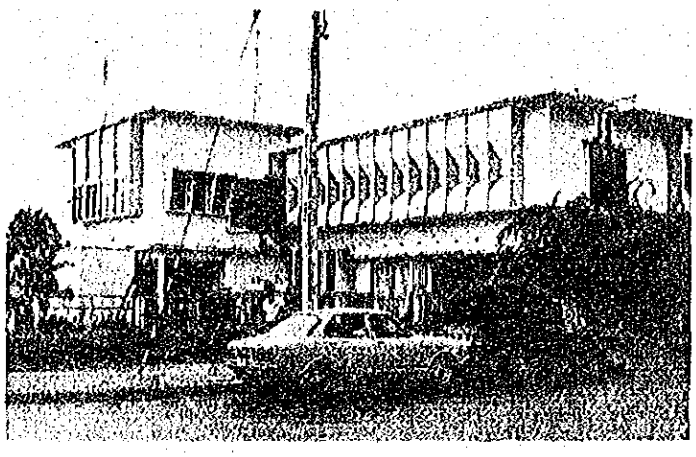
CHAPTER 4. THUNGMAHAMEK TELEPHONE EXCHANGE (MM)

4.1 Service Area

This telephone exchange is in the suburbs of Bangkok City where rapid progress in the construction of residences has been made recently.

The exchange area will be largely scaled down with the cut-over of service areas and service-in of the TC Exchange, as shown in Fig. 4.4.1.



View of MM Exchange Office.

(1) Cut-over to TC Exchange

The area on the west side of the Saint Louis Soi 3.

(2) Cut-over to SW Exchange

The area on the north side of the Sathorn Road.

(3) Cut-over to PL Exchange

The area on the north side of the Rama 4 Road.

With the foregoing cut-overs, the service area of this exchange will occupy about 1,220 hectares.

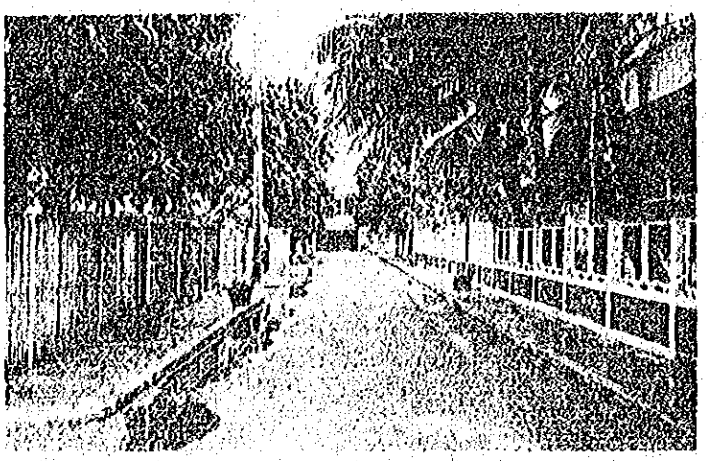
4.2 Demand Forecast and Outline of Area

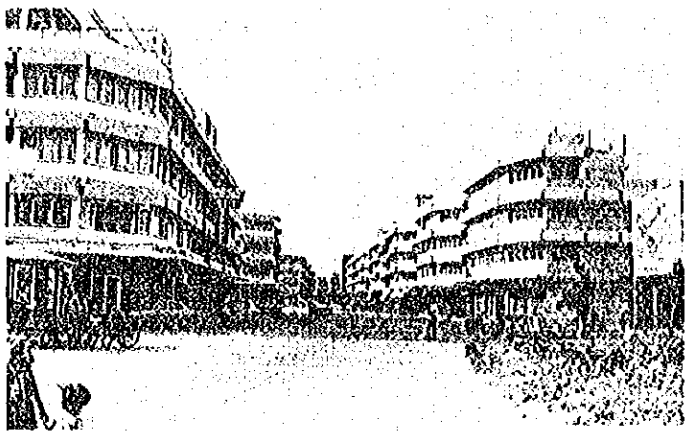
The Thungmahamek area has developed as the residential district of Bangkok and there are some places where farmland or marshes have been made into residential land. With the centralization of population in Bangkok from the outlying regions, the construction of residences in the suburbs has taken a very rapid tempo. The special features of this area are as follows:

(1) Although there is no rapid development of embassies, schools and high-class residential districts along the Sathorn Road, high-class apartment houses are under construction in some parts.

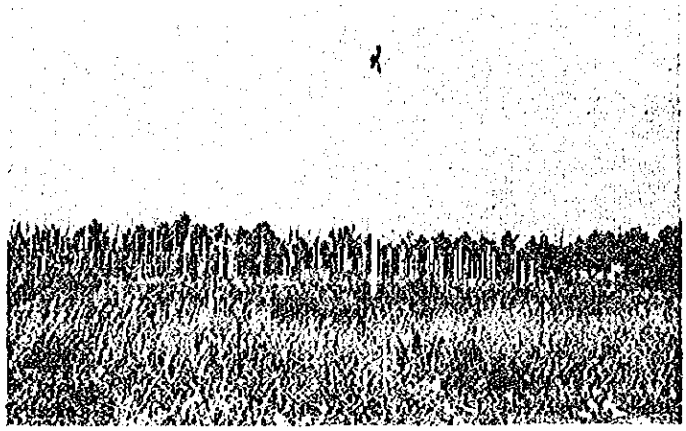


High-class residential district

(2) There is a great deal of farmland and vacant lots remaining in the southern part of the area and the building of residences is continually being made. A large housing area will be constructed in the vacant lots.



New housing area



New housing area under construction on farmland.

(3) The Sathupradit Road leading to the pier to be constructed for the No. 2 Bangkok Harbor will be a trunk road in the future, and it is believed that a large demand for telephones will be generated along this road.

In view of the foregoing points, there will be a large inflow of population in this area in line with the construction of residences and there will be an increase in social activity. Consequently, a large numerical value was acquired for the demand growth ratio in comparison with other exchanges.

Table 4.4.1 Demand Forecast

Area \ Year	1976	1978	1980	1982	1985	1987
Commercial area	4,232	5,248	6,297	7,305	8,760	9,720
Residential area	8,572	10,642	12,700	14,813	17,920	19,890
Special area (including pre-construction area)	1,936	2,410	2,733	3,282	4,120	4,690
Total	14,750	18,300	21,800	25,400	30,800	34,300
Demand Growth Ratio	100.0	129.0	147.7	172.7	208.8	232.5

DEMAND FORECAST OF MM EX.SERVICE AREA

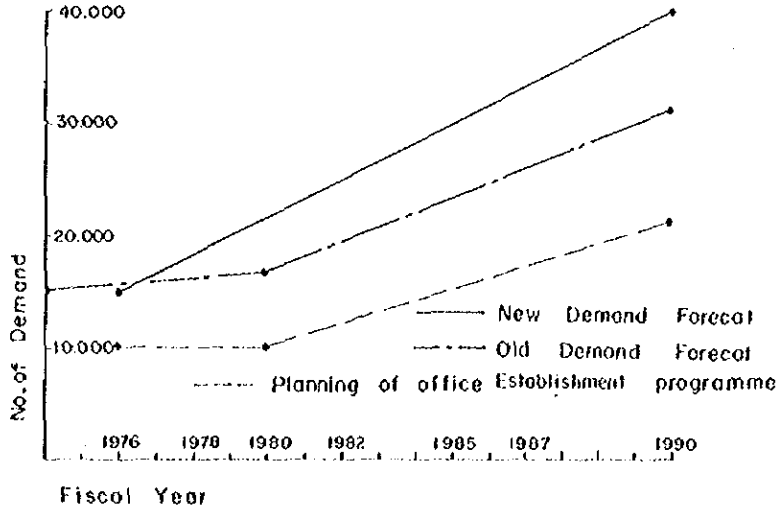


Fig. 4.4.4

4.3 Primary Cable Network Design

4.3.1 Objective Demand for Design

25,400 (in 1982) of Primary cable
34,300 (in 1987) of Secondary cable

4.3.2 Entrance Cable Pairs

The number of pairs of the entrance cables for this exchange is 18,600 pairs and 6,000 pairs will be newly installed.

Existing	3,000 pairs - 4 ASP	1	cable(s)
"	2,100 " - 4 ASP	2	"
"	1,800 " - 4 ASP	5	"
"	1,200 " - 4 ASP	2	"
New Installation	3,000 pairs - 4 ASP	2	"
Total:		12 cables	24,600 pairs

Out of the foregoing, the distributed number of cable pairs under this design work is 23,150 pairs.

4.3.3 Installation of New Cables for Each Direction

(1) Direction of Nang Linchi Road

Although there still are many vacant lots onwards from the intersection of the Chan Road, new conduits will be constructed to meet the future demand growth. The installation of 1,800 pairs of new cables will satisfy the demand in 1982.

(2) Direction of New Chan Road

This road has been completed by extension of the existing Chan Road to connect the Nang Linchi Road and is most suitable as a cable route to the Chan Road. Telephone demand is being generated along the new road. New cables of 1,200 pairs will be installed to meet the demand in 1982.

(3) Direction of Sathupradit Road

With the service-in of the TC Exchange, this road will be the boundary of the service area. There are new conduits in the road and new demands are being generated along the road. To meet such demand in 1982, 1,800 pairs will be placed.

(4) Direction of Soi Rong Phayaban

For the road which is the boundary between the TC Exchange and MM Exchange, 600 pairs will be placed in order to cut-over the secondary cables distributed from the TC Exchange side.

(5) Direction of Rama 4 Road

In the direction from the Rama 4 Road to the Sunthornkosa Road, 3,000 pairs will be placed to meet the demand in 1982.

4.3.4 Selection of Trough, Direct Buried and Aerial Routes

(1) This route is one is which underground conduits was desired but due to the narrowness of the road and heavy volume of traffic which make the new construction of underground conduits very difficult, the direct buried system was adopted for 900 pairs of Stalpeth armoured cable.

(2) Aerial System

The aerial system was adopted for primary cables at 13 places but since they are nearly all of 300 pairs or less, there is no problem.

4.3.5 Line Loss and D.C. Resistance

Although the existing facilities of this exchange have been designed for 9 dB, it will be 7 dB in this design work.

There are some places in the existing cross-connecting cabinet areas which exceed 7 dB and although areas where new cables will be installed have been designed to 7 dB or less as much as possible, the following areas exceeded 7 dB. However, since the demand in these areas 10 years hence will be within 5% of the total demand of 34,300, the TOT has agreed to this matter.

(1) Direction of Rama 4 Road

Maximum Line Loss	7.73 dB
Maximum D.C. Resistance	1,083 Ω
Demand	390

(2) Direction of Sathupradit Road

Maximum Line Loss	7.54 dB
Maximum D.C. Resistance	1,085 Ω
Demand	590

4.3.6 Plan for Non-Removal of Cables

The 02 cable of 1,800 - 4 ASP between the MH #2 and MH #52 will not be removed and will be kept in reserve for the future demand growth in the Vorarat commercial district and surrounding areas.

4.3.7 Cables to be Removed

Table 4.4.2

Section	No. of Pairs	Span Length	Reason for Removal
MH #1 - MH #47	400 - 4 ASP	716.0 m.	Not required due to cut-over to TC Exch.
MH #29 - MH #73	600 - 4 ASP	40.0	"
MH #46 - MH #47	300 - 4 ASP	53.9	"
MH #47 - MH #50	200 - 4 ASP	579.9	"
MH #25 - MH #26	150 - 4 ASP	122.2	"
MH #58 - MH #69	300 - 4 ASP	209.8	Change to big cable.
MH #27 - MH #28	100 - 4 ASP	189.9	"
MH #58 - MH #69	400 - 4 ASP	209.8	"
MH #4 - MH #6	100 - 4 ASP	337.5	"
MH #29 - MH #73	600 - 4 PASP	40.0	Not required due to cut-over.
Total		2,499.0	

4.4 Underground Conduit Design

4.4.1 New Main Conduit Route on Nang Linchi Road

(1) The number of ducts will be 4 and the manhole will be the "A-1" type.

(2) This route will be an extension of the existing underground facilities placed on the Nang Linchi Road.

(3) Position of conduit in the road will be on the same side as the existing underground facilities. Furthermore, for sections where there is no distinction between sidewalk and carriage way, the distance from the road center line to the position in the road was inscribed on the design drawing.

Position of conduit in Nang Linchi Road.

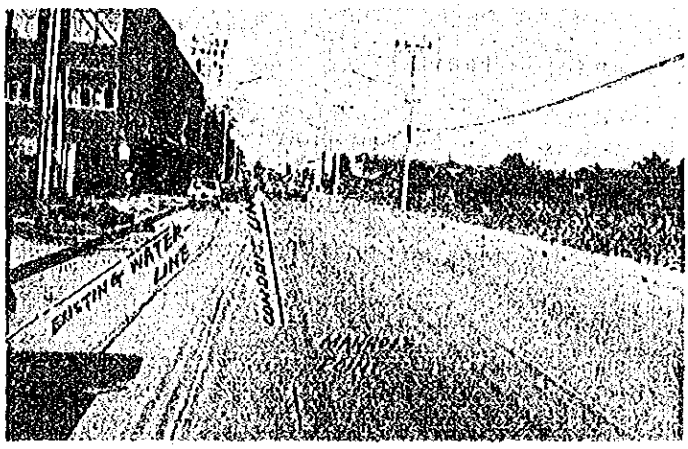
4.4.2 New Main Conduit Route on Chan Road

(1) The connection of this route with the existing conduit on the Nang Linchi Road will be made by construction of a new manhole on the existing route. The manhole will be the "J-3" type, and standard drawing No. 1082 will be applied.

(2) The number of ducts for the new route will be 4, and the manholes will be the "A-1" type.

(3) Due to the existence of underground hindrances and in consideration of the connection with the existing route of the TC Exchange, the position of the conduit will be the same as in the Chan Road of the TC Exchange area.

(4) In the selection of this new main route, since the Chan Road is of high-grade concrete pavement, a round about route on the Soi Chan was considered but the pavement is also of concrete and furthermore, the conduit length and cable length would be longer. Therefore, for economy reasons, the Chan Road route was selected.



Position of conduit in Chan Road.

4.4.3 New Main Conduit Route on Sunthon Kosa Road

(1) The original instruction from the TOT was for this route to be a branch route with 3" ducts. However, the route will have to cross under the railway tracks and since the construction method, soil covering, etc. would make the use of pulling box unsuitable, discussions were held with the TOT and the design was changed to construction of a new manhole and the use of 4" cuts for the conduit route.

(2) Method of the railway undercross will not be by excavation but by underground Piercing Method, and G.I.P. of 6 meter length will be used as ducts.

(3) The route to be extended in the future from the MH #97 will be by the placing of cap pipes.

4.5 Gas Pressurization System Design

4.5.1 Design of Inside Facilities

Since two new cables are to be lead-in in this design, gas distribution and alarm facilities will be additionally installed.

A 5,000 type air dryer is already installed, and its capacity is sufficient.

4.5.2 Design of Outside Facilities

(1) Attachment of pressure guard

The attachment of pressure guards will be inside the cross-connecting cabinets, in principle, but the pressure guards for the following cables will be inside the manholes.

02 cable -- MH #52 12 cable -- MH #74
08 cable -- MH #68

(2) Alarm circuits

The pair numbers of the alarm circuits will be the last pair numbers at each riser point but since the alarm circuits for the following pressure guards will use the pair numbers for other cables, attention must be paid.

A. As to the pressure guard on 07 cable in MH #29 on Soi Suanphlu, this will be attached inside the nearby cross-connecting cabinet #31 to facilitate measurement by leading-in the cable with a copper tube and of the 05 : 1,451 - 1,700 cable terminated in cross-connecting cabinet #31, the 1,699 pair number will be used for the alarm circuit.

B. The 12 cable of pulling box #35 on At Narong Road will be lead-in by copper tube to the cabinet #053 and of the 07 : 201 - 500 cable terminated in this cabinet, the 500 pair number will be used for the alarm circuit.

(3) Attachment of by-pass valve

A by-pass valve will be attached to the 02 cable inside the MH #2 to enable separate measurement.

4.6 Secondary Cable Network Design

4.6.1 Service Area where Direct Distribution will be Changed to System of Cabinet Distribution

The existing direct distribution has 12 distribution blocks (100 pair units) in the A to O groups. Excluding the E & F groups (Civil Aviation), all the blocks will be installed with cross-connecting cabinets. Consequently, 10 new cross-connecting cabinets will be installed in this area.

4.6.2 Cross-Connecting Cabinets with Secondary Cables Held in Reserve

There are many vacant lots in the service area of this exchange and it would be more economical not to suspend aerial cables until the time when telephone demand will be generated. Therefore, the secondary cables will be held in reserve in the following cross-connecting cabinets.

(1) Cross-connecting cabinet #049

There presently are markets and commercial districts in this area but for the forecasted increase in demand, 100 pairs will be held in reserve.

(2) Cross-connecting cabinet #051

Although there are many vacant lots in this area, the construction of residences is projected in the future and 100 pairs will be reserved.

(3) Cross-connecting cabinet #095

This area is now a residential district but there are vacant lots in some parts and 100 pairs will be held in reserve.

(4) Cross-connecting cabinet #110

Buildings are under construction at present in this area but upon consultation with the TOT, the lead-in of secondary cables will not be made and 200 pairs will be held in reserve in the cabinet.

(5) Cross-connecting cabinet #118

There presently are wide vacant spaces and since the construction of residences for official use is anticipated in the future, 200 pairs will be reserved in this cabinet.

4.6.3 Attention to be Paid in Aerial Cabling Work

Aerial cables for army use are suspended in the Jusmag area of the Sathorn Road, and due attention must be paid in the construction work in this area.

4.6.4 Desk Work Design

There is a project for the construction of residences in the area of the cross-connecting cabinet #087 and the cable design was executed from such residence construction design drawings.

Furthermore, a part of the construction work of Nakhon Thai Village is not completed in the area of cross-connecting cabinet #091 and the design was made from the residence construction design drawings for that area.

4.7 Design of Relevant Works

The design for the Vorarat Shopping Center has already been completed by the TOT and is awaiting commencement of construction work. Consequently, the design for this part in this design work is the design made by the TOT.

Sketch of completed Vorarat Shopping Center.

4.8 Construction Period

Since this exchange will utilize the cables which will become vacant after service-in of the TC Exchange for additional installation of secondary cables, the construction work will be after the service-in of the TC Exchange.

4.9 Amount of Works and List of Materials

Refer to the annexed Table 4.4.3 Amount of Works and Tables 4.4.4 to 4.4.13 List of Materials.

CHAPTER 5. TROKCHAN TELEPHONE EXCHANGE (TC)

5.1 Service Area

This exchange office will be located in the present MM exchange office service area and will start as a new branch office. The boundaries of the Trokchan Exchange service area, as shown in Fig. 4.5.1, are as follows:

(1) Cut-Over from MM Exchange

(a) Areas on west side of Shaint Luis Soi 3, Sathupradit Road and Soi Rangpaya Ban.

(b) Area on south side of Sathorn Road.

(2) Cut-Over from SW Exchange

Cross-connecting cabinets Nos. 7, 11, 30, 54 and 87.

(3) Cut-Over from TK Exchange

Cross-connecting cabinets Nos. 2 and 17.

With the above cut-over, the service area will cover approx. 650 ha.

5.2 Demand Forecast and Outline of Area

The Exchange area is in the oldest part of the city and comprises the area along the Charoen Krung Road and the fields in the undeveloped southern part. The shops alongside the Charoen Krung Road are very old with a history of about 80 years and this road is the most traffic congested in the city of Bangkok. On the other hand, there are fields and undeveloped areas in the southern part and it is believed that any development in these areas hereafter will bring about a big change in the TC service area. The special features of the Trokchan service area are as follows:

(1) The districts along the Charoen Krung Road and Trokchan Road are densely populated and very active in commercial operations with a heavy demand for telephone service. The rebuilding into high-rise buildings in the future can be envisaged.

(2) A special feature of land development in Bangkok is that when a road is constructed, houses and shops are immediately constructed on both sides of the road. Consequently, it can be assumed that houses shortly will be built in the area surrounding the recently completed Sathupradit Road, generating a large demand for telephone service.

Now Sathupradit Road

(3) It has the largest number of undeveloped empty lots as compared with other exchange areas and should have a big population growth in the future.

In view of the foregoing, it is envisaged that the Trokchan exchange will have a high demand growth ratio.

Table 4.5.1 Demand Forecast

Area \ Year	1976	1978	1980	1982	1985	1987
Commercial area	4,396	5,275	6,330	7,343	8,812	9,693
Residential area	7,254	8,705	10,446	12,117	14,540	15,994
Special area	850	1,020	1,224	1,540	2,648	3,313
Total	12,500	15,000	18,000	21,000	26,000	29,000
Demand growth ratio	100	120	144	168	208	232

DEMAND FORECAST OF TC EX. SERVICE AREA

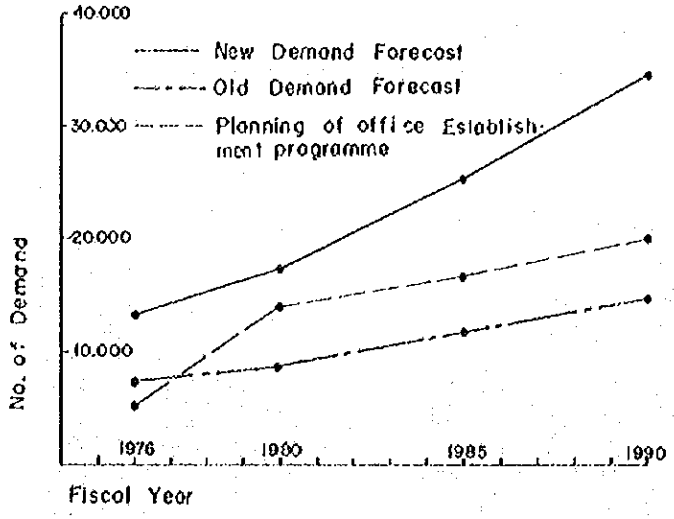

Fig. 4.5.4

5.3 Primary Cable Network Design

5.3.1 Objective Demand for Design

18,000 (in 1980) of Primary cable
26,000 (in 1985) of Secondary cable

5.3.2 Entrance Cable Pairs

The number of entrance cable pairs will be 17,400 pairs, as follows:

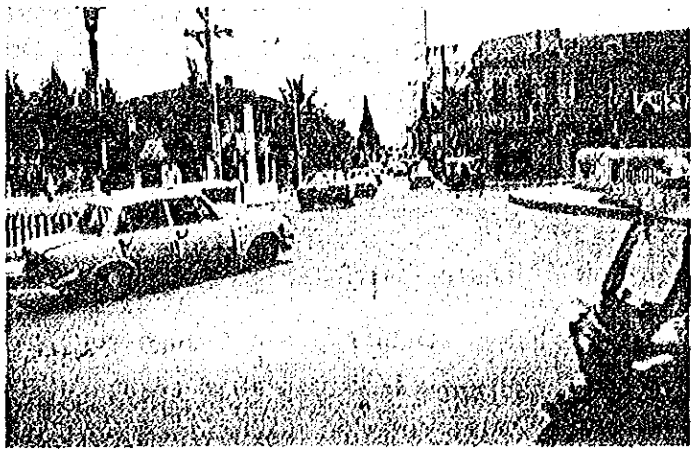
New installation	3,600 pairs	-	32 ASP	2	cable(s)
"	3,000 "	-	4 ASP	2	"
"	2,400 "	-	4 ASP	1	"
"	1,800 "	-	4 ASP	1	"
Total				6	" 17,400 pairs

Of the foregoing, the number of cable pairs for distribution in this design is 15,500 pairs.

5.3.3 Installation of New Cables for Each Direction

(1) Direction of Sathorn Road

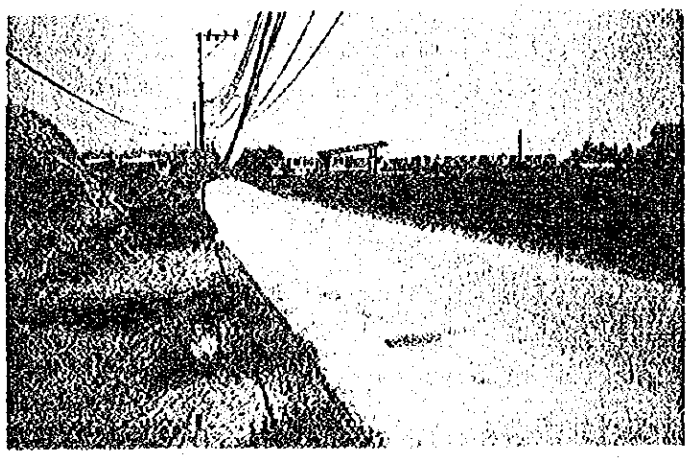
Of the SW area, in order that a part of area along the Sathorn Road can be cut-over to the Trokchan Exchange in this construction design, the laying of 1,200 pairs via the Soi Rongphayaban was designed.



View of Sathorn Road from Saint Louis Road.

(2) Direction of Sathupradit Road

It is envisaged that this area will be developed rapidly with the recent construction of roads and with the connection with the loop road, construction of harbor, etc. but there presently are many fields and empty lots in this area. In order to cope with the rapid growth in demand, the design will be for the laying of 1,800 cable pairs.



New residences in vicinity of Sathupradit Road.

(3) Direction of Soi Phramae Mari and Phaigoen Road

There is a rapid change of the fields into residential districts in this direction and a large demand is anticipated in the future but since the demand for the undeveloped area will be coped with at the time of generating of demand, this design is for the laying of 2,400 cable pairs.

(4) Direction of Charoenkrung Road

This route has a conduit and a trough route, and the cross-connecting cabinets #030 and #031 to be cut-over from the existing cross-connecting cabinets of SW Exchange are all distributed by trough cables.

Consequently, in this design work, the cross-connecting cabinet #025 to be newly installed will be distributed from MI #17 while the other cross-connecting cabinets will be distributed by utilizing the existing troughs.

5.3.4 Selection of Trough, Direct Buried and Aerial Cable Routes

(1) Direction of Sathorn Road

Since there are existing troughs in which secondary cables are presently being laid for distribution, the design is for utilizing these troughs for the laying of primary cables to the cross-connecting cabinets along the Sathorn Road.

(2) Direction of Charoenkrung Road

Since the primary cables of the existing cross-connecting cabinets along the Charoenkrung Road are laid in the troughs, the cables to be additionally laid cannot be placed in the conduits without digging up the road to connect each cross-connecting cabinet with the manholes. However, digging up the road is difficult so the design was made to lay such cables in the troughs.

(3) Aerial Cable Route

There are 8 places where the primary cables are designed for the aerial cabling system and since each of the cables are of 300 pairs or less, there is no problem.

5.3.5 Line Loss and D.C. Resistance

The exchange lines have all been designed to be within the allowable values as follows:

Maximum line loss	5.5 dB
Maximum D.C. resistance	900 Ω

5.3.6 Removal of Cables

Table 4.5.2

Section	No. of Pairs	Span Length	Reasons for Removal
MH #58 - MH #69	150 - 4 ASP	209.9 m.	Unification of small number of pairs due to no vacant ducts.
"	100 - 4 ASP	209.9	
"	50 - 4 ASP	209.9	
MH #3 - MH #58	1,800 - 4 ASP	122.7	Due to difficulty of cut-over in MH #58.
MH #58 - MH #5	200 - 4 ASP	379.3	For raising number of pairs due to lack of vacant duct.
Sathorn Road Trough Cable	600 - 5 LTJ	994.0	Trough cables, reverse distribution due to cut-over.
	300 - 5 LTJ	520.0	
Total		2,645.7	

5.4 *Underground Conduit Design*

5.4.1 New Main Conduit Route on Soi Rang Mukao Road

(1) Hardwares in the exchange building and conduit 36-4" from the exchange building to MH #1 will be designed by TOT. (Design drawings already received from TOT).

(2) Connection with the existing conduit route will be made by the new construction of a manhole in the existing conduit section on Chan Road. This new manhole will be of the "V-1" type and standard drawing No. 1052 will be applied.

(3) There will be 24 ducts and the manhole will be the "A-3" type. However, the exchange manhole will be the "V-2C" type.

(4) Position of conduit on the road will be on the exchange office side. The exchange MH #1 will be outside the exchange office compound according to the wishes of the TOT.

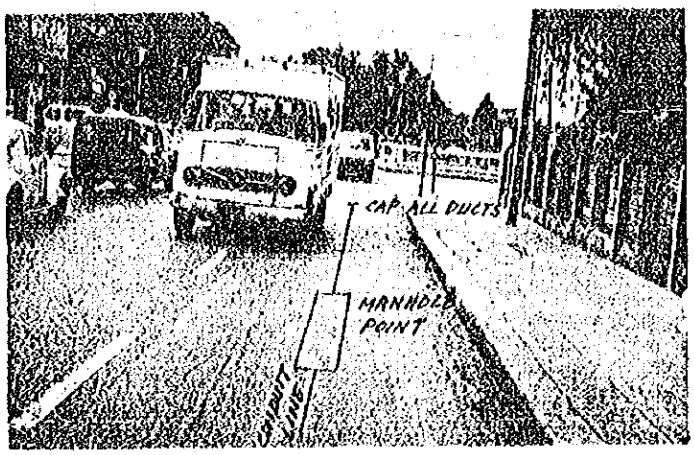
5.4.2 Main Conduit Route on Soi Rong Phaya Ban Road

(1) The underground facilities will be extended from the existing MH #52. Furthermore, a window will be attached to the existing manhole.

(2) Since this is a junction cable route to the SW Exchange, the conduit will be extended to near the Sathorn Road and fixed with cap pipes so that the conduit can be connected when the point of crossing the Sathorn waterway is clarified in the future.

(3) There will be 8 ducts and the manhole will be the "A-1" type.

(4) Position of the conduit will be on the carriage way of the road and on the opposite side of the position of the buried water supply pipe.

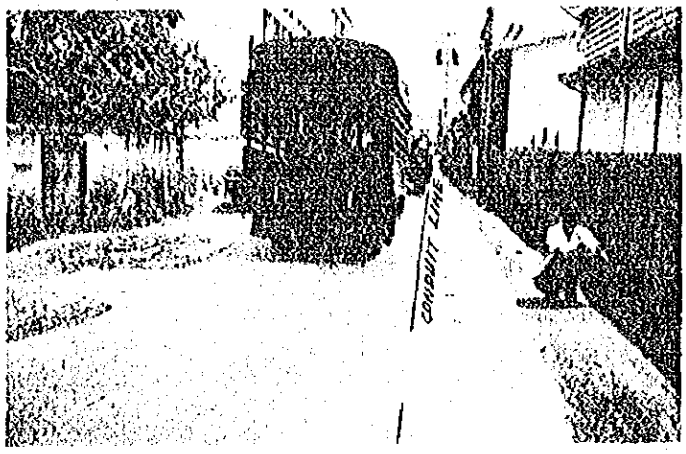


Position of conduit on Soi Rong Phaya Ban Road.

5.4.3 New Main Conduit Route on Soi Phra Mea Mari Road

(1) There will be 4 ducts and the manhole will be the "A-1" type.

(2) Since the road shape on one side between MH #24 and MH #25 is not clear and the road may be widened, the position of the conduit was made on the side where the road shape is clear.

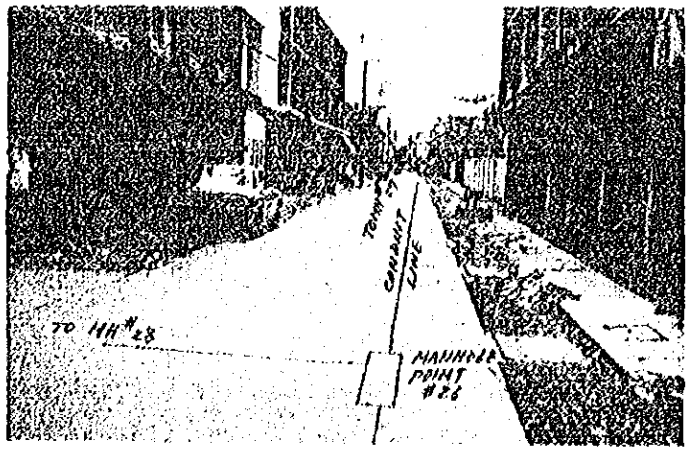


Position of conduit on Soi Phra Mea Mari Road.

5.4.4 New Main Conduit Route on Wat Phaigoon Road and Soi Phonthong Road

(1) In respect to the future route in the east direction from MH #25, 4.6 meters of cap pipes (4 pipes of 4") will be placed. The MH #25 will be the "T" type and standard drawing No. 1077 will be applied.

(2) There will be 4 ducts.



Position of conduit on Wat Phaigoon Road.

5.5 Gas Pressurization System Design

5.5.1 Design of Inside Facilities

(1) Since this is a new exchange, the following gas pressurization facilities will be newly installed.

Air dryer (Type 1,500)
Meter panel
Alarm panel

(2) The installation of the air dryer and the meter panel will be in the Air-Conditioning Room on the 1st floor.

(3) The alarm panel will be installed in the Test Room to facilitate gas pressure supervision.

5.5.2 Design of Outside Facilities

(1) Installation of Pressure Guards

Pressure guards will be installed in the cross-connecting cabinet at the end of each cable in principle to facilitate gas pressure maintenance but since the end of the 05 cable is by aerial distribution, the pressure guard will be installed inside MH #62.

(2) Test Valves

Test valves will be attached to the jointing point or stub cables inside each cross-connecting cabinet in principle but such valves to be attached to the cables inside the manholes or pulling boxes are as follows:

MH #8 & MH #13	--	04 cable
PB #11	--	01 cable
PB #18	--	03 cable

(3) Attachment of by-pass valve

Since the 01 cable of 3,600 pairs will be branched into two cables of 1,800 pairs each in the MH #3, a by-pass valve will be attached for the cut and divide test.

5.6 Secondary Cable Network Design

5.6.1 Service Area where Direct Distribution will be changed to System of Cabinet Distribution

Areas of cross-connecting cabinets #016 and #017.

5.6.2 Cross-Connecting Cabinets with Reservation of Secondary Cables

This exchange office is in an area where rapid demand growth is anticipated in the future but presently there are only fields or vacant lots. In this design work, the installation of new cross-connecting cabinets or the division of existing blocks will not be made and until the new cabinets are installed, the primary cables will be held in reserve in the manholes or the secondary cables held in reserve in the cross-connecting cabinets.

(1) Cross-connecting Cabinet #044

The Saint Louis Hospital is now under construction and 200 pairs for the hospital will be held in reserve in this cabinet.

(2) Cross-connecting Cabinet #001

Since construction of the houses in the residential district has just been started, the 1 - 100 pairs, out of the 02 : 1-200 cable, for distribution to this district will be held in reserve at the #0001 terminal pole.

5.7 Design of Relevant Works

The design for the service areas to be cut-over from the SW and TK Exchanges have already been completed by the TOT. Consequently, the design work for such areas have been executed on the presumption that the construction works have already been completed, based on the TOT design.

5.8 Service Area Cut-Over Design

Refer to Table 4.5.3.

5.8.1 Cut-Over Method

With reference to Table 4.5.3, since this exchange will service-in from the MM Exchange, the method of cut-over will be as follows:

(1) At MH #3, loop jumpering via the new exchange by using the existing cable 02 and the new cables 01 and 03.

(2) Existing cable 08 will be bridge jointed with the new cable 08 at the MH #3.

Through the above (1) and (2) procedures, the circuit connection of 3,600 pairs will be made between the old and new exchanges.

By doing so, it will be possible to connect the subscribers on the west side of the MM Exchange to that exchange by loop jumpering at the TC Exchange.

(3) New cable 05 and existing cable 01 will be bridge jointed in MH #58 and circuit connection will be made between the new and old exchanges.

(4) Existing cable in the direction of Phaingoen Road will be cut over to the new cable 02 and the service area cut-over by loop jumpering at the new exchange.

(5) Existing cable in the direction of Sathupradit Road will be cut over by loop jumpering at the new exchange.

(6) Existing cable on the Soi Saint Louis and Soi Rongphayaban will be cut-over to the new exchange by loop jumpering at the old exchange.

(7) In the direction of Sathorn Road, the existing cable 02 and the new cable 03 will be bridge jointed at the MH #52 and cut-over to the new exchange.

(8) After service-in of the new exchange, each bridge jointing point will be made to standard jointing.

5.8.2 Attention to be Paid in Cut-Over Work

(1) With the service-in of the TC Exchange, the secondary cables distributed to the MM Exchange from the cross-connecting cabinet of the TC Exchange will be cut at the Soi Rongpayaban and Soi Saint Louis which will become the exchange boundaries between the TC Exchange and MM Exchange. Therefore, as shown in the cut-over drawings, cross-connecting cabinets #093, #094, #096, #097 and #098 must be worked on simultaneously in accordance with the MM Exchange design drawing for cut-over of the MM Exchange secondary cables.

(2) Cut-over of the direct buried cable alongside cross-connecting cabinet #051 will be made by putting the cable into the pulling box alongside the cabinet.

5.8.3 Exchange Line Loss Allocation Value and D.C. Resistance Limited Value during Cut-Over Work Period

As shown in the diagram below, the line loss is 10 dB or less and the D.C. resistance is 1,500 Ω or less in line with this cut-over.

5.9 Construction Period

Although there is no particular restriction in respect to the time for starting construction of this exchange building, the completion of the construction work as early as possible is desired in order to speed up the extension of the nearby exchanges.

5.10 Amount of Works and List of Materials

Refer to the annexed Table 4.5.4 Amount of Works and Tables 4.5.5 to 4.5.14 List of Materials.
