## PREFACE

This is the Kabupaten Report of the Feasibility Study of the Local Road Development in the Republic of Indonesia for Kabupaten Kolaka in Sulawesi Selatan Province. The report has been prepared by the Study Team of the Japan International Cooperation Agency (hereinafter called JICA).

Based upon a request from the Government of Indonesia, the Government of Japan arranged for JICA to conduct the Study and JICA accordingly organized a Study Team. The study was carried out using data which were generally prepared by the Kabupaten, routed through the province, under the instructions of Bina Marga of the Ministry of Public Works and Bangda of the Ministry of Home Affairs.

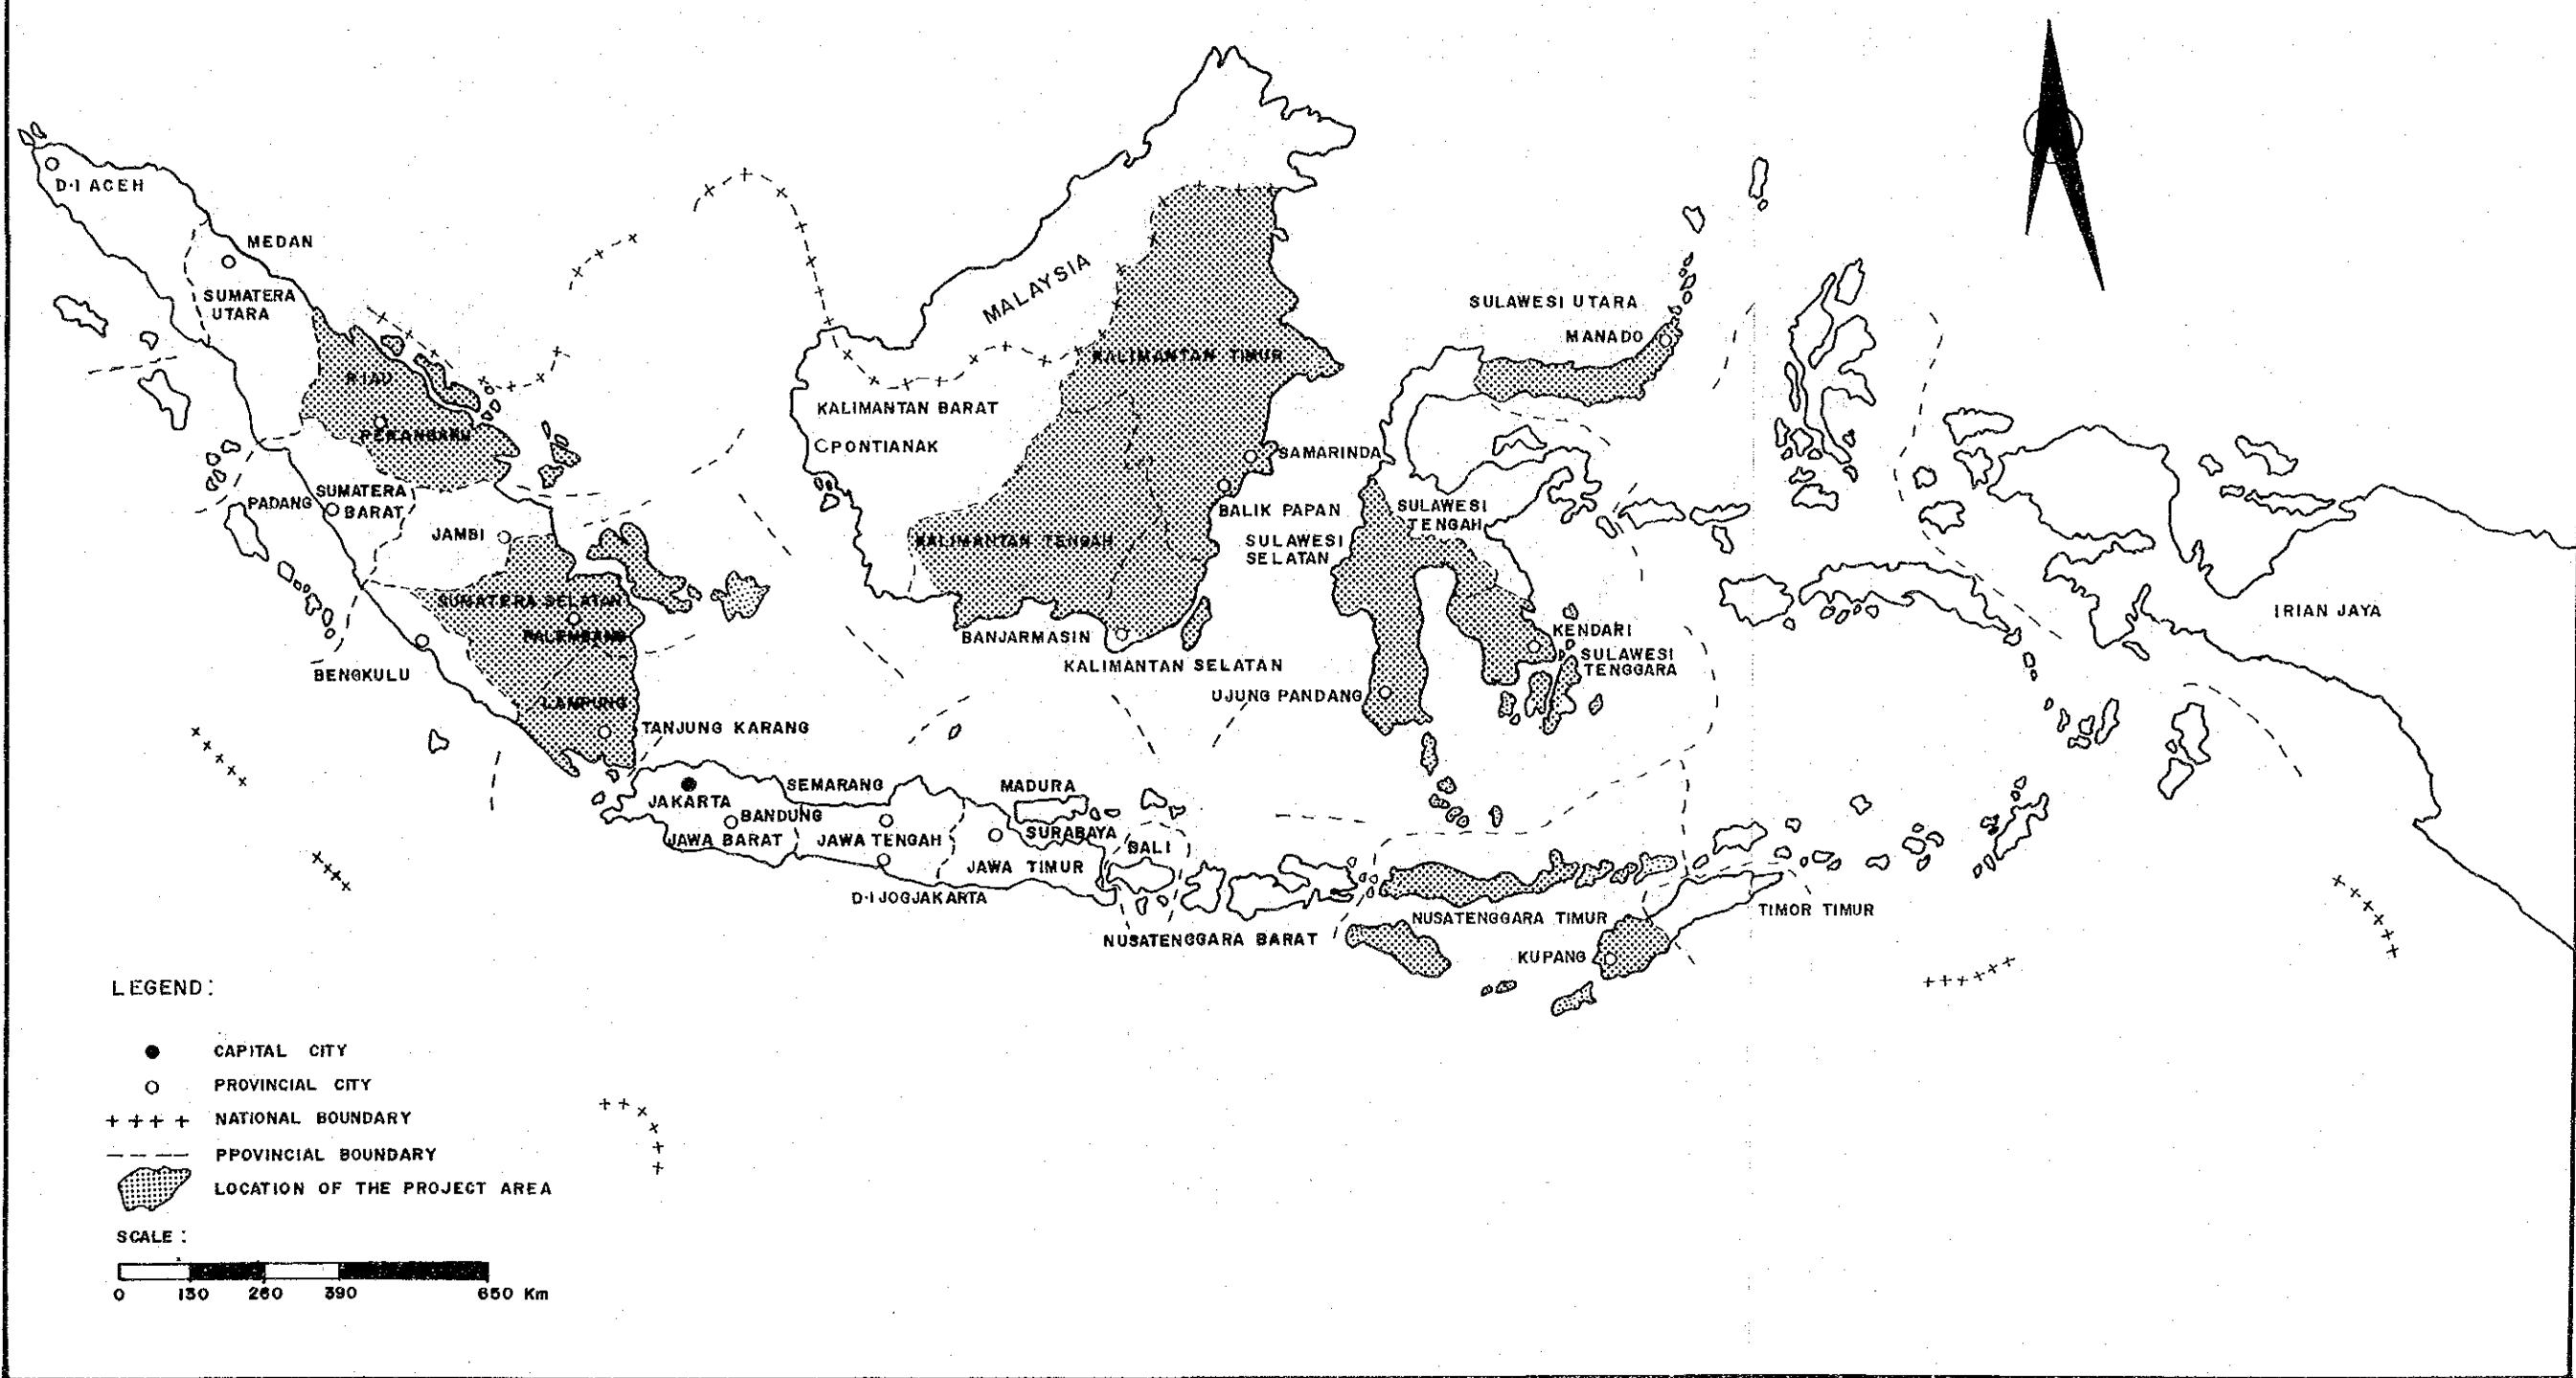

Since the study period was limited, without cooperation of Bina Marga, Bangda and local governments of both province and Kabupaten in collecting the data, the study would not have been completed within the period.

The report consists of the results of the feasibility study and proposed implementation programme of the local road development in the Kabupaten.

The simplified economic feasibility evaluation methodology utilized for the study was established by the Study Team in Phase I Study through a pilot study of seven (7) model Kabupatens, and is described in the Main Report.

The purpose of the study for the Kabupaten is mainly to estimate the total Project Cost for the local road development but only limited data is available for study base. Therefore a detailed survey and design for the improvement of the Kabupaten roads should be carried out before commencing the Project together with a review of this report.

### PREFACE

Chapter 1	BACKGROUND OF THE KABUPATEN	
1.1	Topographic and Meteorological Conditions .....	38-1
1.1.1	Location and Topography .....	38-1
1.1.2	Meteorological Conditions .....	38-2
1.2	Socio-Economic Conditions .....	38-4
1.2.1	Population .....	38-4
1.2.2	Land Use .....	38-5
1.2.3	Agriculture .....	38-8
1.2.4	Other Economic Activities .....	38-11
1.3	Present Status of Kabupaten Roads .....	38-12
1.3.1	Outline of Road Networks .....	38-12
1.3.2	Road Inventory .....	38-13
1.3.3	Bridge Inventory .....	38-17
1.3.4	Traffic .....	38-21
Chapter 2	ESTIMATIONS OF FUTURE TRAFFIC VOLUME AND BENEFIT	
2.1	Future Traffic Volume .....	38-22
2.1.1	Traffic Growth Rate .....	38-22
2.1.2	Present and Future Traffic Volume .....	38-23
2.2	Benefit .....	38-26
2.2.1	Benefit Estimation Method .....	38-26
2.2.2	Benefit .....	38-28
Chapter 3	ENGINEERING	
3.1	Design Criteria and Specification .....	38-29
3.1.1	Geometric Design Criteria .....	38-29
3.1.2	Loading Specification .....	38-29
3.2	Pavement Design .....	38-32
3.2.1	Design Conditions .....	38-32
3.2.2	Pavement Structure .....	38-33
3.3	Design of Bridges and Other Structures .....	38-34
3.3.1	Standard Bridge .....	38-34
3.3.2	Other Structures .....	38-36

3.4	Selection of Equipment Types .....	38-39
3.4.1	Points to be Considered for the Selection .....	38-40
3.4.2	Combinations of Equipment for Major Works and Maintenance .....	38-40
3.5	Workshop and Laboratory .....	38-43
3.5.1	Policy of the Kabupaten Workshop .....	38-43
3.5.2	Workshop Equipment and Tools .....	38-43
3.5.3	Laboratory .....	38-44

#### **Chapter 4 CONSTRUCTION AND MAINTENANCE COST ESTIMATIONS**

4.1	Unit Price .....	38-46
4.1.1	Unit Labour Price .....	38-46
4.1.2	Unit Price of Materials .....	38-47
4.1.3	Hourly Equipment Cost .....	38-48
4.2	Unit Construction Cost by Work Type .....	38-49
4.2.1	All Works Except Bridges .....	38-49
4.2.2	Bridges .....	38-50

#### **Chapter 5 RESULTS OF ECONOMIC FEASIBILITY EVALUATION**

5.1	Preliminary Screening .....	38-51
5.2	Evaluation .....	38-52
5.2.1	Primary Analysis .....	38-52
5.2.2	Secondary Analysis .....	38-52
5.2.3	Ranking of Feasible Road Links .....	38-52

#### **Chapter 6 IMPLEMENTATION PROGRAMME**

6.1	Implementation Schedule .....	38-55
6.1.1	Project Cost .....	38-55
6.1.2	Proposed Road Links .....	38-56
6.1.3	Annual Construction and Maintenance Cost .....	38-60
6.1.4	Construction and Maintenance Equipment Cost .....	38-63
6.1.5	Other Costs .....	38-66
6.1.6	Quantities by Work Type .....	38-66

6.2	Organization and Construction System .....	38-68
6.2.1	Organization .....	38-68
6.2.2	Construction System .....	38-68
Appendix A-1	Input Data for Estimation of the Producer's Surplus Benefit .....	38-A-1
A-2	Engineering Data .....	38-A-2
A-3	Construction and Maintenance Cost for Proposed Road Links .....	38-A-18
A-4	Construction and Maintenance Quantities for all Proposed Road Links .....	38-A-23
A-5	Construction and Maintenance Costs for all Proposed Road Links .....	38-A-26
A-6	Quantities of Bridges on Proposed Road Links .....	38-A-29

## Chapter 1 BACKGROUND OF THE KABUPATEN

### 1.1 Topographic and Meteorological Conditions

#### 1.1.1 Location and Topography

Kabupaten Kolaka is located in the northwestern part of Sulawesi Tenggara Province, and appears geographically as a long and slender shape which lies along Bone Bay.

Kabupaten Kolaka is surrounded by mountains and is itself almost entirely mountainous, i.e the northern mountain Mengkoka of 2,790 meter, the central mountain Batuwila of 2,000 meter and the southern mountain Mendoka of 981 meter above sea level. Accordingly the height above sea level of the northern area is greater than that of the southern area. Kecamatan Pakue Lasusua is located in the northern part of the Kabupaten and has few flat areas because it is almost all mountainous. Kecamatan Mowewe has the same conditions as Kecamatan Pakue, however the Kanaweha River rising in the north of the Kabupaten flows southwards for a while and turns into the neighboring Kabupaten Kendari, where narrow lowlands lie along the river. Kecamatan Kolaka which is located in the middle of the Kabupaten includes Kolaka city, the capital of the Kabupaten, which has a narrow flat area around it. Kecamatan Wundulako, which is located in the southern part of the Kabupaten is also mostly covered by mountains, while a few hills, are found in the southern coastal area. Kecamatan Tirauta, which is located in the middle southeastern part of the Kabupaten is flat. This is formed by part of the low swampy area which extends from the neighboring Kabupaten Kendari, the central area of Sulawesi Tenggara Province.

The Kabupaten has an area of 8,855 square kilometers, approximately 32 percent of the total of the province. It consists administratively of 6 Kecamatans.

### 1.1.2 Meteorological Conditions

The average number of rainy days and the average amount of yearly rainfall in Kabupaten Kolaka are 128 days and 1,680 mm respectively.

One year in the Kabupaten consists of a rainy season and a dry season. The dry season is in general from July through November. However this is variable as Table 1-1-1 shows.

The number of working days per year, which is necessary for planning the construction schedule in chapter 6, is estimated at 240 days using the following formula based upon the data shown in the table referred to above.

$$\text{Working Days} = \frac{365 - \text{Holidays} - \text{Rainy Days} + (\text{Rainy Days} \times \underline{\text{Days}} \times \underline{\text{Holiday}}) + (0.10 \times \text{Rainy Days})}{365}$$

Where :

- Holidays consist of 52 Sundays and 13 national holidays; and
- 10% of rainy days are assumed to be workable days.

Table 1-1-1

## 1.2 Socio-Economic Conditions

### 1.2.1 Population

The population of Kabupaten Kolaka in 1982 was 159,790 which was approximately 15.9% of the 1,002,100 total population of Sulawesi Tenggara Province as shown in Table 1-2-1.

The population density was 0.18 persons per ha which was lower than the provincial density of 0.38.

The recent annual average growth rate of population of the Kabupaten is 5.7% which is higher than both the provincial rate of 3.1% and the national rate of 2.2%. This may be a result of the on-going transmigration programme.

The population of each Kecamatan and its proportion to the Kabupaten population is shown in Table 1-2-2.

Table 1-2-1

POPULATION BY KABUPATEN

DESCRIPTION	POPULATION	AAGR (%)	AREA (ha)	POPULATION DENSITY (persons/ha)	SURVEY YEAR
<b>KABUPATEN:</b>

Table 1-2-2

## POPULATION BY KECAMATAN

Year : 1982

PROVINCE : SULAWESI TENGGARA

KABUPATEN : KOLAKA

KECAMATAN	POPULATION	PROPORTION (%)
WUNDULAKO	48,370	30.3
TIRAUTA	25,052	15.7
MOWEWE	8,545	5.3
KOLAKA	39,989	25.0
LASUSUA	19,920	12.5
PAKUE	17,914	11.2
TOTAL	159,790	100

### 1.2.2 Land Use

In Kabupaten Kolaka, 32,199 ha of the current available land use area, which is approximately 3.6% of the 885,495 ha total area of the Kabupaten, is used for living purposes and for industrial activity of the inhabitants of the Kabupaten. It is the total value of columns (1) through (6) in Table 1-2-3.

The current available land use area consists of 28,179 ha of agricultural harvest area and 4,020 ha of residential area which are 87.5% and 12.5% of the current available land use area respectively.

The agricultural harvest area consists of 12,178 ha of paddy field, 7,012 ha of plantation and 8,989 ha of other cultivated area which are 43.2%, 24.9% and 31.9% of the agricultural harvest area respectively.

It can be realized from the land use that the main industrial production in the Kabupaten is food crops, especially paddy.

Table I-2-3

## LAND USE

PROVINCE : SULAWESI TENGGARA

KABUPATEN	WET PADDY FIELD	UPLAND PADDY FIELD	OTHER CUL- TIVATED AREA	PLANTATION AREA	RESIDENTIAL AREA	USABLE SPACE	RIVER & LAKES	FORESTRY AREA	OTHERS	TOTAL AREA	SURVEY YEAR	(ha)
MUNA	12 (0.1)	3,367 (0.7)	53,999 (11.0)	26,322 (5.4)	4,260 (0.9)	142,000 (29.1)	1,062 (0.2)	221,440 (45.3)	36,278 (7.4)	488,725 (100)	1984	
KOLAKA	12,178 (1.4)	-	8,989 (1.0)	-	7,012 (0.8)	4,020 (0.5)	-	-	773,286 (87.3)	80,000 (9.0)	885,495 (100)	1982

## Notes :

1. The value in ( ) denotes the proportion
2. Source : Kabupaten concerned with the study

### 1.2.3 Agriculture

The cultivated area and food crop production in Kabupaten Kolaka in 1982 were 10,429 ha and 31,441 ton respectively as shown in Table 1-2-4. Of food crops, the area and production of paddy, which consists of wet paddy and upland paddy, was 7,554 ha and 29,818 ton respectively which are 72.4% and 94.8% of the total food crops. The yield rate of paddy production is 3.95 ton per ha. Thus, paddy is the most predominant agricultural crop of the Kabupaten.

As the table shows, average annual growth rates of area and production of paddy in 1979 through 1982 were -4.0% and 24.6% respectively which indicate favorable increase of the paddy productivity although the area is decreasing. This is because the portion of wet paddy field has increased. It is desirable that productivity of paddy increases further and this depends upon the future development of irrigation.

The population of the agricultural sector which is assumed from the employment in the Kabupaten is 87.4% of the total population as shown in Table 1-2-6. Thus this is an agricultural Kabupaten.

A future requirement for agriculture in the Kabupaten is to further progress paddy cultivation by proceeding with the transmigration programme. In addition, increase in cultivation and improvement of productivity of other food crops are essential.

Table 1-2-4

## POPULATION OF AGRICULTURAL SECTOR

PROVINCE : SULAWESI TENGGARA

KABUPATEN	AGRICULTURAL SECTOR	TOTAL POPULATION	PROPORTION (%)	AAGR	SURVEY
				(%)	YEAR
MUNA	119,000	187,653	63.6	0.7	1984
KOLAKA	140,000	159,790	87.4	4.0	1982

Notes :

1. AAGR : Average annual growth rate
2. Source : Kabupaten concerned with the Study

#### 1.2.4 Other Economic Activities

According to the distribution of employees by industry in Kabupaten Kolaka, the primary industry consists mainly of the agricultural and forest sectors employing about 88% of the workforce.

The other sectors employ 4% in the mining and manufacturing sectors which are the secondary industry and 8% in the commercial and services sectors which are the tertiary industry.

(1982)

<u>Item</u>	<u>No of Man Power (Person)</u>	<u>Share(%)</u>	<u>Remark</u>
Agriculture	119,570	87.43	
Live Stock	-		88.36%
Fishery	1,265	0.93	
Industry	1,380	1.01	
Mining	4,321	3.16	4.17%
Commerce	2,363	1.73	
Service	5,368	3.93	7.47%
Others	2,472	1.81	
Total	136,739	100	

The manufacturing industry as one of the secondary industries is mainly composed of processing industries using the materials of timber and various kinds of food. However, they are mainly small-scale domestic-cottage industries and therefore there is little possibility of future rapid development. The mining industry also shows current stagnation because nickel production has declined recently.

In Central Sulawesi Province the agricultural sector is a major industry and recently production volume per ha. Has been increased as a result of promoting the use of modern agricultural techniques to an intensive agricultural sector.

Furthermore, since production of nickel decreased sharply, the agricultural sector's ratio in increasing in Central Sulawesi Province. It seems that this is no a little related to the influence of the transmigration programmes.

### **1.3 Present Status of Kabupaten Roads**

#### **1.3.1 Outline of Road Networks**

In Kabupaten Kolaka there is a provincial road which connects the provincial capital Kendari and the Kabupaten capital Kolaka crossing the Kabupaten from east to west. It is a trunk road connecting two road links running from north to south on both the east and west sides of the mountain range.

The Kabupaten road which runs from the northern boundary with South Sulawesi Province to the southern boundary with Kabupaten Buton along the west coastline of the Kabupaten forms a trunk road in the region west of the mountain range. Most of the Desas in Kecamatan Pakue, Lasusua, Kolaka and Wundulaka are on this Kabupaten road.

The inland areas which have potential for development, i.e. near Pakue, Lapai, Tosiba, Ulunggolaka, Baula and Lamunde, have small road networks connecting to the north-south trunk road. The Kabupaten roads on the east side of the mountain range are formed by the following links:

- A link starting from Puurau or Tongauna of Kecamatan Mowewe, connecting to the provincial road at Talodo via Porabua and Solewatu.
- A link leaving the provincial road at Reterate, running to Lambandia in the southern area of the Kabupaten via Polipolia.

Since the southern area of the Kabupaten has the highest potential for agricultural development, the Solewatu-Talodo section of the above first link and all of the above second link are an important part of the development strategy.

The Kabupaten road connecting to Solewatu and the provincial road via Mowewe have similar characteristics.

There are two more roads which connect to regional trunk roads on both sides of the mountain range, i.e Porabua to Uluwolo in the central part of the Kabupaten and Polipolia to Baula in the southern part of the Kabupaten.

### 1.3.2 Road Inventory

From the road inventory data prepared by the Kabupaten, the number and total length of Kabupaten roads to be studied in Kabupaten Kolaka are confirmed as 63 links and 754 Km respectively. These figures exclude Kabupaten roads with no data.

According to the data the present status of the Kabupaten roads is as follows:

#### (1) Density of Kabupaten Roads

The density of the Kabupaten roads is 0.85 m per ha. This is higher than the national density of 0.48 m per ha but distinctly lower than 2.11 m per ha which is the density in Jawa Island, excluding DKI Jakarta, as shown in the following table.

	Total Length ( km )	Area (ha)	Density (m/ha)
Kabupaten : Kolaka	754	885,495	0.85
Province : Sulawesi Tenggara	1,268	1,374,220	0.92
Jawa Is. (Excluding DKI Jakarta)	27,715	13,159,700	2.11
Indonesia	92,038	191,944,300	0.48

Notes : 1. The value for the province is the total value for the Kabupatens included in the study.

2. The sources of data are as follows:

Kabupaten and Province : Bina Marga Inventory  
Java and Indonesia : Statistical Yearbook of  
Indonesia 1984, published  
by the Central Statistics  
Bureau

#### (2) Kabupaten Road Surface Type

The type of surface on the Kabupaten roads in the Kabupaten is shown in Table 1-3-1.

The legend used in the table is as follows:

ASP : Asphalt

KRK : Gravel/Stone/Telford/Water Bound Macadam

Table 1-3-1 EXISTING ROAD LENGTH BY SURFACE TYPE

	TOTAL	1	46	1	88	1	397	1	10	1	213	1	1	754	1				
	RATIO	1	6	1	12	1	53	1	1	1	28	1	1	18	1				

TNH : Earth

LL : Others

Comparison of the proportion of surface type in the Kabupaten with other regions is as follows:

	<u>ASP</u>	<u>KRK</u>	<u>TNH/LL</u>
Kabupaten : Kolaka	6.1	13.0	80.9
Province : Sulawesi Tenggara	4.3	25.9	69.8
Jawa Is. (Excluding DKI Jakarta)	56.2	25.0	18.8
Indonesia	26.0	26.6	47.4

Thus, in the Kabupaten the proportion of Kabupaten roads with asphalt surface is much lower than either that of Indonesia or of Jawa Island. The proportion of low grade roads such as earth roads and others is distinctly high. This means that the road classification in the Kabupaten is low.

### (3) Surface Condition of Kabupaten Roads

The surface condition of the Kabupaten roads classified as good, fair, poor and bad which are shown as BA, SD, RU and RB respectively, are summarized in Table 1-3-2.

Comparison of the proportions of the various surface conditions of the Kabupaten roads in the Kabupaten with other regions is as follows:

	<u>Good</u>	<u>Fair</u>	<u>Poor</u>	<u>Bad</u>
Kabupaten : Kolaka	34.7	29.1	26.8	9.4
Province : Sulawesi Tenggara	30.6	21.5	36.8	11.1
Jawa Is. (Excluding DKI Jakarta)	45.6	29.8	19.6	5.0
Indonesia	43.5	21.8	21.1	13.6

The surface condition level of the Kabupaten roads in the Kabupaten is lower than both that of Indonesia and of Jawa Island. The proportion in good condition is relatively low.

Table 1-3-2 EXISTING ROAD CONDITION BY SURFACE TYPE

PROVINCE : SULAWESI TENGGARA

KABUPATEN : KOLAKA

{11}

Therefore besides improvement for poor roads in or bad condition it is desirable that the asphalted portion is increased.

#### (4) Terrain Conditions of Kabupaten Roads

The difficulty of road improvement is mainly dependent upon the terrain conditions.

The terrain conditions of the Kabupaten roads, classified as flat, hilly, mountainous and swampy which are shown as DT, BK, GN and RW, are summarized in Table 1-3-3.

The proportions of terrain conditions in the Kabupaten are 41.0% flat, 20.0% hilly, 36.0% mountainous and 3.0% swampy.

Road construction is anticipated to be rather difficult because of the relatively large proportions of hilly and mountainous areas.

#### 1.3.3 Bridge Inventory

A bridge inventory showing the existing condition of bridges on the Kabupaten roads in Kabupaten Kolaka was prepared by the Kabupaten.

The bridge types are classified as timber, concrete, steel and others which are shown in the inventory as KY, BT, BJ and LL respectively.

The inventory shown in Table 1-3-4 and Table 1-3-5 indicates a total of 52 bridges with a total length of 437 m of which 42 or 80.8% are timber, 1 or 1.9% are concrete and 19 or 17.3% are others. However 167 bridges with a total length of 2028 m are required to be newly constructed.

The number of existing bridges by span length is as follows:

<u>Bridge Type</u>	<u>≤3</u>	<u>≤5</u>	<u>≤8</u>	<u>≤10</u>	<u>≤12</u>	<u>≤14</u>	<u>≤16</u>	<u>≤18</u>	<u>≤20</u>	<u>≤99</u>	Total
Timber	-	10	20	5	2	-	4	1	-	-	42
Concrete	-	1	-	-	-	-	-	-	-	-	1
Steel	-	-	-	-	-	-	-	-	-	-	-
Others	-	2	5	-	1	-	-	1	-	-	9
Total	-	13	25	5	3	-	4	2	-	-	52

Thus, most of the existing bridges on the Kabupaten roads are timber and the majority of spanlengths is within the range of 5 m to 8 m.

#### 1.3.4 Traffic

Inventories of the average daily traffic (ADT) on the Kabupaten roads in Kabupaten Kolaka were prepared by the Kabupaten and are shown in Chapter 2.

From the inventories, total value of average daily trips by vehicle type and their proportions in the Kabupaten in 1984 are summarized as follows:

	SEDAN	BUS	TRUCK	MOTOR-CYCLE	TOTAL
Total Trips	166	234	482	1,790	1,782
Proportion (%)	6.21	8.76	18.04	66.99	100.00

Source : Bina Marga Inventory

The proportions of registered vehicles by vehicle type are as follows:

	SEDAN	BUS	TRUCK	MOTOR-CYCLE	TOTAL
Proportion (%)	8.60	3.96	3.78	83.66	100.00

Source : Kabupaten.

Thus, the proportion of motorcycles in the Kabupaten is by far the highest.

From the above tables the following can be observed:

- Number of total trips might be underestimated
- Proportions are probably reasonable.

Essentially, for estimation of future traffic volumes past and present traffic data together with the trend in the number of registered vehicles are important basic data. However the data obtained for the study was traffic count data for each road link in 1985 and of low reliability.

Therefore the future traffic volumes are estimated by the calculation process recommended in chapter 3 of the Main Report.

## Chapter. 2 ESTIMATIONS OF FUTURE TRAFFIC VOLUME AND BENEFIT

### 2.1 Future Traffic Volume

#### 2.1.1 Traffic Growth Rate

The traffic growth rate used for estimation of the future traffic volume on the Kabupaten roads was estimated by the following calculation process.

Growth of Production Basis "A":

$$\sqrt{\text{Annual Population Growth of the Kabupaten}} \times \text{Growth of the Total Cultivated Area}$$

Growth of Productivity "B":

$$\sqrt{\text{Growth of the Total Paddy Field Area}} \times \text{Growth of the Paddy Production per ha}$$

Traffic Growth Rate: Initial estimated figure:

$$GR' = \sqrt{A \times B}$$

Traffic Growth Rate GR = Final adjusted figure:

$$\sqrt{GR' \times \text{Trend of GDP/Capita of the Province Concerned}}$$

Results of the estimation are shown in Table 2-1-1.

Table 2-1-1 TRAFFIC GROWTH RATE ESTIMATION

PROV : SULAWESI TENGBARA KAB : KOLAKA

A)	Growth Rate of Population	:	5.70 (%)
B)	Growth Rate of Cultivated Area	:	0.00 (%)

a)	Geometrical Mean ( A x B )	:	2.81 (%)
b)	Geometrical Mean ( C x D )	:	9.77 (%)
c)	Geometrical Mean ( a x b )	:	6.23 (%)
d)	Geometrical Mean ( c x E )	:	5.97 (%)

TRAFFIC GROWTH RATE : 5.97 (%)

### 2.1.2 Present and Future Traffic Volume

The future traffic volumes on the Kabupaten roads in 1998 for the Project life time of ten years were estimated by the following formula :

$$T_n = T_e (1 + r)^n$$

Where :

$T_n$  : Future traffic volume  $n$  years later

$T_e$  : Traffic volume in 1984

$r$  : Traffic growth rate

The results are shown in Table 2-1-2 together with the traffic volume in 1984.

## 2.2 Benefit

### 2.2.1 Benefit Estimation Method

Generally, estimation of the benefit on each Kabupaten road due to the Project was made by analyzing the direct benefit i.e. the VOC reduction benefit, which was estimated by comparing "with project" and "without project" based upon the future traffic volume on the road. However for the following road links it was decided to estimate the indirect benefit through the producer's surplus benefit.

- a) Road links with present traffic volume (ADT) less than 60 equivalent 4-wheel vehicles.
- b) Road links with no 4-wheel vehicle operation at present.

The indirect benefit was changed into the future traffic volume and the VOC reduction benefit was estimated.

The VOC adopted for the estimation is shown in Table 2-2-1.

Table 2-2-1 VEHICLE OPERATION COST ON KABUPATEN ROADS

SURFACE	CONDITION	(KM)			
		SEDAN	BUS	TRUCK	MOTORCYCLE
ASPHALT	GOOD	104.7	86.2	85.4	15.9

## 2.2.2 Benefit

The benefit estimation was carried out for each Kabupaten road.

Table 2-2-3 shows a sample of the result of benefit estimation.

In the table "surplus" and "VOC" show the estimation method utilized and III A, III B-1, III B-2 and III C show the road classification.

## Chapter 3 ENGINEERING

### 3.1 Design Criteria and Specification

#### 3.1.1 Geometric Design Criteria

Currently a technical standard for improvement of Kabupaten roads i.e., PETUNJUK TEKNIS INPRES PENUNJANGAN JALAN KABUPATEN, TAHUN 1984-1985 is established by Bina Marga.

The geometric design criteria in the above standard are recommended to be adopted in general for the Project. Following discussions with Bina Marga, exceptions to this are allowed for Pavement width and pavement type to minimize the construction cost of the Kabupaten road improvement, if necessary. The geometric design criteria adopted for the Project are shown in Table 3-1-1. The typical cross sections of Kabupaten roads are shown in Fig. 3-1-1.

#### 3.1.2 Loading Specification

The LOADING SPECIFICATIONS FOR HIGHWAY BRIDGES BY DIRECTORATE GENERAL BINA MARGA is used in principle as the basic specification of loading and the TECHNICAL STANDARD FOR KABUPATEN ROADS compiled by Bina Marga shows that the design live load for bridges on Kabupaten roads is 70% of the Bina Marga live road. However, after discussions with Bina Marga the following loads were decided as the design live loads for the standard bridges of Kabupaten roads:

- a. 50% of Bina Marga live load (hereinafter BM 50) is applied for concrete and timber bridges on roads of III A classification.
- b. 10-ton truck load is applied for timber bridges on roads of III B-1, III B-2 and III C classification.

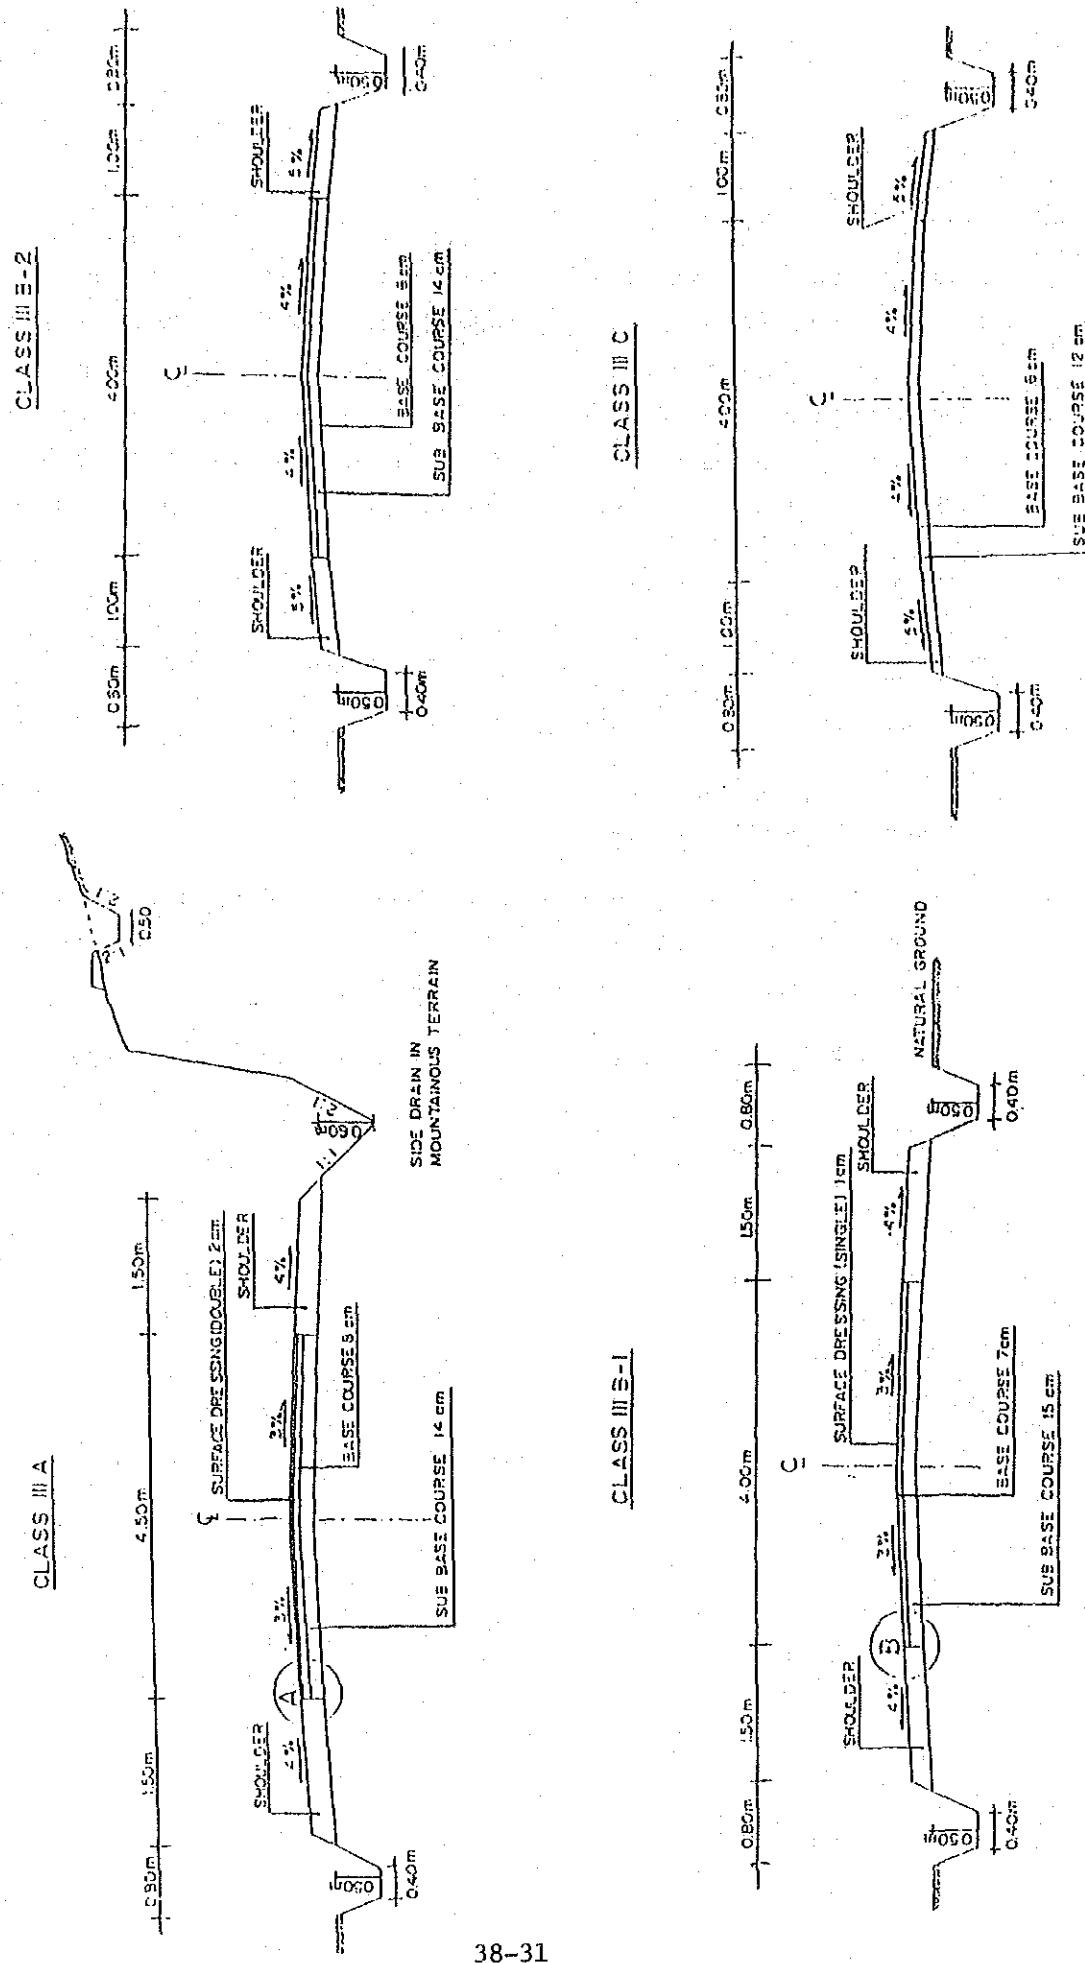

Table 3-1-1

## DESIGN CRITERIA FOR KABUPATEN ROADS

ROAD CLASSIFICATION		CLASS III A		CLASS III B-1		CLASS III B-2		CLASS III C	
SURFACE TYPE		ASPHALT SEAL (DOUBLE)		ASPHALT SEAL (SINGLE)		GRAVEL		GRAVEL	
TRAFFIC VOLUME : ADT (Forecast 10 th year average per day)		3000 - 500		500 - 200		200 - 50		50

Fig. 3-1-1

STANDARD ROAD CROSS SECTIONS

### **3.2 Pavement Design**

#### **3.2.1 Design Conditions**

From the engineering data prepared by the Kabupaten it is noted that the pavement structure of the Kabupaten roads seems to have been determined without adequate designs, therefore the Kabupaten roads generally have insufficient capacity. The standards generally used for highway pavement design such as Road Note 29, Road Note 31 and AASHTO are not suitable for Kabupaten roads with small traffic volumes and loads.

Therefore formulae suitable for the pavement design of Kabupaten roads are recommended as described in Chapter 5 of the Main Report.

The following are important factors for the design of pavement thickness.

##### **1) Design Traffic Volume**

As the pavement thickness is designed for each road classification the design traffic volume of which the target year is 1998, is adopted for each classification as follows:

<u>Road Classification</u>	<u>Design Traffic Volume (vpd)</u>
III A	1,000
III B-1	500
III B-2	200
III C	50

##### **2) Strength of Roadbed**

The CBR value of the existing roadbed is a very important factor for the pavement design but no results are available from CBR tests on the Kabupaten roads.

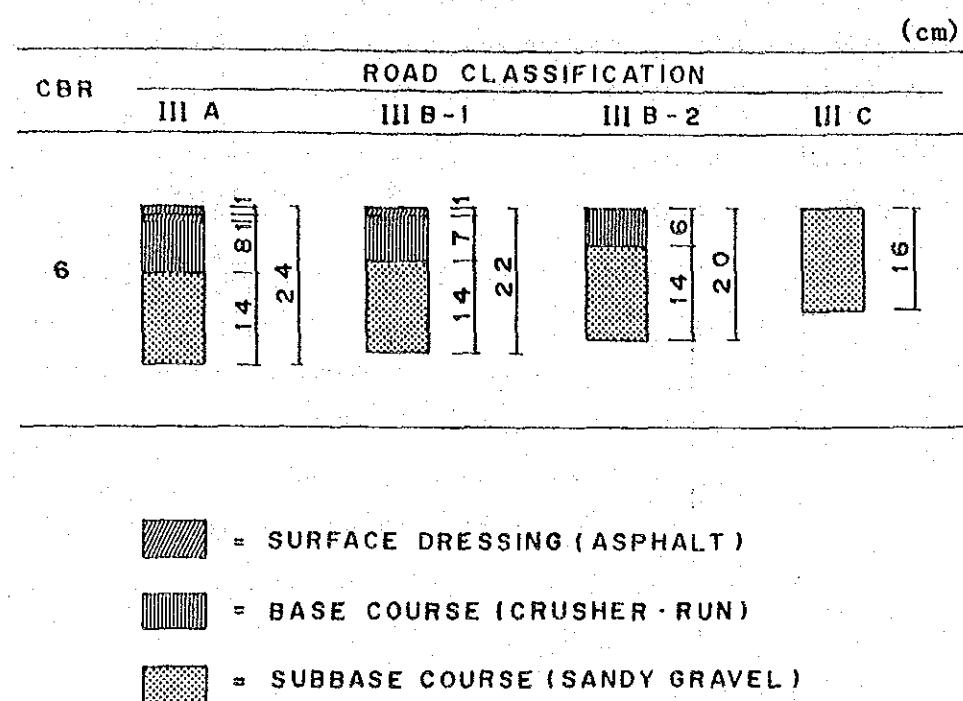

CBR of the laterite is generally in the range of CBR 4 to 10. However site CBR tests should be conducted before construction to finally decide the pavement thickness.

### **3.2.2 Pavement Structure**

Fig. 3-2-1 shows the standard pavement structure adopted for the Kabupaten roads.

Fig. 3-2-1

PAVEMENT STRUCTURE

### 3.3 Design of Bridges and Other Structures

#### 3.3.1 Standard Bridge

There are so many bridges to be improved or to be constructed on the Kabupaten roads in the Project Area that it is very difficult to prepare an individual design for each bridge. Therefore, standardization is recommended as being necessary for the bridge design with conclusions as described below.

##### (1) Bridge Type

###### 1) Superstructure

The following two types have been finally selected with the agreement of Bina Marga after studying the actual rural conditions of bridge construction. Fig. 3-3-1 shows the cross sections of standard types.

- a. Timber beam bridge (hereinafter timber bridge) for roads class III B-1, III B-2 and III C.
- b. Reinforced concrete T-girder bridge (hereinafter RC-bridge) for roads class III A.

###### 2) Substructure

Taking account of the actual combinations of super and substructure types noted from the field survey, the following two types are recommended as standard because of ease of construction and economy.

- a) Timber pile bents for timber bridge
- b) Rubble in Mortar masonry for RC bridge

###### 3) Foundation

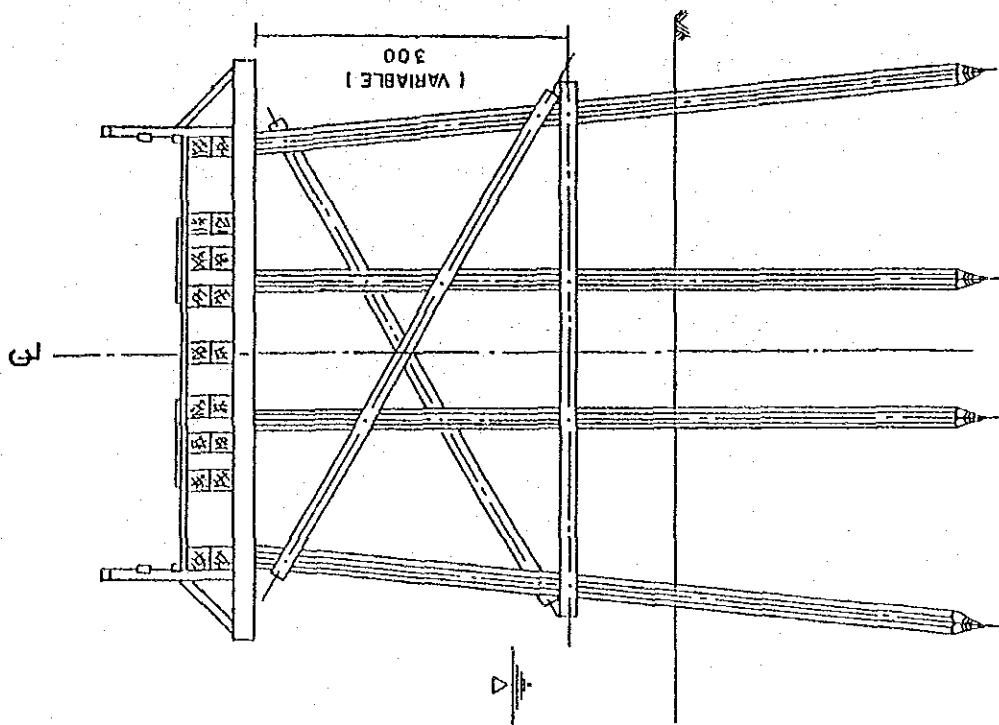

There is no information of subsoil conditions in the inventory data. However, timber piles of 20 cm diameter are generally recommended as piles of this type are in common use.

The pile length is suggested to be a minimum of 3 meters under the bottom of the foundation. The length and number of piles should be decided in order to be adequate for the condition of the foundation materials.

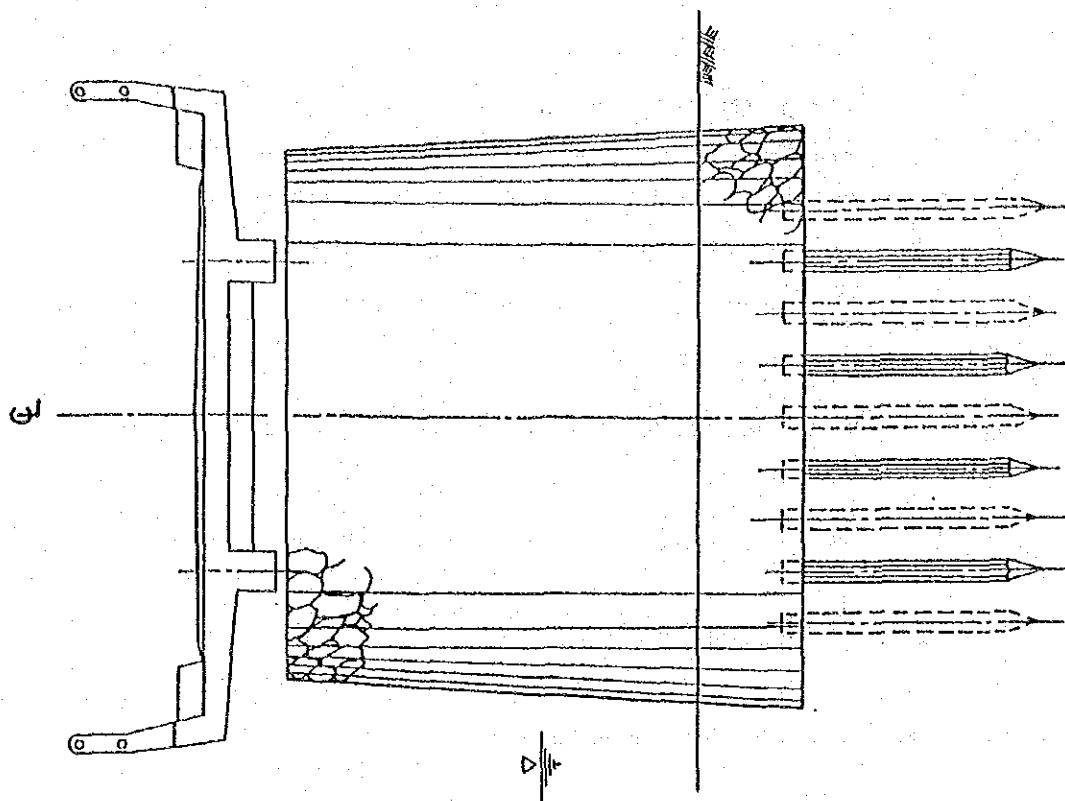

Fig. 3-3-1

CROSS SECTIONS OF STANDARD BRIDGES

TIMBER BRIDGE

REINFORCED CONCRETE BRIDGE

## (2) Bridge Width

The effective bridge widths for the standard bridges have been decided as follows through discussions with Bina Marga considering the actual width of Kabupaten roads:

- a) Timber bridge: 4.0 m in general
- b) RC bridge : 4.5 m in general

## (3) Span Length

The range of span lengths are determined as:

- a) Timber bridge: 3.0, 5.0 and 8.0 m
- b) RC bridge : 3.0, 5.0, 10.0 and 15.0 m

### 3.3.2 Other Structure

Culverts and retaining walls shown in Fig. 3-3-2 and Fig. 3-3-3 are recommended as standard structures.

#### (1) Culvert

The following two culvert types have been adopted for the transverse drainage.

- a) Reinforced concrete pipe culvert  $\phi$  80 cm
- b) Rubble in mortar box culvert with RC slab 80 cm X 80 cm

#### (2) Retaining Wall

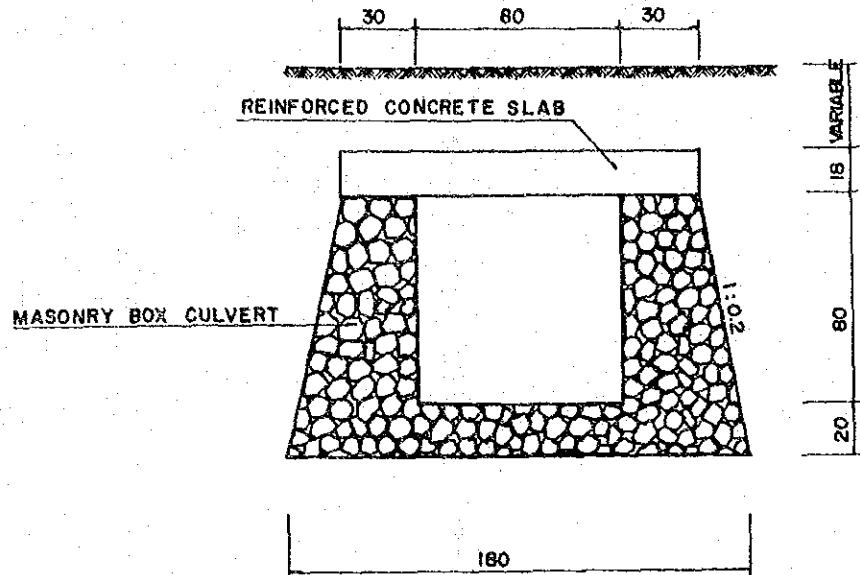

The following two types of retaining walls have been adopted because of ease of construction, economy and familiarity in Indonesia.

- a) Rubble in mortar retaining wall
- b) Timber retaining wall

Fig. 3-3-2

TIMBER RETAINING WALL

RUBBLE IN MORTAR WALL

### **3.4 Selection of Equipment Types**

From the results of comparison of two types of Kabupaten road construction methods, i.e. equipment intensive method and labour intensive method construction methods for major works were basically decided as shown in Table 3-4-1.

Table 3-4-1 CONSTRUCTION METHODS FOR  
MAJOR WORKS

METHOD	WORK TYPE
Equipment Intensive	Earthwork, Base Course and Subbase Course
Labour Intensive	Surface Dressing, Drainage, Bridge and Other Structures.

### 3.4.1 Points to be Considered for the Selection

Full consideration was given to the following points in studying the selection of equipment type.

- a. Most of the construction in the Project is pavement works for road improvement.
- b. The pavement width adopted is equal to or less than 4.5 m and therefore large sized equipment is omitted from the selection process.
- c. Equipment should be capable of withstanding the heavy rainfall and poor soil quality. Equipment for construction in swampy areas is considered if necessary.
- d. Uniformity of equipment types with existing equipment is considered to facilitate repair of the equipment in the provincial work shop.
- e. Since the scale of the construction is small and transportation of equipment will frequently be necessary, wheel type equipment has been selected as much as possible as this can move by itself or by being towed.
- f. The roads likely to be improved are scattered all over the Kabupaten and therefore a low bed truck or equivalent is necessary for transportation of crawler type equipment. It is desirable to protect the existing pavement from damage caused by the movement of crawler type equipment on the existing roads.
- g. The capacity of the equipment has been decided taking into consideration the construction volume and the combination of equipment in the main work.

### 3.4.2 Combinations of Equipment for Major Works and Maintenance

The combinations of equipment for major works and maintenance are listed in Table 3-4-2 and 3-4-3 respectively.

Table 3-4-2 EQUIPMENT OF ONE WORK GANG FOR MAJOR TYPES OF WORK

TYPE OF WORK	EQUIPMENT REQUIRED	
1. Site Clearing in Light Bush	1- Bulldozer 90 HP 2- Dump Truck 3.0 Ton	1- Wheel Loader 1.2 m <sup>3</sup>
2. Excavation & Embankment		
i) Normal Fill	1- Bulldozer 90 HP 1- Vibratory Roller 4.0 Ton (D&T)	1- Water Tank Truck 4,000 Ltr
ii) Fill by Borrow Material	1- Bulldozer 90 HP 3- Dump Truck 3.0 Ton	1- Wheel Loader 1.2 m <sup>3</sup>
iii) Fill in Swamp	1- Swamp Bulldozer 90 HP 1- Water Tank Truck 4,000 Ltr	1- Vibratory Roller 4.0 Ton (D&T)
iv) Excavation to Spoil	1- Bulldozer 90 HP 1- Wheel Loader 1.2 m <sup>3</sup>	4- Dump Truck 3.0 Ton
3. Subgrade Preparation	1- Motor Grader 75 HP 1- Vibratory Roller 4.0 Ton (D&T)	1- Water Tank Truck 4,000 Ltr
4. Subbase Course	1- Motor Grader 75 HP 1- Vibratory Roller 4.0 Ton (D&T)	1- Water Tank Truck 4,000 Ltr
5. Base Course	1- Motor Grader 75 HP 1- Vibratory Roller 4.0 Ton 1- Portable Crusher/Screens 30-40 Ton/H	1- Water Tank Truck 4,000 Ltr
6. Cement Stabilizing	1- Motor Grader 70 HP 1- Bulldozer 90 HP 1- Wheel Loader 1.2 m <sup>3</sup> 1- Flat Bed Truck 3.0 Ton	1- Vibratory Roller 4.0 Ton (D&T) 1- Road Stabilizer 1- Water Tank Truck 4,000 Ltr
7. Surface Course	1- Asphalt Sprayer 850 Ltr 1- Tyre Roller 8-15 Ton 1- Portable Crusher/Screens 30-40 Ton/H	1- Flat Bed Truck 3.0 Ton
8. Concrete	1- Concrete Mixer 0.5 m <sup>3</sup> 1- Water Pump 200 Ltr/Min 1- Concrete Vibrator 3.3 HP	1- Flat Bed Truck 3.0 Ton 1- Hand-Guided Vibratory Roller 1000 Kg

Table 3-4-3

EQUIPMENT OF ONE WORK GANG FOR MAINTENANCE

TYPE OF WORK	EQUIPMENT REQUIRED
Road	1- Motor Grader 1- Tyre Roller 8-15 Ton 1- Hand-Guided Vibratory Roller 1000 Kg 1- Flat Bed Truck 3.0 Ton 1- Dump Truck 3.0 Ton
Bridge and Other Structure	1- Flat Bed Truck With Crane 3.0 Ton

### **3.5 Workshop and Laboratory**

#### **3.5.1 Policy of the Kabupaten Workshop**

A workshop will be provided for each Kabupaten. The function of the workshop is to cope with requests from the construction site. The main service will be routine maintenance while the secondary service will be light repairs which can be carried out by changing parts. Dismantling and assembling of units which need setting or adjustment using special equipment or facilities will not be carried out in the Kabupaten workshop. Such repairs are planned to be carried out by the provincial workshop or the regional Workshop of Bina Marga.

Accordingly the main tasks of the Kabupaten workshop are as follows:

- 1) Administration for and storage of equipment
- 2) Routine maintenance and light repair of equipment
- 3) Storage and supply of spare parts
- 4) Operation of equipment including crushing plant.

#### **3.5.2 Workshop Equipment and Tools**

Equipment and tools for the workshop are recommended as shown in Table 3-5-1.

Table 3-5-1                    WORKSHOP EQUIPMENT AND TOOLS

DESCRIPTION	QUANTITY
Upright Drilling Machine	1 Set

Wire Rope (for sling) 3.2 ton	2
Generator	1

### 3.5.3 Laboratory

For quality control of construction in the Project it is recommended that a laboratory is provided for each Kabupaten. For each laboratory, provision of laboratory test equipment for the following tests is recommended:

- Physical characteristic, compaction and strength tests for the road bed and pavement materials.
- Slump and strength tests for the bridge concrete.

In the laboratory a fixed water tank should be provided for CBR tests and curing of concrete specimens.

The proposed laboratory equipment is listed in Table 3-5-2.

Table 3-5-2                    LABORATORY TEST EQUIPMENT

DESCRIPTION	QUANTITY
Soil Moisture Test Set (JIS A1203)	1
Liquid Limit Set (JIS A1205)	1
Plastic Limit Set (JIS A1206)	1

## Chapter 4 CONSTRUCTION AND MAINTENANCE COST ESTIMATIONS

### 4.1 Unit Price

With regard to the unit prices of materials and labor, the data were collected from each Kabupaten through Bina Marga. The collected data were compared with those of Jakarta using BAHAN BANGUNAN DKI-JAKARTA MAY & JUNE 1985 compiled by PUSAT INFORMASI TEHNIK PEMBANGUNAN, and then finalized.

#### 4.1.1 Unit Labour Price

The unit labour prices of Kabupaten Kolaka and other Kabupatens in Sulawesi Tenggara Province are shown in Table 4-1-1.

Table 4-1-1

UNIT LABOUR PRICE

KABUPATEN	MAN	SKL LAB	CAP	MAS	LAB	DRIV	OPE	(Rp)
Muna	2,500	2,250	3,000	3,000	1,750	2,000	2,500	
Kolaka	3,300	3,000	3,500	3,500	2,200	3,000	4,000	
Average	2,900	2,625	3,250	3,250	1,975	2,500	3,250	

Notes :

- MAN : Mandur
- SKL LAB : Skilled Labour
- CAP : Carpenter
- MAS : Mason
- LAB : Labourer
- DRIV : Driver
- OPE : Operater

**4.1.2 Unit Price of Materials**

Table 4-1-2 shows the unit price of materials for Kabupaten Kolaka together with for other Kabupatens in Sulawesi Tenggara Province.

Table 4-1-2 UNIT PRICE OF MATERIALS

MATERIAL	UNIT	MUNA	KOLAKA	AVERAGE	(Rp)
Bitumen	L	300	400	350	
Asphalt oil	L	800	850	825	
Gasoline	L	250	250	250	
Sand	M <sup>3</sup>	7,500	4,000	5,750

## 4.2 Unit Construction Cost by Work Type

### 4.2.1 All Works Except Bridges

The unit construction costs by work type, excluding bridge construction costs, have been estimated using the combination of equipment described in Clause 3.4 and the unit prices already listed. The results are summarized in Table 4-2-1.

Table 4-2-1 UNIT COST BY WORK TYPE EXCEPT BRIDGE WORK

PROV : SULAWESI TENGGARA KAB : KOLAKA

(Rp)

ITEM	UNIT	LOCAL	FOREIGN	TOTAL
Site Clearance in Light Bush	#2	166	91	257
Subgrade Preparation	#2	21	11	32
Normal Fill	#3	1,712	866	2,578
Fill in Swamp	#3	2,581	1,058	3,619
Normal Excavation to Spoil	#3	1,002	525	1,527

## Chapter 5            RESULTS OF ECONOMIC FEASIBILITY EVALUATION

### 5.1 Preliminary Screening

The road links to be improved should be effective for development of the Project Area. The road links where improvements were assumed to be inefficient for development of the Project Area were generally screened out using the following cut-off criteria.

- (1) Very short roads, less than 2 Km long, which have no connection with the trunk road network.
- (2) Roads not connected to the network at any point
- (3) Unpreferred roads, due to poor suitability for transportation compared to other existing alternative roads serving the same purpose.
- (4) Road in good condition according to the Bina Marga road inventory which lists improvement projects carried out in the last two or three years
- (5) Roads with asphalt surface in good condition
- (6) Urban roads, except those forming part of a longer route
- (7) Roads serving single large organizations rather than the general public
- (8) Roads with no inventory data
- (9) Kabupaten roads also assigned as provincial roads

The road links to be screened out in Kabupaten Kolaka are shown in Table 5-1-1.

Table 5-1-1

ROAD LINKS TO BE SCREENED OUT

KABUPATEN : KOLAKA

CRITERIA NO	ROAD LINK NO

## **5.2 Evaluation**

### **5.2.1 Primary Analysis**

The Kabupaten roads were classified by using the future traffic volume on the road links in 1998. The primary analysis of the IRR was carried out using the construction and maintenance costs. Road links where IRRs were more than 10% were defined as feasible links.

Results of primary analysis are shown in Table 5-2-1.

### **5.2.2 Secondary Analysis**

From the infeasible road links evaluated by the primary analysis, road links where the IRRs were between 1% and 10%, i.e. road links which could become feasible if down graded by one rank, in classification were down graded and the costs re-estimated. Using these costs, a secondary analysis of IRR was carried out. Road links where these IRRs were then more than 10% were also defined as feasible links. This reflected that even though the road classification was rather low the road link should be improved.

Results of secondary analysis are shown in Table 5-2-2.

### **5.2.3 Ranking of Feasible Road Links**

From the results of the primary and secondary analysis, road links where the IRRs were more than 10% were selected and their NPVs and B/Cs were estimated. The ranking of feasible road links from the economic evaluation are decided in the order of the NPVs, i.e. the larger the NPV the higher the road link priority as shown in Table 5-2-3.
