/1: Sediment runoff volume after the implementation of the Sabo project is reduced less than the allowable sediment volume; therefore, reduction volume of sediment for the project benefit is estimated at difference between them.

/2: For the Maninila river, the sediment runoff volume under with-project condition is reduced to $42,600 \text{ m}^3$ which is over the allowable sediment volume; however, this excess is included in the reduction benefit because excess volume is regulated by sand retarding function of consolidation works of the Sabo project.

/3: Sediment runoff volume under with-project condition is more than the allowable sediment volume, and this excess is regulated by

the natural retarding function. Therefore, this excess volume is excluded from the reduction benefit.

/4: Unit dredging cost = £40/m³

/5: Dredging cost/50 years (probable flood)

TABLE-7.7.2 PROJECT BENEFIT AND COSTS
FOR THE SABO PROJECT

(Unit: ₦ 10^3)

Item	Total
I) Annual Project Benefit	<u>5,064</u>
1) Mud/debris flow damage reduction benefit	<u>3,502</u>

/1: Total damage of crops (Quinali A and Yawa)/Return period of mud/debris flow = ₦16,120,000/5 years = ₦3,224,000

/2: Total damage of houses (Quinali A and Yawa)/ 5 years = ₦869,000/5 years = ₦174,000

/3: Number of population affected x cost of relief goods and medical assistance per person/5 years = 8,140 persons x ₦64/person/5 years = ₦104,000
