PREFACE

In response to a request of the Government of the Republic of the Philippines, the Government of Japan decided to conduct a feasibility study on the Hospital Development Project in the Cagayan Valley Region (Region I) and the Ilocos Region (Region II), and entrusted the Japan International Cooperation Agency (JICA) with its work, to carry out the study.

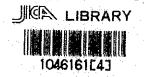

In view of the importance of this Project which will have a great impact upon health, medical care and socio-economic development of the country, the Government of Japan despatched to the Philippines the Urabe Mission in June, 1977, and the Tanabe Mission in June, 1978, for general descussions. Further in November, 1978, the JICA despatched a Preliminary Study Mission led by Dr. Hitoshi Kasuga, Professor, Department of Public Health, School of Medicine, Tokai University, to descuss the Scope of Work with Philippine officials, and in March-April, 1979, despatched a Preliminary Survey Team for detailed study of the 19 hospitals involved.

As the result of those studies, a draft report was prepared in July-August, 1979, and finally, this report has been formulated.

I hope this report will contribute not only to the development of the Project but also to the strengthening of the ties of friendship between our two countries.

I wish to express my sincere appreciation to the officials concerned of the Government of the Republic of the Philippines and others who have extended generous assistance and cooperation to the Survey Team.

Keisuke Arita President Japan International Cooperation Agency

0-1 CONTENTS OF THE HOSPITAL DEVELOPMENT PROGRAM AND AN OUTLINE OF THE DETAILS

This program forms a part of the Philippine National Development Plan (1978 \sim 1982). The Ministry of Health determined that the systematic development of medical facilities should be carried out in order to promote adequate health services for the entire nation and this program is a link in that design.

an a sector a sector fi

The Ministry of Health's Health Care Facilities Development Program is administered by an interlocking chain of governmental bodies — the sitio, balangay, municipality, chartered city, province and region. The provisioning from the municipal level downward is being made possible through the assistance of the World Bank. This Plan covers the development of hospitals under the upper level province, region and chartered city. It includes the carrying out of research from field studies on up, and the executing of plans, based on Ministry of Health Standards, which are most appropriate for the supplying of facilities and medical equipment, the management, maintenance and financing of each of the 19 hospitals (see Fig. A) in Ilocos (Region I) and the Cagayan Valley (Region II), together with carrying out evaluations of the results.

Through these studies, analyses and plans, the Philippine Hospital standards may be reviewed as a matter of course and improvements may be proposed.

0-2 THE PARTICULARS

1977, June

On the occasion of the 7th Yen Credit Plan Conference the Philippine side requests a proposal. As it can not be handled by the Conference it becomes a subject for the Technical Cooperative program.

SCOPE OF WORK FOR FEASIBILITY STUDY OF THE HOSPITAL DEVELOPMENT PROJECT IN REGION I & II

I. OBJECTIVE

The objective of this study is to prepare a feasibility report of the proposed standardization, development construction, and expansion of the various indicated hospitals in Regions I and II; incorporated in the proposed upgrading of hospital and supported by the National Health Plan, to further develop the implementation of the restructured Rural Health Care Delivery Systems.

II. PROJECT AREAS AND HOPSITALS

2.1 Project Area

The study covers particularly Regions I composed of the following provinces: Abra, Benguet, Pangasinan, Ilocos Norte, Ilocos Sur, La Union and Mt. Province; and the four cities of Baguio, Dagupan, Laoag and San Carlos.

In Region II, the provinces which are in the study are: Batanes, Cagayan, Ifugao, Isabela, Kalinga-Apayao, Nueva Vizcaya and Quirino.

2.2 Project Hospitals

Region I

2.2.1 Medical Center

Don Mariano Memorial Hospital (Batac, Ilocos Norte) Baguio General Hospital Pangasinan Medical Center

2.2.2 Regional Hospital

La Union Regional Hospital

- 2.2.3 Provincial Hospitals
 - Abra Provincial Hospital Bontoc Provincial Hospital

Benguet Provincial Hospital Gabriela Provincial Hospital Ilocos Norte Provincial Hospital

Region II

2.2.4 Regional Hospitals

Cagayan Regional Hospital Regional Mental Hospital Maj, F. Marcos Vet. Memorial Hospital

2.2.5 Provincial Hospitals

Cagayan Provincial Hospital (Aparri) Ifugao Provincial Hospital Kalinga-Apayao Provincial Hospital Isabela Provincial Hospital Batanes Provincial Hospital Nueva Vizcaya Provincial Hospital (Magsaysay) Quirino Provincial Hospital

III. SCOPE OF THE STUDY

The following studies will be performed by the team of the basis of the Hospital Development and Standardization Program and relevant studies which were conducted by the Government of the Republic of the Philippines.

- 3.1 Study of the Project in relation to the Hospital Development Plan
 - 3.1.1 The priority of the Project in the National Development and Regional Development Plans;
 - 3.1.2 The relationship between the Project and the National Health Care Delivery System;
 - 3.1.3 The relationship between the Project and the Manpower Training Program;
- 3.2 Study of the General Conditions (economic, social, medical care), of the Project Areas

3.5 Preparation of Equipment List for Project Hospitals

Based on the results of 3.4; the following equipment list will be prepared considering the new requirements, additional equipment to complete, and conditions of existing equipment. Considering further cost of repair and maintenance.

3.5.1 The list of equipment and furniture of each hospitals

- 3.5.2 The list of expendable supplies for initial operation of the project hospitals
- 3.6 Preparation of the hospital design concept for the project hospitals

Based on the result of 4.4; the following items will be studied for the construction of new regional hospitals and Regional Mental Hospital, expansion and completion of the project hospitals

- 3.6.1 Probability of obtaining a suitable site of hospital which must be owned by the ministry of Health
- 3.6.2 Consideration of Geographical orientations
- 3.6.3 Scoial Welfare activities available in the hospital
- 3.6.4 Total floor space of hospital and individual floor spaces of each service area
- 3.6.5 Number of beds required for each of the project hospital, and standard floor area for a single bed
- 3.6.6 Types and quantities of outpatient and emergency services
- 3.6.7 Number and description of services (Pediatrics, Surgery, Nursing, Dietary, Adm., Psychiatry, OB Gyne, Medicine, etc.)
- 3.6.8 Type of room for installation of specific equipment and facility

3.6.9 Power source, gas supply, method of lighting and necessity for air-conditioning

3.6.10 Type of water supply, drainage and sewerage system 3.6.11 Control and other measures against various hazards

3.6.12 Quality and quantity of dietary services

3.7 Preliminary Engineering

Based on the results of 3-6, the preliminary design of the following items will be performed, considering economy and maintenance systems.

- 3.7.1 Preliminary Engineering Design
 - a. Preparation of site plan (including boundary and existing facilities)
 - b. Topographic survey and study and planning of infrastructural facilities such as access road, water supply and drainage, sewerage, power and telephone, etc.

c. Geological and underground water survey

d. Consideration of alternative site

e. Design of access roads, landscape and parking areas

- f. Design of hospital building and structures
- g. Design of water supply, drainage and sewerage system, special waste disposal system (including nuclear waste disposal system)
- h. Design of facilities for power and gas supplies, lighting, ventilation and air-conditioning

3.7.2 Preliminary Specification

Preliminary technical specifications will be prepared in depth considering local conditions.

3.7.3 Labor, material and machines for construction

- a. Sutdy of available manpower for construction and local contractors and labor cost.
- b. Study of available local construction materials such as cement, steel, aggregates, concrete block, lumber, pipes and etc., and their unit prices.

3.8 Preparation of Construction Plan

and the second second

Construction plan will be prepared by following items after in depth consideration of local characteristics of climate and operation of existing hospitals during construction.

3.8.1 Construction methods considering sufficient availability of local labor.

3.8.2 Construction plan

3.8.3 Tendering procedures

3.9 Preparation of Facilities and Equipments Maintenance Plan

Maintenance plan will be prepared after in depth consideration on the following items.

- 3.9.1 Existing and future organizations for maintenance and management of hospitals.
- 3.9.2 Existing and future number of available manpower and their training program

3.9.3 Characteristics of equipment and facilities

3.9.4 Available financing

3.10 Project Cost Estimation

Based on the result of 3-7, 3-8, and 3-9, bill of quantities and project cost estimation will be prepared. Project cost will be divided into foreign currency indirect foreign currency and local currency and costs of recent hospital construction in the Philippines and maintenance costs of existing hospitals will be considered in detail.

3.10.1 Construction cost including engineering, administration and contingencies

3.10.2 Cost of additional equipment and furniture

3.10.3 Meintenance cost

3.11 Benefits and Evaluation of the Project

Since it is difficult to calculate the economic rate of return of medical care project, qualitative evaluation will be performed rather than quantitative estimation of benefits. For the evaluation, following items will be considered.

3.11.1 Influence of the project on the improvement of health of people in the project area.

3.11.2 Influence of the project on the qualitative and quantitative improvement of hopsital manpower.

3.11.3 Economic effects induced by the construction, expansion and completion of the project hospitals.

IV. STUDY SCHEDULE

The study will be executed in accordance with the study schedule. (See Appendix 1)

V. REPORTS

The JICA shall prepare and submit the following reports in English.

5.1 Inception Report

Ten copies of Inception Report will be prepared and submitted at the commencement of the study in the Philippines.

5.2 Progress Report

Ten copies of Progress Report will be prepared and submitted at the end of the study in the Philippines.

5.3 Draft Final Report

Twnety copies of Draft Final Report will be prepared and submitted within two and a half months after the commencement of the study in the Philippines. Within twenty days or receipt of the Draft Final Report, the JICA will be provided with comments on it.

5.4 Final Report

Complete sets of Final Report (twenty copies) will be prepared and submitted within one month of receipt of the comments on the Draft Final Report.

VI. MODIFICATION OF THE SCOPE OF WORK

During the execution of the study, changes can be made in the text of the scope of work by mutual agreement considered useful by both parties in facilitating the work to be performed.

APPENDIX I

0-3 OBJECTIVES

This Study is a part of the Philippine Government and Ministry of Health supported program for the improvement of health care services. In order to realize the development of provincial and regional hospitals and medical centers, field studies on the condition of the facilities, surrounding environs, medical equipment and fixtures, management and finances at the 19 Region I and Region II Hospitals will be carried out based upon the Ministry of Health Comprehensive Development Program's Standardization Plan. On the basis of the analyses of these studies feasibility planning of the upgrading of hospital facilities as suitable in light of the premised objectives is to be conducted. Through these field studies, analyses and plans, the standardization of the Philippine Hospital Development Program may be rationally studied and reported upon.

0-4 THE RELATIONSHIP BETWEEN THE NATIONAL HEALTH CARE SERVICES PROGRAM AND THIS STUDY

In the National Comprehensive Health Care Services Plan the medical facilities are divided into 3 gradings depending on their service grade.

Primary health care services are provided by Rural Health Units (R.H.U.), Balongay Health Units (B.H.U.), Community Hospitals and Health Centers (C.H., H.C.) and Puericulture Centers (P.C.).

The lower secondary health care services are normally, provided by Emergency Hospital -- 25 bed capacity hospitals used for short term services. The secondary health services are ordinarily provided by 50-100 bed capacity provincial hospitals built in provincial capital cities.

Tertiary health care services are provided by regional hospitals and medical centers serving units of several provinces together which also serve as centers for the dispersal of health care guidance for rural health clinics.

In addition, medical treatment health services systems education and the education of nurses and other health workers, which fall under the area covered by the program will be carried out. (See the following Table)

This study, analysis and plan covers the higher secondary health care services and tertiary health care services included in the abovementioned Comprehensive Health Care Services System. It is for the purpose of studying, planning and evaluating the development of provincial and regional hospitals and medical centers. Also this development will necessarily lead toward promoting the growth of the Philippine national power and economy.

Table - The Relationship between Health Care Grades,	Project

0-5 REGIONS AND HOSPITALS STUDIED

The regions targeted for this study are Ilocos (Region I) and Cagayan Valley (Region II) in the Northern part of the Island of Luzon. Region I includes the 7 Provinces of Abra, Benguet, Pangasinan, Ilocos Norte, Ilocos Sur, La Union and Mt. Province, and the 3 cities, Baguio, Dagupan and Laoag. Cagayan Valley (Region II) includes the 7 Provinces of Batanes, Cagayan, Ifugao, Isabela, Kalinga Apayao and Nueva Vizcaya and Quirino.

Project hospital facilities

• Ilocos (Region I)

i) Medical Centers

Don Mariano Marcos Memorial Hospital

Baguio General Hospital Pangasinan Medical Center

ii) Regional Hospitals

La Union Regional Hospital

iii) Provincial Hospitals

Abra Provincial Hospital

Bontoc Provincial Hospital

Benguet Provincial Hospital

Gabriela Silang Provincial Hospital

Ilocos Norte Provincial Hospital

iv) New Sites Proposed (for use of the Pangacinan Medical Center)

• Cagayan Valley (Region II)

i) Regional Hospitals

Cagayan Regional Hospital Regional Mental Hospital

Major F. Marcos Veteran Memorial Hospital

ii) Provincial Hospitals

Cagayan Provincial Hospital

Ifugao Provincial Hospital

Kalinga Apayao Provincial Hospital

Isabela Provincial Hospital

Batanes Provincial Hospiial

Nueva Vizcaya Provincial Hospital

Quirino Provincial Hospital

iii) Sites Proposed for the Construction of New Hospitals

For the Cagayan Regional Hospital and Regional Mental Hospital

For the Major Marcos Veteran Memorial Hospital

For the Cagayan Provincial Hospital

For the Ifugao Provincial Hospital

19 Hospitals* and 5 New Hospital Construction Sites in total (See Fig. B)

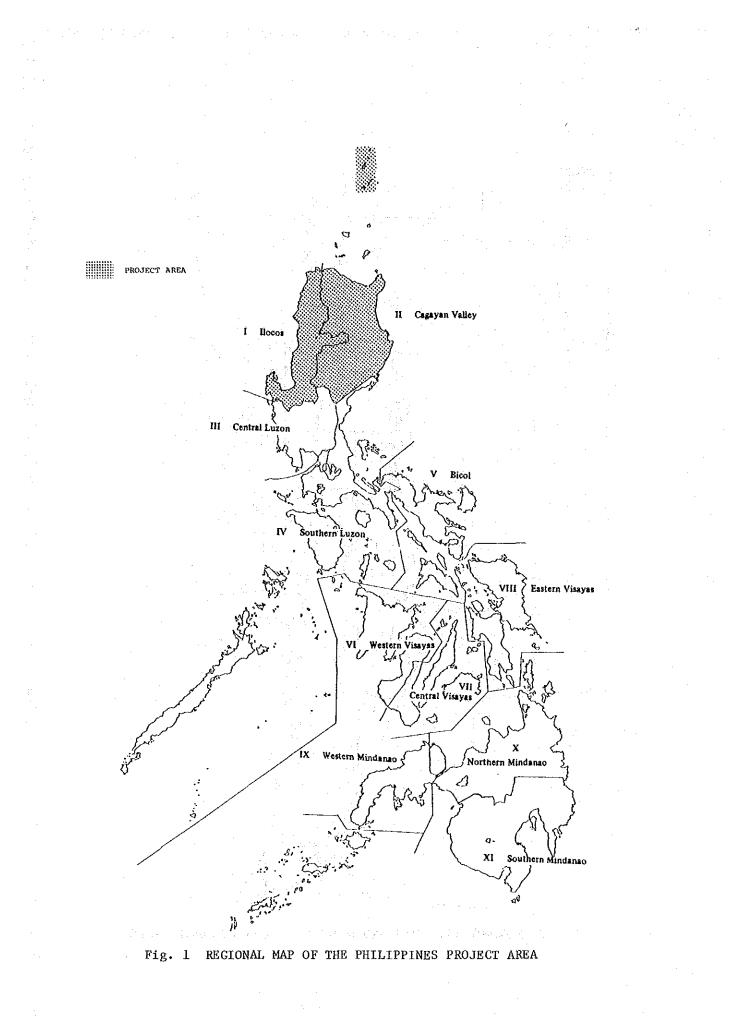

Note: Cost estimate of I-8 (Don Mariano Marcos Memorial Hospital) is made excluding the cost of completion of the building (which was under construction at the moment of field survey), the water work and electrical work in its new building but including the cost of medical equipment and furniture, necessary water work and electrical work.

No costs for the renovation of existing old facilities are included.

Cost estimate of II-8 (Major F. Marcos Veteran Hospital) is made in the same way like I-8 but including the cost of construction of additional facilities (service I & II and staff acommodation facilities), electrical work and mechanical work.

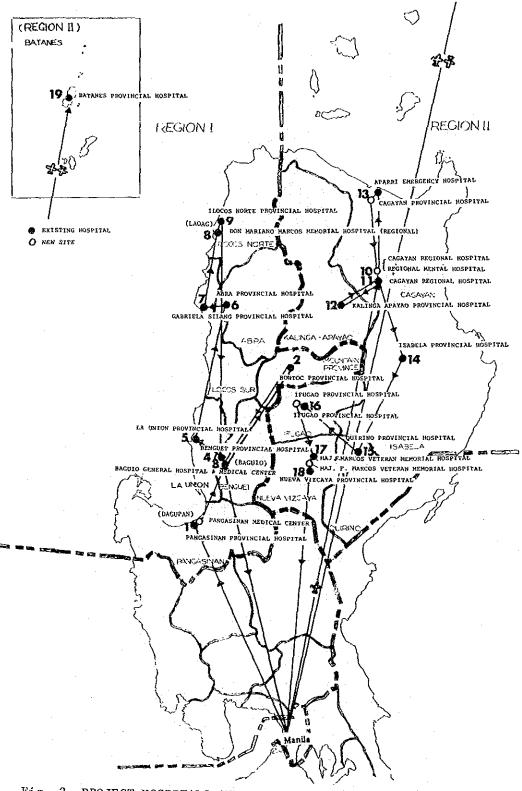

Cost estimate of II-4 (Cagayan Provincial Hospital) is made based on standard cost, assuming that the feasible site will be shown later on by Philippine side.

Actually 18 separate hospitals as the Cagayan Regional Mental Hospital, which is currently under construction, will become part of the Cagayan Hospital upon its completion.

3. EXPLANATION AND MUTUAL AGREEMENT OF THE INCEPTION REPORT.

"Inception Report of the Feasibility Study of the Hospital Development Project" is explained by Japanese Field Study Team, reading and confirming through all items, and finally recognized as a whole by both parties.

Questions and answers about Inception Report (page 1-17) and confirmation about the "List of the Survey and Datum to be Requested to the Philippine Side" are made.

3.1 Questions and Answers

As implementing planning and surveillance is legally allowed in Philippines only by licensed architect, Japanese side should show only feasibility planning, the scales of the drawings is discussed, in site plan 1/1000 1/500 and in other drawings 1/500 1/200, and finally accepted by both parties as is submitted in the Inception Report.

4. ASCERTAINED ITEMS ABOUT "THE LIST OF THE SURVEYS AND DATUM TO BE REQUESTED TO THE PHILIPPINE SIDE" (Appendix 8)

Following items are ascertained by both parties:

- 4.1 Drawings of the three projected hospitals are ready and the rest of them are not made
- 4.2 Standardization about this project are available as floor area lists by each hospital rank and as the lists of medical equipment and furniture but no detailed standardization plans are available.
- 4.3 About reutilization of extreme old facilities may be judged by Japanese side after survey.
- 4.4 The drawings of the existing facilities are to be tried to submit by Philippine side to Japanese Study Team and the drawings of those which are constructed about 1940 are not available.
- 6.5 Topographic survying maps of each projected nospitals are now coming 'ready by Philippine side and will be submitted to Japanese side before the end of the field survey.
- 4.6 Maps (1:50000 1:250000) which Japanese side couldn't succeeded to obtain will be tried to get by Philippine side.
- 4.7 70M boring for water source check of each site will be done by the Philippine side and result will be submitted to Japanese side.

- 4.8 Sub-soil conditions in northern parts of Luzon Islands is generally good (2000 ^{psi/}) and only in Manila district boring and penetration test are obligated. In case of necessity Philippine side will ask those corresponding datum from Public Work Office Regional Distric Branches.
- Allower 4.9 Enlargement of power settive is not considered in this project and mainly problem resolved by using generators.
- 4.10 Enlargement of tele-communication receive is not considered in this project .
- 4.11 No city gas (territorical) in Region I and II
- 4.12 No water supply (territorical) in Region I and II except in Baguio City
- 4.13 No severage service (territorical) in Region I and II
- 4.14 For the meeting at project hospitals in such area where there is no territorical supply of city gas, water supply and sewerage system, corresponding representatives are not necessary to be invited.
- 4.15 As for the price list to types of medical equipments and furniture etc. Mr. Izawa will make survey with the aid of Philippine side in Manila after his return from the survey trip in Region I and II
- 4.16 As for the average labor price in Philippine, Datum will be asked from NEDA same time so Japanese mission visit its office.
- 4.17 As for the delivery collection of the questionnaires listed below, Philippine side promised to make a quick arrangements.

PROGRESS REPORT

This report describes that the field study of the Feasibility Study of the Hospital Development Project in accordance with the IMPLEMENTING ARRANGEMENT concluded between MINISTRY OF HEALTH OF REPUBLIC OF THE PHILIPPINES and JAPAN INTERNATIONAL COOPERATION AGENCY in March 1979, was performed as follows:

I. OBJECTIVES OF FIELD STUDY

This study was conducted for a feasibility study of 19 Project Hospitals in the Republic of the Philippines.

11. FIELD STUDY SCHEDULE AND PROJECT HOSPITALS

See Appendix 1 and 2

III. MEMBER OF FIELD STUDY TEAM

See Appendix 3

IV. ATTENDANCE AT THE MEETING IN EACH PROJECT HOSPITALS See Appendix 4 and 5

V. CONTENTS OF FIELD STUDY

- a. Collection of supplemental information related to the superior plans.
- b. Collection of supplemental information on natural environmental conditions.
- c. Collection of supplemental information on social and economic conditions.
- d. Collection of information on the conditions of health and medical services and facilities.
- e. Collection of information for design concept.
- f. Collection of information on engineering design.
- g. Collection of datum on construction costs, unit prices of building materials, and conditions of supply and transportation of building materials.

VI. METHOD AND STATE OF FIELD STUDY

This Field Study was performed as follows, except for that shown in VIII.

- a. Collection of questionnaires requested to each hospital in advance.
- b. Hearing of checklist prepared in advance.
- c. Investigation of sites by rough measurings and photographing.
- d. Request for submission of drawings of existing buildings and sites, etc.
- e. Collection of statistics and publications.
- f. Investigation of market prices.

VII. UNOBTAINED INFORMATIONS

Names of unobtained informations and responsible personnel to their submission are shown in Appendix 6.

VIII. MEDICAL EQUIPMENT

The Japanese feasibility team will modify the medical equipment of the Project Hospitals.

IX. STANDARDIZATION PROGRAM

The Japanese feasibility team will comment on the standardization program based on the just concluded field survey.

X. OTHERS

Unfinished buildings and mechanical and electrical equipments will be completed in principle by the Philippines funds of the total project funds.

Medical equipments, furnitures etc. will be supplied by the foreign funds.

XI. SCHEDULE OF FEASIBILITY STUDY IN JAPAN

Feasibility study will be performed by general datum from Philippines and datum which were collected during the field study. Draft final report will be submitted on middle of July, and final report will be submitted on middle of August, 1979. We sincerely ask you the continuous help and cooperation for the collection of unobtained and additional informations etc. and the framing of REPORT.

As per attached.

MINUTES OF DISCUSSIONS

During the discussion held between the JICA Mission of the Hospital Development Project for the Explanation of the Draft Report and the Philippine Government on August 9, 1979, the following major points were taken up:

- 1. The Philippine Panel found the draft report fairly acceptable. However, comments and/or recommendations on certain specific details will be forwarded to the JICA Office, Manila on or before August 21, 1979.
- 2. The Philippine Panel took note of the comments of the JICA Mission on the treatment of 3 problematic hospitals, namely: Cagayan Provincial Hospital, Don Mariano Marcos Memorial Hospital, and Major Ferdinand Marcos Veterans Memorial Hospital. The Philippine Panel decided to hold in abeyance its position on the matter until a decision is reached by its Ministry of Health.
- 3. The JICA Mission agreed to provide an additional chapter in the Final Report which will contain all the items which were discussed during the meeting including the comments and recommendations of the Philippine Panel and a cost list for each hospital under Flan I and Plan II.

EDUARDO G. CORPUZ Assistant Director-General National Economic and Development / Authority KYCSUKF OZAKI Team Leader JICA Mission of the Hospital Development Project for the Explanation of the Draft Report

Cycanke Onki

Republic Philippines PROJECT MANAGEMNENT STAFF Ministry of Health

August 3, 1979

JAPANESE INTERNATIONAL COOPERATION AGENCY Tokyo, Japan

Dear Sir:

Draft Summary Report of the Hospital Development Project is acceptable only with the following comments on the submitted plans.

It is, therefore, suggested that the following comments be studied before making the Final Report.

COMMENTS ON THE SUBMITTED PLANS:

- 1. Emergency and Treatment Rooms must be provided with emergency waiting hall, capacity 20 persons.
- 2. The Out-patient Department each consultation must be provided with separate examination room; provide separate staff toilet
- 3. The Family Planning Room must be provided with doctor's office, showing the interviewing room and with two separate rooms
- 4. Interconnecting doors at OPD not necessary
- 5. Increase floor area of lobby
- II. Administrative Service:
- 1. Medical records room must be near the business office
- 2. The director's, chief nurse, and administrative offices are inadequate in sizes.
- Provide a separate cashier's office adjacent to the business office;
- 4. Provide toilet and bath of the Director's Office;
- III. The Ancillary Department:
- All x-ray rooms must be provided with a single passenger toilet, dressing room and control
- Bacteriology and laboratory rooms are inadequate. The door must be separate with the rest of the laboratory facilities.
- Size of storage room in the pharmacy room is inadequate. Relocate Pharmacy nearer to OPD and Emergency Room;

more-

Page 2

- IV. Surgery Department:
- 1. No clean-up, necessary after operation;
- 2. Scrub-up to be relocated nearer to OR/DR
- 3. Provide surgical supervising area
- 4. Provide anesthesia storage room
- 5. Provide steril, inst. storage for due operation in use
- 6. Provide for stretcher/and closet of janitor
- 7. Delete the nurse station in the aseptic area.
- 8. Provide another cubicle for suspect nursery, nearby the well baby cubicles, and provide formula area and utility for the nursery;
- 9. Doctor's locker room should be provided with door before the aseptic and door going to the aseptic
- 10. Labor room must be provided with toilet and bath
- 11. Delete the machinery room
- 12. Aseptic area must be well defined
- 13. Provide nurses locker room
- V. Nursing Units:
- 1. Limit ward room to over 6 beds maximum, if possible with toilet for each within the room
- 2. Specify the following nursing units:
 - a. Pedia
 - b. Ob-gyn
 - c. Surgical Ward
 - d. Medical
 - e. Provide isolation room (male & female)
 - f. Medicare ward and private room (single and semi-private)
- 3. Segregate the dirty and clean linen rooms
- VI. Dietary:
- 1. Provide staff dining;
- 2. Provide day food storage
- Separate the cafeteria from hospital dietary processing and preparation areas.
- 4. Relocate the laundry area at the hospital maintenance block;

Very truly yours MANUEL F. JUAN, JR., M.D. Officer-in-Charge

I-O SUMMARY OF THE PHILIPPINE HOSPITAL DEVELOPMENT PROJECT STUDY REPORT

This is a summary of the report that was written based upon the results of the in-detail Study which was made over a 40-day period of the 19 hospitals and the prospective sites in Region I and II. The report was based upon the "Scope of Work" agreed upon by Philippine Health Officials and the JICA under the Technical Assistance Program between Japan and the Philippines.

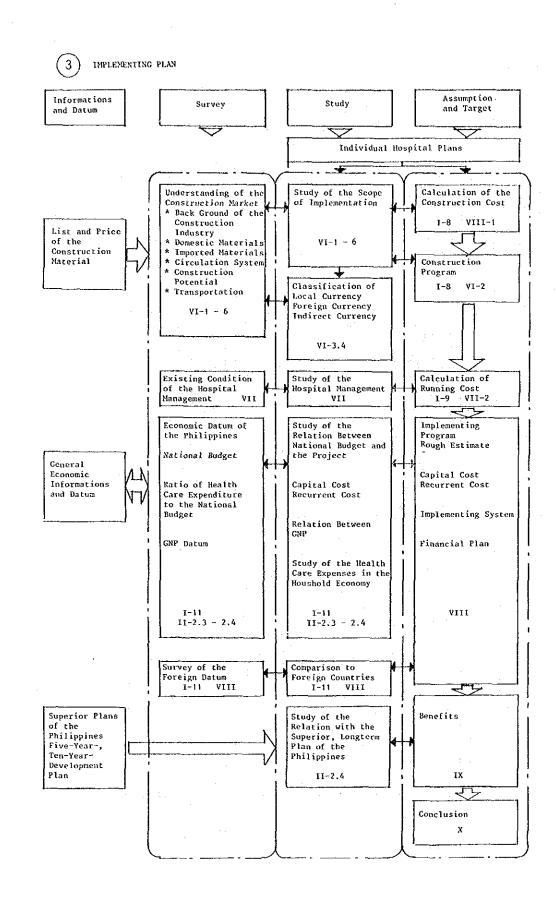

The Department of Health's National Health Care Services Standards, being extremely well though out, the Study followed its standards in its planning, while taking into consideration present conditions, the international level which the Philippine healthcare ought to attain and the need to cope with future eventualities.

It is hoped that this report be studied in reference to the Philippine Comprehensive Health Care System and the Philippine hospital Development Program Standards.

I-3

. .

1--4

I-1 GENERAL OUTLINE OF REGIONS I AND II

The Project area for this feasibility study (hereinafter study), Regions I and II are situated on the Northernmost end of the Island of Luzon, with a combined total area of 57,971 km² (Region I - 21,568 km², Region II - 36,403 km²), thus occupying approximately 19.3% of the total national land area of 300,000 km². In respect to population, their combined total of 5,202,000 (Region I - 3,269,000, Region II - 1,933,000) is 12.4% of the national total.

The Western portion of these two regions; which extend from 16° to 19° latitude in the Northern part of the Philippines, comprises a level plain running alongside the coast; the central portion and eastern sea coast is a rolling, mountainous zone. The Cagayan river flows northward through the center of Region II, which lies between the central mountainous zone and the eastern coast mountainous zone. The river basin is composed of wide and flat plains. But, as these two regions' western sea coasts and Cagayan valley are enclosed by the central mountaineous zone, at present communications are not very easily made.

The main products of both regions are agricultural with rice and tobacco being the major crops, in addition to which, there is an off-shore fishing industry on the western coast and a dried fish processing plant near Pangasinan. In the eastern sea coast's mountainous zone there are forestry, lumbering and other such kinds of industries. Moreover, recently, forestation, dam building and the rationalization of agriculture, etc. have been strongly advanced in the central mountaineous zone.

Weather-wise, Region I has a dry season from November to April and a rainy season from May to November. Region II on most years suffers damage from tropical cyclones and floods.

The temperature is, on the whole, tropical with temperatures in most of this area in excess of 30° celsius; but Baguio, the region's largest city, being 1,500 meters above sea level, has a year-round temperature between 18.2 and 20.6° celsius. Besides Baguio,Bontoc, Ifugao and other locations over 1,000 meters above sea level also have low temperatures.

Regarding traffic connections, a Philippine-Japanese Friendship Highway has been built running North-South through the two regions, and the traffic running on this national road is convenient. Yet, the roads running to the mountainous area are is not sufficient. In the case of the project hospitals, as well, there is a great difference in transportation conditions; and it was felt that this has great effect on health care service (Bontoc, Ifgao, Quirino PHs, among others, are either distant from National highways or accessible only by poor roads). There are airports in San Fernando, Ilocos Norte, Tuguegarao, Aparri and Basco. As Batanes PH is on a distant island, the airplane is its major mode of transportation. Also, the educational level and rate of literacy is relatively high.

A comparison of the regions' vital statistics gives:

	Region I	Region II	Total
Land area	37.2%	62.8%	100%
Population	62.8%	37.2%	100%
Population densi	ty 2.85	1.	

From which it can be seen that Region II's development is lagging that of Region I. This is thought to be attributable to Region I's having had traffic from Manilla from years back along a level coastal road, whereas Region II's broad plain land, being on the other hand blocked from traffic by the Dalton pass and mountain range, hasn't developed. These conditions, are seen in the medical statistics we will next bring up, and in other areas; but after improvements in transportation due to national highways are completed, the population growth rate in Region II will exceed by a large margin that of Region I and the rapid development of this region is expected through Cagayan River management and the development of agriculture, electric power, waterworks and other industrial infrastructure. It is absolutely necessary that healthy manpower be provided for this development by improved health care.

For this, it is desirable to situate a string of private and government main hospitals in the plain running north-south in Region I and sufficient government hospitals (100 bed scale) for the inhabitants of the central mountain range and, in Region II, to situate a string of government and private central hospitals running north-south from Tuguegarao along the Cagayan river basin, and to lay roads to assure the connection of East and West in several places in the central mountain range.

With the development of this group of hospitals, the improvement in the quality of health care will mean that the supply of sufficient healthy manpower for the rapid development expected in the regions may be anticipated, as the completion of this Hospital Development Program will be most influential in satisfying this demand.

I-2 OUTLINE OF REGION I AND II'S HEALTH CARE

35.3% of the hospitals in Region I are government facilities and 47% in Region II, for a combined total of 40.5%; and 50.6% of the beds in Region I are government, and 74.9% in Region II, for a combined total of 58.4%, which shows the role played by government hospitals to be very large. It is judged that the role played by public hospitals in Region II will become especially vital with the completion of the present development program.

The Philippine regional medical health care system comprises of puericulture centers (P.C.), community hospitals and health centers (C.H.H.C.), barangay health stations (B.H.S.), rural health units (R.H.U.), emergency hospital (E.H.) provincial hospitals (P.H.) regional hospitals (R.H.) and medical centers (M.C.) built and provisioned in accordance with the respective needs of sitio, barangay municipality, chartered city, province and region and operating under the three level health care service appropriate to each facility.

This hospital development program covers the upper part of the system described above and is to serve as the key to the development of all regional health care services.

1. Health Care Indicators and International Level

The condition of Region I and II health care facilities and the health indicators, shown in the Philippine Report, and DOH data, are as follows.

1)	Health care facilities	s Region	I Region I	Ĩ	
	Medical center	1	 		
÷	Regional hospital	1	1		
	Provincial hospital	7	- 7		
	Total	9	8		
2)	Health care manpower	Region I	Region 11	Dist	rib.
	Physician	891 (0.25 phys./ 1,000 pop.)	210 (0.09 phys./ 1,000 pop.)	81%	19%
	Nurse	865	331	75%	2.5%
	Nurse Attendant	367	199	65%	35%
	Dentist	Unknown	40	 	-
	Mid-wife	687	287	70%	30%
	Sanitation Inspector	218	113	66%	34%

3) Health Indicators

and and an and an and an	Region I	Region II	2 Region Total and average
Crude Birth rate per 1,000 pop.	37.2	31.8	32.05
Crude Death rate per 1,000 pop.	7.6	7.4	7.53
No. of hospitals gov./gov. and priv.	36/102	34/72	70/173
No. of Beds gov./gov. and priv.	2248/4834	1700/2269	4148/7103
Beds/1,000 pop. (gov't)	0.7	0.85	0.75
Beds/1,000 pop. (gov't and priv.)	1.39	1.06	1.23

The above figures are on the same order as the Philippine national average and the 19 hospitals actually studied. They are low by international standards, in this connection, the health care facilities and health indicators of 38~40 nations were compared to those of the Philippines by dividing them into 8 groups of which the Philippines pertains to the 7th.

	Grade	No.		
Beds	7th group	153/100,000 pop. (30th place among 35 nations)		
Physicians	11	22/100,000 pop. (39th out of 40)		
Nurses	n	31/100,000 pop. (35th out of 38)		

(refer to following table)

In its capacity to authorize private and government health care facilities and provide health care supplies, there is a need for national health care administration to provide more government hospitals for isolated and lowincome areas. NUMBER OF BEDS BY COUNTRY: PER 100,000 POPULATION

I-3 PROJECT HOSPITALS' CONDITIONS AND FEASIBILITY DEVELOPMENT PLAN

1. Development Priorities

As the study clearly revealed that, with the exception of two or three hospitals, the hospitals are aged, the medical equipment is extremely antiquated, the toilets and other facilities are unsanitary owing to insufficient water and electric supplies and, moreover, the quality control of vaccine and other medicine is less than perfect owing to the insufficient electric power, the development priorities are as listed below.

- 1) Bringing Infectious Diseases Under Control
 - (1) To give priority to developing the diagnosis and treatment related buildings and medical equipment which make up the core hospital function to plan the rapid control of infectious disease.
 - (2) To give priority to the development of water supply and drainage to erradicate the causes of infection within and in the vicinity of the hospital.
 - (3) To provide separate electric power installations, to at least guarantee a small quantity of power around the clock from one system in order to improve vaccine and medicine quality control.

Through taking these measures, the prevention of infection, etiological studies and treatment may be properly carried out. Thus it can be expected that the incidence of such diseases as infectious phneumonia, influenza, TB, gastro-enteritis and tetanus which presently are the leading diseases, may be drastically reduced within a short time period.

2) Building

The results of this study of project hospitals show that, excluding 2 facility's with new main buildings under construction (Don Mariano Marcos, Major Marcos Veteran). 1 hospital under construction (Cagayan Mental Hospital) and 4 hospitals (Don Mariano Marcos Hospital, Kalinga Apayao, Aparri, Nueva Viscaya) which are of relatively recent construction, 14 hospitals -- as shown in the following Table, the main parts of the hospitals -having been constructed in the early 50's or earlier are already over 25 years old.

Those of wood construction are extremely rotted and require rebuilding, and those of brick construction also need extensive rennovation to be used again. The construction year of additional and annex buildings varies widely, but excluding some exceptions, they are also worn out like the main buildings. The equipments and spaces of these existing buildings are not suitable for an upgraded hospital. Therefore, while new building construction will be primarily for the diagnosis and treatment portions, existing buildings are to be converted into wards and the like.

3) Water Work Utility

In the Philippines a public water supply development programm is now under way by the LWUA (Local Water Works Utility A.D.M.) and B.P.W (Bureau of Public Work), but the degree of deffusion is not yet enough. Water supply equipment, capacity and the distribution area in main cities are still limited and most of the inhabitants still get water from wells, springs and rivers. In the case of these project hospitals, only Baguio, Bontoc, Don Mariano Marcos, Ifugao and Batanes are getting water from public water net works, but most of their water quantity is insufficient and often cut off. Only Baguio city has a sufficient water supply system. Also only Baguio city has a public sewage system but the treatment facility is at present under construction and drainage is let to flow directly into the rivers without treatment. In the rest of the project hospitals, drainage treatment is done mainly by septic tank, and further drainage is let into to creeks, rivers or rice paddies.

Because of the above mentioned conditions of water supply, sewage treatment facilities and capacities, flush toilets in hospitals cause give rise to an insanitary environment and "Inside the Hospital Infection". Thus, in this plan, the development of water supply facilities including water source, and sewage facilities including sewage and drainage treatment systems for the aim of realizing of sanitary hospitals is given top priority.

.

.

4) Electricity supply

In the Philippines, power plant projects are now under way by the NPC (National Power Corporation), but the development is not sufficient at this moment.

In Region I, one of project areas, there is a power supply from the N.P.C. (only Bontoc city from private franchaise). In Region II, a public power supply is not available and Cagayan RH Kalinga Apayao PH, Aparri EH, Maj. F. Marcos are supplied power by private franchise.

The reliability of the power supply is low because of long blackouts in the wet season and the low quality and small quantity of the power supply being insufficient, ensuring that hospital functions go on is difficult. In this program, while supporting the saving of energy, the developing of electric power source facilities, including the provision of generators, and the installation of parallel transmission is to be given priority in order to guarantee minimal hospital functioning at all times.

The expected results of this in terms of the Hospital Development Program in general, and the improvement of health care services in particular are:

- introduction of new top quality examination, diagnosis and treatment facilities (X-ray related equipment);
- 2. creation of complete laboratory facilities (pathology);

3. upgrading and development of health care;

4. ward development;

5. preventative measures, etc.

As a result of the field survey and analysis of data, strengthening of hospital functions and provision of related construction and facilities were selected as they seemed to be appropriate for regional medical and health care service and expected to be cost-effective in terms of investments.

Actual planned scale,

In preparing the actual plan, standard scales of 100, 200 and 300 beds were first set, followed by planning for each scale in respect of buildings (central treatment, surgery, administration, services, etc.), facilities (water supply and drainage, air-conditioning and power) and medical equipment. At the same time, based on the survey of each hospital, the grade of the hospital concerned (scale of treatment and the bed capacity) was determined in the light of the population of the area covered. The improvement plan for each hospital was then formulated by coordinating these operations. The resulting proposal regarding the scale of facilities and the contents of the improvement plan for each hospital is given below.

> Current figure or

	· · ·	ratio.
Determination of bed capacity per population.	$1.5 \sim 1.6$ Beds 1,000 persons	0.75 Beds 1,000 persons
Floor area per bed (excluding living quarters).	<u>35 m²</u> Bed	$\frac{14 \text{ m}^2}{\text{Bed}}$

Service	(SERVICE)	20%	19.7%

I-4 PRESENT CONDITION AND THE SUPPLY PLAN OF MEDICAL EQUIPMENT

The results of the present study show that much of the equipment currently in use has passed its better years. Further, probably because they came to the hospital under UNICEF, WHO and Japanese aid programs, supplies of maintenance parts were not adequate. In addition, there is a shortage of service personnel in hospitals. As a result, they do not seem to be functioning satisfactorily.

What was also common to all the hospitals covered by the study was the insufficient power and water facilities for medical equipment.

In view of the above mentioned situation, not only a large increase in medical equipment and the establishment of a training system for handling the equipment but also provision of power and water facilities and the establishment of a maintenance system combining the appointment of a maintenance officer for each hospital and a circulating guidance service provided by the central administration will be necessary under the present plan.

The attached standard table of medical equipment has been compiled for the purpose of upgrading the capacity of medical and health service of each project hospital by a few grades.

The major diseases treated by the project hospitals may, in most cases, be placed in the category of infectious disease at present. In the near future, however, with the expansion of the public medical health service by the Philippine Department of Health and the implementation of the Hospital Development Project covered by the present study, the distribution of diseases handled by these medical facilities is expected to undergo a major change. Accordingly, the standard table contains the data in anticipation of future development.

The table has been prepared with the emphasis in the supply of medical equipment placed on the central treatment sector including higher accuracy in diagnoses, improved sterilization and disinfection, and the strengthening of surgical, post-surgical, premature birth and neo-natal sections. The present situation revealed by the study can be upgraded considerably by the table.

Normally, a public hospital development program of this kind is not implemented all at once, but is carried out in phases or by fiscal year. Accordingly, the table has been prepared on the basic assumption that as prerequisites (manpower and economic factors) for the public health care service are gradually supplied, medical equipment is either added or replaced according to the needs of each hospital for possible doubled effects. With regard to the relationship between medical equipment and building area, the present area per bed is extremely small at 14 m², clearly inadequate for good health care service. However, the present plan proposes 35 m² per bed with planning for easy extension in the case of a change in medical load in future, medical equipment is expected to be sufficiently utilized.

Under the planned improvement in medical equipment, accuracy in medical treatment and examinations is expected to increase markedly with the strengthened central treatment, particularly in X-ray and surgery, diagnostic and pathological examinations, and sterilization, thus making the control of infectious diseases in a short period. Further, it has a sufficiently wide scope to be able to cope with diversified diseases of the advanced country type in future. (For the change in the distribution of diseases, refer to the previous section.)

Examples of Upgrading of Medical Equipment

Those medical equipment recommended under the present improvement plan are markedly advanced compared with the existing equipment. Specifications of the equipment for the central treatment sector which was given emphasis in planning may be outlined as below.

1) X-ray Room

(1) General X-ray apparatus.

All wave silicon rectifying system, top performance for normal fluorscopy radiography and hitention radiography with motor-driven Examining couch with exploration and shot radio graphic unit vertical horizontal, Trandentenburg positions. With bucky apparatus and floor side X-Ray tube stand.

Output. 150 KV 300 mA, 125 KV 500 mA 120 KV 4 mA

(2) X-ray apparatus for TB cases.

X-Ray Tomograph Apparatus.

(3) X-ray apparatus for gastroenterological cases.

Diagnostic X-Ray television Apparatus.

2) Sterilizer

In addition to the autoclave equipped with a large sterilization precision guarantee device, ethylene oxide gas sterilizer is to be installed at those hospitals with a bed capacity of 200 beds and above.

3) Laboratory

In addition to BHR, ECG and PCG, the standard equipment is to include Spectro photometer Electrophoresis appratus, Fluoresence microscope.

4) Post-operative control sector

The standard equipment, based on ICU, is to include patient heart recording monitor, Automatic respirator, 0^2 Tent ϵ .

5) Delivery Room

The equipment for neonates and premature cases is to include Infant incubalor (Regulates temprature by electronic control and automatically contorol type), Infant CPAP System (continuos positive air way pressure).

6) Operating Room

The standard equipment is to include operating table (Full automatic electro motive) Electro-surgical unit (solid state type) Anesthesia Apparatus (11" long flow meter type) Infant circle absober.

THE ALLOCATION OF HEALTH-CARE RELATED PERSONNEL I-5

The most serious manpower problem is the shortage of physicians. The shortage is particularly acute in Region II, where the rapid deployment of physicians by administrative initiative -- eg. by putting into law the obligation for new med. school graduates to serve in regional hospitals for a fixed period of time and training them -- must be carried out.

Nurse and paramedical personnel are relatively abundant, but the development of medical facilities, introduction of medical machines and disembursement of the budget is not going smoothly. The introduction of many more radiologists, paramedical and other personnel to accompany the up-grading of the diagnosis, treatment and examination facilities ought to be considered. Maintenance personnel, especially those for maintaining medical equipment are lacking. It is an urgent task to train maintenance personnel within hospitals concordant to strengthening maintenance systems throughout the nation.

I-6 MORBIDITY STRUCTURE AND PARTICULARS OF DIAGNOSIS AND TREATMENT

° Distribution of diseases

The Philippine morbidity pattern given in the following table of the ten leading diseases and ten leading causes of death shows a classical infections disease pattern.

10 leading diseas	ses		10 leading causes of	dea	ath
Influenza	A	33.3%	Pneumonia	A	26.3%
Gastro-enteritis and colitis	A	27.6	Tuberculosis all Forms	А	17.9
Tuberculosis	А	15.9	Disease of the Heart	В	14.6
(all forms) Pneumonia	A	10.4	Diseases of the Vascular System	В	8.2
Malaria	А	3.1	Malignant Neoplasms	B .	7.6
Measles	А	2.6	Gastro-Enteritis	А	7.0
Dysentery (all forms)	A	2.6	& Colitis		
Whooping cough	A	2.5	Avitaminosts & other Nutritional Deficiency		6.8
Malignant neoplasms	В	1.4	Accidents	D	5.0
Infectious Hepatitis	Ā	0.6	Bronchitis, Emphyserma Asthma	A+I	
	· .	100 A.	Tetanus	Α	2.6

Comparing this morbidity pattern with that of developed countries' shows a large difference which stresses the desireability of quickly upgrading the health-care services. Classifying the morbidity into 5 types -- A = infectious diseases, B = geriatric diseases, C = childbirth-related complic, D = externally caused injuries E = others - and comparing the 1974 ratios of causes of death broken-down by these types for the Philippines and an average of 5 developed nations gives the following:

The Philippines shows an infectious disease pattern and the developed nations a geriatric disease pattern.

o Particulars of diagnosis and treatment given the current conditions noted above, the stress in health care at high ranking hospitals needs to be strongly weighted in favor of bringing these infectious diseases to a standstill,

Concrete objectives are:

- 1 Infectious disease control perfection of the examination dept. backed up by preventive activities
- 2 Conquering malnutrition, especially protein deficiency
- 3 Preparing geriatric disease countermeasures for the future
- 4 Measures to reduce neonatal, infant and maternal mortality
- 5 The increase of happy, healthy families and a proper social structure through family planning and related activities.

Moreover, EET and dental departments will definitely be added to the internal medicine, surgery, pediatrics and OB-GYNE which form the core departments at 100~200 bed scale hospitals; and in 300 bed and up hospitals the internal medicine department will be divided into its specialities, a separate plastic surgery department will differentialed from the main surgery department and the EET department will also separate. Further, rehabilitation, will be limited to physical therapy, and ICU's will be established at 200~300 bed scale hospitals.

o Laboratory tests and other tests

The following table gives the details on laboratory, physiological and radiological diagnosis.

	w many types of ions/tests may be

	1	3	4	4	6	7			
	1	1	1	4	6	12			

1-22

The Philippine morbidity pattern resembles that of Japan's before 1947. In the case of Japan, the subsequent improvement of health care services resulted in halving the incidence of infectious disease within several years, with the pattern thus shifting to a geriatric one after 1955. Together with this change in the morbidity, the mortality rate diminished, with it dropping by about 1/2 in the 3 years between 1947 and 1950 (900/100,000 $\rightarrow \div$ 400/100,000).

The result of this development program may be expected to be similar to that in Japan because diagnosis and treatment are stressed.

;

1-23

I-7 PROPOSED STANDARDIZATION OF MEDICAL CARE FACILITIES (including the review of the Philippine standard).

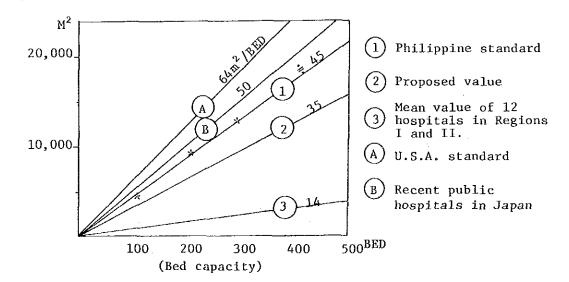

In connection with the planned improvement in government hospitals in Region I and II, the Philippine Department of Health has proposed standardization covering from soft ware such as the contents of medical care service to hard ware such as buildings and medical equipment prior to the nation-wide application.

The Japanese side has conducted a detailed study of 19 hospitals and planned for hard ware such as buildings and facilities. At the same time, the scale of hospital facilities, allocation of personnel, medical departments, examination items, medical equipment, etc. have been examined with a view to standardization. Since these have been outlined in 04-06, this section will be devoted to the determination of standards for construction and the scale of construction, and to the examination of the standardization of construction and facilities.

1. Determination of the Hospital Scale

Since the building area per bed is an important factor in ascertaining the scale of a hospital, the present condition of the Philippine project hospitals, the Philippine Department of Health standard, the U.S. standard and Japanese public hospitals have been compared. (Figure below.)

According to the comparative study, the floor area per bed at the Philippine project hospitals is extremely small at = 14 m^2 compared with 45 m² recommended by the Philippine Department of Health and 50 m² at recently constructed public hospitals in Japan.

l) Scale

As a result of the analysis of the present condition at the Philippine project hospitals and the medical environment of each hospital, it has been decided to set the standard scale at 35 m^2 .

2) Sectors and the area ratio by sector

Hospital functions have been classified into Ward, Outpatient Department, Central Treatment Department, Administration, Service I and Service II. The table below gives the area ratio by sector, which corresponds approximately to that at public hospitals in Japan.

Departments	Proportion	(Reference: Public Hospitals in Japan)
WARD	40%	42%
0.P.D.	10%	13%
ANC	20%	18%
ADM	10%	8%
SERVICE-1, -2	20%	19%
	100%	100%

3) Standardization of buildings and facilities

Standard capacities of hospital buildings are to be 100, 200 and 300 bed. Since the hospitals are to be built in the tropics, they are to have the architectural form of the single-corridor type with a sunshade provided on the concrete roof. The standard span is $6.0\text{m} \times 5.4\text{m}$ with both ends of the building constructed for easy extension in future. It is to be single-storied for 100 beds and two-storied for 201-450 beds. The plan is shown on the next page.

In addition, service sector and living quarters for physicians and nurses are to be standardized.

 Standardization of water supply, drainage and power facilities

With regard to water source, terminal treatment and power source, the facilities are classified by bed capacity, e.g., 100, 200, 300 and 450 beds, for the standardization within the classification.

			1.1		Basi	compo	sition	ı				
Bed capacity by scale	Central treat- ment	Out- patient	Adminis- tration	Ward	Services	Living quarters	Well	Water supply	Drainage treat- ment	Air-con- dition- ing	Power	Medícal equip- ment
100	100			50 x2			200	200	100	100	100	100
200	200	200	200	×4	200	×2	300		200	200	200	200
250	300	300	300	x5	300	×2		300	250 300	300	300	3,00
300				×6		×3	×3		<u>ل</u> 450	Ĩ		Ĩ
450				L x		\bigsqcup_{x4}	.5LJ _{x4}			\Box		
'igures bed apacities	Fig	ires be	d indi	cating	funct	ion (1	.00 = f	or 100	beds).			<u></u>

5) Functional unit composition and structural composition of each hospital

6) Effects of standardization

- o The standardization of medical functions (facilities, medical equipment, manpower) has marked effects in the standardization of wide-ranging medical service, organic services and mutual assistance.
- o The standardization of hardware is extremely advantageous in productivity, workability, interchangeability, handling, prices and repairs, and is to construct the basis of stable medical care service together with the standardization of functions.

of scheduled extension.

Composition of the departments according to the standard

2. Specific Hospital Development Plan

In respect to the above-mentioned $5 \sim 9$ Philippine health care services, while the Philippine standards are highly regarded, upon analysis of the findings of the field studies, the make-up, scale and form of buildings, etc. of the hospitals providing regional health care services was established as written below. Still, these suggested standards are substantial, considering that the present conditions in Philippine health care are not especially high by international standards.

1) Strengthened Policies

As the control of infectious disease is the first objective, the following measures are to be carried out.

o Improvement of diagnosis and treatment -

(the control of infectious disease through up-grading the hospital by developing appropriate examination, diagnosis and treatment)

 Construction of improvement of the drainage and water supply system -

> (to prevent the spread of contagion within and in the vicinity of the hospital)

o Installation of electrical equipment -

(installing a special circuit to ensure quality control of the vaccine, medicines and specimens, and the provision of electrical equipment for other diagnosis and treatment uses)

In addition to the above, the improvement and construction of accommodation to attract and keep physicians.

o The improvement and construction of living quarters -

2) Establishment of Scale

The study resulted in establishing the following as proposed values:

		Alternative Plan I	Alternative Plan II
0	Floor area/bed (not including personnel quarters)	35 m ²	30 m ²
0	Planned scale of treatment	Equivalent to 2,775 beds	same as on left
0	Planned bed capacity	3,175	2,900
o	Building area-hospital	109,000 m ²	95,000 m ²
	- personnel accommodation	21,200 m ²	15,000 m ²
	- Total	130,200 m ²	110,000 m ²

3) Energy conservation measures

With petroleum and other energy resources being in scant supply, the minimization of operating expenses and particularly the conservation of energy by public facilities is taken into consideration for planning purposes. Concretely speaking, plan for the adoption of one-story building with well ventilated (flow-through) rooms, making air conditioning unnecessary, and aside from a special electrical circuit for the refrigerators, electrical equipment using a minimum amount of energy through use of parallel electrical systems are to be implemented.

4) Development Outline - 19 Nospital Breakdown

Project Grade of Hospitals (Planned scale of each hospital)

() The figures within Parenthesis are for Plan II

I-8 MAINTENANCE PLAN

For the implementation of this hospital development project sufficient and adequate maintenance plan of buildings, and facilities is necessary to maintain the hospital function. In the field surveyed hospitals the actual conditions of buildings, facilities & medical equipments are in most cases insufficient and therefor it is strongly advisable to establish the maintenance system, the maintenance expert personnels and the maintenance method.

1. Maintenance Plan for Buildings and Facilities

For these maintenance work, daily, weekly, monthly and annual regular consolidations (ordinary overhaul, regular overhaul) and repairs are necessary for each building part (structural part, roof, fixture, exterior and interior finish etc.) electrical equipment part, airconditioning part, water work equipment part and medical equipment part.

:

Following are examples of building maintenance.

Structural Part

subsidance, crack neutralization, seismic proof

: every 5 years overhaul

annual check

Roof

leakage of water, crack : monthly overhaul
corrosion, gutter
clogging

Fixture

aluminum, steel doors : annual overhaul and windows

Interior and Exterior Finish : monthly $\sim 2/year$ overhaul

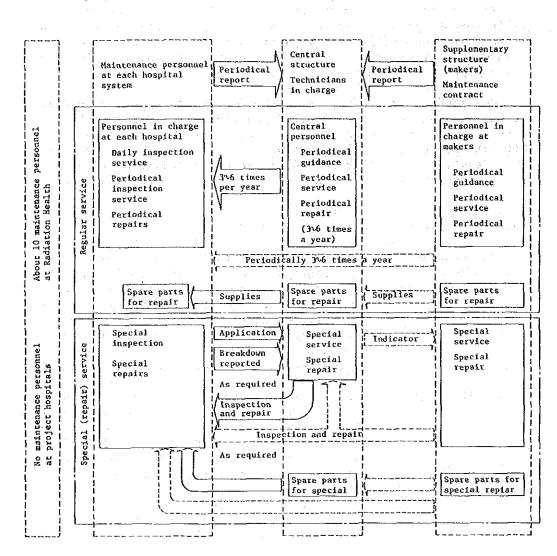

Maintenance System of buildings, facilities and medical equipments is shown in Page 1-33.

2. Maintenance Plan for Medical Equipment

The present survey reveraled that some of the facilities and medical equipment were left unrepaired due to the lack of spare parts, skills and technicians. Since the present improvement plan proposes upgrading on a large scale of facilities, particularly equipment and medical equipment, it may result in effective functioning of these equipments. Improvement in service organization is thus proposed as shown by the figure below in respect of training in handling method, allocation of maintenance personnel to each hospital, improvement in central structure, recruitment of manpower, maintenance contract with makers, securing of spare parts, etc.

With the provision of the maintenance system, the hospital functions to be upgraded under the existing and the present plans will be able to build up the basis for maintaining adequate functions.

Under DOH's current service system, there are no maintenance personnel except at two or three large scale hospitals, and there are only about ten technicians in Manila forming the central structure of the national service.

Proposed structure of the facilities and medical equipment maintenance service

* Number of personnel based on the standard proposed by the Japanese side.

I-9 CASE STUDY FOR THE CONSTRUCTION IMPLEMENTATION PLAN

The present development plan is formulated based on the Philippine Standard, analysis of the Philippine data and the results of the field survey, placing emphasis on the actual aspect of health and medical care services of the Philippines; it is, therefore, in many aspects below the Philippine Standard.

The study of the ratio to an the impact on capital expenditure, current expenditure and national expenditures shows favorable results. However, Development Plan is not so small for the expenditure of the Philippines, and total capital expenditure will amount to 952 million pesos (early August, 1979 at the moment of the additional field survey), for the implementation of the Hospital Development Project.

Following two alternative plans (I & II) are studied in this report as implementation plans.

ALTERNATIVE PLAN I :

Plan for implementing the entire contents of the Development Project at once (5 years term) and includes as a principle the constructions of the central function of the hospital, like central treatment, laboratory, OPD, ADM, Service section and additional wards, and also the supply and development of sufficient medical equipments, water and power facilities.

ALTERNATIVE PLAN II:

- The plan is made to reduce capital expenditure at the initial stage and includes the construction of minimized facilities at once (5 years term) and supplement the additional facilities continuously and as phase by phase investment. Following are contents of this plan.
- In principle construct new facilities of central treatment, service section and other necessary minimum facilities.

For other sections existing facilities are reused as much as possible after renovation.

- Cut-off the non-essential medical equipment and existing beds and other furniture are used again but supply lacking furnitures.
- Minimize the capacities of mechanical and electrical facilities.

water work facilities 50% electrical facilities 75% compared to the alternative plan I. The gaps between plan I & II shall be supplemented as soon as possible in future as a second phase project.

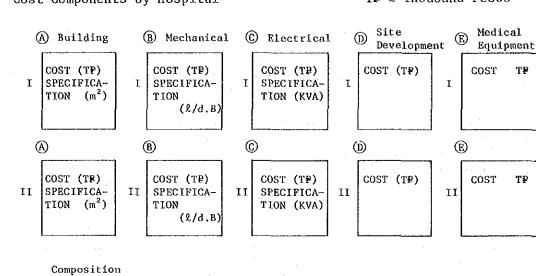

During these two phases, the shortage which will be caused by super-annuated facilities and medical equipments shall be supplemented continously due to the actual aspect of each hospital.

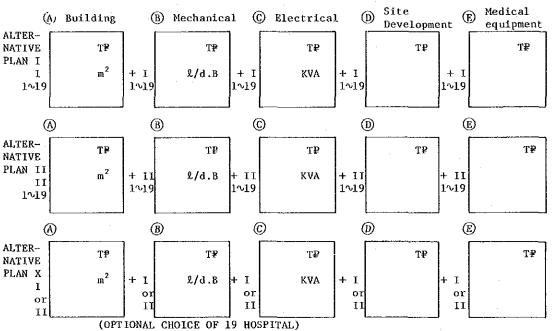

The cost estimate of this project is made on the following condition:

;

The cost for Alternative Plan I is total cost of the project, and the cost for Alternative Plan II is the cost of I phase of total project.

Above mentioned Alternative Plan I, II are combinations of following construction cost by hospital. And in addition to the Alternative Plan I & II the Plan X is possible with optional choice of each hospital by necessity and therefore wide range of selective possibilities are available as the capital outlay for the initial stage.

Construction Cost by Hospital

NOTE; INDIRECT COST LIKE CONTINGENCY etc: are included in each cost component in the proportion of each cost component.

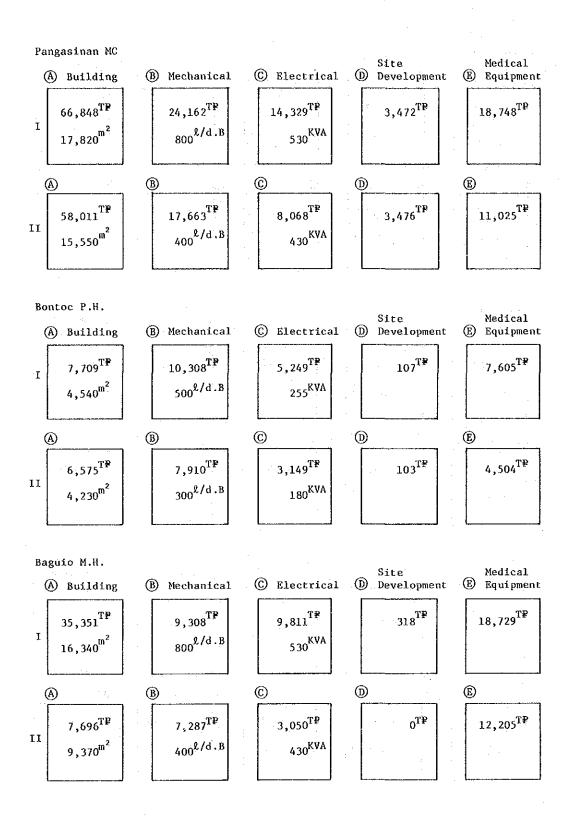

Cost Components by Hospital

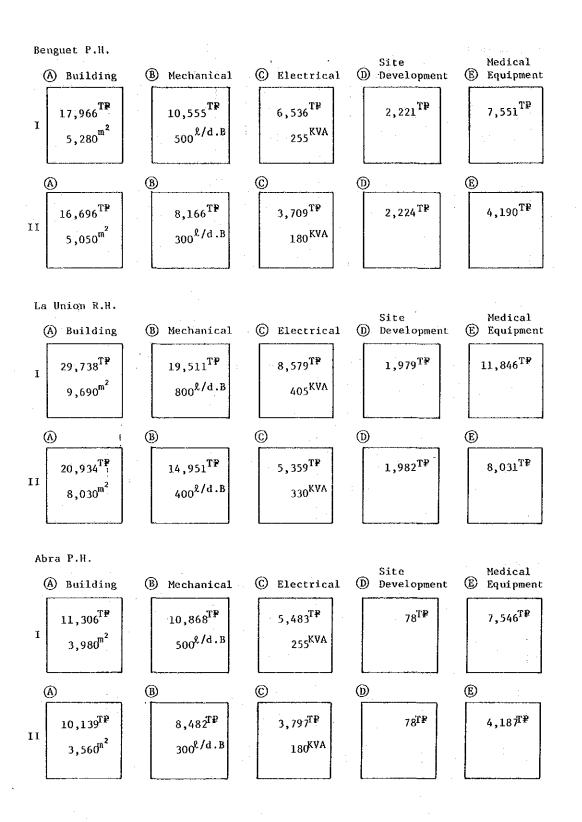

T₽ = Thousand Pesos

I-10 CONSTRUCTION COSTS, CURRENT EXPENDITURE AND PROJECT FUND OPERATIONS FOR PLAN I

1. Construction Costs

1) Conditions of Estimation

Estimation of construction costs was made for Plan I and Plan II on the conditions given below.

- Unit prices and prices of construction materials, machinery and equipment, medical equipment and labor are those as of August 1, 1979.
- (2) In so far as possible, construction materials, machinery and equipment, and medical equipment are to be obtained in the Philippines.
- (3) With regard to materials, machinery and equipment to be imported, transport cost, import duties, import procedure expenses and other necessary expenses were included in the estimates.
- (4) Miscellaneous expenses
 - o Survey cost
- : for the survey of site, foundation, water quality, source of water supply, etc.

o Design and supervision

of hospital management, medica equipment, etc.	o Consultant fees	: consultation fees in re	spect
equipment, etc.		of hospital management,	medical
		equipment, etc.	

o Management expenses: project management.

o Local revise of construction costs

o Reserve funds : Physical contingency 10%, price contingency 30%.

(5) Construction costs of new building for Don Mariano Marcos Memorial and Major F. Marcos Veteran Memorial Hospitlas are excluded, though the cost of medical equipment is included.

Construction costs, equipment and fixtures costs for 19 hospitals are given below.

				Currenci	es
	Section	Table value	Local	Foreign	Indirect Foreign
	Construction	222	133	0	89
es	Electrical work	139	57	65	17
lití.	Mechanical work	82	33	43	6
Facili	Site development work	11	, 11 7 ve 1 − 7 ve	0	4
• • •	Sub-total	454	230	108	116
Mee	lical equipment	112	9	95	8
	sign and consultant es, etc.	386	136	193	57
(1	Total JS\$ Equivalent)	952 (126.93)	375 (50.00)	396 (52.80)	181 (24.13)

(in Million Pesos)

The total cost of the Project (PLAN I) is estimated at 952 million pesos (US\$126.93 million), including the foreign and the indirect foreign currency component of 577 million pesos (US\$76.93 million).

.

Annual allocation of construction costs based on annual construction schedule for 19 hospitals is given below.

(in Million Pesos)

1-49

*1 Price increase is estimated based on the results of additional survey in Angust, 1979. 15% increase in local and indirect foreign currenties during the term of March-August-1979 about following items

Increase Rate	22	8%	32	15%
Rate of Currencies (L-702 F-02 I-302)	(L-41% F-53% I-6%)	(L-53Z F-47Z I-0Z)	(L-15% F-83% I-2%)	<pre>(L-70% F-0% I-30%)</pre>
<u>Ltem</u> Construction	Electrical Work	Mechanical Work	Medical Equipment	Site Development

Price Contingency is estimated uniformly 30% (rough target year is 3rd year)

Note: o lat year's cost is composed only by survey costs + 1/3 × (design-, consultant-, supervision-, and administration fee)

o From the costs of each hospital 40% is allocated in the beginning year and 60 in the ending year.

а,

2. Current Expenditure (income and expenditure)

Under the present improvement plan, the first group will commence operation in the third year and it will be after the seventh year when all hospitals are ready for operation with the improvement. The scale of current expenses at that point is expected to be in the region of 117 million peso (excluding Cagayan Mental Hospital). The table below gives income and expenditure of each hospital.

(in	1000	pesos)
