 period.

In the indirectly affected area, the growth rates are higher in West Region and North Region.

### 2) Economic structure

In almost all regions, the shares of agriculture will decline and ones of the other sectors will increase.

Relatively important changes will be found in mining, processing and manufacturing in Mandalay (Main) and West Region.

The shares of the primary industries in 2005/06 will be at around 58 percent for Pegu (East), 48 percent for Mandalay (Main) and 17 percent for Rangoon, as against 61 percent, 50 percent and 19 percent in 1985/86, respectively.

### 3) Per Capita Gross Regional Product

Per capita gross regional product in 2005/06 will account at Kyat 3,906 for Rangoon, Kyat 2,706 for Mandalay (Main) and Kyat 2,600 for Pegu (East) as against Kyat 2,592 for the whole country.

Their relative level (national average = 100) will decline by 5 points for Rangoon and by 7 points for Pegu (East) and will increase by 1 point for Mandalay (Main) in 2005/06, compared with ones in 1985/86. In the indirectly affected area, the relative level will increase in the West Region and North Region and will decline in East Region and South-East Region in 2005/06 compared with 1985/86.

Note: Refer to Table 2.1.i on the definition of the Regions.

Gross Regional Product means the gross value added originated from the territorial sphere of region defined.

Totals may not be consistent as the amounts of each component are rounded off.

## 2-2 Present Transportation Conditions

### 2-2-1 Railway Service

On the Mandalay line there were 18 passenger trains and 10 freight trains per day in 1984/85.

The 18 passenger trains consist of 6 express, 4 mail/ordinary and 8 mixed/local trains, and their characteristics are summarized as following:

Table 2.2.1 Train Formation and Capacity

| Train No.            | from/to   | No. of coaches |       |      |     |     | Total | Seating Capacity |

There are some special trains (unit trains) for carrying such as lime stone, ballast and sugar cane, in addition to the above scheduled services.

#### 2-2-2 Passenger Transport by BRC

The Mandalay line, between Rangoon and Mandalay, transported 6,252 thousand passengers and 718 million passenger-kms in 1984/85. This means approximately 17,000 passengers per day and 22 percent of the total amount of the main lines (excluding the suburban line).

Table 2.2.4 No. of Passengers

| Year    | Mandalay line | Main line total | Share (1000) |
|---------|---------------|-----------------|--------------|
| 1982/83 | 6,239         | 30,323          | 21 percent   |
| 1983/84 | 6,676         | 29,563          | 23 percent   |
| 1984/85 | 6,252         | 28,800          | 22 percent   |

Source: BRC

There are about 90 stations between Rangoon and Mandalay, and the number of passengers boarding at major stations is summarized in the table below.

Table 2.2.5 No. of Passengers and Average Trip Length  
by Major Stations <sup>1/</sup>, 1980/81

| Station                   | No. of Passengers Boarding (per day) | Average Travel Length (kms.) |
|---------------------------|--------------------------------------|------------------------------|
| Mandalay <sup>2/</sup>    | 4,180                                | 370                          |

### 2-2-3 Freight Transport by BRC

Mandalay line had 926 thousand tons of freight transport in 1984/85 and the demand had decreased from 1,001 thousand in 1982/83.

Table 2.2.9 Tonnage of Freight

| Year    | Mandalay line | Main line total | (1000 ton) |
|---------|---------------|-----------------|------------|
|         |               |                 | Share      |
| 1982/83 | 1,001         | 2,257           | 44 percent |
| 1983/84 | 980           | 2,208           | 44 percent |
| 1984/85 | 926           | 2,087           | 44 percent |

**CHAPTER 3 TRANSPORT DEMAND FORECAST**

**RESTRICTED**

## CHAPTER 3 TRANSPORT DEMAND FORECAST

### 3-1 Methodology

#### 3-1-1 General

Traffic demands both in passenger and freight on the Mandalay line were forecasted based on the present OD tables analyzed in 2.2 of Chapter 2.

The general procedure of the forecasting are summarized in the following flow-chart.

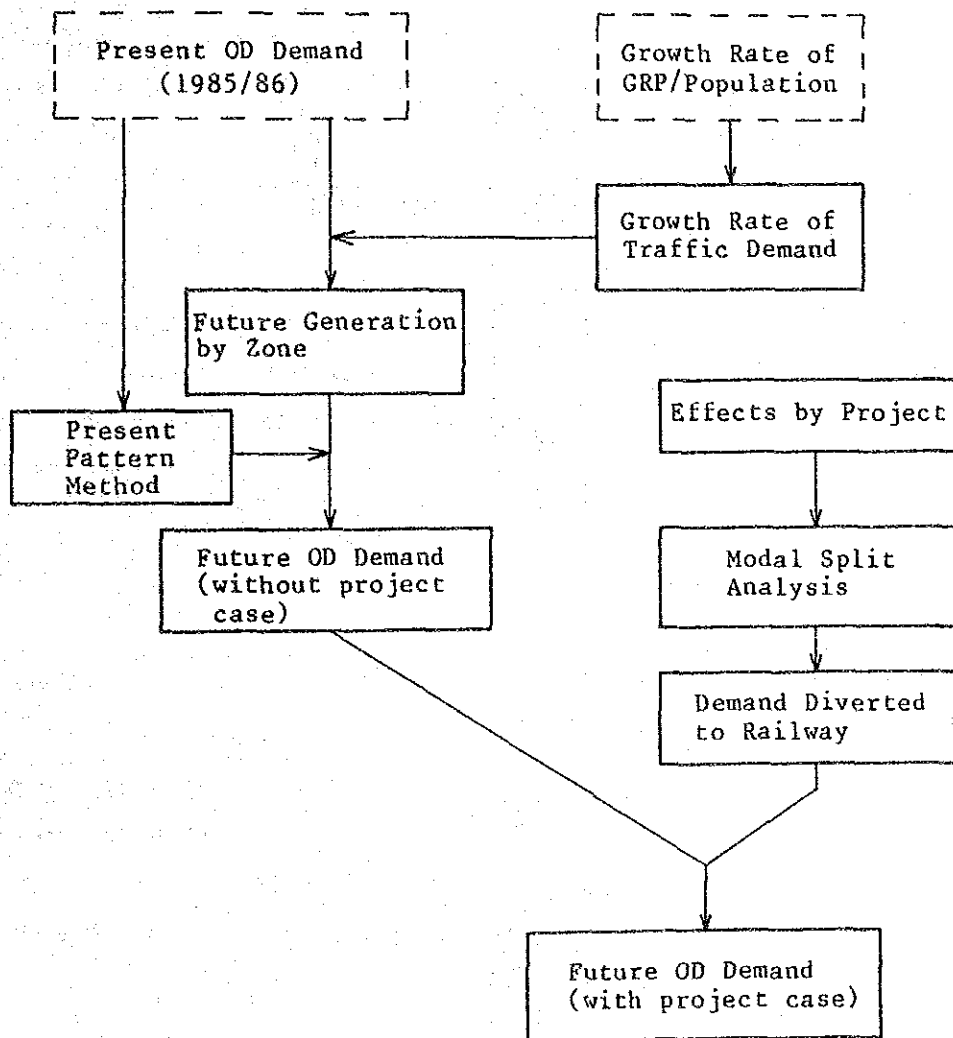

Fig. 3.1.1 Outline of Demand Forecast Procedure

3-1-2 Major Premises for the Forecasting

(1) Study area and zoning

Since the forecasting aimed at estimating the traffic demand along the Mandalay line by major sections, the line was divided into 6 sections (by 7 Origin-Destination Nodes) and the related branch lines were merged into the terminated zones as shown in Fig. 3.1.2.

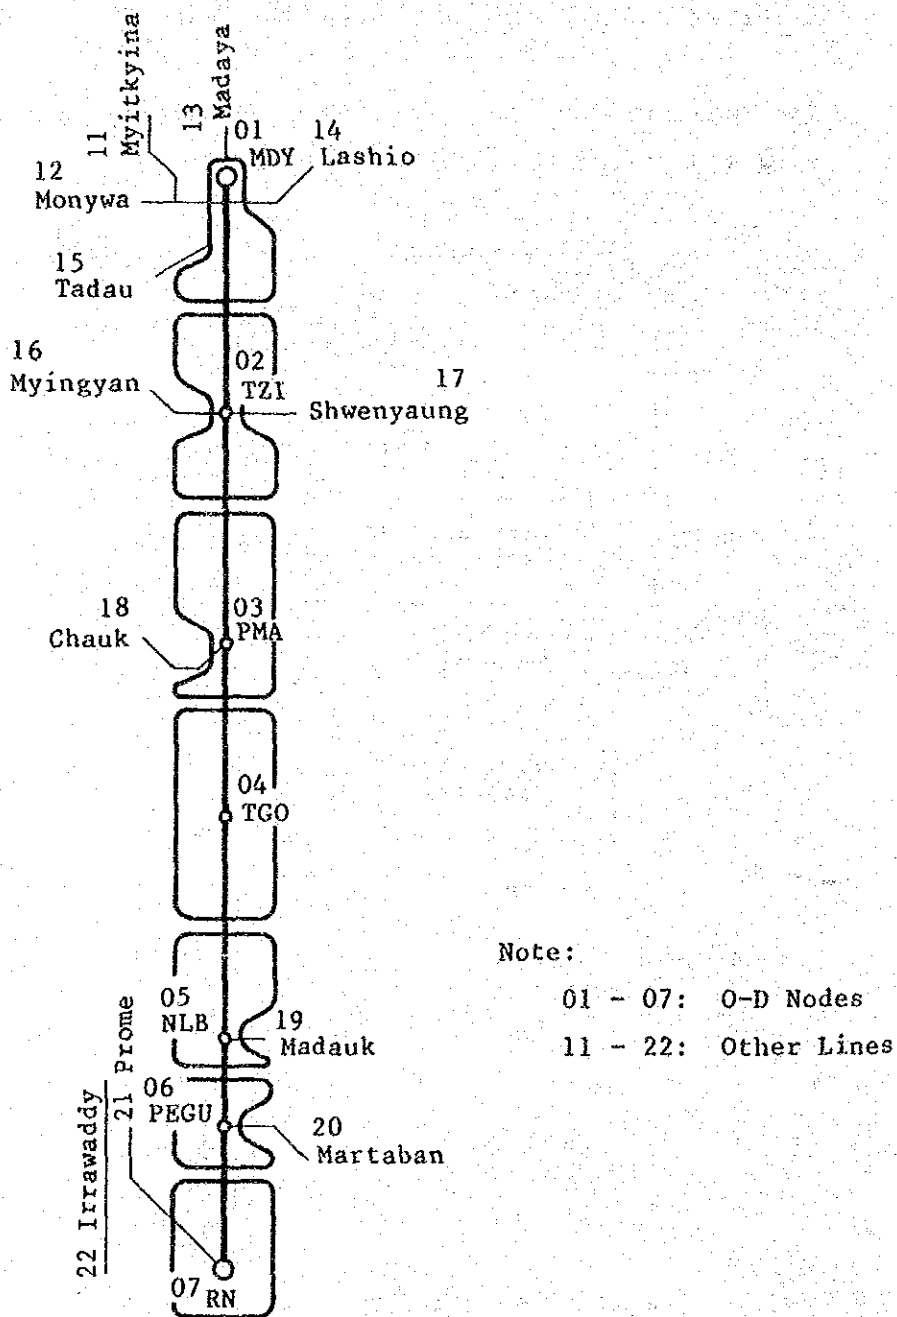

Fig. 3.1.2 Zoning Map

(2) Target years

Taking 1985/86 as the basis year, 1993/94, 1996/97 and 2005/06 are target years in accordance with the stage planning of the project and forecasting regional economy. Moreover, in order to provide the data for economic and financial evaluation, 2016/17 is the final target year, being the 30th year since the commencement of the project implementation.

(3) Transport conditions of other modes

Regarding the competitive transport modes such as road and water, future improvement/change in terms of travel time and fare is not considered except in the case of authorized programmes.

(4) Passengers by express or local trains

Travel time reduction by the project depends on the train service: express or local. The ratio of the two types are estimated by OD pair based on the actual survey results and this is assumed to be the same even in the future.

### 3-1-3 Growth Rate of Traffic Demand

The relationship between socio-economic indicators and transport demand was analyzed based on the statistical data from 1975/76 to 1985/86, and finally the followings were obtained.

Table 3.1.1 Results of Traffic Generation Analysis

| Items                            | Factor                        | Correlation coefficient | Elasticity to the growth rate |
|----------------------------------|-------------------------------|-------------------------|-------------------------------|
| <u>Passengers</u> <sup>1/</sup>  |                               |                         |                               |
| - Railway                        | GDP<br>(Transport Service)    | 0.87                    | 0.55                          |
| - Railway and road <sup>2/</sup> | - do -                        | -                       | 0.80                          |
| <u>Freight</u>                   |                               |                         |                               |
| - Railway                        | GDP<br>(Total Net Output)     | 0.79                    | 0.66                          |
| - Railway and road               | GDP<br>(Total Goods Products) | 0.80                    | 0.96                          |

<sup>1/</sup> Data from 1975/76 to 1982/83

<sup>2/</sup> Based on the estimated passenger data by road

The results obtained above were applied for future generation forecast by zone in accordance with economic growth rate by region. Table 3.1.2 shows the results of without project case.

Table 3.1.2 Growth of Future Demand (without project case)

#### 3-1-4 Origin-Destination Distribution Pattern

Since the growth of future demand by zone were balanced within some extent, the present pattern method was adopted in order to estimate O-D pattern in future.

### 3-1-5 Effects of the Project

The significant effects of railway improvement by the project are:

- increase in train speeds
- punctuality of train operation
- increase in frequency
- improvement in safety

and they bring about an adequate modal split condition between railway and road transport.

Therefore, the effects on the future demand by railway are considered from two aspects; the growth of demand and the diverted demand by reduction of travel time.

For the former the growth rate of Railway and Road estimated in Table 3.1.1 was applicable. The modal split model was analyzed for the latter. Modal split between railway and road transport was explained by the following formula:

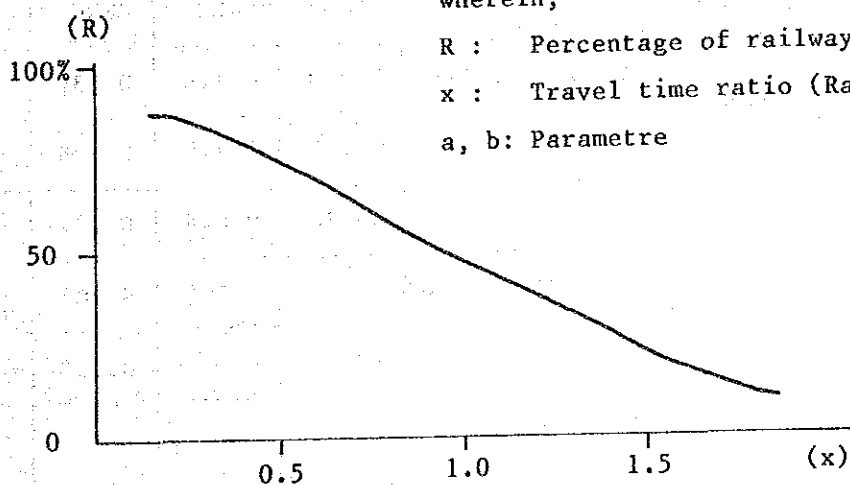

$$R = \frac{1}{1 + a \cdot \exp^{bx}}$$

wherein,

R : Percentage of railway share

x : Travel time ratio (Railway/Road)

a, b: Parametre

while, the reductions of travel time by railway are estimated by project phase, that is, phase 1 - Rangoon to Toungoo (effective from 1993/94) and phase 2 - whole line (from 1996/97). Travel times differ by train types such as express, local and freight train.

Table 3.1.3 shows the travel time reduction rate by express train, as an example.

Table 3.1.3 Travel Time Reduction Rate <sup>1/</sup> (Express)

| (Phase 2)           | 1 | -   | 0.755 | 0.754 | 0.750 | 0.728 | 0.732 | 0.727 |
|                     | 2 |     | -     | 0.754 | 0.747 | 0.719 | 0.725 | 0.721 |
|                     | 3 |     |       | -     | 0.738 | 0.698 | 0.712 | 0.709 |
|                     | 4 |     |       |       | -     | 0.669 | 0.700 | 0.699 |
|                     | 5 |     |       |       |       | -     | 0.753 | 0.724 |
|                     | 6 |     |       |       |       |       | -     | 0.698 |
|                     | 7 |     |       |       |       |       |       | -     |

The diverted traffic demand was calculated by applying these reduction rates to the modal split model examined before. As the result, the approximately 5 to 25 percent of diverted traffic adding to the basic volume are estimated in accordance with the travel time reduction by OD pairs.

### 3-1-6 Forms of Results Tabulation

These results of demand forecasting are tabulated mainly in two forms; Origin-Destination tables (7 zones x 7 zones) and traffic volume by section.

Table 3.1.4 List of Basic Results

### 3-2 Passenger Traffic

Passenger demands forecasted in accordance with the procedure mentioned hereinbefore are summarized as follows:

### 3-2-1 Total Demand

Total passenger demands on the Mandalay line are forecasted as 10,523 thousand in 1993/94 and 14,442 thousand in 2005/06 in case of without project, and the annual increase rate is 2.7 percent against 8,494 thousand in 1985/86. On the other hand, in case of with project 11,906 thousand in 1993/94 and 19,388 thousand in 2005/06 are estimated, with the diverted demand from road transport added.

Both number of passengers and passenger-kilometers are summarized in Table 3.2.1.

Table 3.2.1 Total Passenger Demand

(1000)

| Year    | Without project |                         | With project |                         |

### 3-2-3 Traffic Volume by Section

Future traffic volume by section is derived from estimated OD table, and the summary is tabulated in Table 3.2.3.

Table 3.2.3 Passenger Traffic Volume by Section

| Section                  | (1000)          |         |         |              |         |
|--------------------------|-----------------|---------|---------|--------------|---------|
|                          | Without project |         |         | With project |         |
|                          | 1985/86         | 1993/94 | 1996/97 | 1993/94      | 1996/97 |
| 1) MDY-TZI               | 1,787           | 2,252   | 2,437   | 2,395        | 2,902   |
| 2) TZI-PMA               | 2,457           | 3,079   | 3,332   | 3,313        | 3,998   |
| 3) PMA-TGO               | 2,618           | 3,260   | 3,525   | 3,579        | 4,234   |
| 4) TGO-NLB               | 2,685           | 3,330   | 3,598   | 3,754        | 4,336   |
| 5) NLB-PEGU              | 2,728           | 3,376   | 3,648   | 3,822        | 4,392   |

**RESTRICTED**

**CHAPTER 4 TRANSPORT AND ROLLING STOCK PLAN**

**RESTRICTED**

## CHAPTER 4 TRANSPORT AND ROLLING STOCK PLAN

### 4-1 Transport Improvement Plan

#### 4-1-1 Short-term Improvement Project

The deterioration of the ground facilities and rolling stock of BRC has progressed, and their present condition is such that it is difficult to perform satisfactorily the railway's inherent functions, such as providing high-speed, safe, punctual, and mass transport for the nation. This makes it necessary to take action to improve transport on the Mandalay Line, the main trunk line, by carrying out the short-term improvement project on track, signalling, and telecommunication. The following four points are the main guidelines for this project.

- (a) Reduction in scheduled time by increasing train speed
  - Maximum speed
    - Passenger train : 80 km/h (50 mph)
    - Freight train (with bogie make-up) : 56 km/h (35 mph)
  - Maximum permissible speed through turnouts
    - Straight side : 72 km/h (45 mph)
    - Turnout side : 32 km/h (20 mph)
- (b) Improvement of punctuality, by decrease of delays in train operation
- (c) Enhancement of safety, by the improvement of facilities
- (d) Increase in track capacity to meet the increased transport demands

To satisfy the four points mentioned above, the present short-term improvement project includes improvement of tracks, using long-welded rails, improvement of the block system and of interlocking in the station yards, improvement of the main communication network, and also improvement of the train control system, etc. Stable transport on the Mandalay Line will be achieved by these measures.

Table 4.1.1 Scheduled Time for the  
Section between Rangoon and Mandalay

| Type of train             | At present (A)  | At the time of completion of Ph.-1 | At the time of completion of Ph.-2 (B) | Reduction rate (%) (A-B)/A |
|---------------------------|-----------------|------------------------------------|--|----------------------------|
| Express passenger trains  | 13 hrs : 45 min | 12 hrs : 00 min                    | 10 hrs : 00 min                        | 27                         |
| Ordinary passenger trains | 19 : 05         | 16 : 10                            | 14 : 00                                | 27                         |
| Freight trains            | 37 : 10         | 32 : 00                            | 25 : 00                                | 33                         |

Source: Study Team

The braking rate attained at the time of the completion of the modernization of rolling stock, is as shown below.

(a) The braking rate for passenger trains will be increased from the present 41 percent, to 82 percent.

(b) The braking rate for important freight trains will be increased to 50 percent. (Most wagons are not equipped with brake equipment at present.)

(c) Normal braking distance, based on the above:

Passenger trains: 2200 ft. (Max. speed : 50 mph)

Freight trains : 1/2 mile (Max. speed : 35 mph)

Each of the above distances does not include any margin.

#### 4-2 Effect of Transport Improvement

##### 4-2-1 Speed Increase

The increase in train speed is one of the important targets of transport improvement. As shown in Table 4.1.1, the scheduled time of all types of trains will be greatly shortened when the facility improvement is completed in Phase-2.

This will improve passenger and freight service, increase working efficiency of rolling stock by 16 percent, increase track capacity and cause diversion of passenger and cargo traffic from other means of transport.

#### 4-2-2 Improvement of Punctuality

At present, the speed restriction at turnouts and some bridges due to repair works, defective communication network and signal failures hinder smooth train operation to cause delays in train operation.

Table 4.2.1 shows the trends of the delay on passenger trains for the past three years, and the average delay time per type of trains is shown in Fig. 4.2.1. The figures show accelerated tendency of the delay. The freight trains between Malagon and Myohaung are planned to take 37 hours and 10 minutes, however, actually take 50 to 60 hours.

Introduction of train radio, and control telephone system, and improvement of turnouts, can greatly contribute to reducing the delays in future train operation. The effect on the delay of the improvement is shown in Table 4.2.2.

Table 4.2.1 Number of Passenger Train Delays for the Past Three Years on the Mandalay Line [Percent]

| Type of Train | Year   | On-time | 1-30 min | 30 min-1 h | 1-3 hr | 3 hr and over |
|---------------|--------|---------|----------|------------|--------|---------------|
| Express       | '83/84 | 51      | 26       | 10         | 4      | 5             |
|               | '84/85 | 34      | 34       | 18         | 12     | 2             |
|               | '85/86 | 11      | 32       | 24         | 27     | 6             |
| Ordinary      | '83/84 | 16      | 17       | 18         | 39     | 10            |
|               | '84/85 | 6       | 14       | 14         | 42     | 22            |
|               | '85/86 | 2       | 12       | 17         | 45     | 23            |
| Local         | '83/84 | 24      | 21       | 24         | 25     | 6             |
|               | '84/85 | 10      | 17       | 21         | 33     | 18            |
|               | '85/86 | 5       | 6        | 10         | 19     | 17            |

Table 4.2.2 Reduction Rate of Delay Time

| Phase | Alternative plan A | Alternative plan B |
|-------|--------------------|--------------------|
| 1     | 43%                | 41%                |
| 2     | 90%                | 85%                |

- Note: 1. Difference in plans A and B is mainly due to introduction of train radio in plan A.  
 2. For alternative plans A and B, refer to Chapter 5-4.

Source: Study Team

#### 4-2-3 Improvement of Safety

Table 4.2.3 shows the number of train accidents on the Mandalay line for the past three years, of which serious accidents, i.e., train collisions, train derailments and train fires, amount 80. Rolling stock collisions and derailments in station yards, train accidents at level crossings, and train separation amount as high as 119.

When train accidents are grouped by cause, the number of train accidents from human errors such as by a driver or station staff is 38, the number from defective track or signal failure among those is 6, and that from level crossing failure is 31.

The facility improvement plan will eliminate most of the train accidents caused by facility failure and human mistakes, except for the accidents caused by rolling stock failure, when Phase-2 is completed.

Among the facility improvements, train separation detection will be provided to prevent train collisions caused by train separation.

Table 4.2.4 shows the decrease in train accidents under alternative plans A and B for signals, as compared with the accidents based on the data for the past three years.

Table 4.2.3 Number of Train Accidents on the Mandalay Line

| Classification                           | 1983/84   | 1984/85   | 1985/86   | Total      |

| 2     | 75%                | 60%                |

Note: 1. Difference in plans A and B is mainly due to introduction of ATS in plan A.

2. For alternative plans A and B, refer to Chapter 5-4.

Source: Study Team

#### 4-2-4 Increase in Track Capacity

On the Mandalay line, the sections where the track capacity has to be checked are 1) from TGL to YTG (9.3 km) where the suburban trains and trains for Martaban line are jointly using the same tracks, 2) from PEGU to PAG (17.3 km) the longest block section, 3) from TNGD to TGO (6.8 km) where a single track bridge locates in the double track sections, and 4) from SMN to TAB (11.7 km) the longest block section in the single track sections.

The approximate present and future track capacity is calculated based on the assumption that the train operation diagram of the concerned section is made on the aforementioned premise, taking into account the average running time between stations and handling time for blocking.

As Table 4.2.5 shows, the track capacity of all sections will be greatly increased over that at present, as a consequence of increase in train speed and decrease in block handling time.

Therefore, the track will have sufficient capacity for the planned train diagram (number of trains) in 1996/97, when Phase-2 is to be completed, and further increase in future.
