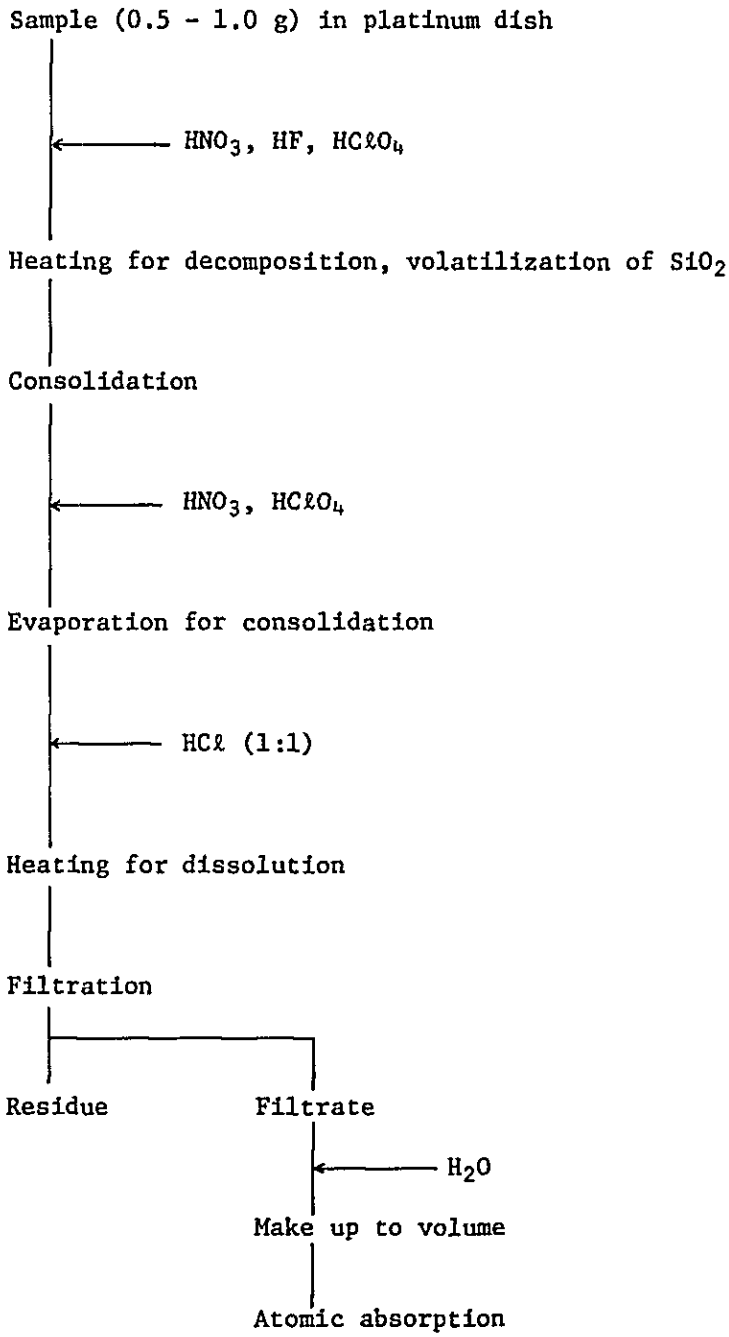
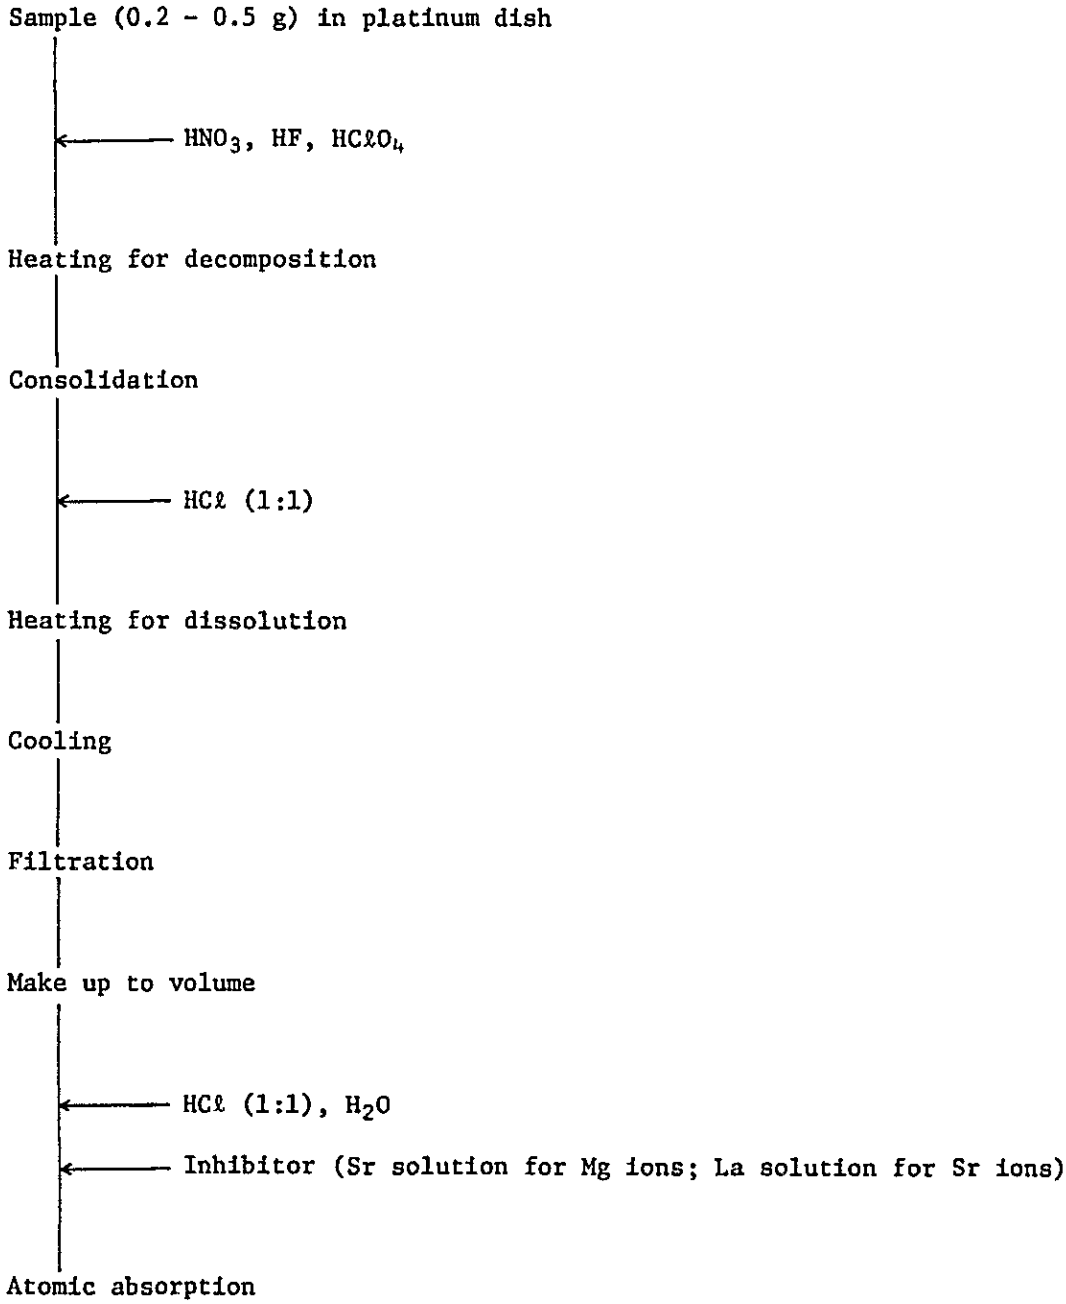
A. I-12 Flow sheets of chemical analysis.

(Cu, Pb, Zn)

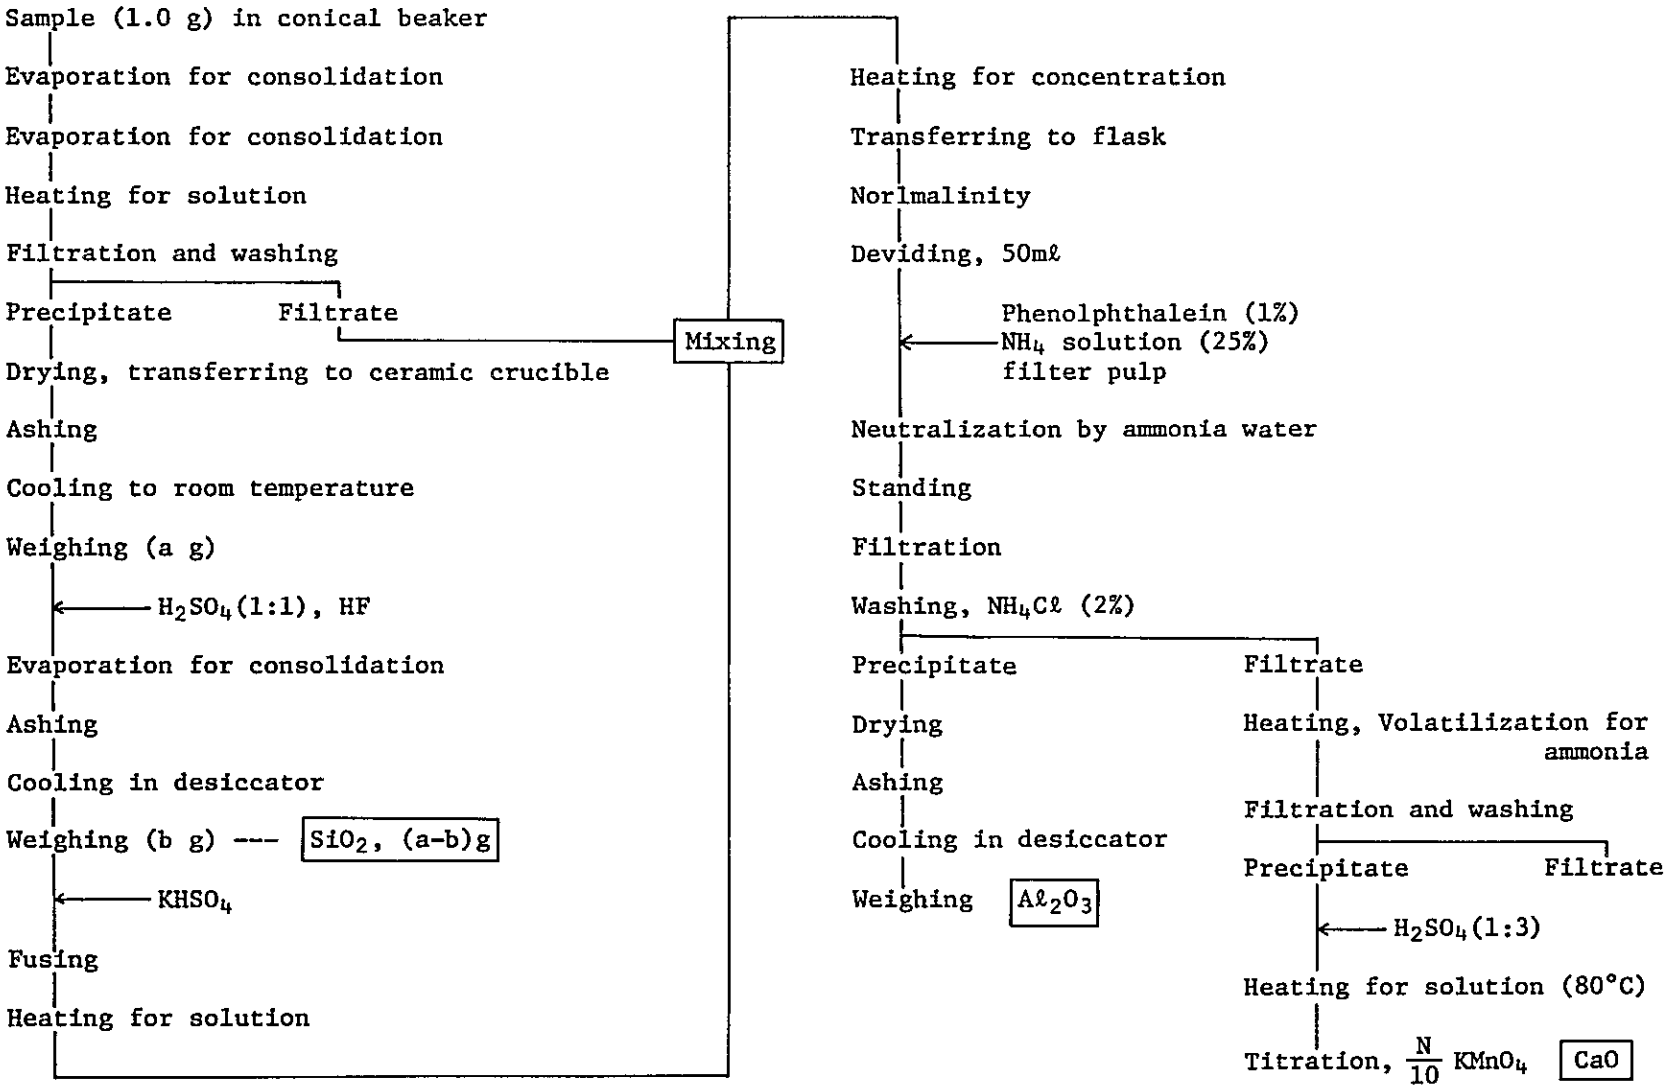


(Mg, Sr)

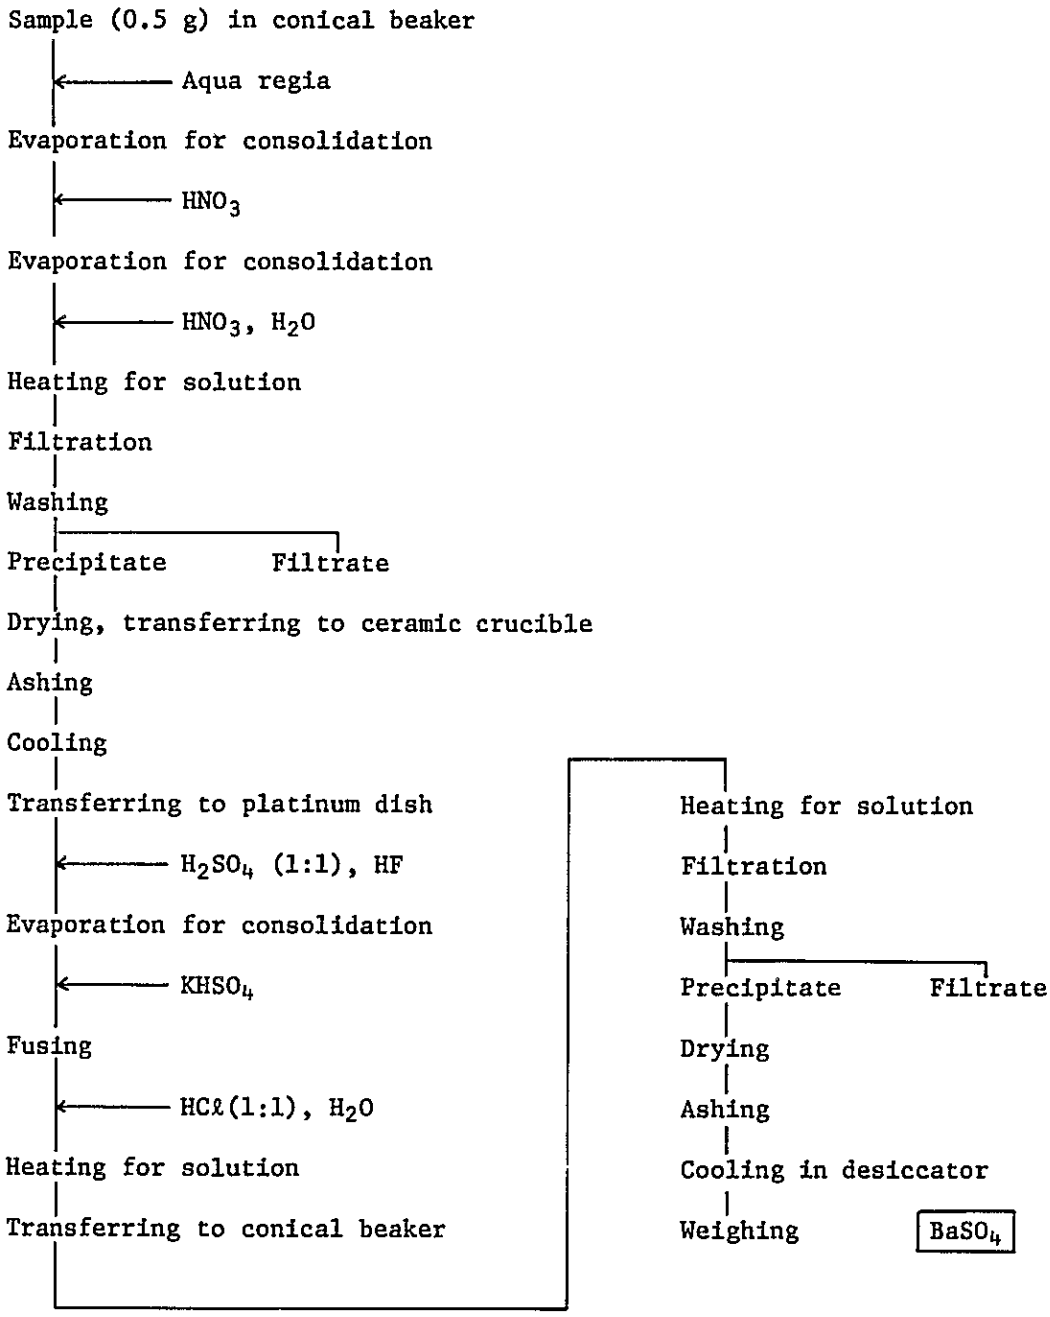


Sample (0.2 - 0.5 g) in platinum dish
HNO3, HF, HClO4
Heating for decomposition
Consolidation
HCl (1:1)
Heating for dissolution
Cooling
Filtration
Make up to volume
HCl (1:1), H2O
Inhibitor (Sr solution for Mg ions; La solution for Sr ions)
Atomic absorption

(SiO_2, Al_2O_3, CaO)



($BaSO_4$)



Sample (0.5 g) in conical beaker
Aqua regia
Evaporation for consolidation
HNO_3
Evaporation for consolidation
HNO_3, H_2O
Heating for solution
Filtration
Washing
Precipitate
Filtrate
Drying, transferring to ceramic crucible
Ashing
Cooling
Transferring to platinum dish
H_2SO_4 (1:1), HF
Evaporation for consolidation
$KHSO_4$
Fusing
HCℓ(1:1), H_2O
Heating for solution
Transferring to conical beaker
Heating for solution
Filtration
Washing
Precipitate
Filtrate
Drying
Ashing
Cooling in desiccator
Weighing
$BaSO_4$

A. II-5 Microscopic observation of the thin section.

(1)

Sample No.	Location		Group	Rock Name	Microscopic Observations
	Hole No.	Depth (m)			
53101	No.53-MJ1	14.8	PU	Biodolosparite	The rock consists of sparry dolomite (>98%) and calcite (<1%). Sparry dolomite shows mosaic texture of anhedra to subhedra (20 to 100μ in size). The larger dolomite crystals constitute fossils i.e. echinoid spines or algal filaments up to 500μ in size. Very rarely calcite is observed in anhedral form up to 300μ in size. Opaque minerals are very scarcely observed in dolomite crystals or filling cavities of dolomite crystals.
53105	No.53-MJ1	74.8	PU	Dolosparite (Well crystalline dolomite)	The rock consists of sparry dolomite ($\geq$ 95%), chalcedonic quartz ($\leq$ 5%), and calcite (<0.5%). Sparry dolomite shows mosaic texture of subhedra to euhedra. Megacrystals of dolomite up to 1.5 mm x 0.8 mm in size form so-called zebra structure with smaller crystals up to 300μ in size. Rarely micritic dolomite (<5μ in size) fills pores or cavities of sparry dolomite with opaque minerals. Chalcedonic quartz aggregates in irregular shape filling open spaces of dolomite crystals. Calcite exists rarely of anhedra up to 100μ in size. Opaque minerals are recognized filling cavities or pores of dolomite crystals.
53107	No.53-MJ1	104.8	PU	Dolosparite (Well crystalline dolomite)	The rock consists of sparry dolomite ($\geq$ 98%), opaque minerals, quartz, and calcite. Sparry dolomite shows mosaic texture of subhedra to anhedra (20μ to 600μ in size) and is rarely observed megacrystals (0.5 mm x 1 mm in size). Opaque minerals aggregate in veinlet or fill up boundaries between dolomite megacrystals and smaller crystals. Quartz is rarely recognized as chalcedony in irregular shape up to 150μ in size.
53113	No.53-MJ1	194.8	PU	Zebra Dolomite (Well recrystallized dolomite)	The rock consists of almost sparry or well recrystallized dolomite. Megacrystals up to 0.6 mm x 1.8 mm in size shows mosaic texture and construct so-called zebra structure with the band of smaller crystals up to 200μ in size. Chalcedonic quartz is rarely observed forming microspheroid-like or filling cavities of dolomite crystals (100 to 300μ in size). Opaque minerals up to 40μ are very rarely recognized in irregular shape or as microspheroid in the smaller crystals.
53117	No.53-MJ1	254.8	PU	Breccia Dolomite (Dolosparite)	The rock consists of sparry dolomite (>95%), calcite ($\approx$ 2%), opaque minerals,and quartz ($\approx$ 1%). Macroscopic observation of the piece sample apparently shows brecciated dolomite, but under the microscope this rock is composed of almost sparry dolomite. The sparry dolomite shows mosaic texture of subhedra to euhedra and may be classified into two parts i.e. megacrystals up to 600μ and smaller crystals (15 to 150μ). Calcite is recognized in anhedra to subhedra developed lamellar twinning up to 100μ. Opaque minerals are recognized as microspheroid or in irregular shape of aggregates up to 20μ in the smaller crystals of dolomite.

Sample No.	Location		Group	Rock Name	Microscopic Observations
	Hole No.	Depth (m)			
53206	No.53-MJ2	89.8	PU	Silty dolostone (Introdolosparite)	The rock consists of dolomite (≤80%), amorphous material with opaque minerals (≈15%), calcite (≈5%), and quartz (<1%). Dolomite is almost sparry but micritic dolomite is included in amorphous material. Sparry dolomite shows mosaic texture of subhedra to euhedra up to 300μ in size. Amorphous material with opaque minerals formed impure mud shows very low interference color. Sparry calcite shows mosaic texture of anhedra to subhedra up to 100μ in size coexisting with sparry dolomite. Quartz is recognized as chalcedony and detritus. Chalcedonic quartz is composed of very fine grained aggregate up to 50μ in diameter and detrital quartz up to 50μ in size is scattered in the impure mud or in sparry dolomite.
53210	No.53-MJ2	149.8	PU	Dolosparite with strongly disseminated pyrite	The rock consists of sparry dolomite (≈60%), pyrite grains (≤40%), and detrital quartz (≤0.5%). Sparry dolomite shows mosaic texture of anhedra to subhedra. Pyrite spotted or interspersed among dolomite crystals shows cube, elongated cube or aggregate up to 200μ in size.
53211	No.53-MJ2	164.8	PU	Dolosparite (Dolarenite)	The rock consists of sparry dolomite (>90%), opaque minerals (≈5%), amorphous material (≈3%), calcite (<1%), and quartz (<1%). Sparry dolomite shows mosaic texture of subhedra to euhedra up to 300μ in size. Opaque minerals spotted in sparry dolomite or filled cavities of sparry dolomite shows in veinlet shape up to 50μ in width. Amorphous materials are recognized among the smaller dolomite crystals up to 120μ in size with opaque minerals.
53215	No.53-MJ2	224.8	PU	Biopelmicrite	The rock consists of calcite (≈85%), quartz (≈10%), and opaque minerals (<5%). Sparry calcite constitutes brachiopods shells, gastropods, ostracods and others up to 1.5mm in size. Micritic calcite formed matrix up to 5μ in size, partly constitutes pellet up to 450μ in diameter. Quartz, almost detritus, coexists with micrite forming matrix up to 50μ in size. Opaque minerals are recognized in the matrix in aggregate or veinlet shape up to 100μ in size and rarely exist at the inner part of brachiopods shells. Amorphous material may be identified as clayey material but not exactly.

Sample No.	Location		Group	Rock Name	Microscopic Observations
	Hole No.	Depth (m)			
53220	No.53-MJ2	229.8	PU	Sapropelic calcilutite (Bituminous muddy ls.)	The rock consists of calcite ($\geq$50%), amorphous material ($\approx$20%), opaque minerals ($\approx$20%), quartz ($\approx$5%),and plagioclase (<5%). Sparry calcite ($\geq$30%) of anhedra or microspheroid up to 60μ in diameter fills up other materials. Micritic calcite ($\approx$20%) cemented matrix with amorphous or bituminous material shows very fine anhedra up to 10μ in size. Amorphous material shows very dark greyish brown in color and very low interference color. It may be bituminous or saplopelic material. Opaque minerals are recognized in irregular shape partly cubic accompanied with amorphous material. Quartz, almost detrital quartz is rarely observed in the matrix up to 30μ in size. Plagioclase is also observed as fragment up to 20μ in size very rarely and shows albite twinning.
53304	No.53-MJ3	58.6	PU	Detrital sparite (Calcarenite)	The rock consists of calcite ($\geq$70%), detrital quartz ($\approx$25%), chalcedonic quartz ($\approx$1%), opaque minerals ($\leq$1%),and amorphous aggregates ($\approx$2%). Sparry calcite ($\approx$40%) aggregates of 3 crystals or more in subhedra to anhedra. Micritic calcite (30%) formed matrix shows equigranular texture (2 to 5μ in size). Detrital quartz is recognized within the matrix in angular or subangular shape up to 80μ in size. Chalcedonic quartz fills up cavities or pores of calcite crystals up to 150μ in size. Opaque minerals are very rare forming microspheroid or irregular shape. Amorphous aggregates form pellets with quartz fragments and calcite up to 1 mm x 2.5 mm in diameter.
53305	No.53-MJ3	71.0	PU	Bioclasparmicrite (Calcisiltite)	The rock consists of micritic calcite ($\approx$40%), sparry calcite ($\approx$30%), detrital quartz ($\approx$25%), chalcedonic quartz ($\approx$2%), amorphous material ($\approx$2%),and opaque minerals ($\approx$1%). Micritic calcite formed matrix shows very fine grained up to 5μ in size and partly constitutes algal pellets (30 to 80μ in diameter). Sparry calcite built up algal filaments, echinoid spines, fragments of bryozoan and unknown lime clast, shows mosaic texture of anhedra up to 100μ in size. Detrital quartz spotted in matrix (20 to 40μ in size) is angular or subangular fragment. Chalcedonic quartz radiated or shown wave extinction may be derived from fragment of radiolaria (30 to 50μ in size). Amorphous material formed pellet (30 to 60μ in diameter) shows very dark brown in color. Opaque minerals are rarely recognized in very fine grained up to 5μ in size and partly aggregate in irregular shape up to 20μ in size.

Sample No.	Location		Group	Rock Name	Microscopic Observations
	Hole No.	Depth (m)			
53308	No.53-MJ3	123.0	PU	Bioclasparmicrite (Calcisiltite)	The rock consists of calcite(≦75%), detrital quartz (<20%), amorphous material (<5%), opaque minerals (≦1%),and chalcedonic quartz (≒0.5%). Calcite may be classified into 3 types i.e. sparry calcite, lime clast and micrite. Sparry calcite aggregates of five or more in the matrix (50 to 600μ in size). Lime clast may be derived from algal debris or algal fragments (150 to 800μ). Micritic calcite formed matrix shows very fine grained up to 5μ in size. Detrital quartz is spotted in matrix up to 60μ in size. Amorphous material formed pellet or micro ellipsoid (50 to 200μ in diameter) shows brown to dark brown in color. Opaque minerals are very rare in tiny size (2μ to 40μ) and partly aggregated in irregular shape. Chalcedonic quartz is very rarely observed up to 150μ in size with fine grained opaque minerals.
53314	No.53-MJ3	209.8	PU	Dolomitic limestone (Dolomitic sparite)	The rock consists of sparry calcite (≒55%), sparry dolomite (≒40%), chalcedonic quartz (≒3%), opaque minerals (≒1%),and detrital quartz (≒1%). Sparry calcite shows mosaic texture of anhedra formed megacrystal up to 600μ in size. Sparry dolomite shows also mosaic texture of subhedra to euhedra (50 to 100μ in size). Chalcedonic quartz filled open space of dolomite crystals aggregates in irregular shape (100 to 200μ in size). Opaque minerals are recognized filling cavities among dolomite crystals or gathering in irregular shape (5 to 150μ in size). Detrital quartz are rarely observed in dolomite crystals (10 to 30μ in size).
53320	No.53-MJ3	299.8	PU	Sandy limestone (Pelsparite)	The rock consists of pellets (>55%), sparry calcite (<35%), detrital quartz (≦10%), potash felspar (≦0.5%) and opaque minerals (≦0.5%). Pellet is composed of micritic calcite (1-2μ) and shows microspheroid (30-120μ in diameter). Sparry calcite filled up or cemented pellets shows mosaic texture of anhedra and rarely constructs echinoid spine, ostracods and bryozoan. Detrital quartz is often observed in sparry calcite with chalcedonic quartz (20 to 80μ in size). Detrital potash felspar is rarely recognized in pellet or sparry dolomite (20 to 50μ in size). Opaque minerals are rarely observed in irregular shape partially cubic form (20 to 50μ in size).

A. II-6 Microscopic observation of the polished section.

A. II-6 Microscopic observation of the polished section.

(1)

Sample No.	Location		Rock Name	Microscopic Observations
	Hole No.	Depth (m)		
53105	No.53-MJ1	74.8	Breccia Dolomite	The ore minerals are very few in this specimen. Goethite, pyrite, and sphalerite is observed. Goethite associated with lepidocrocite shows pseudomorph after pyrite in microsphere or framboid up to 10μ in diameter. Pyrite shows framboidal form or microsphere up to 5μ in diameter. Sphalerite is scarcely recognized in irregular shape or bleb-like up to 20μ in size, filling pores and cavities among dolomite crystals. Cu Pb Zn 5 ppm, 27 ppm, 60 ppm
53107	No.53-MJ1	104.8	Dolostone	Galena mono crystal is observed in only the appointed specimen. The galena (600μ X 800μ) is pure white in color observed characteristic triangle pits. Around the rim of galena, cerussite is recognized in grey color and shows worm-eaten-like form up to 20μ in size. Goethite replaced pyrite shows cubic or framboidal form up to 20μ in size in grey bluish tint color. Pyrite, creamy yellow in color, shows microsphere or framboidal form up to 20μ in diameter. Sphalerite is very rare and only recognized in irregular shape up to 30μ in size filling cavities among dolomite crystals. Cu Pb Zn 3 ppm, 24 ppm, 19 ppm
53113	No.53-MJ1	194.8	Zebra Dolomite	The ore minerals are very few in this specimen. Pyrite associated with goethite shows framboidal form or microsphere up to 10μ in diameter. Goethite shows pseudomorph after pyrite in cube and framboid (5-20μ in size). Sphalerite is scarcely observed in framboid or microspheroid (5 to 20μ in diameter). Cu Pb Zn 4 ppm, 27 ppm, 26 ppm
53117	No.53-MJ1	254.8	Breccia Dolomite	The ore minerals are recognized as pyrite and magnetite. Pyrite is generally observed in cube or framboid up to 60μ in size and is scattered as star-flecked sky. Magnetite fragments up to 30μ in size are scarcely observed in only the cavities among dolomite crystals. Cu Pb Zn 5 ppm, 31 ppm, 14 ppm

Sample No.	Location		Rock Name	Microscopic Observations
	Hole No.	Depth (m)		
53206	No.53-MJ2	89.8	Silty dolostone	The ore minerals are determined to almost pyrite and very few sphalerite. Pyrite spotted in star-like up to 50μ in size shows framboidal form among dolomite crystals. In the vicinity of dolomite megacrystals, pyrite grains grow up larger up to 100μ in size. Sphalerite is scarcely recognized in irregular shape up to 20μ in size. Alteration is none. Cu Pb Zn 12 ppm, 69 ppm, 29 ppm
53211	No.53-MJ2	164.8	Sandy dolostone	The ore minerals are almost pyrite in this specimen. Pyrite spotted in the dolomite crystals aggregate together in framboidal or cubic form up to 30μ in size. In the vicinity of dolomite megacrystals, pyrite grains grow up larger up to 100μ in size. Sphalerite is scarcely observed in irregular shape up to 20μ in size near pyrite grains. Alteration is none. Cu Pb Zn 7 ppm, 42 ppm, 29 ppm
53213	No.53-MJ2		Bituminous mudstone with concentrated pyrite	Pyrite is extraordinarily concentrated in this specimen. The pyrite grains that aggregate together in framboids or cubes up to 100μ in size are densely scattered in the matrix. Alteration is none. Sphalerite is ordinarily observed of anhedra up to 200μ in the vicinity of quartz vein and along fractures. Cu Pb Zn 6 ppm, 110 ppm, 19,080 ppm
53215	No.53-MJ2	224.8m	Calcareous siltstone	The ore minerals are rarely observed. Pyrite is mostly recognized as framboidal aggregates up to 15μ, and occasionaly gathers in cubes up to 70μ. Sphalerite in irregular shape up to 50μ in size often associates with pyrite. Alteration is none. Cu Pb Zn 22 ppm, 27 ppm, 128 ppm

Sample No.	Location		Rock Name	Microscopic Observations
	Hole No.	Depth (m)		
53304	No.53-MJ3	58.6m	Limestone	A few galena grains (1 mm x 1.5 mm ~ 2 mm x 3 mm) are observed in this specimen. Galena of subhedra is replaced by cerussite along cleavage oscillately and around the rim. Cerussite is recognized in lattice form or in worm-eaten-like up to 20μ in width surrounding galena. Goethite shows pseudomorph after pyrite in cubes or in framboid up to 120μ in diameter. Pyrite, the remnant of replacement in creamy yellow color, exists rarely in framboid up to 10μ in diameter. Cu Pb Zn 3 ppm, 533 ppm, 299 ppm
53305	No.53-MJ3	71.0	Limestone	A few galena grains (1 mm x 1 mm to 2 mm x 3 mm) are observed in this specimen. Galena filled pores of calcite crystals is replaced by cerussite along cleavage and arround the rim. Cerussite derived from galena shows worm-eaten-like form and lattice shape up to 200μ in width. Goethite is recognized as the pseudomorph of after pyrite in cube or framboid up to 50μ in size. Pyrite, the relict of alteration, shows microsphere, framboid or aggregate up to 20μ in size. Sphalerite is rarely observed in microspheroid or subrounded form up to 30μ in diameter. Cu Pb Zn 4 ppm, 686 ppm, 299 ppm
53308	No.53-MJ3	123.0	Limestone	The ore minerals are rare in this specimen. Pyrite spotted in the matrix of calcite crystals, shows in framboidal or cubic form up to 20μ in diameter. Goethite shows pseudomorph after pyrite of framboid or cube up to 50μ in size. Sphalerite is scarcely observed in irregular shape of anhedra up to 30μ in size. Cu Pb Zn 6 ppm, 158 ppm, 277 ppm

A. II-7 Fossils under microscopic observation.

Sample No.	Hole No.	Stratigraphical Units	Fossils	Estimated Age
53104	No.53-MJ1	Pucara Group	Shell fragments (not identified)	Jurassic
53106	No.53-MJ1	Pucara Group	Not identified	Jurassic
53303	No.53-MJ3	Pucara Group	Shell fragments (not identified)	Jurassic
53307	No.53-MJ3	Pucara Group	Echinoid spine and shell	Jurassic
53310	No.53-MJ3	Pucara Group	Shell fragments of gastropods and bivalves	Jurassic

A. II-8 Photomicrographs of rocks, ores, and fossils.

(1) Thin Section of Rocks

Sample No.	Hole No.	Rock Name
53105	53-MJ1	Breccia Dolomite
53107	53-MJ1	Dolostone
53117	53-MJ1	Breccia Dolomite
53210	53-MJ2	Muddy dolostone
53215	53-MJ2	Calcareous siltstone
53220	53-MJ2	Silty limestone
53304	53-MJ3	Limestone
53305	53-MJ3	Limestone with Echinoid
53308	53-MJ3	Limestone with Algal
53314	53-MJ3	Dolomitic limestone
53320	53-MJ3	Limestone

Abbreviations

Al : Algal Bit : Bituminous Brp : Brachiopod

cal : calcite dol : dolomite Pel : Pellet

Py : Pyrite qz : quartz

(2) Polished Section of Ores

Sample No.	Hole No.	Rock Name
53107	53-MJ1	Dolostone with galena
53206	53-MJ2	Silty dolostone
53211	53-MJ2	Dolostone with pyrite
53213	53-MJ2	Dolostone with ore
53304	53-MJ3	Limestone with ore
53305	53-MJ3	Limestone with ore
53308	53-MJ3	Limestone with pyrite

Abbreviations

cal : calcite Crs : Cerussite dol : dolomite

Gn : Galena Py : Pyrite Sp : Sphalerite

(3) Fossils
