### PREFACE

Since a project for technical cooperation of afforestation at Pantabangan in the Philippines was set in 1977, it has attained the third year, shifting form the first phase of the development of individual afforestation technology to the second phase to systematize for the management of it.

The profect is the first technical cooperation one for the Japan International Cooperation Agency in forestry sector. It has been bringing about its fine results by making various efforts in close cooperation with personnel concerned in Japan and the Philippines.

This report was compiled in November, 1979, by Mr. Osamu Takasawa who reterned to Japan after the expiration of his term for 2 years and three months. It is sumary and analysis on the performance of activities of the project for past three years.

Dispite the project faced difficulties to afforest on the bald area where is in severe conditions, valuable date were prepared, conducting the profect even in frequent confusion. The analysis of the project findings has been examined in the view of forest management.

In order to promote smoothly the project hereafter, we hope the report will contribute, as a reference one, to personnel concerned.

December 1979

Kenji Hori Director of Forest Development Cooperation Department, Japan International Cooperation Agency

### ACKNOWLEDGEMENT

I would like to thank the following individuals who made my stay in the Philippines happy, memorable and highly rewarding:

- Director Edmundo V. Cortes, Bureau of Forest Development, for his deep interest to the project and for the valuable assistance he has extended to me during my stay.
- 2. Mr. Rogelio B. Baggayan, Project Director and Chief of the Reforestation and Afforestation Division, BFD, who had assisted me in coordinating and arranging many of my duties and project studies regarding the RP-Japan Project.
- 3. Mr. Jose L. Lechoncito, Assistant Project Director and Assistant Chief of the Reforestation and Afforestation Division, BFD, who has helped in making this report and also gave me personal suggestions and advice.
- 4. Mr. Felipe D. Buenaflor and Mr. Juanito P. Regadio, Section Chiefs, Reforestation and Afforestation Division, BFD, who have guided me to various places in the Philippines during observation study and tour.
- 5. Mr. Manuel H. Zambrano, Project Leader, Assistant District Forester, Maringalo Forest District Office, who has assisted me in my work and has closely coordinated all project activities effectively throughout my stay in the project, thereby making everything easy to manage. And also to Mrs. Zambrano for her kindness and friendliness.
- 6. Miss Emily A. Taeza, Stenographer, BFD Central Office, for typing this report and for extending to me kind services in the office.
- 7. Mr. Senshi Namba, Project Chief Adviser, and all Japanese Experts, who have worked with me during my stay and for giving me valuable official and personal advice.
- 8. Officers and Staff of the Japanese Embassy and the JICA Manila Office for making my stay fruitful and comfortable.
- 9. To all Filipino Counterparts who are my best "kaibigan", and to all members, to the staff and personnel of the project, with whom I have several experiences with hiking together in the mountains and discussed problems of the project including their solutions which often-times would make us awake very late in the night.
- 10. Mrs. Joy Cruz Millare, personal friend of mine and my wife, who taught us the Filipino way of life and the national language.

11. And, finally, the hundreds of people whom I met here in this country who gave me their time to acquaint myself with forestry practices in the Philippines and for their being hospitable. And to all those whom I cannot acknowledge because of lack of time and space but have in one way or the other help me during my stay in this country, I owe them a debt of gratitude.

November 1979

Osamu Takasawa Expert on Forest Management The RP-Japan Technical Cooperation Project for the Afforestation of

the Pantabangan Area.

### I. INTRODUCTION

### 1. Objective

This technical cooperation project aims at the development of various technquees in forestry so as to contribute to the successful afforestation of open grassland and other denuded lands of nearly 50,000 hectares in the Pantabangan Area which is one of the most important watershed in the Republic of the Philippines.

### 2. Background

In the Philippines, forests have long been one of the most important sources of livelihood for the people. In fact, people have benefited from rich forest resources where they derive construction materials, fuel and various other products. Besides, forest products have consistently been a major source of foreign exchange. Therefore, logging activities have also been developed in proportion to the increase of world wood demand. On the other hand, the regeneration techniques of the tropical forest such as those obtaining in the Philippines has barely started and have not been fully established. Until recently, the forest was considered a hindrance to agricultural development that it had to be cleared as fast as possible. It was a process that the logged-over area had been turned to open land by kaingineros which will become eventually agricultural lands, pasture lands and others turned into wastelands. The decrease of forest land had resulted in the decrease of forest resources production.

Lately, however, the influence of the forest on the environment, aside from its being the source of timber and other forest products, have slowly gained recognition so that there is now public awareness on the importance of the forest on human life. In particular, the deterioration of forests in the important watersheds has become a public concern as one of the causes for the frequent occurrence of floods and draughts. It is, also, feared that the overall devastation of the forest land may threaten the sustained productivity of forests in the near future. Thus, the government adopted the afforestation and reforestation of open and grassland as one of the most important policies from the viewpoint of the land conservation and forest resources management.

In these circumstances, the Philippine Government made a request to the

- 1 -

Japanese Government for the cooperation and assitance in the technical and financial aspects in the field of afforestation, in 1973. In response to the request, the Japanese Government concluded with the Philippine Government to establish the RP-Japan Technical Cooperation Project after dispatching survey teams several times, and the Pantabangan area was selected for the project site because of its immediate necessity of rehabilitation aiming at the development of afforestation techniques which could be replicated in other watershed areas of the country.

### 3. Outline of the Project

To attain the objective set forth, the project is managed following the master plan appended in the Record of Discussions.

The first step is to develop the various individual techniques for afforestion through the establishment of the trial plantations. Subsequent step is to establish the large scale pilot plantations.

In the pilot plantations, studies will be carried out for the systematization of various afforestation techniques including the forest management on a large scale, the establishment of forest protection system and other necessary activities in forest management. At the same time, the training of Filipino foresters is conducted for the application of those techniques developed. Training grant to Japan were also extended to Filipino foresters to afford them the opportunity to train and adopt afforestation, erosion control and forest management techniques of that country.

For the implementation of this project, it has a Central Office in Bureau of Forest Development, Quezon City, and a Technical Cooperation Center located in the project site. Actual implementation of the project activities is executed at the Technical Cooperation Center. A Joint Committee is organized to discuss, review and approve plans and programs pertaining to project implementation. The project activities have started in November, 1976, upon the arrival of two Japanese Experts. The Five-Year Work Program of the project, which was expected to be completed by 1982 was approved on the first Joint Committee Meeting on June 1977. However, it was recently found out that nationwide price hike caused by increase in the price of oil, coupled with the existence of pasture in the proposed project site would have brought about a difficulty to pursue the present five-year program. Therefore, it was deemed necessary to revise the program for the smooth implementation of the project.

- 2 -

### II. PRESENT STATUS OF THE AREA

#### 1. Natural Environment

#### 1.1 Location

The project site is located at the northeastern part of Nueva Ecija province and adjoins Cagayan River watershed by a branch of the Sierra Madre Mountains. It is embraced by the Upper Pampanga River Basin which supports Pantabangan and Talavera River draining to the vast Pampanga Plain. Geographical location of the project site is 16° of north latitude and 121° of east longitude. The area is covered by two municipalities - Pantabangan and Caranglan, all within Nueva Ecija Province. It is also under the jurisdiction of BFD Forest District 3, known as Upper Pampanga River Basin Multiple Use Management District, and District 9, known as the Pantabangan District under Regional Office No.3 located at San Fernando, Pampanga.

The Technical Cooperation Center which is located in the project area is situated 189 kilometers from Manila passing along Manila-Cagayan highway.

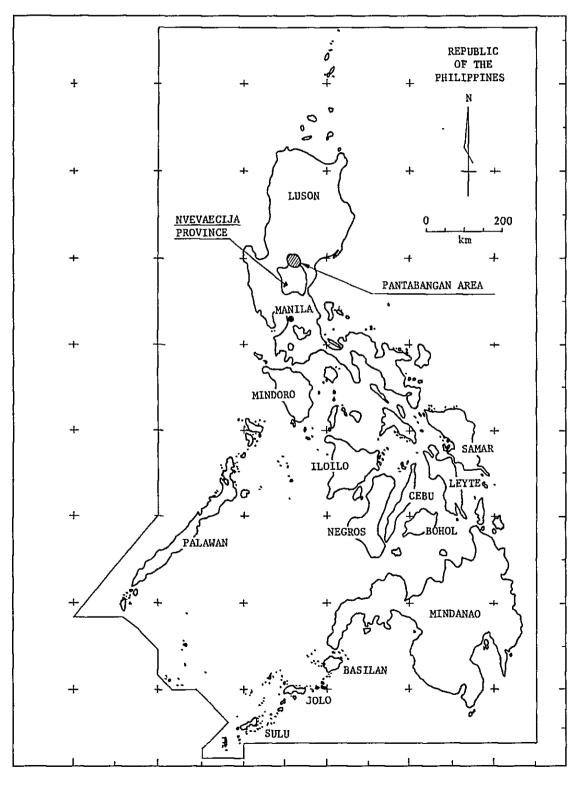

### 1.2 Soil Cover

The area consists of 115,000 hectares forest land, 12,900 hectares alienable and disposable land, and 8,900 hectares of lake and rivers. The forest land compose the forested area which covers 51% or 58,500 hectares and 49% or 55,900 hectares are the grassland.

### 1.3 Climate

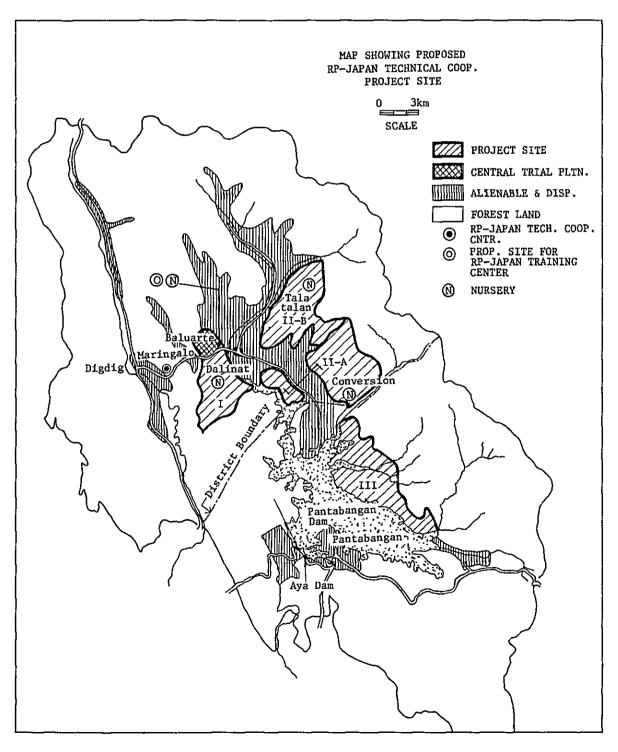

Mean temperature of the area is 27°C with an average annual rainfall of around 2,000 mm obtained in the Pantabangan area for the past years. Range of daily temperature is almost similar throughout the year and average maximum temperature is 30.1°C and 22.2°C is the average minimum temperature. Dry season and rainy season is quite obvious and the period from November to April is very severe dry season. The area is located near the border of climatic zones, and rainfall is abundant throughout the year just in the east of divide (Pacific coast of Luzon Island). Therefore, the peaks of the divide (1,000 a.s.l.) are covered with clouds even during dry season.

| 1. | FOREST LAND                   |           |                |
|----|-------------------------------|-----------|----------------|
|    | Forested area                 |           | 58,523.0 has.  |
|    | Grassland                     |           | 55,883.0 "     |
|    | Cultivated area               |           | 511.5 "        |
|    | Barren land                   |           | 55.0 "         |
| -  | House lot                     |           | 19.0 "         |
|    | Eroded area                   |           | 18.4 "         |
|    |                               | Sub-Total | 115,009.9 has. |
| 2. | ALIENABLE AND DISPOSABLE LAND |           | 12,906.7 "     |
| 3. | LAKE AND RIVER                |           |                |
|    | Lake (Reservoir)              |           | 7,568.0 has.   |
|    | River                         |           | 1,344.0 "      |
|    |                               | Sub-Total | 8,912.0 has.   |
|    |                               | TOTAL     | 136,828.6 has. |

### 1.4 Topography

The whole catchment area may be classified into the following topographic types: Alluvial, plateau, rolling hills, mountains with little undulations, mountains with abundant undulations, and steep mountains. However, the areas proposed for pilot forests (grasslands) consists roughly of rolling hills and mountains with little and abundant undulations. Topography of grasslands is classified into summit and uplands, hillside slope and deposit and erosion. Those grassland is distributed in the elevation range of 230 to 800 meters above sea level and average gradient is 7-10 degrees.

### 1.5 Geology

The foothills of Sierra Madre Mountains east of the Pantabangan area indicates a NNE-SSW trending synclinorium with flanks made up of regionally metamorphosed thick sequence of Upper Cretaceous to Upper Eocene volcanic lava flows and pyroclastic rocks. The formation includes thin intercalations of well-bedded and equally metamorphosed elastic sedimentary rocks as key beds. In general, andesitic tuff breccia and andestitic lavas with thin horizons of hale and sandstone constitute the basal zone. Vertically, they grade imperceptively into predominantly basic volcanics composed of basaltic tuff breccia and basaltic lavas, also intercallated with thin beds of elastic sedimentary rocks.

### 1.6 Soils

Soils in the area belong to red podosolic soil. Surface soil is a little dark and lower layer is reddish brown although red weathering and podosolization do not seem to be so extreme. This is probably due to wide distribution of immature soil, which results from severe surface erosion. In fact, at the upper part of slope or convex slope, the surface layer is shallow and the evidence of surface erosion can be observed. On the contrary, at the lower part of slope or concave slope, the surface layer is deep and lower layer is dark reddish brown. Moreover, the soils in this area are generally very hard and dense, and their physical properties are poor.

Soil fertility, naturally, depends on the topography, geology and type of soil. In this area, soils are generally acidic and infertile.

#### 1.7 Vegetation

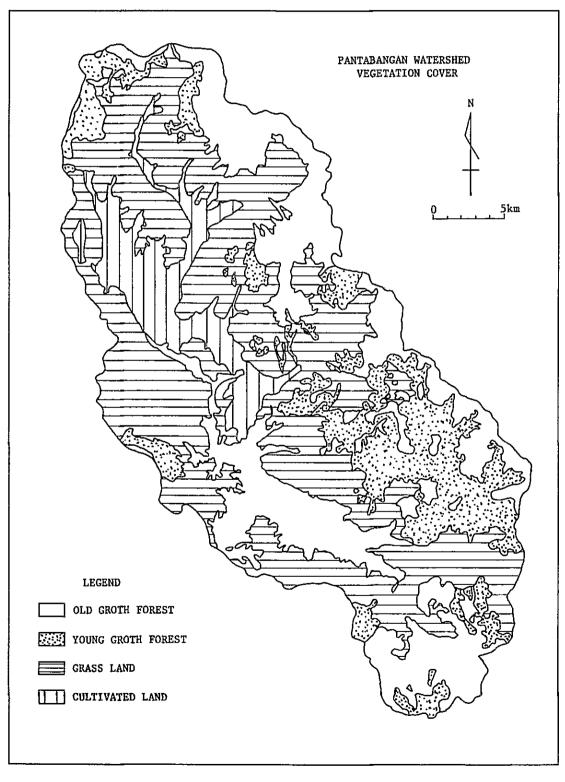

In the Pantabangan area, mountains higher than 1,000 m. a.s.l is covered by mossy forest. Below 1,000 m. a.s.l. the whole area used to be a tropical rain forest, but at present, most parts have been logged-over except a small portion of natural forest remaining in the southeast. In the northern part of the area, natural forests of <u>Pinus kesiya</u> is distributed on the ridges higher than 800 m. a.s.l.. Almost the whole area lower than 800 m. is cogon land.

In the Talavera watershed, the ratio of forested area is higher than in the Pantabangan area. That is because of steeper slope and later forest

- 12 -

exploitation.

In the cogon land, some natural forests are in a strip or spot, along a creek surrounded by a little steep slope, but all the rest is covered with grasses. The vegetational composition of grassland is comparatively simple. Major species are Talahib (<u>Saccharinum spontaneom</u>), Cogon (Imperata cylindricum), Samon (Themeda triandra).

.

### 2. Social Circumstances

### 2.1 Population

According to the 1975 census, the population of Carranglan and Pantabangan municipalities are 16,875 and 18,074. At present, Conversion is the only labor source for the project among the barangays in Pantabangan. The number of both sexes from 15 to 49 years old is 7,323 in Carranglan. The population increase percentage in Carranglan is 8.6% from 1970 to 1975.

### 2.2 Local Production

The major source of income in the area is agriculture. Majority of the people are engaged in rice farming. The rice-field in the municipality of Carranglan is about 3,400 ha, of which 1,400 ha are the irrigated ricefield and 2,000 ha are the rainfed ricefield. The average ricefield size per family in Carranglan as reported by the Department of Agrarian Reform was about 2.5 ha in 1976. In the irrigated ricefield, not all of the area are planted in the dry season because of inadequate water supply. Therefore, most of rice planting activities are done during rainy season. The average yield reported by the Department of Agrarian Reform in the Carranglan area for 1976 was 39.9 cavans/ha in the rainfed fields and 54.4 cavans/ha in the irrigated field while the Bureau of Agricultural Economics had reported the rice yield at Carranglan were 2.2 and 1.6 tons/ha for irrigated and rainfed rice, respectively.

### 2.3 Employment

Most of the local people are working at their own field or are employed in agricultural works. The average wage for agricultural workers is 7 - 8 pesos with food. As agricultural works are mostly done during rainy season, there are less chances for the people to be employed during dry season.

The second is the RP-Japan Afforestation Project which have been employing more or less 1,000 laborers a day since 1977. The maximum number of laborers employed have reached to 2,200 last June, 1979. With the expansion of the project activities, the lack of labor force during the planting season for both agricultural works and the project, is becoming the problem in the area.

### 2.4 Pasturage

Livestock farming has been quite a suitable occupation in the area because of wide grassland. Usually, the forage consumed by the animals is produced without any input. However, this pasturage is one of the largest hindrance for watershed management especially in a critical area like the Pantabangan watershed. Since 1975, the BFD regulations do not allow the renewal of the lease contract or permit, but the pastures are still existing legally and illegally,

- 17 -

and making trouble with the afforestation project because they obstruct the implementation of plans and programs of the project. In the Pantabangan, one communal pasture which cannot be cancelled, is existing.

2.5 Kaingin

Kaingin management is a part of forest development activities. Though survey of kaigins in the area is not completed yet, it is estimated that there are approximately 300 families/kaingineros in the area. They cultivate from 1 to 5 hectares for upland crops and transfer to another area after 2 to 3 years. Their annual income is estimated at about 1,000 to 2,000 pesos which is quite low. To prevent erosion and forest fire caused by shifting cultivation and burning, resettlement of kaingineros and educating them on the value of forest is urgently necessary. In addition, involving them in the afforestation activities will redound to the benefits of both kaingineros and the project.

### III. REFORESTATION ACTIVITIES IN THE AREA

#### 1. San Jose Reforestation Project

The San Jose Reforestation Project is under the jurisdiction of the Upper Pampanga River Basin Multiple-Use Management District (UPRBMUND, R-3, D-3). Since 1938, this project has been undertaking reforestation activities in the Talavera watershed area. Though it was reported that the project has reforested about 7,200 hectares of openlands, this figure actually includes the areas replanted annually because of frequent fire occurrences during dry season. At present, the project undertakes about 200 hectares of plantation establishment yearly, producing 500,000 seedlings in Puncan Nursery and the other subsidiary nurseries. The main problem of the project is forest fire which damages the plantations. This is bought about by the insufficient funds provided to the profect for protection activities. Seed collection is also undertaken from the 20 - 30 years established plantations of Teak, Mahogany and Narra.

### 2. Carranglan Reforestation Project

The Carranglan Reforestation Project is also under UPRBMUND and undertakes the reforestation activities in the Pantabangan watershed area. Based on available records of the District Office, the project has reported around 7,600 hectares of established plantations. However, based on actual estimate, less than half of the area established has existing forest plantations while the rest has been always subjected to forest fires. Starting October 1979, the forest renewal activities of the project will be concentrated in the Talavera watershed area while the RP-Japan Afforestation Project expands its activities in the Pantabangan watershed area.

### 3. Pantabangan Special Project

The Pantabangan Special Project under the jurisdiction of the Pantabangan District (R-3, D-9) was started in 1975. The project office is located at Conversion, Pantabangan and it undertakes reforestation activities in the northern part of the Pantabangan Dam. It was reported that the project had reforested 2,000 hectares and had established 17 nurseries, with a total capacity of 5.0 million seedlings. The subsidiary nurseries are distributed strategically in the proposed plantation area. The use of

Data source: Accomplishment Report, UPRBMUMD, September, 1979

boats to transport personnel and materials characterizes the system that is best suited to the area.

The major concern is forest protection and Yemane was selected as the main species from the viewpoint of fire resistance. The Pantabangan district has been proposing to transfer the jurisdiction of its established plantations within the municipality of Carranglan to the UPRBMUMD or RP-Japan Project so that the Pantabangan Special Project can concentrate its activities in Pantabangan.

### 4. Aya Forest Nursery

The Aya Forest Nursery with a total capacity of 500,000 seedlings, under the Pantabangan District, serves the plantable areas near the town of Pantabangan, and also provides seedlings for the planting activity of PD 1153 (refer to 3-6).

### 5. National Irrigation Administration Project

The reforestation activities of the National Irrigation Administration (NIA) commenced in 1974 as a joint venture with BFD, MAB-UNESCO, U.S. Peace Corps and BFD-UNDP.

In support of their reforestation activities, NIA has established 2 central nurseries and 4 subsidiary nurseries, with a total capacity of about 13 million seedlings. Approximately 2,000 hectares of plantation was established since the start of the project until 1978. They have likewise constructed 10 kilometers of roads and trails. Among the species planted are: Yemane, Benguet Pine, <u>Albizzia falcataria</u>, <u>Albizzia julibris-</u> sin, Giant Ipil-ipil, Agoho, Rain tree, Teak, Narra and Mahogany. The average survival of the two-year old plantation was reported as 40%. Approximately 90 hectares of the plantation was burned in 1978.

### 6. PD 1153 Planting Activity

The Presidential Decree No. 1153, requiring the planting of one tree every month for five years by every citizen was issued in 1977. Following this Decree, the BFD and the municipalities in the area has been deeply involved in this planting activity. The areas planted are located near the towns and barangays.

### 7. Family Approach Program

This program was designed to give direct and greater participation in reforestation by the families found within or near the proposed plantation areas. Five hundred forty five (545) hectares of denuded land along the periphery of the Pantabangan reservoir in Barrio Delacay (under D-9) had been established under Phases I and II. Other objectives of this program are:

- a) To create job opportunities and provide additional source of income for the displaced people of Pantabangan;
- b) To enhance forestry consciousness by involving the families in actual seedling production and plantation establishment; and
- c) To generate possible raw materials for cottage industries.

The report says that this program, involving 125 participating families has been quite successful and the average survival rate reaches 90%. Moreover, the program is now currently implementing its Phases III and IV. The Phase III of the program involves 50 families with a planting area of 150 hectares, while Phase IV has 100 families and a planting area of 300 hectares.

### 8. Communal Tree Farm Program

The program was launched in the early part of 1979. It aims to generate income for communities by tree planting, coupled with agricultural crop production. It also aims to accelerate the reforestation activities in the country. Three of BFD Reforestation Projects in this area initiated 50 hectares of the areas each, for this program.

### IV. ACCOMPLISHMENT AND REVIEW OF THE PROJECT ACTIVITIES

#### 1. Previous Program and Accomplishment

The previous work program of the project was prepared in 1977 and the budgetary program was approved on the 3rd Joint Committee Meeting held on May 8, 1978. The substance of the program was to establish the plantation of 8,100 hectares during the period of six years from 1977 up to 1982. The total estimated expenses to be provided by the Philippine Government amounted to 37,360,000 pesos. However, in 1979, the planning and management staff of the project concluded that it was difficult to implement the project based on the said program because of the following reasons:

- A. Necessity of further research and experimental activities: Natural environment is too severe to conclude technical studies within a few years. Further trials is required to avoid the failure in conclusion.
- B. Existence of pasture lands within the proposed plantation sites: Existing pasture lands and other occupants were discovered by the project survey team. Relocation of the plantation site is recommended to evade trouble with pasture lessees concerned. It needs re-programming of detailed plans.
- C. Limitation of administrative capacity: Supervision of activities and payment of the project expenses have reached to the full limit of its management capacity. Reinforcement or increase of administrative personnel is urgently needed in order to effect administrative efficiency and up-to-date payment of project obligations.
- D. Difficulty and delay of infrastructure construction: Forest civil engineering has not yet gained the recognization as vital part of forestry in this country. Forest road construction, especially, has met with financial and technical difficulties. The management should consider this situation in planning.
- F. Shortage of budgetary requirement: The program, prepared in 1977, placed cost estimates based on 1977 level. Since then, wage and price hike hit the project. Unless re-planning of budgetary requirement is made appropriate, management of the project will not be attained.

# 2. Nursery Operation

## 2.1 Nursery establishment

In the master plan, three main nurseries in each parcel (Farcel I, II and III), were proposed to raise seedlings required for the project, equipped with mechanized irrigation systems and transportation facilities for hauling of seedlings from nursery to planting site. The project, had established three (3) main nurseries and three (3) subnurseries within the proposed plantation site since 1977, with the capacity to produce the needed seedlings. However, there is shortage of vehicles for transportation of seedlings and insufficient water supply in nurseries during summer. Aside from the nurseries in the proposed site, the project have utilized the Piut and Nanlagarian Nurseries to supply our seedlings needed but these nurseries were established by the San Jose Reforestation Project which is situated adjacent to the RP-Japan Project. These two nurseries are located beside the Talavera river which has sufficient water supply even during dry season.

| Nursery     | Parcel | Date<br>Established | Area<br>(Has.) | Production<br>Capacity<br>(sdlgs.) |
|-------------|--------|---------------------|----------------|------------------------------------|
| Baluarte    | I      | Jan. '77            | 2.2            | 800,000                            |
| Dalinat     | I      | Nov. '78            | 0.8            | 400,000                            |
| Talatalan A | II     | Oct. '77            | 1.8            | 700,000                            |
| Talatalan B | II     | Jan. '79            | 1.0            | 100,000                            |
| Bangabanga  | II     | Nov. '78            | 1.0            | 100,000                            |
| Conversion  | III    | Oct. '78            | 3.2            | 800,000                            |
| Piut        |        | Dec. '78            | 0.8            | 150,000                            |
| Nanlagarian |        | Dec. '78            | 0.7            | 150,000                            |
| TOTAL       |        |                     | 12.1           | 3,300,000                          |

## Table IV-3. List of Nurseries

## 2.2 Seed procurement

Increase of the annual target of plantation establishment increases also the seed requirement. The increase of seed requirement from 1977 to 1979 is shown in Table IV-4. Among those seeds, pine species (except Benguet Pine), Eucalyptus species and some of experimental species were procured from foreign countries through JICA. The seeds of other species were locally procured through BFD and purchased from the private suppliers. Narra, Yemane and Teak will be needed more in large quantities from now on, so that the procurement schedule and the storage of these seeds should be considered seriously to obtain not only sufficient quantity but also high quality of seeds for the project.

| Species         | 1977       | 1978        | 1979        |
|-----------------|------------|-------------|-------------|
| Giant Ipil-ipil | 5 lit.     | 60 lit.     | 51 lit.     |
| Agoho           | 5 "        | 1 "         | 1 "         |
| Yemane          | 116 "      | 210 "       | 1,653 "     |
| Eucalyptus sp.  | (0.05)"    | (0.4) "     | (0.3) "     |
| Benquet Pine    | 13 "       | 60 "        | 27 "        |
| Caribean Pine   | 3.5 kgs.   | 45 kgs.     | 14 kgs.     |
| Oocarpa Pine    | 2.5 "      | 35 "        | 11 "        |
| Other Pines     | 11 lit.    | 30 lit.     |             |
|                 | 7 kgs.     |             |             |
| Narra           | 1,600 lit. | 10,100 lit. | 28,866 lit. |
| Teak            | 500 "      | 1,345 "     | 1,922 "     |
| Mahogany        | 1,000 "    | 3,310 "     | 1,214 "     |
| TOTAL           | 3,250 lit. | 15,196 lit. | 33,759 lit. |
|                 | 13 kgs.    |             |             |

Table IV-4. Seed Requirement from 1977 to 1979

Ref. 1) Requirement for the following planting season

2) Other experimental species excluded.

## 2.3 Seedling Production

In the project nurseries, the total number of 4.4 million seedlings was produced during the last 3 years. Aside from this, 350,000 seedlings in 1977, 450,000 seedlings in 1978 and 1,000,000 seedlings in 1979 were taken from the other BFD projects to augment the project seedling requirements. Nursery techniques - the production of healthy and vigorous seedlings have been developed for the most part, through practice. But there are still aspects of nursery techniques that are to be studied and examined especially when dealing with delicate species.

| Species         | 1977    | 1978      | 1979      | Total     |
|-----------------|---------|-----------|-----------|-----------|
| Giant Ipil-ipil |         | 145,000   | 541,000   | 686,000   |
| Agoho           |         | 47,000    | 2,000     | 49,000    |
| Yemane          |         | 19,000    | 233,000   | 252,000   |
| Eucalyptus sp.  |         | 35,000    | 21,000    | 56,000    |
| Benquet Pine    | 52,000  | 225,000   | 755,000   | 1,032,000 |
| Caribean Pine   | 32,000  | 332,000   | 379,000   | 743,000   |
| Oocarpa Pine    | 30,000  | 163,000   | 268,000   | 461,000   |
| Other Pines     | 52,000  | 69,000    | 50,000    | 171,000   |
| Narra           | 20,000  | 159,000   | 180,000   | 359,000   |
| Teak            | 10,000  | 33,000    | 17,000    | 60,000    |
| Mahogany        | 10,000  | 341,000   | 133,000   | 484,000   |
| Others          |         | 18,000    | 25,000    | 43,000    |
| TOTAL           | 206,000 | 1,586,000 | 2,604,000 | 4,396,000 |

Table IV-5. Seedling Production Accomplishment

•

## 3. Plantation Establishment

3.1 Accomplishment:

In 1977, the Project had established 177 hectares of the Central Trial Plantation at Baluarte, Carranglan. Another 30 hectares plantation was established at Talatalan but was burned in 1978. The first Trial Plantation had served as fields of technical studies. The project have been conducting various kinds of research activities in the Central Trial Plantation.

The following year, 775 hectares of plantations were established and 71 hectares of the plantations which include the area burned in 1977 were replanted.

In 1979, the project was able to establish only 1,051 hectares of plantations against the target goal of 1,800 hectares as embodied in the previous work plan. The reason why the project was not able to meet its goal was the price hike and the increase of labor wages due to the oil crisis that hit the country.

At the height of the planting activities, on July 15, 1979, the mass labor lay-off was ordered and the project activities were suspended. Though the project was allowed to employ 100 laborers again starting August 1, the number of laborers was not enough to accomplish the target goal and the weather condition was no longer favorable for planting.

For the smooth implementation of the project activities, the improvement of the administrative system on work planning and accounting is pointed out. Also proposed is the rationalization of working system as follows:

- a) <u>Close supervision of laborers and appropriate instruction in the</u> <u>field to raise the efficiency of labor control thus, minimize</u> labor cost.
- b) <u>Improvement of machinery maintenance</u> to lessen the maintenance costs and the operational time loss caused by mechanical trouble.
- c) Proper work scheduling of heavy equipment and vehicles to lessen the fuel consumption and the working time loss.

In some part, it was observed that the working efficiency were lowered because of lack of interest to work on the part of laborers because of repeated delay in the payment of their wages and also due to lack of adequate experienced field supervisors to supervise the work in the field. -30-

As a trial, the project had conducted a barangay approach planting in 1979. This approach aims at the afforestation practice with lesser supervision and lesser expenses. It is also good for the barangay people because anytime during the certain period anybody in the barangay can be employed in the planting activity. The payment is done through the barangay leaders. Therefore, the barangay people can schedule the work by themselves and they can share the income as they like.

The scheme was found acceptable for both the project and the barangay, and the project is now studying further the possibility to adopt this method widely in the project.

The fruit-tree planting trial which was conducted in 1978 is the other innovative approach employed. The main purpose is the protection of plantations with the cooperation of the barangay people and they, in return, can be benefited from the fruit harvest in future. It was observed that the people are only willing to cooperate if they can get something from this plantation later on in exchange of their labor.

# 3.2 Record of Established Plantation:

The project established the observations spots in 1979 to record the growth of trees planted. These records will serve as basic data for the determination of suitable species in the area and for the selection of adaptable planting and tending techniques. So far, the project has only the young plantations less than three years old, which are yet too young to allow us make a conclusion.

Judging from the initial stage of growth and survival, Yemane (Gmelina arborea) and Narra (Pterocarpus indicus) are considered as the most suitable species in the area. Among pine species, Benguet Pine (Pinus kesiya or Pinus insularis) shows high growth and survival rate. Generally, pine species are considered to grow well at higher elevation, near the natural distribution of Benguet Pine. The survival rate of Teak (Tectona grandis) is comparatively high, but the growth is low because of die-back during dry season. Giant Ipil-ipil (Leucaena pulverulenta) shows high growth rate with the application of fertilizer. Direct seeding of Yemane and Giant Ipil-ipil had been tried but the germination and survival was quite low. The cultivation planting had been tried in 1978. Although the result was better comparatively, it is not advisable to adopt this method from the viewpoint of erosion

- 31 -

control and machinery operation on the slope.

The stump planting of bare seedlings which is adopted for Teak and Yemane is the most economical method. For other species, however, the weather and the shipment are to be studied to apply such method. As for the spacing,  $2 \times 2$ ,  $2 \times 3$  and  $3 \times 3$  are practical.

Table IV-6 Plantation Establishment (By Year, by Parcel and by Block)

|            |           | 1977  | 1978  | 1979    | Total   |

## <u>RP-JAPAN AFFORESTATION PROJECT</u> BARANGAY APPROACH OF PLANTATION ESTABLISHMENT

Eriel B. Bumatay

#### INTRODUCTION

The RP-Japan Afforestation Project had introduced the Barangay approach on plantation establishment in 1979. It is most likely by contractual basis wherein the Chief of Barangay is given the responsibility to conduct planting within a fixed area. This approach is, in most advantage to those out-of-school youth who are not actually employed in the project.

## OBJECTIVE

The first launching was completed in a 40-hectare area in Parcel II-B of the project, the purpose of which, is to plant in the minds of the population the love of nature, our natural resources as a whole. It was known, however, that plantation establishment becomes faster but sure. The selection of seedlings is rigid in order for them to attain very satisfactor percentage survival in the future. The usual constraints of supervision and recuitment of laborers are also eliminated among the technical men of the project.

With regards to protection competition exists among the Barangay Chiefs as to who of them will be able to protect their respective plantation during the fire season.

# PLANTATION ACTIVITIES

The establishment of plantation by Barangay approach begins during the planting season. The nurseries in operation provide the seedlings for disposal to different barangays. Preparation of plantation areas such as staking, digging, brushing, hauling and planting is undertaken by the barangays themselves. After planting, what follows is the application of fertilizer and replanting.

#### CONCLUSION

Numerous advantages mentioned above seemingly favor this method of plantation establishment, among which is the rigid selection of plantable seedlings to ensure a high percentage of survival. The use of proper technique to encourage produce high resistant seedlings in the nurseries could always be assured. Protection and management is well organized and placed in the hands of the Barangay Captains.

\* Administrative Officer, RP-Japan Afforestation Project

## 4. Plantation Maintenance

## 4.1 Weeding:

Weeding was done based on the actual grass growth survey in each Parcel. The plantations are mostly covered by cogon of which the height reaches to 100 cm. in the rainy season. Depending on the height and thickness of grass, there are three kinds of methods, clear weeding, strip weeding, and ring weeding. Strip and ring weeding are commonly applied in the project and clear weeding is for fire protection to serve as firebreak. It is recommended that weeding be applied twice a year, particularly in the beginning and end of the rainy season. However, the project conducts weeding operation only once a year considering the labor demand during the season. The working efficiency survey which was conducted by the project, brought out the result that the machine weeding requires less labor force.

The controversial points on the introduction of machinery operation is the difficulty to purchase in large number locally and, the constant supply of fuel during the operation and the care and maintenance of these machineries.

| Machine  | Strip  | 800                  | 3.1                 | Width : 70-100 cm. |

Table IV-12. Weeding Work Efficiency

Vegetation: Cogon grass (average height 80 cm) Spacing : 2 m x 2 m (2,500 seedlings/hectare) Bush cutter: ROBIN MODEL NB04-2D (37.7 cc) Reported by: Eriel B. Bumatay (1977)

## 4.2 Fertilization:

The purpose of fertilizer application in the plantation is to promote the initial growth of planted seedlings. The application method is a half-moon plowing of upper slope and the dosage is 30 grams per seedling. The fertilizer tried in the project is the N-P-K, component of 20-10-10, 13-17-12 and 14-14-14. Among the species fertilized to the plantations, Giant Ipil-ipil, Yemane and Teak showed the remarkable fertilizer effect in their growth. Besides, the slow-released solid fertilizer is tested in the plantations.

5. Forest Protection

Forest protection means mostly fire protection and fire-fighting activities.

In 1978, 30 hectares of plantation in Parcel II was burnt and 16 hectares in 1979.

Generally, the bigger the established plantation is, the more protection cost increases. The project employed 480 fire-fighters and 60 plantation guards to protect 1,000 hectares of established plantations during the dry season from January to May, 1979.

The protection activity includes patrolling, watching, education and firebreak construction for the prevention of fire and fire suppression including the training of fire-fighters.

Moreover, the project have established the fruit-tree plantation in the project site to expect the cooperation of the inhabitants for the protection of the project plantation. They, in return, will be benefited from

- 39 -

the fruit harvest in future.

For a protective green belt, also the project tried the line planting of Kakawati cuttings in 1979. The performance was not so satisfactory but the project continues the study on this method. Causes of fire is classified into two categories, which are the intentional and the accidental. The intentional fire includes malicious burning of the project and meaningless lighting to start fire just for fun. The accidental involves carelessness of trespassers, range preparation, kaingin-making and so on.

Fire Prevention Activities:

- a) Patrolling Patrolling in and outside of the plantations by Forest Guards and Fire-fighters equipped with flasslight and walkie-talkie.
   During the fire season, one Jeep is assigned for patrol.
- b) Watching Fire detection and trespasser control at 2 permanent lookout towers and other temporary stations. Walkie-talkie is linked up with the radio at the tower and Technical Cooperation Center.
- c) Firebreak Construction Firebreak is constructed surrounding the plantations and inside, 30 m. of width and 40 m/hectare of density.
- d) Education of rural people Display of signboards, streamers and posters. Distribution of T-shirts and Patch. Film showing and propaganda on the community meeting.
- e) Fire-fighter training Training is held before and during the fire season, especially for new employees.

Fire-fighting Systems:

- a) Fire detection Patroller and tower man report through the radio to the Center, the place or direction. Protection officer infers the place from the reported directions.
- b) Dispatch of fire-fighters Fire-fighters equipped with water shooter is dispatcheed by trucks and jeeps available. Also, Protection Officer and relief party keeping the contact with Center through radio.
- c) Fire suppression Swatters and tree branches are used for suppression with the help of water shooter. Depending on the topography and weather condition, fire control officer conducts back firing. After the fire had been put out, a mopping up operation is conducted to be sure all fires are completely put out.
- d) Watching after suppression After suppression, fire-fighters and plantation guard watch the area burnt at least 24 hours to prevent secondary fire.

 e) Investigation - Investigation is conducted immediately after the fire. Report gives data for analysis and informations for future prevention.

## 6. FOREST ROAD CONSTRUCTION

The project have constructed 33.0 km. of the main or access roads and 18.8 kms. of the operational or plantation roads up to the present. Main road is a permanent and all weather road to be maintained as long as the project needs. It may serve as a public road also, if the people who resides near the road want to pass through. Operational road is constructed only for the plantation establishment and maintenance which last a few years. Therefore, it is more economical to construct the operational road than main road unless there is danger of erosion.

The project has constructed all these roads by administration making use of the equipment of the project. However, the maintenance of equipment and the training of operator became a big problem because spare parts are not readily purchased and the mechanics and operators are not well experienced. Operators once trained seek transfer to other agencies or companies who offer high salaries.

7. EROSION CONTROL

The erosion control work was started late in 1977 by Forester Masayoshi Shinagawa, expert on erosion control. After the detailed survey of the project site, 3 spots of structural works and 10 spots of vegetative works were constructed. Besides, 1 check dam which was requested by the R-3, D-3 Forest District was constructed by the trained RP counterpart.

Considering the importance of the erosion control work in the critical watershed area, this erosion control project is proposed to be transferred to the Training Center for Forest Conservation which is expected to become operational soon.

# 8. Research and Training

The project has been conducting various kinds of research activities which aim at the immediate technical development for a large scale afforestation project. The subjects are the development of adaptable techniques to the project, and those techniques are introduced immediately in the project operation. At the same time, the project continues to measure and record the growth of planted seedlings periodically.

In 1979, the project established the seed orchard aiming at the development of tree breeding techniques.

The project has a training system which consist of on-the-job training through the practice of the project operation and off-the-job training like seminars and observations. The project also, sends the staff to Japan for advanced training. Moreover, the project has been cooperating to other forestry training programs conducted by the Bureau and other foreign agencies.

## 9. Equipment and Facilities

Since 1977, the Japanese Government has donated the equipment and materials to the project. The project still needs several equipment especially for fire protection and for road construction. The problem for those equipment is lack of proper maintenance. Likewise, the mechanics and operators lack the necessary experience and the unavailability of spare parts in the local market. For the mechanics and operators, proper training and the granting of higher wages can solve the problem, but the project cannot purchase the spare parts as some is not available in the country. The project has constructed several buildings to accommodate staff and personnel and to facilitate the project management. Also constructed are two look-out towers for fire protection.

## 10. ORGANIZATION

The project was started with five RP-Counterparts and two Japanese Experts. Since then, the project has increased the number of staff. At present, 31 personnel serve on full-time and 7 serve as concurrent capacity. Seven (7) Japanese Experts serve as technical advisers.

#### 11. LABOR FORCE

Since 1977, the number of laborers employed in the project has increased and it reached 2,200 last June, 1979, which was the maximum record of laborers employed in the last 3 years.

During the planting season in 1979, the project received a letter from the Mayor of Carranglan requesting for coordination with the municipal authorities concerning the hiring of labor force which are needed by the project and for rice production in the area. Also the project received the request from schools in Carranglan asking not to employ students under compulsory education so that they will not stop going to school. In response to these requests, the project decided to enforce five working days only so that Saturdays and Sundays will be devoted to rice production activities. And also, the project issued an order to all Incharge of different field activities instructing them not to employ children under compulsory education, from the educational standpoint. In such social circumstances, future labor force shortage in the area is predicted to increase. The project has tried to recruit labor force from neighboring municipalities to meet with the project labor demand. The problems on importing labor force are:

- 1. Repeated delay of payment of wages which hinder the project from recuitment of short-term imported labor.
- Public transportation system is inadequate to transport the laborers, and transporting laborers by the project vehicles is not advisable considering availability of vehicles and unexpected accident.
- 3. Housing accommodation for laborers is not available and construction of cottages for them requires additional expenses.

The municipal authorities of Carranglan requested also, to employ the people in the area continuously. Expecting the cooperation of the people living in the locality on forest protection and the other project activities, proper labor force management and control should be considered in the project management plan.

The proposed project area is far from the dwellings of people and the project activities and laborers will be dispersed to several places from now on. The increase of commuting distance may result to the shortening of actual working hours and the requirement of transportation services for laborers. In Parcel III, the use of bancas in transporting laborers will be one of the transportation measures. Involving the kainginero and other squatters in the project site is another matter to be studied.

Note: Mandays from July to September, 1979 is the presumed number.

.

#### 12. BUDGET AND EXPENSES

The budget of the project was 2 million pesos in 1977, 5.5 million pesos in 1978 and 7.1 million pesos in 1979. Among these, 1 million pesos in 1977 and 2 million pesos in 1978 were the collateral funds of Rice Donation extended to the Philippines by the Japanese Government. In 1979, the nationwide price hike had influence on the project activities because the budget plan was prepared in 1977 and was estimated based on the cost level of that time. Besides, the allotment for labor wages in 1979 was retrenched and 20% of wage hike resulted in the suspension of project activities in July 15, 1979. Roughly comparing the plantation establishment cost; 9,500 pesos per hectare in 1977, 7,100 pesos per hectare in 1978 and 6,800 pesos per hectare in 1979. This shows that the unit cost was decreased in spite of price hike.

Among the items of 1979 budget, labor wages (01) is 3,937,000 pesos out of 7,117,000 pesos or 55% of total budget. The ratio of labor wages in the budget is considerably high and the effect of wage increase to the expenses was not disregarded. Most amount for other services (06) were disbursed for the brokerage fee of equipment from Japan and the expenses for repair service of equipment was limited. For supplies and materials (07), the increase of allotment for fuel cost was covered by controlling the expense of other items. The disbursement of capital outlay (20) was delayed because of procedural mistake on releasing allotment and it caused the delay of construction works.

The financial crisis of the project was mainly caused by the budgetary shortage against the target goal of the project activities. This is because the work plan was not checked in certain period and was not adjusted to the real budgetary situations.

Items to be studied for the improvement of accounting system are as follows:

- To increase the number of Special Disbursing Officers (S.D.O.) or to increase the working capital of S.D.O. in order to meet the increase of allotment given to the project.
- To assign at least one S.D.O. at the Technical Cooperation Center, dealing with the disbursement of supplies and materials (07), for smooth disbursement and for proper control of expenditures.
- 3. To submit the monthly or quarterly accounting report to the Project Director to avoid unexpected budgetary shortage.

() : Balance left for 4th Quarter

- 4. To fill up the accounting staff and personnel in the Technical Cooperation Center and field offices to hasten the submission of payrolls and other expense vouchers.
- 5. To plan the monthly or quarterly expense and work plan based on the actual allotment or remaining balance of the budget.

As for the planning of annual budgetary requirement, main points to be considered are as follows:

- 1. Preparation of the budgetary requirement plan one year advance to have enough time to discuss about the propriety of the plan.
- Review and evaluation of the previous plan to give more accuracy on the basic cost estimate of the activity.
- 3. Collection and filing of necessary information for conformity with the work plan.

# 13. JICA ASSISTANCE

The Japan International Cooperation Agency (JICA) has been supporting the project not only in accordance with the agreement in the Record of Discussions but also by other technical and financial assistance. Based on the Record of Discussions, JICA has cooperated with the Bureau of Forest Development which is the executing body of the project by sending experts on the fields of forestry, donation of necessary equipment and training of RP-Counterparts in Japan. Moreover, JICA has also extended assistance such as restoration works of the project facilities and construction of model infrastructures for the smooth implementation of the project.

The Japanese experts dispatched to the project have been working together with the RP-Counterparts to develop various techniques and improve the project management. Therefore, they are expected to serve as technical advisers for the project from now on.

The project has been implemented with the use of equipment and materials donated to the project by JICA. All these are necessary items for the success of the project. Therefore, it is required to be utilized and maintained for the project implementation throughout the period of the project operation.

From the standpoint of immediate necessity for the smooth implementation of the project, JICA has extended assistance on the restoration of facilities damaged by disaster, and the construction of model infrastructures which were needed immediately for training and experimental purposes. These construction works assisted by JICA contributed to the project financially and technically, especially for the forest civil engineering such as forest road construction.

#### V. RECOMMENDATIONS ON PROJECT MANAGEMENT

Since the project had started its operation in January, 1977, it has established 2,030 hectares of plantations and has been successful in the development of afforestation techniques in the Pantabangan area. The project is, still, expanding its activities and is facing various problems to attain its objectives. Therefore, the project surely requires the improvement and reinforcement of its management.

There are three main points to be considered regarding project management. The so-called three M's, those consist of manpower, materials and money.

Manpower - Organization Staff and Personnel Labor force Materials - Land Equipment and Materials Money - Budget Accounting

These three factors are all necessary for the management and are related mutually. Therefore, a well-balanced and harmonized planning of these three factors will result to the expected accomplishment of the project goal. Another basic idea for the better management is PLAN-DO-SEE-SYSTEM.

(PLAN)
```

Formerly, the management staff were apt to foreget reviewing the accomplishment of activities. Reviewing after practice and accomplishment analysis before planning is one of the keypoint to implement the project successfully. Finally, it is recommended that all foresters and technical personnel should supervise field work frequently, inspect field activities regularly and conduct survey and research work in the field. This practice will, surely, benefit both the project and the personnel concerned. APPENDICES

APPENDIX A

FORESTRY LAWS, REGULATIONS AND ORDERS .

•

Compiled by

NOBUHITO HOBO

October 1979

#### I. CONSTITUTION:

The Constitution of the Republic of the Philippines prescribes the state policies, rights and obligations of citizens, conduct of the government, the national economy and the patrimony of the nation. All laws and regulations are based on this Constitution.

#### **II. PRESIDENTIAL DECREES:**

#### P.D. 54

This decree specifies penalties to persons who directly or indirectly cuts, declares, classifies, possesses or export logs in violation of existing laws, rules and regulations.

#### P.D. 330

This decree specifies that any person who cuts, gathers, removes, or smuggles timber or other forest products from any forest in violation of existing laws, rules and regulations shall be guilty of the crime of qualified theft as defined and penalized under the Revised Penal Code.

#### P.D. 331

The document stipulates that all public forests be developed, managed and utilized on a substained-yield basis with the assistance of technically trained and Registered Foresters. It seeks to harmonize the productivity and stability of the nation's forest ecosystems.

#### P.D. 705

This Revised Forestry Reform Code was promulgated in 1975. This code defines the functions and responsibilities of the Bureau of Forest Development. It answers all views of forest resources management, utilization, demarcation, protection, enforcement and rehabilitation. Thus, this code has instructions concerning forest policies of the nation.

As the result, all laws, orders, rules and regulations or any part of them which were inconsistent with this code were repealed or amended accordingly.

#### P.D. 865

This decree amended section 32 of P.D. 705 to allow temporarily limited and selective exportation of logs.

#### P.D. 953

This decree requires every person who owns land adjoining a river or creek, to plant trees extending at least 5 meters on his land adjoining it. Likewise, every holder of a license agreement, lease, license or permit from the government, involving occupancy and utilization of forest or grazing land with a river or creek therein shall plant trees extending at least 20 meters from the edge of it.

#### P.D. 1153

This decree makes mandatory and obligatory the participation of the citizenry, 10 years of age and above unless physically disabled, to plant one tree every month for five consecutive years. Trees planted shall be taken care of for at least two years and replace if the same die, are diseased or are defective.

#### P.D. 1559

This decree amended 23 sections of P.D. 705, including Section 32 which was amended by P.D. 865, and added 2 sections, to make the said code more responsive to present realities and to the new thrust of government policies and programs on forest development and conservation and rationalization of the wood industry.

#### **III. LETTERS OF INSTRUCTION:**

#### L.O.I. 145 -

Directed the Presidential Committee on Wood Industries Development to work out and submit a program at promoting the development of industrial forest plantation and tree farms.

#### L.O.I. 404 -

Requires all government agencies to participate in the tree planting campaign all over the country.

#### L.O.I. 409 -

Was issued to execute offices of D.N.R. and B.F.D. to determine the performance of forest concessionaries and their adherence to forest regulations and policies.

#### L.O.I. 423 -

Brought a new massive approach towers forest ecosystem management directing the creation of Presidential Council for Forest Ecosystem Management (PCFEM).

#### L.O.I. 424 -

Requires the participation of local governments from regional down to the barangay level in order to make more effective the tree planting program as required under L.O.I. 404.

#### L.O.I. 525 -

Was issued to expedite the implementation of the government's agroforestry development pilot project under Proclamation No. 1632.

#### L.O.I. 550 -

States that the Secretary of Natural Resources shall cause the training of the barangay officials to qualify them as deputy fish wardens and/or deputy forest officials.

#### L.O.I. 818 -

Requires all holders of existing timber licenses to reforest one hectare of open, denuded and/or brushland, forest area, for every hectare logged-over, planting the same species as cut.

#### L.O.I. 822 -

Requires the cancellation of the effective permits to operate sawmills granted to those without any timber license, logging concession, or authorized sources of logs.

#### IV. OTHER ORDERS RELATED TO THE PROJECT IMPLEMENTATION

Forest Special Uses Regulations was promulgated in 1941 for information and guidance governing the leasing or granting of permits. This regulations, still, serves as implementing guidelines on forest special uses, including pasturage, practically.

BFD Special Order No. 104, Series of 1977 was issued on March 29, 1977, to establish a Joint Committee for implementation of the Technical Cooperation Project for the Afforestation of the Pantabangan Area.

LC Committee Special Order No. 32, Series of 1978, was issued on February 1, 1978, to create Composite LC Team No. 90 for survey of the RP-Japan Project sites and other special land classification cases requiring immediate action. APPENDIX B

RECORD OF DISCUSSIONS BETWEEN THE JAPANESE FORESTRY SURVEY TEAM AND DEPARTMENT OF NATURAL RESOURCES CONCERNING THE TECHNICAL COOPERATION PROJECT FOR THE AFFORESTATION OF THE PANTABANGAN AREA •

In pursuance of the Survey for Implementation Planning of the Project which was conducted in December, 1975, the Japanese Forestry Survey Team, organized by the Japan International Cooperation Agency (JICA) and headed by Mr. Katsuhiro KOHTARI, Special Adviser to the President of JICA visited the Philippines from June 10 to 18, 1976 for the purpose of discussing with the authorities concerned of the Government of the Republic of the Philippines concerning the desirable measures to be taken by both Governments to implement the Technical Cooperation Project for the Afforestation of the Pantabangan Area.

As a result of the discussions, both parties agreed to recommend to their respective Governments to carry out the matters referred to in the attached Record of Discussions concerning the technical cooperation in the said project.

June 18, 1976

KATSUHIRO KOHTARI Head of the Japanese Forestry Survey Team EDMUNDO V. CORTES Director Bureau of Forest Development

A True Copy: ot1/10/26/79

#### RECORD OF DISCUSSION

1. (1) In line with the forestry policy of the Republic of the Philippines aiming at the proper conservation, management and utilization of forest resources, the Government of the Republic of the Philippines and the Government of Japan will cooperate, through their appropriate agencies, in implementing the Technical Cooperation Project for the afforestation of the Pantabangan Area (hereinafter referred to as "the Project").

> The purpose of the project will be to establish afforestation techniques so as to contribute to successful afforestation in the open grass lands and other denuded lands of about 50,000 has. in the Pantabangan Area which is one of the most important watersheds in the Republic of the Philippines. The master plan of the Project is specified in Annex 1.

- (2) The Project will be implemented based on the guidelines of the annual work plan to be formulated by the Joint Committee referred to in Article 8.
- 2. (1) In accordance with laws and regulations in force in Japan, the Japanese authorities concerned will take necessary measures to provide at their own expense the services of the Japanese experts as listed in Annex 2 through the normal procedures under the Colombo Plan Technical Cooperation Scheme.
  - (2) In accordance with laws and regulation in force in the Philippines, the Japanese experts mentioned above and their families will be granted in the Philippines, privileges, exemptions and benefits within the framework of the Colombo Plan Technical Cooperation Scheme.
- 3. (1) In accordance with laws and regulations in force in Japan, the Japanese authorities concerned will take necessary measures to provide at their own expenses such equipment, machinery, vehicles, a motor boat, implements, instruments, tools, spare parts and other materials, as listed in Annex 3 required for the Project through the normal procedures under the Colombo Plan Technical Cooperation Scheme.

- (2) The articles referred to above will become the property of the Government of the Republic of the Philippines upon being delivered c.i.f. to the Philippine authorities concerned at the ports of disembarkation and/or international airports, and will be utilized exclusively for the implementation of the Project.
- 4. (1) In accordance with laws and regulations in force in Japan, the Japanese authorities concerned will take necessary measures to receive the Philippine personnel engaged in the Project for technical training or study tour in Japan through the normal procedures under the Colombo Plan Technical Cooperation Scheme.
  - (2) The Government of the Republic of the Philippines through the authorities concerned will take necessary measures to ensure that the knowledge and experience acquired by the Philippine personnel through technical training in Japan will be utilized primarily for the effective implementation of the Project.
- 5. (1) In accordance with laws and regulations in force in the Philippines, the Government of the Republic of the Philippines through the authorities concerned will take necessary measures to provide at its own expense:
  - (a) the services of the Philippine experts and other personnel as listed in Annex 4;
  - (b) acquisition of land and buildings as listed in Annex 5, as well as other incidental facilities required therefor;
  - (c) supply or replacement of articles necessary for the implementation of the Project other than those provided by the Japanese authorities concerned under Article 3 (1);
  - (d) suitability furnished housing accommodations for the Japanese experts and their families.
  - (2) In accordance with laws and regulations in force in the Philippines, the Government of the Republic of the Philippines through the authorities concerned will take necessary measures to meet:
    - (a) expenses necessary for the construction of forest roads and other facilities except for such equipment, machinery, vehicles, tools, spare parts and other materials, as listed in Annex 3;
    - (b) expenses necessary for transportation within the Philippines

of the articles as listed in Annex 3 as well as for the installation, operation and maintenance thereof;

- (c) all operating expenses necessary for the implementation of the Project;
- (d) customs duties, internal taxes and any other charges, if any, imposed in the Philippines with respect to the articles to be brought in from Japan as listed in Annex 3;
- (e) expenses for transportation facilities and internal travel in the Republic of the Philippines of the Japanese experts while on duty;
- (f) free medical and dental services and facilities for the Japanese experts and their families, within the framework of the Colombo Plan Technical Cooperation Scheme;
- (g) customs duties, and texes on personal and household effects of the Japanese experts and their families, as well as on one motor car for each expert, within the framework of the Colombo Plan Technical Cooperation Scheme.
- 6. The Secretary of the Department of Natural Resources through the Director of the Bureau of Forest Development of the Government of the Republic of the Philippines will be responsible for the administrative matters for the implementation of the Project, and the Japanese experts will provide primarily technical guidance and advice for the Project.
- 7. The Government of the Republic of the Philippines through the authorities concerned shall undertake to bear claims, if any accidents arise, on the Japanese experts engaged in the Project resulting from, occuring in the course of, or otherwise connected with, the discharge of their official functions in the Philippines, except for those claims arising from willful misconduct or gross negligence of the Japanese experts.
- 8. For the successful and smooth implementation of the Project a Joint Committee will be established as specified in Annex 6.
- 9. (1) The period of the technical cooperation mentioned in this record of discussions will be two (2) years.
  - (2) Within this period there will be mutual consultations between the two governments to reach a bilateral agreement for the technical cooperation thereafter.

- 73 -

(3) This record of discussions will serve as a basis for the implementation of the Project.

Annex 1. The Master Plan of the Project

The Project will be implemented through the organization as shown in the attached chart. The Technical Cooperation Center is composed of an administrative office and related facilities, a pilot forest, and nurseries. The administrative office and related facilities will be established in the district office of the Upper Rampanga River Basin Multiple Use Management District. Supervision and administration of the whole activities of the Technical Cooperation Center, as well as the fundamental experiments and indoor trainings necessary for the Project implementation, will be conducted by the officers stationed at the Center.

In the Pilot Forest (including forest roads) and the nurseries, development and improvement of requisite techniques and on-the-job training will be performed.

As to the scale of the Pilot Forest, -rial plantations of 1,300 has. will be established in the first phase of the Project, and test plantations of 6,300 has. in the second phase.

The activities of the Center will be:

- 1. Development and improvement of requisite techniques
  - 1) Development of specific techniques
    - (1) Species trial
    - (2) Tree improvement
    - (3) Trials in nursery techniques
    - (4) Trials in planting tec-niques
    - (5) Trials of counter measures against fire insects, diseases and meteorological damages
    - (6) Trials in the techniques on forest road and soil conservation works
  - 2) Management Test
    - (1) Systematization of silvicultural and forest protection techniques
    - (2) Economic assessment of afforestation on an industrial scale
    - (3) Test and investigation on the environmental implications of afforestation
    - (4) Test and study on the social implications of afforestation
    - (5) Other necessary studies and investigation

#### 2. Technical Training

- 1) Training of managerial staff
  - (1) Planning techniques of afforestation project
  - (2) Technical and managerial aspects of nursery and plantation works
  - (3) Techniques for designing and managing forest road and soil conservation works
  - (4) Techniques for the application of machine power
  - (5) Techniques to control fire, insects, diseases and meteorological damages
- 2) Training of Technical Staff
  - (1) Techniques of nursery and plantation works
  - (2) Techniques of tree improvement
  - (3) Techniques of forest road and soil conservation works
  - (4) Operation and maintenance of machinery
  - (5) Education on forest protection

APPENDIX C

PROPOSED MASTER PLAN OF THE PROJECT

•

DRAFT OF AGREEMENT BETWEEN THE GOVERNMENT OF JAPAN AND THE GOVERNMENT OF THE REPUBLIC OF THE PHILIPPINES CONCERNING TECHNICAL COOPERATION FOR THE FORESTRY DEVELOPMENT PROJECT OF THE PANTABANGAN AREA

#### The Master Plan of the Project

The Project consists of the following two Sub-projects and both Sub-projects are controlled by Project Director referred to in Annex IV under the guidance and advice of Chief Adviser referred to in Annex II stationed at the Head Office set up in the Central Office of the Bureau of Forest Development, Diliman, Quezon City.

Sub-project I: Afforestation Technical Cooperation Center

- The purpose of this Sub-project will be to develop and improve afforestation techniques and to train Philippine counterparts and other technical staff so as to contribute to afforestation in the Pantabangan area through establishment of the Pilow Man-made Forest and nurseries.
- 2. The Pilot Man-made Forest will be composed of trial plantations in the first phase which is about 1,300 hectares in size and of test plantations in the second phase which is about 6,800 hectares in size.
- 3. The activities of the Afforestation Technical Cooperation Center are as follows:
  - (a) Development and Improvement of Techniques of Afforestation
    - (i) Specific techniques
      - (1) Trial in techniques on selecting species
      - (2) Trial in nursery techniques
      - (3) Trial in planting techniques
      - (4) Trial in counter measures against forest fire and disease, insect and meteorological damages
      - (5) Trial in techniques on forest roads construction
    - (ii) Management techniques
      - Systematization of silvicultural techniques and forest protection techniques
      - (2) Economic assessment of afforestation on a large scale
      - (3) Test and research on the environmental implications of afforestation
      - (4) Research and study on the social implications of afforestation
      - (5) Other necessary studies and research

- (b) Technical Training on Afforestation
  - (i) Training of management techniques
    - (1) Planning of afforestation project
    - (2) Techniques for systematization of nursery and plantation work
    - (3) Techniques for designing and managing forest roads
    - (4) Techniques for the application of machine power
    - (5) Techniques for prevention of forest fire and disease, insect and meteorological damages
  - (ii) Training of working techniques
    - (1) Techniques of nursery and plantation work
    - (2) Techniques of forest roads construction
    - (3) Operation and maintenance of machinery
    - (4) Techniques of forest protection

Sub-project II: Training Center for Forest Conservation

- The purpose of this Sub-project will be to conduct theoretical and practical training for forestry technicians and foresters as well as to develop and improve forest conservation techniques.
- 2. The activities of the Training Center for Forest Conservation are as follows:
  - (a) Technical Training on Forest Conservation
    - (i) Training courses
      - Ordinary courses:
         Erosion control course
         Operation course
      - (2) Senior courses:Erosion control courseGeneral course
    - (ii) Training subjects:
      - (1) Erosion control engineering
      - (2) Erosion control planning
      - (3) Design of erosion control facilities
      - (4) Construction and maintenance of erosion control facilities
      - (5) Mechanized construction of erosion control facilities
      - (6) Afforestation for erosion control
      - (7) Other necessary subjects for forest conservation

- (b) Development and Improvement of Techniques and Forest Conservation
  - (1) Design of erosion control facilities
  - (2) Construction and maintenance of erosion control facilities
  - (3) Mechanized construction of erosion control facilities
  - (4) Other necessary techniques for forest conservation

•

RP-JAPAN TECHNICAL COOPERATION FOR THE AFFORESTATION OF THE PANTABANGAN AREA

#### FIVE-YEAR WORK PROGRAM (1978-1982) RP-JAPAN TECHNICAL COOPERATION FOR THE AFFORESTATION OF THE PANTABANGAN AREA

#### 1. Five-Year (1978-1982) Plan and Cost Estimates

Attached you will find the table (Annex "A") indicating target goals and local cost estimates of the project. The operational expenses is provided by the Philippine Government for the following activities: administration, construction of facilities, nursery operations, plantation establishment, plantation protection and maintenance, forest roads construction, erosion control, etc.

- 2. As the project progresses, set goals will be increased and, therefore, we shall need additional number of laborers annually. The strategy is to employ all local labor in the community where the project is located. However, if there is no available labor force in the locality in view of increasing requirements of the project, manpower from neighboring villages and communities shall be utilized.
- 3. Technical Personnel Component Requirement

Annex "B" indicates the number of personnel needed to pursue with effectiveness and efficiency the implementation of the project. Under the personnel program, about eight foresters shall be assigned to the project as RP counterparts.

- 4. Protection Plan of Plantation from Fire and Other Agents of Destruction This activity is always given top priority in our reforestation activities. Under this scheme, the following activities are to be undertaken:
  - a) <u>Physical protection of established plantations.</u> This will be undertaken by employing laborers and be given sectors of responsibility within established plantations.
  - b) <u>Roving patrol</u> shall be created to supervise the sectoral protection crews and to patrol not only the plantation site but surrounding vicinities.
  - c) Construction of firelines and firebreaks and watch towers. The project is in the process of constructing watch towers strategically situated within the project area. Hand in hand with the construction of this infrastructure is the construction of fire-lines and

firebreaks. These firelines and firebreaks are necessary in extensive plantation areas where the same could not be adequately covered by the sectoral crews and roving patrols.

d) Information campaign. - It is the task of the project to initiate information campaign on forest conservation and forest protection of the area. This activity may be undertaken firstly, by person to person contact, distribution of conservation leaflets, and other materials like towels with inscriptions or prints regarding protection of forest lands from fire.

APPENDIX G

# REFORESTATION THROUGH FAMILY APPROACH IN PANTABANGAN, NUEVA ECIJA

Oscar M. Hamada\*

#### I. BACKGROUND INFORMATION

The construction of Pantabangan Dam called for the resettlement of the whole population of the old Pantabangan town on higher grounds where they hardly found lands to till. In response, different government agencies collaborated to uplift the social condition of the people. Projects were created for their benefits which include employment, food assistance, housing project, awarding of farm lots, etc. But most of these projects are about to be finished, as a result, a great number will have no job.

It is true that a number of them were awarded with farm lots for food production but many still resort to baingin making as a source of living. Added to this, is the reported illegal cutting of trees. The effects of these activities are evident in the area and if these nefarious activities continue, it will shorten the expected life span of the multi-million peso dam.

The DNR launched a program in 1976 using the same scheme, system and procedures. The result of the program was found to be effective and the people were receptive to its objectives. The program involved 30 families and was able to reforest 185.0 hectares of barren lands. It is proposed, therefore, that in order to help and promote forest consciousness to the displaced people of Pantabangan, another program involving seedling production and plantation establishment through family approach be undertaken.

#### II. OBJECTIVES OF THE PROGRAM

- To create job opportunities and provide source of income for the resettled families (70) in Pantabangan;
- To reforest at least 210.0 hectares of denuded lands within the watershed of Pantabangan Dam within a period of two (2) years;

<sup>\*</sup> District Forester, R-3, D-9 (Co-Project Leader, RP-Japan Afforestation Project).

- To develop forest consciousness and encourage the people to appreciate the value of trees by actually doing nursery and plantation activities;
- 4. To establish better relationship between forestry personnel and the community; and
- 5. To produce raw materials for livestock and cottage industries.

#### III. SYSTEMS AND PROCEDURES

- The Project Leader shall conduct a seminar and training program for the participating families about nursery and plantation practices;
- 2. The families shall be given seeds to propagate which will be sufficient to cover the area allotted to them. Enough seedlings should be raised to give allowance for mortality and culling. Propagation may be carried out in their own backyards or in nearby nurseries established for common use;
- 3. All activities shall be done on a contractual basis or piece work system. An inventory shall be undertaken after every major activities to determine the quantity of work done and the corresponding amount to be paid;
- Potted seedlings should be well maintained and hardened according to established nursery practices;
- 5. Survey and subdivision of the area shall be made not later than April, 1977 so that the area will be thoroughly prepared;
- Land preparation includes construction of trails, brushing, digging of holes and staking;
- Planting should be done following the contour lines using a spacing of 3 x 3 meters; and
- Each family shall be responsible in protecting their designated lots against fire, animals and trespassers.

#### IV. MODE OF PAYMENT:

Payments will be in six (6) installments, after every major activity has been accomplished. Two installments will take place for the nursery operations while four installments for the plantation operation.

#### A. Nursery Operation

First payment will be done after preparing the potbeds and potting/ sowing of seeds. Every family is required to pot at least 4,500 in order to give allowance for mortality and culling. The first payment will be \$0.03 per pot or a total of \$135.00. Second payment will be based on the number of plantable seedlings at \$0.05 each. The maximum required number of seedlings to be planted will be 3,600. Any excess seedlings thereof will be turned over to the government.- free of charge. The total amount to be given for the nursery operation per 1,200 seedlings or per hectare will be \$105.00. The overall cost of the seedlings will be \$0.08 per piece.

B. Plantation Operation

Third payment will be done after the area has been fully planted at 1,200 seedlings per hectare. The activities involved are: construction of trails, transporting of seedlings, brushing, digging of holes, staking, planting and fertilization. The amount to be given will be based at ¥0.01 per seedling planted or ¥120.00 per hectare.

Fourth payment will be given three or four months after planting, that is, after conducting an inventory of the seedlings that survived in the plantation. The activity involved will be the construction of firelines, including the protection of the established plantation. The amount to be paid will be based on \$0.06 per surviving seedling.

Fifth payment will be done after weeding, cultivation, replanting, and fertilization. The seedlings to be used for replanting will be provided by the BFD or the families themselves. The amount to be paid will be 90.07 per seedling or 984.00 per hectare.

Sixth payment will be the final payment to be given after the family has cleared or weeded his assigned area and a final inventory of the living seedlings/saplings has been conducted. The amount to be paid will be based on ¥0.03 per seedling/sapling that survived. The total amount to be given for the plantation operation will be ¥312.00 per hectare, assuming a 100% survival during the turn-over of the plantation area to the government.

- 108 -

All in all, the amount paid per hectare will be \$417.00 at 100% survival count. Hereunder is the breakdown of the activities and the correspond-ing amount to be paid per hectare:

|     | Nursery Operation   | Unit Cost/Hectare                      |
|-----|---|--|
| (In | sing & maintenance of seedlings<br>cludes potbed preparation, pot—<br>& maintenance of seedlings) | \$105.00/1,200 seedlings<br>or one ha. |
|     | Planting Operation  | Unit Cost/Hectare                      |
| 1.  | Construction of trails  | ¥12.00/ha.                             |
| 2.  | Transporting of seedlings   | 36.00/ha.                              |
| 3.  | Land preparation (brushing,<br>staking & hold digging)  | 48.00/ha.                              |
| 4.  | Planting & fertilization<br>(3 m x 3 m spacing)   | 96.00/ha.                              |
|     |   | ⊉192.00/ha.                            |
|     |   |  |

Maintenance & Protection of Plantation

| 1. | Construction of firelines      | ₽10.00/ha.   |
|----|--------------------------------|--------------|
| 2. | Weeding & cultivation (2x)     | 72.00/ha.    |
| 3. | Seedling cost (20% replanting) | 16.00/ha.    |
| 4. | Replnating & fertilization     | 16.00/ha.    |
| 5. | Protection of plantation       | 6.00/ha.     |
|    |                                | \$120.00/ha. |

#### V. CONCLUSION

The project which aims to provide source of income for the resettled families in Pantabangan will at the same time protect and conserve the watershed of the Pantabangan River which likely will be tilled and utilized for kaingin purposes if no proper measure will be undertaken.

The project also aims to make the people more conscious to forest conservation and, therefore, protection of said land is expected. This at the same time, develop the forest consciousness of the children who will likely be participants in their parents' endeavor. APPENDIX H

WEATHER REPORT

RAINFALL (1977-1979)

CARRANGLAN, NUEVA ECIJA

APPENDIX I

COST ESTIMATE ON THE ESTABLISHMENT, MAINTENANCE AND PROTECTION OF A ONE-HECTARE PLANTATION

MAY 1979

REFORESTATION AND AFFORESTATION DIVISION BUREAU OF FOREST DEVELOPMENT

#### INTRODUCTION

Reforestation work is a costly endeavor. It is a labor-intensive activity wherein it involves more muscles than machines. It is also a slow process considering that trees, unlike other plants, take more years to grow and mature.

The Reforestation and Afforestation Division, BFD, has prepared the herein cost data in order to have a general basis in determining the actual cost of reforestation work in the country today. This may serve as guide in the preparation of plans and programs for contractual reforestation and in justifying our request for budget releases. The prevailing rates used herein may not represent the actual cost in a particular locality, hence, it is subject to adjustment in order to conform with the actual conditions obtaining in a locality where reforestation work is to be undertaken. The type of species used and the cost of seeds may, likewise, alter the cost of raising seedlings which will affect the total cost of reforestation per hectare.

The cost estimates were made from the time the seeds are collected and propagated in the nurseries, up to the time when a sufficient number of trees are growing in the plantation. Thus, it has been estimated that a three-year period will be sufficient enough to grow a tree at a desirable height that does not need further maintenance and protection.

# COST ESTIMATE ON THE ESTABLISHMENT, MAINTENANCE AND PROTECTION OF A ONE-HECTARE PLANTATION

## SUMMARY

| A. | FIRST YEAR:  |             | Cost/ha.      |
|----|--|-------------|---------------|
|    | 1. Nursery activities                                    |             | ₽1,173.53     |
|    | 2. Plantation, establishment, maintenance and protection |             | 1,589.77      |
|    | 3. Administration and supervision                        |             | 95.00         |
|    |  | Sub-total   | ₽2,858.30     |
| в. | SECOND YEAR:   |             |               |
|    | 1. Nursery activities                                    |             | 161.25        |
|    | 2. Plantation maintenance and protection                 |             | 561.21        |
|    | 3. Administration and supervision                        |             | 95.00         |
|    |  | Sub-Total   | ₽ 817.46      |
| c. | THIRD YEAR:  |             |               |
|    | 1. Plantation maintenance and protection                 |             | ⊉ 253.50      |
|    | 2. Administration and supervision                        |             | 95.00         |
|    |  | Sub-Total   | ⊉ 348.50      |
|    |  | Grand Total | ₽4,024.27     |
|    |  | or 🗜        | 1.61/seedling |

-

#### 1. COST ESTIMATE OF ESTABLISHMENT, MAINTENANCE AND PROTECTION OF A ONE-HECTARE PLANTATION (FIRST YEAR)

## BASIC ASSUMPTION

1. Daily wage of a laborer is \$13.00.

2. Species to be used is Narra (No. of seeds per liter - 59).

3. Cost per liter of seeds of Narra is \$0.50.

- 4. Seedlings will be raised in polyethylene bags.
- 5. Cost of polyethylene bag is \$36.00/thousand or \$0.04 per bag.
- The spacing in the plantation is 2 m x 2 m or 2,500 seedlings to be planted per hectare.
- Seedling requirement includes a tree percentage allowance of 10% or 2,750 seedlings to be raised per hectare.

2/ Distance is one (1) kilometer

3/ No. of man-days is .01 x 365 days/year, or 3.65 man-day/ha./year

# II. COST ESTIMATE OF REPLANTING, MAINTENANCE AND PROTECTION OF ONE-HECTARE ESTABLISHED PLANTATION (SECOND YEAR)

# BASIC ASSUMPTIONS

- 1. The spacing in the plantation is 2 m x 2 m or 2,500 seedlings per hectare.
- 2. Mortality rate of planted seedlings is 15% or 375 seedlings per hectare.
- 3. Cost of raising one (1) narra seedling per our estimate of cost of nursery operation is \$0.43.
- 4. Daily wage of laborers is \$13.00.

### III. COST ESTIMATE OF MAINTENANCE AND PROTECTION OF ONE HECTARE ESTABLISHED PLANTATION (THREE YEARS OLD AND OVER)

| 1. | Supervision <u>2</u> / | ₽150.00 |
|----|------------------------|---------|
| 2. | Sundries <u>3</u> /    | 135.00  |
|    | TOTAL                  | ₽285.00 |

-

- $\underline{1}$  No. of man-day is 0.1 x 365 (No. of days per year) or 3.65 man-days for the whole year.
- 2/ This covers the traveling expenses of personnel.
- 3/ Includes cost of supplies and materials, other services and incidental expenses.

APPENDIX J

.

FOREST ROAD CONSTRUCTION STANDARD COST ESTIMATE PER KILOMETER .

BY FOR. MASAYOSHI SHINAGAWA

JUNE 1979

**RP-JAPAN AFFORESTATION PROJECT** 

Basic Assumptions:

1. Length 1,000 m ; 2. Width 5.0 m with side canal : 3. Soil Cutting : 7.5 m<sup>3</sup>/m (see Chart I)  $7.5 \text{ m}^3/\text{m} \ge 1,000 \text{ m} = 7,500 \text{ m}^3/\text{km}$ 4. Culvert Ø 200 cm 0.5 spot x 7.0 m = 3.5 m\$ x 8.0 = 16.0 mØ 100 cm 2 : x 9.0 = 36.0 m Ø 60 cm : 4 Ø 45 cm : 4 x 9.0 = 36.0 m 0.2 m<sup>3</sup>/m (See Chart I) 5. Side Canal : Cutting 800 m Length 6. Graveling : Depth : 0.15 m 3.0 m Width : Length : 1,000 m  $0.15m \times 3.0m \times 1,000m = 450 m^3$ 7. Wet Stone Work: 2.15 m<sup>2</sup>/spot (See Chart 2) 6 spots x = 12 spots  $12 \times 3.77 = 45.2 \text{ m}^2$ 8. Dry Stone Work 5 spots x = 10 spots 10 x  $3.77 = 37.7 \text{ m}^2$ Average inclination - 27°30'

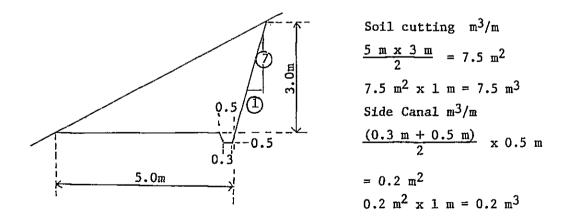

CHART I. CROSS SECTION OF SOIL CUTTING

Scale  $\frac{1}{50}$ 

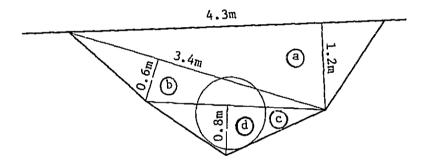

$$a = 4.3 \times 1.2 \div 2 = 2.58m^{2}$$
  

$$b = 3.4 \times 0.6 \div 2 = 1.02m^{2}$$
  

$$c = 2.4 \times 0.8 \div 2 = 0.96m^{2}$$
  
Total 4.56m<sup>2</sup>  

$$d = (0.5)^{2} \times t = 0.79m^{2}$$
  
3.77m<sup>2</sup>

CARRIAGE 1 m<sup>3</sup> (Sand and Gravel)

```
1) Dump truck rental (8 tons)
```

```
a) Cycle time L: Distance 5,000 m
cm = 25/6,000 x (L - 1,000) + 15
.. cm = 31.7 min.
b) Daily working hour : 6.5 hours
c) One day trip : 6.5 ÷ 31.7 / 60 = 12.3 times/day
d) Load volume capacity : 8.0 ÷ 1.7 x 0.9 = 4.2 m<sup>3</sup>
e) Daily working volume : 12.3 x 4.2 = 51.7 m<sup>3</sup>
f) Daily Dump truck rental: ¥730.00
g) Dumptruck rental per m<sup>3</sup>: 730.00 ÷ 51.7 = ¥14.1
2) Driver, Helper : 1 M.D. - 51.7 m<sup>3</sup> = 0.02 M.D./m<sup>3</sup>
3) Diesel oil consumption 7.6 liters/hour x 6.5 hour ÷ 51.7 m<sup>3</sup> = 0.96 liter/m<sup>3</sup>
4) Other oil: 20% of diesel oil consumption
```
