PREFACE

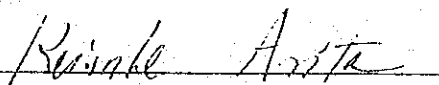

In response to the request of the Government of the Kingdom of Thailand, the Government of Japan decided to conduct a study on the East Coast Water Resources Development Project (Phase II) and entrusted the study to the Japan International Cooperation Agency (JICA). The JICA sent to Thailand a survey team headed by Mr. H. Waki, comprising experts of Nippon Koei Co., Ltd. and Nippon Kensetsu Consultant company, from July 26 to December 22, 1982.

The team had discussions with the officials concerned of the Government of the Kingdom of Thailand over the project and conducted a field survey in the East Coast area. After the team returned to Japan, further studies were made and the present report has been prepared.

I hope that this report will serve for the development of the Project and contribute to the promotion of friendly relations between our two countries.

I wish to express my deep appreciation to the officials concerned of the Government of the Kingdom of Thailand for their close cooperation extended to the team.

August, 1983

Keisuke Arita
President

Tokyo, Japan

August, 1983

Dear Sir,

LETTER OF TRANSMITTAL

We have the pleasure of submitting to you herewith the Final Report of the East Coast Water Resources Development Project (Phase II) for the Government of the Kingdom of Thailand.

The Study was conducted by the Study Team composed of Nippon Koei Co., Ltd. and Nikken Consultant Inc. during the period from July 1982 to August 1983, including the field survey and investigation in Thailand for the five months period from July to December in 1982. The Study formulated the overall water resources development plan for the East Cost Area to cope with the future water demand and clarified the need of the development of the three dams, namely Khlong Luang, Khlong Yai and Khlong Thap Ma Dams. It was ascertained that the development of the three dams was pre-requisite for the industrial and agriculture development of the Area. We hope that the Study will serve as the base for the further progress and implementation of the project in future and accordingly contribute to the well-balanced economic and social development of the Area and Thailand.

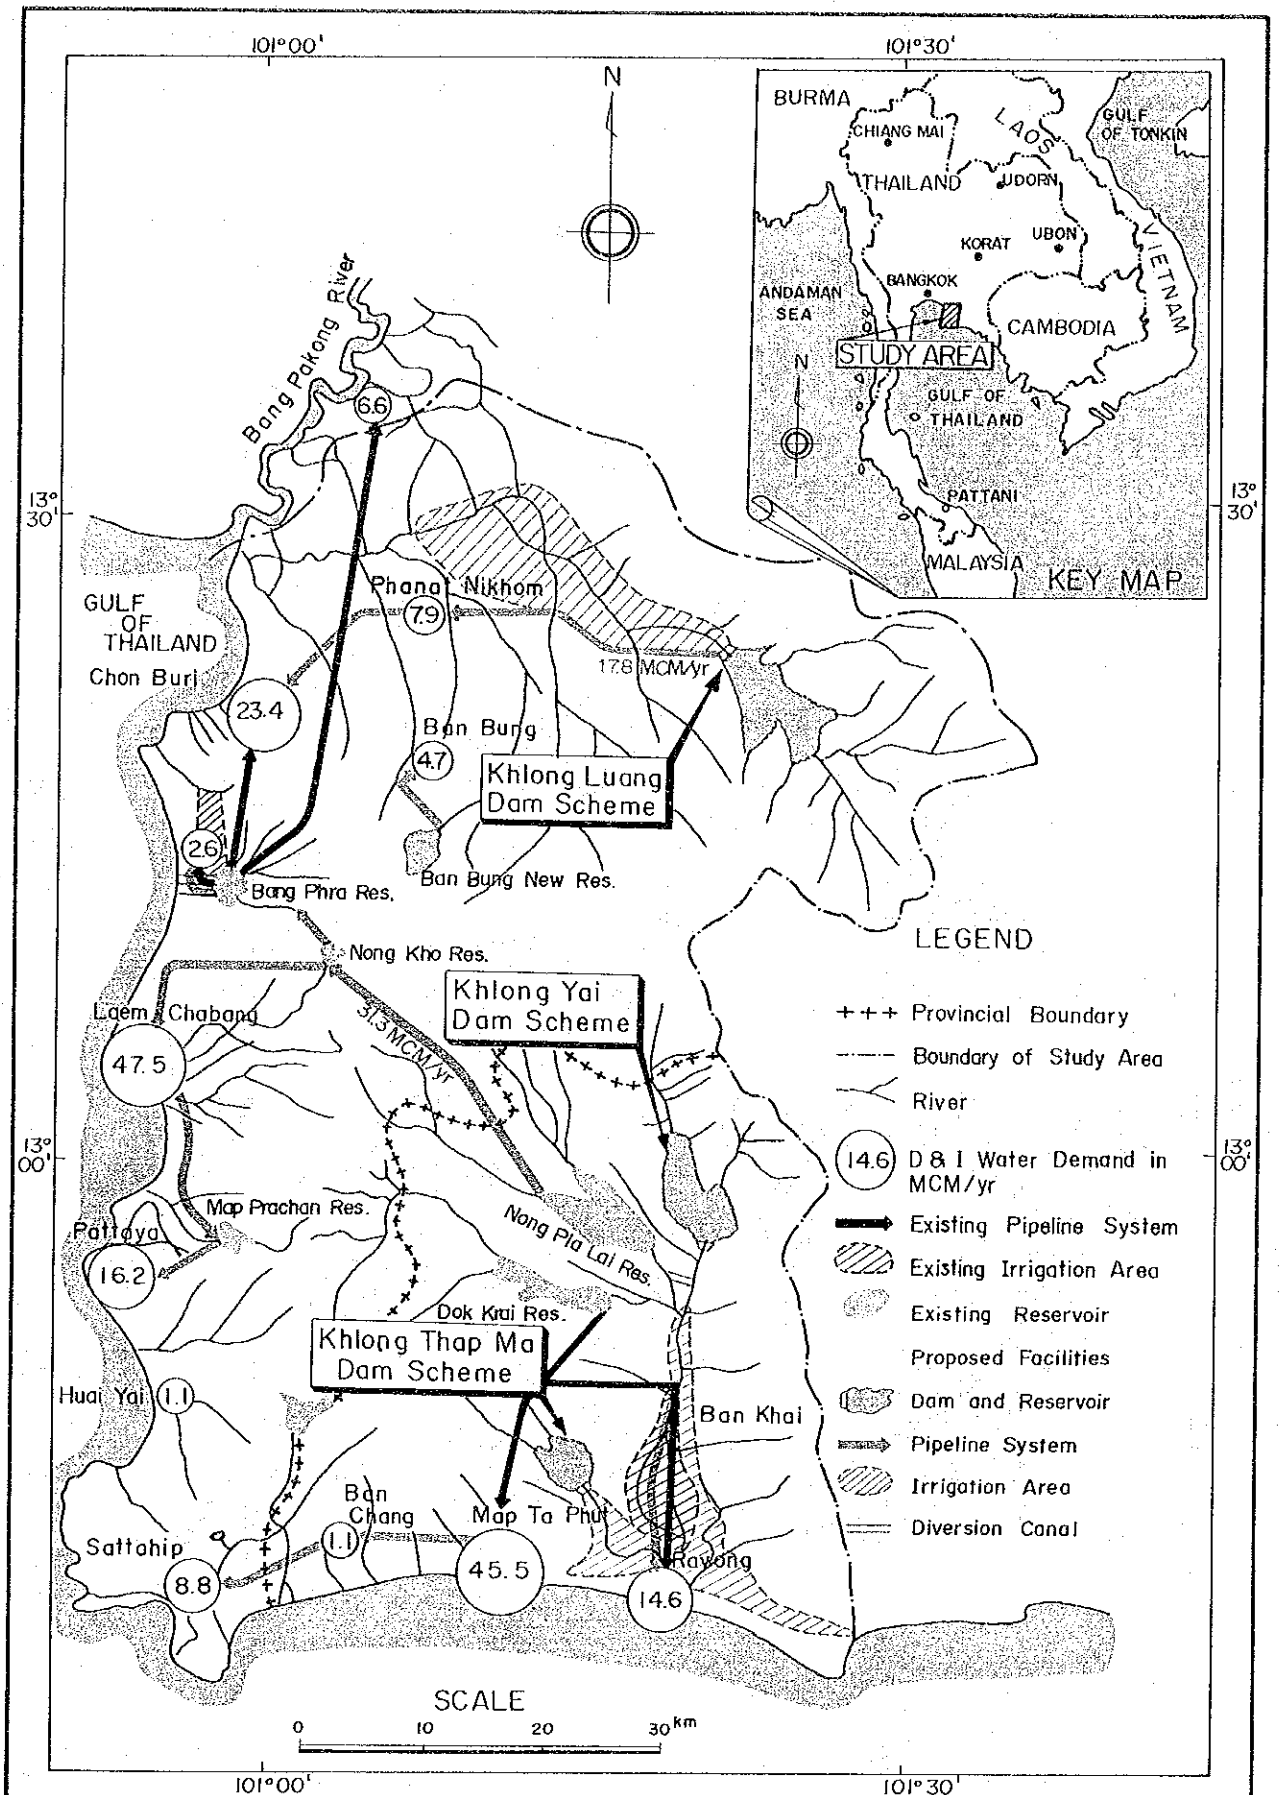

We wish to express our sincere gratitude to the personnel of your Agency, Advisory Committee, the Embassy of Japan in Thailand as well as to the officials and individuals of the agencies concerned of the Government of the Kingdom of Thailand for their kind assistance and cooperation extended to the Study Team.

Very truly yours,

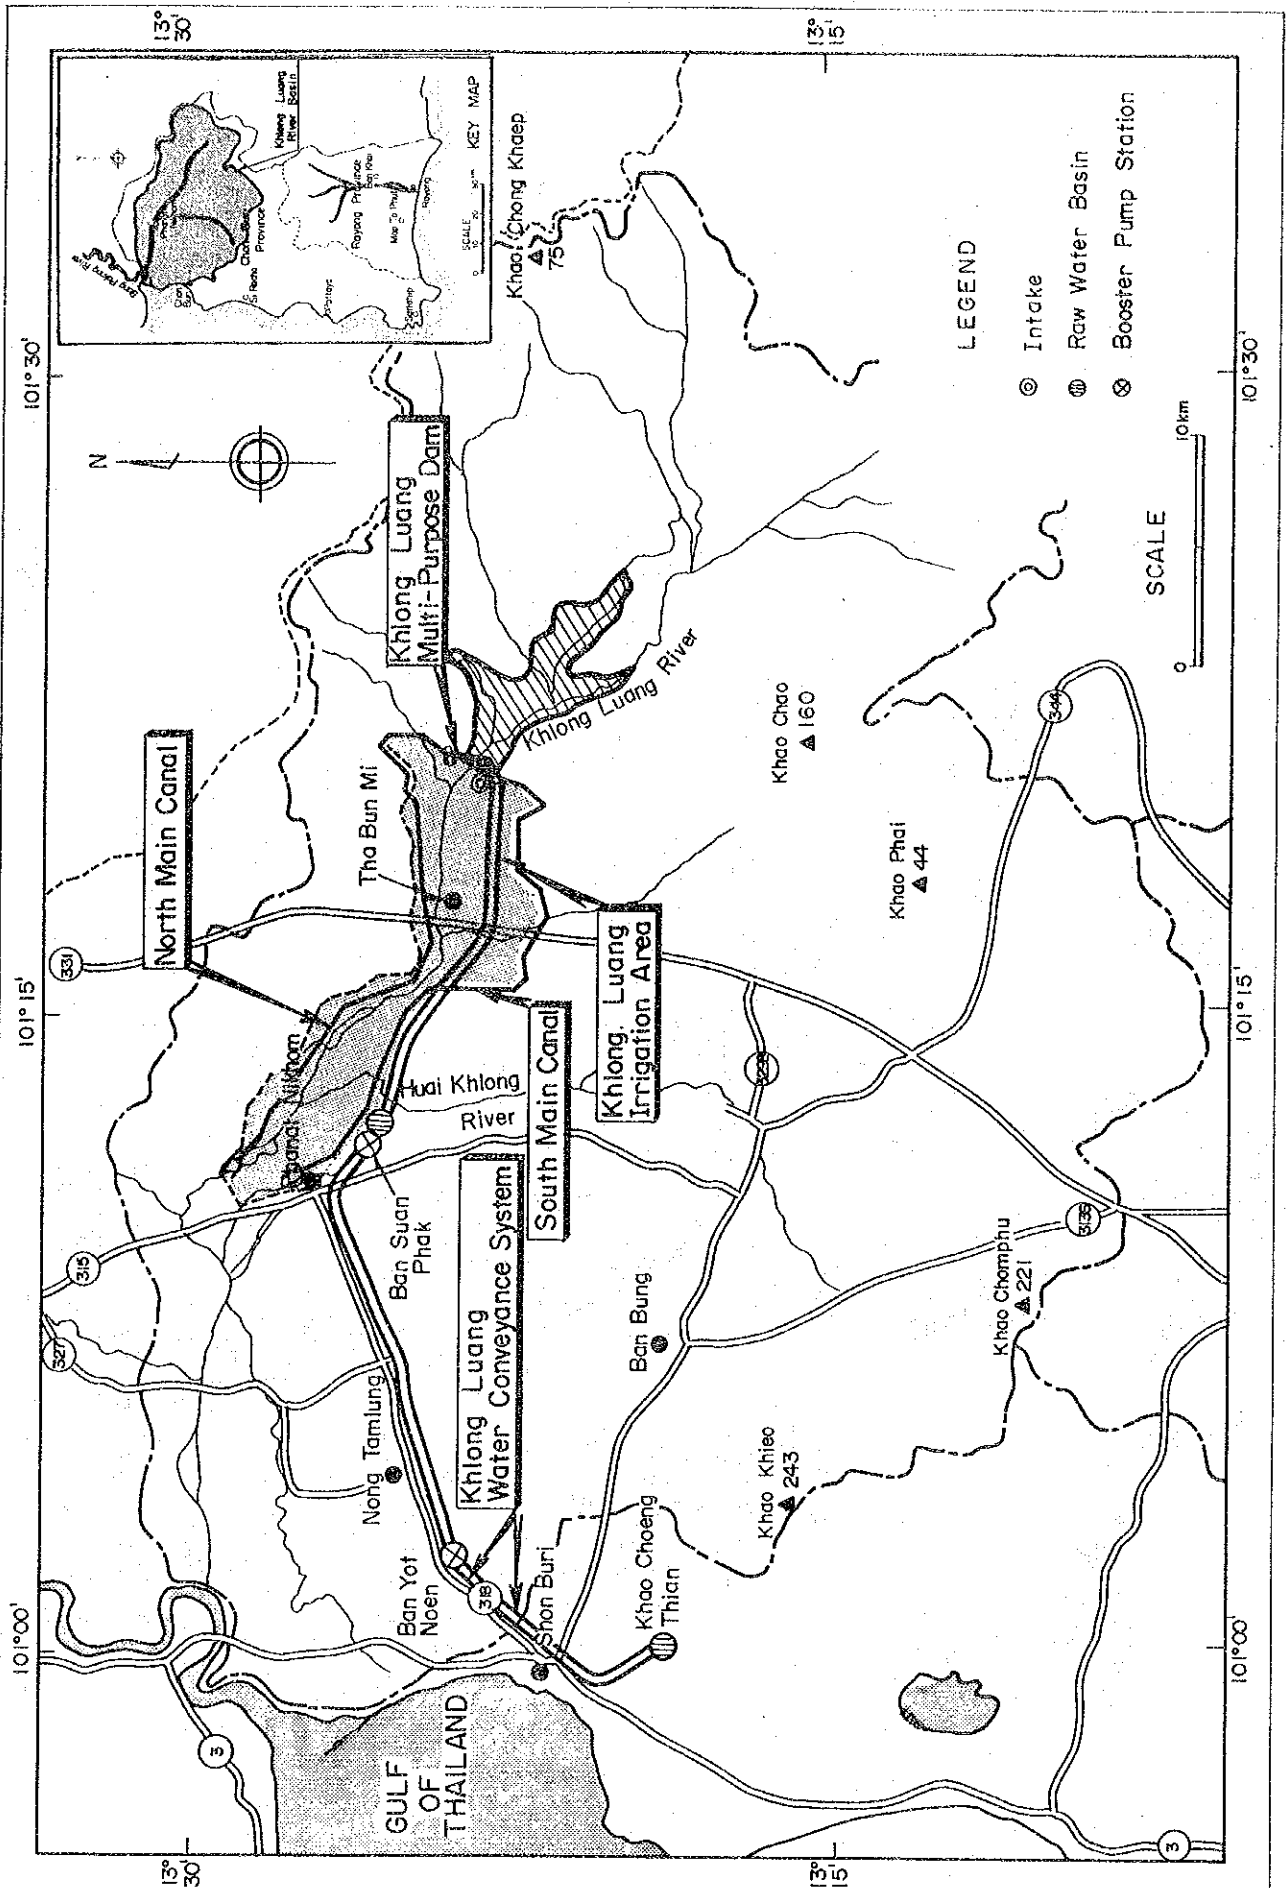

Haruo Waki
Team Leader
East Coast Water Resources
Development Project (Phase II)

ABBREVIATIONS AND LOCAL TERMS

A. ABBREVIATION OF MEASURES

(1) Length

mm = millimetre
 cm = centimetre
 m = metre
 km = kilometre

(2) Area

m² = square metre
 ha = hectare = 10⁴ m²
 km² = square kilometre = 10⁶ m²
 rai = 0.16 ha

(3) Volume

lit, l = litre = 1,000 cm³
 kl = kilolitre = 1 m³
 m³ = cubic metres
 MCM = million cubic metres
 = 1,000,000 m³

(4) Weight

mg = milligramme
 g = gramme
 kg = kilogramme
 t = ton = 1,000 kg
 qwt = quintal = 100 kg

(5) Time

s = second
 min = minute
 h = hour
 d = day
 yr = year

(6) Money

฿ = Baht (unit of Thai currency
 US\$ 1 = ฿ 23.0)
 \$ = US dollar
 ¥ = Japanese Yen

(7) Electric Measures

kV = kilovolt
 kW = kilowatt
 MW = megawatt = 1,000 kW
 kWh = kilowatt hour
 kVA = kilovolt Ampere

(8) Other Measures

mmho = micromho = conductance
 ppm = parts per million
 ppb = parts per billion
 % = per cent
 LCD = litre per capita
 per day
 PS = 0.736 kW
 pH = scale for acidity
 ° = degree
 ' = minute
 " = second
 °C = degree centigrade
 10³ = thousand
 10⁶ = million
 10⁹ = billion (milliard)

(9) Derived Measures Based on the Same Symbols

m³/s = cubic metre per second
 ton/ha = ton per hectare
 10⁶m³/yr, MCM/yr
 = million cubic meter
 per year

B. OTHER ABBREVIATIONS

GDP = gross domestic product
 GRP = gross regional product
 El. = elevation
 HWS = high water surface
 SD = sanitary district
 DA = development area
 ESS = Eastern Seaboard Study
 FOB = free on board
 CIF = cost, insurance and
 freight
 WHO = World Health Organization

1. INTRODUCTION

1.1 Authority

The East Coast Water Resources Development Project, Phase II (the Study) was carried out in accordance with Implementation Arrangement, Technical Cooperation for Feasibility Study on East Coast Water Resources Development Project, Phase II, which was concluded in the date of February 22, 1982 between Japan International Cooperation Agency (JICA) and Royal Irrigation Department (RID), Ministry of Agriculture and Cooperatives, the Government of Kingdom of Thailand.

1.2 Study Objective

The Government issued the Fifth National Economic and Social Development Plan (the Fifth National Plan) in October, 1982, cardinal principles of which are (i) to restore the nation's economic and financial stability, (ii) to adjust the economic structure to improve the foreign trade balance and (iii) to alleviate the poverty. The Fifth National Plan places a great emphasis on Eastern Seaboard Development in order to accomplish its objectives.

The Eastern Seaboard lies along the coastal area in Chon Buri and Rayong Provinces. The natural gas oriented industrial development is being actively promoted, particularly in Sattahip-Rayong area, where the natural gas is unloaded. On the other hand the agricultural development is contemplated to be promoted in both the Khlong Luang and Rayong river basins to create the balanced socio-economic situation throughout region. Such development activities will certainly induce a rapid increase of water demand, which will cause to strain the present water demand and supply balance situation. An integrated development planning, however, is essential to ensure future efficient use of water and land resources.

The objective of the East Coast Water Resources Development Project, Phase II is to formulate the comprehensive water resources development plan over the Study Area.

1.3 Study Team and Advisory Committee

The JICA appointed a Study Team to carry out the Study with the counterpart support provided by RID. An Advisory Committee was established by JICA to review the findings by the Study Team.

The Study Team derived from time to time assistance from Colombo Plan Experts attached to RID.

The members of the Advisory Committee and Colombo Plan Experts and Study Team are as listed in Table 1 and 2.

1.4 Scope of Study

The scope of the Study covers the followings;

Part A: Study for the long-term water demand and supply balance in the Study Area

Part B: Feasibility study for Khlong Luang, Khlong Yai and Khlong Thap Ma Dams.

The Part A study was executed in Bangkok during a 5-month period from July to December, 1982 in parallel with the field survey and investigation necessary for the performance of both the Part A and Part B studies.

The field survey and investigation were accomplished in a close coordination with RID. Its outlines are as summarized hereunder.

- (i) Topographic Survey
- (ii) Geological Investigation and Material Survey
- (iii) Groundwater Reconnaissance Survey
- (iv) Flood Damage Survey
- (v) Hydrological Investigation
- (vi) Farm Economic Survey
- (vii) Compensation and Relocation Survey
- (viii) Water Quality Analysis

1.5 Study Report

During the course of the Study, an Inception Report and Study Report on Long-Term Water Supply Plan were prepared. The Final Report which is submitted herein comprises;

Volume 1: Summary

Volume 2: Feasibility Study on Khlong Luang Dam Scheme

Volume 3: Feasibility Study on Khlong Yai Dam Scheme

Volume 4: Feasibility Study on Khlong Thap Ma Dam Scheme

It is supported by the Sectoral Reports, Priced Bill of Quantities and Data Book.

1.6 Acknowledgement

The Study Team at first makes a most cordial acknowledgement to Mr. Sunthorn Ruanglek, Director General of RID and Mr. Boonthai Otaganonta, Chief Engineer for Civil Engineering of RID for their kind assistance and advise throughout the period of the Study. A heartfelt gratitude is also made to the officials of the various departments and agencies of the Government who have given valuable advices, informations and data in performing the Study. An acknowledgement is expressed to the officials of RID for their counterpart service, provision of data and information and effectual assistance for field survey and investigation throughout the study period.

2. LONG-TERM WATER SUPPLY

2.1 Water Demand

The ultimate target of the long-term water supply plan is to formulate the most optimum water resources development and water supply plan in view of increasing importance on land and water resources development for the development of industry and the increase of agricultural production. For the purpose of the Study, the Target Years are set at 1991 as an intermediate year and at 2001 as a final year, in due consideration of the periods of the national five-year plan and the period of Eastern Seaboard Development.

The water demand comprises the domestic use, industrial use and irrigation use. A concept of river maintenance flow is introduced. In accordance with principles of water resources management, the Study Area is divided into 10 zones as shown in Fig. 1 and water demand-supply balance was elaborated zone by zone. The annual water demand is estimated at intervals of 5-year period as presented in Table 3.

The domestic water demand is projected separately for urban area and rural area, based on future population, water consumption per capita and service factor. The urban area is divided into development area and non-development area, according to the strategy of Eastern Seaboard Development. The population in urban area is predicted to increase substantially due to the increased employment opportunity in the development area; 358×10^3 in 1981 to 739×10^3 in 2001. The rural population increases to a little extent; 570×10^3 in 1981 to 645×10^3 in 2001. The domestic water demand will increase largely from $22.1 \times 10^6 \text{ m}^3$ in 1981 to $91.5 \times 10^6 \text{ m}^3$ in 2001, resulting from expansion of pipe-water supply services into rural area and increase of water consumption in urban area due to population increase. The number of pipe-water served population will be 898×10^3 in 2001; an increase of 745×10^3 from 1981.

The industrial water demand will grow enormously from $10.3 \times 10^6 \text{ m}^3$ in 1981 to $88.5 \times 10^6 \text{ m}^3$ in 2001 resulted from the proposed industrial development activities. The Study Area embraces six strategic development zones; Chon Buri for urban service industry, Laem Chabang for export processing and light industry, Sattahip for port-related industry, Map Ta Phut for chemical, petrochemical and heavy industries, Rayong for agro-industry and Pattaya for tourism industry.

The irrigation development will be implemented in both the Khlong Luang and Rayong river basins, keeping a pace with the industrial development. In the absence of the Government's long-term development plan, a provisional plan has been established by the Study Team for the period from 1982 to 2001, which comprises the development of Khlong Luang, Ban Khai Extension and Khlong Thap Ma Irrigation Schemes. According to the provisional plan, the irrigation water will increase from $81.2 \times 10^6 \text{ m}^3$ in 1982 to $247.0 \times 10^6 \text{ m}^3$ in 2001.

The river maintenance flow is the minimum discharge which is able to maintain water depth, flow velocity, water quality, channel stability, aquatic ecosystem and scenery to the extent necessary for navigation, fish catch, operation and maintenance of intakes, maintenance of river facilities, sea water repulsion, prevention of estuary clogging, conservation of groundwater, preservation of riparian land and people's amenity. The rate of the river maintenance flow is tentatively determined by the Study Team for each representative river of a zone in due consideration of river management under the present circumstances.

2.2 Proposed Long-Term Water Supply Plan

In order to determine the water resources development requirement, the water demand and supply balance was carefully analyzed zone by zone. As the results, under the present water resources development conditions, an acute shortage of water supply is foreseen to occur; $65.1 \times 10^6 \text{ m}^3$ in 1991, $117.3 \times 10^6 \text{ m}^3$ in 1996 and $149.5 \times 10^6 \text{ m}^3$ in 2001. The coastal area suffers serious water deficit because of concentration of the industrial development zones.

The coastal area is scarce of water resources owing to geographical condition, while its backward area, the Khlong Luang and Rayong river basins are blessed with fair water resources. This naturally leads to evolve an integrated development plan of water resources and inter-zone water diversion system, in order to satisfy all the water demand throughout the Study Area.

The recommended long-term water supply plan for Target Year 2001 is shown in Fig. 1, which is ascertained to be the most optimum in view of financial requirement, technical soundness and socio-economic aspects. It is constituted by construction of 5 multiple-purpose dams, 2 intakes and 8 raw water conveyance systems including 5 inter-zone water diversion systems. The dams involved in the plan are the Khlong Luang and New Ban Bung Dams in the Khlong Luang river basin and the Nong Pla Lai, Khlong Yai and Khlong Thap Ma Dams in the Rayong river basin. Both the Khlong Luang and Nong Pla Lai Dams will fully dissolve the water deficit in Chon Buri - Pattaya area by diverting the water at rates of $11.0 \times 10^6 \text{ m}^3$ and $31.3 \times 10^6 \text{ m}^3$, respectively, in 2001. The existing Dok Krai Dam will properly ensure the water demand in Sattahip - Map Ta Phut area with diversion of $54.8 \times 10^6 \text{ m}^3$.

2.3 Development Programme

The proposed long-term water supply plan will be implemented progressively in a stage-wise way in accordance with growth of water demand. Dams require a long time for their construction and impounding water. Therefore their construction works need to be commenced for many years beforehand based on long-term perspectives. The development programme of dams is prepared in relation to the growth of the water demand as shown in Fig. 2.

The raw water conveyance system can be constructed in a short time and can be expanded as need arises. The irrigation development will be implemented in parallel with construction of dam so that irrigation service can be attained immediately upon completion of dam.

3. FEASIBILITY STUDY

3.1 Nature of the Project

The long-term water supply plan has clearly revealed the significance of development of Khlong Luang, Khlong Yai and Khlong Thap Ma Dam Schemes. These schemes have a nature of multiple-purpose areal-development project, since they are designed as element in regional plan.

The Khlong Luang and Khlong Yai dams have the functions of irrigation water supply, domestic and industrial water supply to both the inside and outside of the basin and flood control. The Khlong Thap Ma Dam serves the irrigation water supply and flood control. The development components of the respective scheme are thus defined as follows.

| Scheme | Component |
|-------------------|--|
| 1. Khlong Luang | (a) Multiple-purpose dam (b) Water conveyance system between dam and Chon Buri (c) Irrigation and drainage system |
| 2. Khlong Yai | (a) Multiple-purpose dam (b) Water conveyance system between Nong Pla Lai dam and Nong Kho dam (c) Irrigation and drainage system in Ban Khai Extension Area |
| 3. Khlong Thap Ma | (a) Multiple-purpose dam (b) Irrigation and drainage system |

The feasibility study of the above-mentioned three schemes was conducted subsequent to the study for the long-term water supply plan in order to sound their technical and economic feasibility and financial viability.

3.2 Plan Formulation

The plan formulation has been accomplished in two steps. The first step is directed to ascertain the optimum land and water resources development plan, which comprises the water resources development, domestic and industrial water supply and agricultural and irrigation development. The second step is to formulate the optimum basic flood control plan by a combination of dam and river improvement.

As the results of the plan formulation study, the optimum development scales of Khlong Luang, Khlong Yai and Khlong Thap Ma Dam Schemes are determined as follows.

| Description | Unit | Khlong Luang | Khlong Yai | | Khlong Thap Ma |
|---|------------------------------|--------------|----------------------------|------------------|----------------|
| | | | Khlong Yai Dam | Nong Pla Lai Dam | |
| <u>(1) Water Resources Development</u> | | | | | |
| Reservoir | | | | | |
| Gross storage | 10^6 m^3 | 169.1 | 71.5 | 200.7 | 74.3 |
| Surcharge | 10^6 m^3 | 34.3 | 16.9 | 43.5 | 13.5 |
| Active storage | 10^6 m^3 | 119.0 | 48.0 | 144.4 | 56.1 |
| Flood water level | El.m | 40.5 | 48.8 | 47.0 | 26.9 |
| High water level | El.m | 39.5 | 47.5 | 45.0 | 25.7 |
| Low water level | El.m | 33.8 | 40.6 | 33.3 | 16.2 |
| Dam | | | | | |
| Dam crest | El.m | 42.5 | 50.8 | 49.0 | 28.9 |
| <u>(2) Domestic and Industrial Water Supply</u> | | | | | |
| Basin use | $10^6 \text{ m}^3/\text{yr}$ | 1.4 | - | - | - |
| Inter-zone | $10^6 \text{ m}^3/\text{yr}$ | 11.0 | 31.3 to Nong Kho reservoir | | - |
| <u>(3) Land Development</u> | | | | | |
| Net irrigation area | ha | 6,600 | 7,700 | | 2,400 |
| Cropping intensity | % | 140 | 140 | | 170 |

The Khlong Yai Dam Scheme is formulated with an integration of Nong Pla Lai Dam, which is being contemplated to be implemented in advance of Khlong Yai Dam. The Nong Pla Lai Dam was formulated to enable the existing Dok Krai Dam to bear the domestic and industrial water demand in Map Ta Phut - Sattahip area. It also aims at expanding the irrigation area in the basin. Further, as a consequence of the water balance study over the Study Area, an inter-zone water diversion from Nong Pla Lai Dam is projected in order to cope with the increased water demand in Chon Buri - Pattaya area.

The Khlong Yai Dam is subsequently proposed to secure the inter-zone water diversion by Nong Pla Lai Dam in one hand and to further expand the irrigation area on the other hand. With development of Khlong Yai Dam, the whole irrigable area in the Rayong river basin, consisting of the Ban Khai existing area (4,800 ha) and Ban Khai Extension Area (7,700 ha), can be fully brought under intensified agriculture with the year-round irrigation water supply.

In future Dok Krai Dam will be run properly for the domestic and industrial water supply to Map Ta Phut-Sattahip area. The Nong Pla Lai and Khlong Yai Dams will be operated as one unit to sustain the irrigation water demand in the basin and inter-zone water diversion to Chon Buri - Pataya area.

An intensified agriculture will be practiced with provision of the year-round irrigation water supply. Crops have been carefully selected in due consideration of the objective of the Fifth National Plan, soils and land capabilities in the irrigable area and livelihood of farmers. The proposed cropping patterns are shown in Fig. 3.

Preliminary assessment was carried out on rehabilitation of irrigation and drainage system in Ban Khai existing irrigation area. It concluded that the rehabilitation works are firmly justifiable from the economic viewpoint.

A basic flood control plan was established for both the Khlong Luang and Rayong river basins based on a standard project flood, which has a recurrence interval of 50 years. The plan is formed by a combination of dam and river improvement. According to the flood control study, flood damages in the Rayong river are expected to be reduced to a great extent due to regulation effects by Dok Krai, Nong Pla Lai, Khlong Yai and Khlong Thap Ma reservoirs. The Khlong Luang reservoir also contribute to flood damage reduction but its effect is limited to a narrow extent. The river improvement works along the Rayong river are evaluated not economically attractive for the present, while that along the Khlong Luang river poses to bear some economic return. A systematic flood damage statistical survey is recommended to be carried out in order to clarify the economic and financial losses more realistically.

3.3 Preliminary Design

3.3.1 Multiple-purpose Dam

A homogeneous earth fill type dam has been selected for all the dam-sites from the viewpoint of geological condition and availability of construction materials. Seepage through dam body and foundation was analyzed by applying the Finite Element Method. The Khlong Yai and Khlong Thap Ma Dams are designed with a deep core trench to intercept underseepage. For the Khlong Luang Dam, an earth blanket is proposed to be spread over the upstream area to suppress the possible leakage through intermediate zone in a depth of 7 to 20m and to control high leakage area in the left abutment.

The spillway is designed based on the design inflow flood of 500-year recurrence interval in accordance with the design criteria of RID. The spillway is capable of regulating a probable maximum flood with a sufficient freeboard.

Preliminary designs of dams are shown in DWG NO. 1 to 3. Principal features of dams and spillways are presented in Tables 4 to 6.

3.3.2 Water Conveyance System

The annual raw water transmission quantity has been projected for every 5-year period as tabulated below.

| Water Conveyance System | (Unit: $10^6\text{m}^3/\text{yr}$) | | |
|-------------------------|-------------------------------------|------|------|
| | 1991 | 1996 | 2001 |
| Khlong Luang | 1.4 | 6.7 | 12.4 |
| Nong Pla Lai | 4.9 | 14.2 | 31.3 |

Both water conveyance systems are planned to be implemented in two phases so as to be flexible to the growth of the water demand. The system capacity has been determined to be 1.3 times of the annual average supply rate in due consideration of daily and seasonal fluctuation in water consumption. Tables 4 and 5 present the principal features of the water conveyance systems by development phase.

The Khlong Luang system connects Khlong Luang Dam to Chon Buri with 56 km long pipeline in 2 rows. The system capacity is determined to be 0.26 m^3 per second for both the first and second phase works. The pipeline is $\phi 600$ mm in inside diameter and equipped with two booster pump stations.

The Nong Pla Lai system links Nong Pla Lai Dam with Nong Kho Dam with 53 km long pipeline in two rows. The system capacity is 0.65 m^3 per second for both the first and second phase works. The pipeline is divided into two reaches; the upstream reach with a length of 33 km is $\phi 900$ mm in inside diameter and is equipped with a booster pump station. The downstream reach is 20 km in length and $\phi 800$ mm in inside diameter.

DWG NO. 4 and 5 show the alignment of the Khlong Luang and Nong Pla Lai systems respectively.

3.3.3 Irrigation and Drainage System

The Khlong Luang irrigation area with a net area of 6,600 ha is located immediately downstream from the proposed damsite and is divided into North Area with 3,100 ha and South Area with 3,500 ha as shown in DWG NO. 6. The South and North Main Canals are 31.1 km and 21.8 km respectively and are designed in concrete lining. The principal features of the irrigation and drainage facilities are presented in Table 4.

The Ban Khai Extension Area extends along the Left Main Canal of Ban Khai existing area as shown in DWG NO. 7. Two headworks will be constructed, namely, Nong Pla Lai headwork and Khlong Yai headwork. Their diversion weir consists of concrete weir and earth embankment dikes. The concrete weir is designed as a floating type. A diversion canal between the both headworks is lined with concrete and has a discharge capacity of 4.9 m³ per second. The main canal is 45.2 km in length and is designed in trapezoidal cross section and with concrete lining. The principal features of the irrigation and drainage facilities are summarized in Table 5.

The Khlong Thap Ma irrigation area with a net area of 2,400 ha lies along the both banks of the Khlong Thap Ma river and will be served by two main canal systems as shown in DWG NO. 8. The West Main Canal serves 1,150 ha and is lined with concrete. The East Main Canal commands 1,250 ha and is also lined with concrete. The principal features of the irrigation and drainage facilities are as summarized in Table 6.

3.4 Investment Cost

The investment cost was estimated on the basis of the international competitive bidding and based on the 1982 price level. It consists of direct construction cost, compensation and relocation cost, administration cost of executive agencies, engineering services and physical and price contingencies. The estimated investment costs are shown in Tables 7 to 9 and are summarized below.

(Unit: $\text{¥ } 10^6$)

| Schemes | Foreign Currency Portion | Local Currency Portion | Total |
|----------------|--------------------------------|------------------------------|--------------|
| Khlong Luang | <u>1,902</u> | <u>2,664</u> | <u>4,566</u> |
| First stage | 1,419 | 2,517 | 3,936 |
| Second stage | 483 | 147 | 630 |
| Khlong Yai | <u>3,154</u> | <u>4,426</u> | <u>7,580</u> |
| First stage | 2,387 | 4,150 | 6,537 |
| Second stage | 767 | 276 | 1,043 |
| Khlong Thap Ma | <u>391</u> | <u>1,200</u> | <u>1,591</u> |

The investment cost of Nong Pla Lai Dam is updated and incorporated into the investment cost of Khlong Yai Dam Scheme for the purpose of economic and financial analyses.

Disbursement schedule of the investment cost is shown in Tables 10 to 12.

3.5 Implementation Programme

The implementation programme is prepared in the light of the predicted water demand and supply balance situation and is shown in Figs. 4 to 6.

The Khlong Luang and Khlong Yai Dam Schemes are programmed to be implemented in two stages. The first stage comprises a multiple-purpose dam, first phase of water conveyance system and irrigation and drainage system. The second stage is the construction of the second phase water conveyance system. The implementation programmes of the three contemplated Schemes are summarized hereunder.

| Schemes | Implementation Schedule | |
|----------------|-------------------------|--------------|
| | First Stage | Second Stage |
| Khlong Luang | 1985 - 1991 | 1992 - 1996 |
| Khlong Yai | 1984 - 1991 | 1992 - 1996 |
| Khlong Thap Ma | 1985 - 1989 | - |

The Khlong Luang and Khlong Yai Multiple-purpose Dams and their associated water conveyance systems have to commence operation in 1991 at the latest. Otherwise Chon Buri - Pattaya development area would incur a serious shortage of domestic and industrial water. Additional investigation and detail design of the dams thus have been planned to take place from the 1985 dry season.

3.6 Benefit

The project benefits are derived from the domestic and industrial water supply, agricultural development and flood control. The water supply and agricultural benefits increase year after year in accordance with increase of water demand and expansion of irrigation area and agricultural supporting systems. The annual project benefits at full development stage are estimated as follows.

| Scheme | (Unit: $\text{฿ } 10^6/\text{yr}$) | | | |
|----------------|-------------------------------------|--------------------------|---------------|---------|
| | Water Supply | Agricultural Development | Flood Control | Total |
| Khlong Luang | 423.3 | 180.7 | 49.8 | 653.8 |
| Khlong Yai | 793.6 | 198.2 | 57.2 | 1,049.0 |
| Khlong Thap Ma | - | 81.7 | 19.5 | 101.2 |

The benefits of Khlong Yai Dam Scheme are resulted from a joint operation of Khlong Yai and Nong Pla Lai Multiple-purpose Dams.

3.7 Economic Evaluation

The economic feasibility was evaluated by economic internal rate of return (EIRR). Useful life is assumed to be 50 years. The EIRR is computed for 5 cases as tabulated below.

| Case | (%) | | |
|---------------------------------------|-----------------|---------------|-------------------|
| | Khlong Luang | Khlong Yai | Khlong Thap Ma |
| (1) Standard | 16.1 | 15.0 | 12.1 |
| (2) 10% of Cost Increase | 13.5 | 11.3 | 11.1 |
| (3) 10% of Benefit Decrease | 13.3 | 11.0 | 11.0 |
| (4) (2) + (3) | 11.2 | 8.6 | 10.0 |
| (5) Delay in Construction for 2 years | 11.0 | 9.1 | 10.1 |

As shown in the above, all the Schemes indicate the high economic feasibility.

3.8 Financial Analysis

The investment cost was allocated to each component by means of a separable cost-remaining benefit method as shown below.

| Project Components | (Unit: $\text{฿ } 10^6$) | | |
|----------------------------------|--------------------------------|------------------------------|-------|
| | Foreign Currency Portion | Local Currency Portion | Total |
| <u>Khlong Luang Dam Scheme</u> | | | |
| Water Supply | 1,112 | 867 | 1,979 |
| Agricultural Development | 684 | 1,557 | 2,241 |
| Flood Control | 106 | 240 | 346 |
| Total | 1,902 | 2,664 | 4,566 |
| <u>Khlong Yai Dam Scheme</u> | | | |
| Water Supply | 2,356 | 2,644 | 5,000 |
| Agricultural Development | 593 | 1,360 | 1,953 |
| Flood Control | 205 | 422 | 627 |
| Total | 3,154 | 4,426 | 7,580 |
| <u>Khlong Thap Ma Dam Scheme</u> | | | |
| Agricultural Development | 326 | 984 | 1,310 |
| Flood Control | 65 | 216 | 281 |
| Total | 391 | 1,200 | 1,591 |

Financial aspect of the Scheme is evaluated by respective component paying particular attention to the repayability of the Scheme to the international loan. International loan is assumed to be financed with an interest rate of 3.5% per annum and a term of 30 years including 10 years of grace period. Repayability is examined based on the project cost allocated to each project component and revenue expected to be collected through water tariff.

Water tariff on domestic and industrial water supply is assumed to be $\text{P} 4.0/\text{m}^3$. Water tariff on irrigation water is broadly assumed to be equivalent to the annual O&M cost. It is estimated to be $\text{P} 670$ per ha for the Khlong Luang Scheme, $\text{P} 530$ per ha for the Khlong Yai Scheme and $\text{P} 960$ per ha for the Khlong Thap Ma Scheme.

International loan is expected to be repayed in due schedule, with the Government's subsidy given at the appropriate time as presented in Tables 13 to 17.

3.9 Executive Agencies

RID will be responsible for implementation, operation and maintenance of dam and irrigation components. An appropriate agency would be appointed for the implementation, operation and maintenance of the raw water conveyance system. The Center for the Integrated Plan of Operation (CIPO) established within National Economic and Social Development Board (NESDB) will coordinate all the activities of the agencies with the activities related to the Eastern Seaboard Development.

3.10 Environmental Aspects

Environmental aspects were preliminarily evaluated according to the standard established by National Environmental Board. The standard comprises four categories namely, physical resources, ecological resources, human use values and quality of life values. It is clarified that the proposed development activities will induce positive impact on human use value and quality of life values greatly. Impact on such items as water quality and fauna and flora will be minimized or avoided by guaranteeing the river maintenance flow to the downstream of the river.

4. CONCLUSION AND RECOMMENDATION

As a result of feasibility study, Khlong Luang, Khlong Yai and Khlong Thap Ma Dam Schemes are proved to be technically, economically and financially feasible. In order to accomplish the objectives of the Fifth National Plan, an earliest implementation of these Schemes are cordially recommended.

In particular, Khlong Luang, Khlong Yai and Nong Pla Lai Multiple-purpose Dams are recommended to be realized as earlier as possible to save the Study Area from water deficit, which is being foreseen to occur within a couple of years. It is therefore strongly desired to commence the detail engineering works such as detailed field investigation and design and preparation of tender documents at latest in 1984 for Nong Pla Lai Dam and 1985 for Khlong Luang and Khlong Yai Dams.

The implementations of Khlong Luang and Nong Pla Lai water conveyance systems are proposed to be proceeded in two phases so as to be flexible with possible increase and decrease in water demand. However, the first phase works of the both systems should commission in service in 1991 at the latest in order to save Chon Buri - Pattaya area from water deficit.

The irrigation development is recommended to be carried out in parallel with implementation of multiple-purpose dam so that the intensified agriculture with the year-round irrigation water supply can be practiced soon after completion of the dam. The rehabilitation works of irrigation and drainage system in Ban Khai existing area are also recommended to be materialized at an earliest date.

Table 4 PRINCIPAL FEATURES OF KHLONG LUANG DAM SCHEME

| | | |
|--|-----------------------|--------------------------------------|
| 1. MULTIPLE-PURPOSE DAM | | |
| 1.1 Hydrology | | |
| (a) Catchment area | | 526 km ² |
| (b) Annual average inflow | | 3.97 m ³ /s |
| (c) Design flood for spillway (500-year flood) | | 1,460 m ³ /s |
| (d) Extra-ordinary flood (Probable maximum) | | 2,520 m ³ /s |
| 1.2 Reservoir | | |
| (a) High water level | | El. 39.5 m |
| (b) Low water level | | El. 33.8 m |
| (c) Flood water level | | El. 40.5 m |
| (d) Extra-ordinary flood water level | | El. 40.9 m |
| (e) Gross storage | | 169.1x10 ⁶ m ³ |
| (f) Surcharge | | 34.3x10 ⁶ m ³ |
| (g) Active storage | | 119.0x10 ⁶ m ³ |
| (h) Dead storage | | 15.8x10 ⁶ m ³ |
| (i) Reservoir area at HWL | | 32.2 km ² |
| 1.3 Main Dam | | |
| (a) Type | Homogeneous earthfill | |
| (b) Crest elevation | | El. 42.5 m |
| (c) Dam height above riverbed | | 14.5 m |
| (d) Crest length | | 3,820 m |
| (e) Crest width | | 8.0 m |
| (f) Slope, upstream | | 1 : 2.6 |
| downstream | | 1 : 2.4 |
| (g) Embankment volume; | | |
| Earthfill, including blanket | | 2,605,000 m ³ |
| Filter | | 213,000 m ³ |
| Rock riprap | | 154,000 m ³ |

1.4 Saddle Dam

| | |
|--|------------------------|
| (a) Type | Homogeneous earthfill |
| (b) Crest elevation | El. 42.5 m |
| (c) Dam height above original ground surface | 7.5 m |
| (d) Crest length | 2,250 m |
| (e) Crest width | 8.0 m |
| (f) Slope, upstream | 1 : 2.6 |
| downstream | 1 : 2.4 |
| (g) Embankment volume; | |
| Earthfill | 215,000 m ³ |
| Filter | 53,000 m ³ |
| Rock riprap | 31,000 m ³ |

1.5 Spillway

| | |
|--|-----------------------------|
| (a) Type | Non-gated side channel weir |
| (b) Overflow weir crest elevation | El. 39.5 m |
| (c) Overflow weir width | 70.0 m |
| (d) Length of chuteway, including stilling basin | 90.0 m |

2. WATER CONVEYANCE SYSTEM

| (d) Pump capacity | 3 | 2 |
| (f) Floor area of pump station | 259 m ² | |
| 2.4 Head Tank | | |
| (a) Location | Ban Khao Khayai | |
| (b) Storage capacity | 2,327 m ³ | |
| (c) High water level | El. 118.0 m | |
| Low water level | El. 115.0 m | |
| 3. IRRIGATION AND DRAINAGE SYSTEM | | |
| 3.1 Net Irrigation Area | 7,700 ha | |
| 3.2 Nong Pla Lai Headworks | | |
| (a) Location | Nong Pla Lai river | |
| (b) Design flood | 200 m ³ /s | |
| (c) Flood water level | El. 27.05 m | |
| (d) Design intake discharge | 4.90 m ³ /s | |
| (e) Design intake water level | El. 25.46 m | |
| (f) Type of diversion weir | Floating type | |
| (g) Height of weir above riverbed | 3.56 m | |
| (h) Length of fixed weir | 60 m | |
| (i) Crest elevation of fixed weir | El. 25.56 m | |
| (j) Width of scouring sluice | 3.0 m | |
| (k) Sill elevation of intake | El. 23.96 m | |
| (l) Intake gate (B x H) | 2.5m x 2.0m | |
| (m) Number of intake gate | 2 | |

3.3 Diversion Channel

| | |
|----------------------|----------------------------------|
| (a) Design discharge | 4.9 m ³ /s |
| (b) Type | Trapezoidal, lined with concrete |
| (c) Bottom width | 2.0 m |
| (d) Length | 1,800 m |

3.4 Khlong Yai Headworks

| | |
|-----------------------------------|-------------------------|
| (a) Location | Khlong Yai river |
| (b) Design flood | 280 m ³ /s |
| (c) Flood water level | El. 26.57 m |
| (d) Design intake discharge | 11.09 m ³ /s |
| (e) Design intake water level | El. 25.00 m |
| (f) Type of diversion weir | Floating type |
| (g) Height of weir above riverbed | 4.1 m |
| (h) Length of fixed weir | 95.0 m |
| (i) Crest elevation of fixed weir | El. 25.1 m |
| (j) Width of scouring sluice | 8.0 m |
| (k) Sill elevation of intake | El. 23.0 m |
| (l) Intake gate (B x H) | 4.0 m x 3.0 m |
| (m) Number of intake gate | 2 |

3.5 Main Canal

| | |
|--|----------------------------------|
| (a) Type of canal | Trapezoidal, lined with concrete |
| (b) Side slop | 1:1.5 |
| (c) Effective width of inspection road | 5.0 m |
| (d) Length | 45.2 km |

3.6 Lateral and Sub-Lateral Canals

| | |
|--|----------------------|
| (a) Type of canal | Trapezoidal, unlined |
| (b) Side slop | 1:1.5 |
| (c) Effective width of inspection road | 3.0 m |
| (d) Total length | 123 km |

3.7 Canal Structures 503 nos.

3.8 Drainage

| | |
|---------------------|-------|
| (a) New drains | 81 km |
| (b) Improved drains | 43 km |
| (c) Structures | 59 km |

Table 6 PRINCIPAL FEATURES OF KHLONG THAP MA DAM SCHEME

1. MULTIPLE-PURPOSE DAM

1.1 Hydrology

| | |
|--|-------------------------|
| (a) Catchment area | 158 km ² |
| (b) Annual average in flow | 1.75 m ³ /s |
| (c) Design flood for spillway (500-year flood) | 920 m ³ /s |
| (d) Extra-ordinary flood (Probable maximum) | 1,540 m ³ /s |

1.2 Reservoir

| | |
|--------------------------------------|-------------------------------------|
| (a) High water level | El. 25.7 m |
| (b) Low water level | El. 16.2 m |
| (c) Flood water level | El. 26.9 m |
| (d) Extra-ordinary flood water level | El. 27.5 m |
| (e) Gross storage | 74.3x10 ⁶ m ³ |
| (f) Surcharge | 13.5x10 ⁶ m ³ |
| (g) Active storage | 56.1x10 ⁶ m ³ |
| (h) Dead storage | 4.7x10 ⁶ m ³ |
| (i) Reservoir area at HWL | 10.5 km ² |

1.3 Main Dam

| | |
|-------------------------------|--------------------------|
| (a) Type | Homogeneous earthfill |
| (b) Crest elevation | El. 28.9 m |
| (c) Dam height above riverbed | 20.4 m |
| (d) Crest length | 810 m |
| (e) Crest width | 8.0 m |
| (f) Slope, upstream | 1 : 3.1 |
| downstream | 1 : 2.6 |
| (g) Embankment volume | |
| Earthfill | 1,182,000 m ³ |
| Filter | 92,000 m ³ |
| Rock riprap | 71,000 m ³ |

1.4 Saddle Dam

| | |
|--|-----------------------|
| (a) Type | Homogeneous earthfill |
| (b) Crest elevation | El. 28.9 m |
| (c) Dam height above original ground surface | 3.3 m |
| (d) Crest length | 420 m |
| (e) Crest width | 8.0 m |
| (f) Slope, upstream | 1 : 3.1 |
| downstream | 1 : 2.6 |

| | | |
|---|-------------------------------------|------------------------|
| (g) Embankment volume | | |
| Earth fill | | 35,000 m ³ |
| Filter | | 9,000 m ³ |
| Rock Riprap | | 5,000 m ³ |
| 1.5 Spillway | | |
| (a) Type | Non-gated side-channel weir | |
| (b) Overflow weir crest elevation | | El. 25.7 m |
| (c) Overflow weir crest width | | 50.0 m |
| (d) Length of chuteway, including stilling basin | | 235 m |
| 2. <u>IRRIGATION AND DRAINAGE SYSTEM</u> | <u>East Area</u> | <u>West Area</u> |
| 2.1 Net Irrigation Area | 1,250 ha | 1,150 ha |
| 2.2 Intake | | |
| (a) Location | Khlung Thap Ma Reservoir | |
| (b) Discharge capacity | 1.80 m ³ /s | 1.66 m ³ /s |
| (c) Diameter of outlet conduit | ø1,300 mm | ø1,300 mm |
| (d) Length of outlet conduit | 100 m | 87 m |
| (e) Intake gate (B x H) | 1.3m x 1.3m | 1.3m x 1.3m |
| 2.3 Main Canals | | |
| (a) Type of canal | Trapezoidal, lined with concrete | |
| (b) Side slope | | 1 : 1.5 |
| (c) Effective width of inspection road | | 5.0 m |
| (d) Length | 5.3 km | 11.3 km |
| 2.4 Lateral and Sub-lateral Canals | | |
| (a) Type of canal | Trapezoidal, unlined | |
| (b) Side slope | | 1 : 1.5 |
| (c) Effective width of inspection road | | 5.0 m |
| (d) Total length | 17 km | 21 km |
| 2.5 Canal structures | 73 nos. | 105 nos. |
| 2.6 Drainage | | |
| (a) New drains | | 31 km |
| (b) Improved drains | | 8 km |
| (c) Structures | | 10 nos. |

Table 7 INVESTMENT COST OF KHLONG LUANG DAM SCHEME
