Chapter 6 Construction Plan

6-1 Construction Plan

6-1-1 Mulberry Field Reclamation

a) Outline

The following farms will be created in the proposed site of Sericulture Centre at

	Mulberry Field	Grassland	Total
Farm No.1	2.96	0.98	3.94
Farm No.2	2.02	0.25	2.27
Total	4.98	1.23	6.21

Of the total farm area shown above, 3 ha mulberry field for silkworm egg production should be reclaimed at an early stage. The reclamation work can be carried out in the wet season because the soil in the proposed farm site promises good drainage. However, for full coverage of the whole reclamation area which calls for compacting, it should preferably be conducted in the dry season.

The following new field will be created in the Sub-Centre site.

	Mulberry Field	Grassland	Total
New Field	17.8	0	17.8

In the Sub-Centre area, too, reclamation of 3.5 ha mulberry field area should be completed at an early state. The reclamation work in this area should be planned with account taken of the following conditions.

- (1) Use of large machinery is difficult because of the absence of a suitable transport road.

- (2) The 1.5 km long connecting road between the national highway and New Field is in a poor condition. Passage of vehicles on this road is rejected even by a small rainfall. Further, there are no cross-rive bridges constructed on this road. The reclamation work should therefore be preceded by the improvement of the connecting road and the construction of temporary bridges.
- (3) The Sub-Centre site is poorly conditioned for drainage because it is covered with heavy clay soil which makes the groundwater level very high even in the dry season (June ~ September). Hence, the whole site is swampy throughout the year.
- (4) Virtually now earthwork is required because the site is flat and not dispersed.

On account of these reasons, reclamation work in the wet season should be avoided as far as practicable. Further, it is necessary to make prior arrangements and consultation with the pertinent administrative authority to secure its cooperation in the execution of the reclamation work.

b) Sequence and Method of Reclamation Work

Sericulture Centre Area:

- (1) Trees and weeds should be removed.
- (2) Reference piles for farm reclamation and road construction should be driven on lines shown in the drawings according to the base lines and bench marks.
- (3) Finishing stakes should be provided from the reference piles. The initial year reclamation work should cover mulberry fields A and B of Farm No.2 and mulberry field A of Farm No.2.
- (4) An 11-ton class bulldozer should be introduced for uprooting and removal of gravels with the rake.

- (5) Excavated gravels should be transported to the site shown in the drawing since they will be used for masonry of the sheathing work of the farm and road. The gravels should be transported chiefly by manual labour without planning secondary transportation. However, consideration should be given to the use of the bulldozer or a horse carriage because the volume of gravels will be considerably large. The gravels are expected to have a maximum diameter of 100 mm but are soft, so that they should be crushed before transportation.
- (6) Gravels with a diameter of less than 5 cm will be used for road pavement, and those with a diameter of 10 ~ 20 cm for building foundation work. Gravels with these two diameter ranges should therefore be carried to the previously designated places.
- (7) Banking of the planned places in the farms should be performed as illustrated below.

- (8) Masonry of embankment should be conducted in parallel with the farm reclamation work.
- (9) The following cautions should be observed in the masonry work.
- a. Mortar should be used for masonry, but it should not fill more than 50% of voids for the purpose of satisfactory drainage.
 - b. The masonry should not be provided on the existing natural ground.

(10) Farm road construction should be started after removing gravels from the farm area.

(11) Gravel paving of the farm road should be carried out as instructed below.

a. Gravels with a diameter of less than 50 mm should be used with each spreading depth set at 10 cm, using bulldozer or road-roller for compacting.

(12) Construction of the side ditch along the farm road should preferably be conducted after completion of the pavement work if this does not cause any particular impediment to drainage.

- (13) Finish levelling of the farms should be carried out by means of the bulldozer on fine days in order to prevent compaction.

Subcenter

- (1) Same as the above center construction procedure (1) - (3).
- (2) Main farm road shall be constructed.
- (3) As described in the outline, this area is characterized with a heavy clay soil with much underground water, and the drainage is very poor.

It is necessary to control the moisture content of the soil so that the construction is effected when the moisture content is optimum to enable best compaction.

Accordingly, construction in a rainy season or on a rainy day in a dry season must be completely avoided.

- (4) Construction is processed in the following order:
 - a. Provide a drainage ditch. - Manual labor.
 - b. Soft subgrade in the road filling shall be replaced with the sand. The range shall be determined upon consultation with the site supervisor.
 - c. Spreading depth of the soil should be kept within 5 cm each time, and the spread soil shall be rammed after dried up by sunshine.
 - d. After completion of the filling, pave with gravel. Spreading and rolling are performed in the similar manner as in the case of the center, but we recommend to spread clay up to 2 - 3 cm upon a spread gravel layer of 10 cm deep before finishing. The addition of clay prevents the rain water from entering the subbase course.

e. A bulldozer is used for the filling work in principle, but manual labor may be adopted if the bulldozer delivery is delayed.

- (5) Lateral farm load in the field is constructed like the main farm load.
- (6) Subcenter field reclamation involves non-land adjustment. Disposed roots line shall be provided along the main farm road and the branch farm road.

Non-land adjustment is mainly for the rain water drainaze, and is performed by a bulldozer. When the top soil is cut more than 50 cm, the place will be treated as the surface soil.

- (7) The downstream drainage canal in the field shall be excavated by manual labor.

6-1-2 Building site construction plan

Build ng site area

Location	Area	
Centre		1.12HA
Sub-Centre	New Field	0.60HA
	Station	0.50HA
Total		2.22HA

(1) Center

Reclamation includes 1% entire gradient.

Dug out stones during the field reclamation are used for building foundation works.

The expected building site is reclaimed by bulldozers, but no rake dozer is used.

Stones in other places than the cleaved portion will not be dug out.

(2) Subcenter New Field

As the underground water level is high, filling shall be performed up to the same level as the main farm road.

Since the settlement due to consolidation is expected because of the clay subsurface, soil exploration is necessary.

If boring is impossible, carry out the filling exceeding 10 cm, foundation piling must be considered upon consultation with the supervisor.

(3) Subcenter-Soppong Sericulture Station

This area also has a soft subsurface, and the settlement due to consolidation is expected. Whole building site shall be filled up to the current road level. Mountain sand is recommended for the filling material. The filling not only improves the drainage but also prevents unequal settlement after the building construction. Spreading depth of the filling soil shall be 20 ~ 30 cm. After levelling and rolling by a bulldozer, compact the ground using compactors.

6-1-3 Engineering plan for source facilities

The water source for the center and sub-center are both natural rivers. Water is drawn by the underground flow system; porous pipes are buried by excavating the rivers. The pumping stations are of steel-reinforced concrete rahmen construction for durability and vibration resistance.

List of Water-drawing Structures

	Center	Subcenter
Water-drawing intake	Porous C.P. (diameter: 300 mm) L=31 M	Porous C.P. (diameter: 600 mm) L=18 m
Water-drawing pit	Reinforced concrete BxLxH=1x3x7 m	HP diameter: 1200 mm H=5 m
Pump station	RC construction BxLxH=3.6x9.2x3.5m A=331 m	Same
Site area	A=30x30=900 m	Same

1. Center

The bed of the Berang River is covered with pebbles. A bulldozer will be used. The gut will be changed in advance and sandbags used to temporarily coffer the river. The water flow in this river is large even during the dry season so construction during the rainy season must be avoided.

The level of excovation of the water absorption pit is high; therefore, care must be taken in normal plane protection to avoid accidents.

Due to the sandstone layer, construction on rainy days must be changed upon consulting with the field supervisor if concrete laying is difficult due to excessive leakage.

The foundation of the pump station is very important. Construction work must be started only after checking the bearing power of the ground. Concrete laying must be performed in conformity with the General Technical Specifications.

2. Sub-center

The riverbed of the branch of the Taweleng River is clay. It is possible to excavate this riverbed by manual labor; however, introduction of a backhoe recommended. Since the amount of water flow in the dry season is approximately 10 e/s, construction may be carried out without difficulty.

A 1200 ϕ HP (hydraulic pump) is installed at the water intake pit. Since this may not be performed by manual power a crane is necessary. The pump station is the same as that for the center.

6.1.4 Engineering Plan of Water Pipe

1. Specifications of Pipes

	Total Length	Kind of Pipe	Pipe Diameter	Maximum internal water pressure
Center	1368.4 m	Tactile cast iron pipe	100 mm	180 m
Sub-center	88.0 m	Vinyl chloride pipe	150 mm	17 m

2. Engineering Sequence

- (1) Water pipe engineering starts from the source to upward.
- (2) In storing on the engineering site, pipes are protected by sleepers or wheels layed beneath and piled up with their hubs and spigots alternately. However, ductile cast iron pipes are not permitted to be piled up beyond 25 layers.
- (3) Pipes stored are carried by manpower to the piping site along the microwave road.
- (4) At the piping site, pipes are lined with their hubs in the same direction and in parallel with the planned route. Skids must be surely provided.
- (5) In the case of underground piping works, the excavation must be large enough so that refilling of soil and sand reaches the pipes bottom. Excavation for joints is made deep enough to make joints connection works easy and to allow powerful con-

nection works. Especially, cares are fully taken for the joint connection works, because a fairly larger hydraulic pressure acts upon the water pipes of the centres.

- (6) Refilling up to the upper end of a pipe is performed in a manner so that earth and sand may be packed thoroughly to its bottom and surrounding. Cares should be taken in refilling works to avoid any affect, relief or lateral deflection.
- (7) Refilling earth should be free from either pebbles or rocks mixed with and applied water binding.
- (8) In performing a main road crossing work, refilling and rolling compaction should be made after the completion of pipe laying on one side of the car route at first, followed by excavation of pipe laying works on the other side to avoid making route crossing and excavating works simultaneously. However, this does not apply to any places where a rundabout path may be easily established. Road restoration and maintenance works (pavement, etc.) should be made after the pipe laying.

3. Other matters to be attended

- (1) For both the fore and back parts which are fastened with thrusts and blocks, be careful of the their boundary which tends to cause such dangers as non-uniform settlement. Especially, it is necessary in any refilling works to hang a pipe with two wire ropes, because the settlement becomes the largest during and immediately after a refilling.
- (2) In order to prevent irregular settlement of the pipe route, no tools nor equipments must be placed on the route after refilling.

- (3) The water pipe route must be constructed by skilled laborers because of the possible danger of water hammer.

6-1-5 A. Construction Schedule of the Sericultural-Centre

Items	1st Year	2nd Year	3rd Year	Remarks
1 Land Preparation				
Muberry field	<u>3.0HA</u>	<u>4.0HA</u>	<u>1.0HA</u>	1st year bulloozzer is rented
Glassland		<u>1.0HA</u>		After 2nd year bul. will be provided from Japan
Building site				
2 Pump Station				
Intraice work		<u>L=31M φ300</u>		ry season only
Pump house (2 places)		<u>1,000M²</u>		included installation of pumps
3 Pipe laying				
Foundation		<u>L=1,390M</u>		Aqueouct 5 places support 82 places buried 989M surface 326M
Pipe laying				
4 Buildings				1st : Mulberry field maintenance room 2nd : Silkworm egg refrigerator room

Note 1st year 76' 10 ~ 77' 3 2nd year 77' 4 ~ 78' 3 3rd year 78' 4 ~ 79' 3

Buildings of centre will be disgned and constructed by indonesian side therefore, the schedule of buildings is not clear.

B. Construction Schedule of the Sub Centre

Items	1st Year	2nd Year	3rd Year	Remarks
NEW FIELD				
1 Land Preparation				
Mulberry field	<u>3.5HA</u>	<u>6.0HA</u>	<u>5.0HA</u>	Expected dry season only
Glassland Building site		—		After the 4th year Dry season only
2 Pump Station				
Intaice work		<u>L=18M ø600</u>		Dry season only
Pump house		<u>1,000M²</u>		Included installation of pumps and pipe laying
3 Buildings		---	---	
SOPPENG SERICULTURAL STATION				
1 Building site preparation		—		
2 Buildings		---	---	Dry season only

Note The above schedule will be affected with the condition of the road from national road to the new field.

6-2 Specification

6-2-1 General Technical Specification

1. Earthworks

- 1-1 Site Clearing
- 1-2 Excavation-General
- 1-3 Excavation for structure
- 1-4 Excavation of rock foundation
- 1-5 Backfilling
- 1-6 Foundation preparation of embankment
- 1-7 Finish to embankment

2. Concreteworks

- 2-1 Cement
- 2-2 Concrete aggregates
- 2-3 Mixing water
- 2-4 Concrete mixes
- 2-5 Mixing concrete by machine
- 2-6 Mixing concrete by hand
- 2-7 No concrete during unsuitable weather
- 2-8 No partially set material
- 2-9 Depositing concrete
- 2-10 Vibration of concrete
- 2-11 Curing and protection
- 2-12 Formwork-General
- 2-13 Removal of forms
- 2-14 Reinforcement
- 2-15 Placing reinforcement steel

3. Pipe Line

- 3-1 Earth foundation and sand foundation
- 3-2 Concrete foundation
- 3-3 Laying and connection of pipes
- 3-4 Steel pipes and Ductile iron pipe
- 3-5 Vinyl pipes

4. Farm Road

4-1 Setting out

4-2 Tolerance in earthwork dimensions

4-3 Site Clearing and Preparation of Foundation

4-4 Placing and Compaction of Material

4-5 General Pavement

5. Metalwork

6. Welding

7. Timberwork

8. Painting

9. Water Stop

GENERAL TECHNICAL SPECIFICATION

1. EARTHWORKS

1-1 Site Clearing

The works under this Clause shall include the supply of all labour, materials and Constructional Plant and the performance of all works necessary for clearing the area to be occupied by the Works and Temporary Works.

Such clearing shall include the cutting down and uprooting of all trees, bushes and vegetation, grubbing and removal of the tree roots and stumps, removal of vegetations, structures and other obstructions to the extent required by the Engineer, but not otherwise.

1-2 Excavation-General

All excavation shall be carried out to the lines and levels shown on the Drawings or to such lines and levels as the Engineer may direct. The Contractor shall trim all permanent excavations to the levels and dimensions shown on the Drawings.

Before commencing excavation, the Contractor shall survey and take levels over the entire area in which excavation is to be carried out. The Contractor shall use bench marks approved by the Engineer for such survey works. The surface levels so determined shall be subject to the Engineer's approval, and measurement of excavation shall be based upon the approved surface levels.

When any excavation has been taken out and trimmed, the Engineer shall be informed accordingly so that he may inspect the completed excavation, and no excavation shall be filled in or covered with concrete until it has been inspected and the Contractor has been authorized to proceed with the work.

1-3 Excavation for Structures

Excavation for foundation work shall be carried out in a safe manner and to the lines and levels shown on the Drawings or to such lines and levels as may be approved by the Engineer. Firm foundations are to be achieved by moistening and tamping if necessary.

Excavation for cut-offs and wing-wall footings serving a cut-off purpose shall be so executed that, below the level of the bankseat, concrete shall be placed against the sides of the excavation without the use of intervening formwork. In the event of over excavation for cut-offs or wall footings, below the level of the bankseat, extra concrete to fill the extra excavation shall be provided at the Contractor's expense.

1-4 Excavation of Rock Foundations

Where structures are to be founded on rock the bottom of the excavation is to have all loose rock removed. Immediately before concreting the surface shall be thoroughly cleaned of all loose material and dirt by means of water jets, all to the satisfaction of the Engineer.

1-5 Backfilling

Backfilling shall, unless otherwise specified, be carried out with approved materials and shall be well compacted in 15 centimeter layers to the satisfaction of the Engineer. Topsoil, vegetation or other organic material shall be excluded from backfilling material.

Payment for backfilling shall be made for the net volume of fill in place, measured after compaction to the lines to which the excavation was measured. Free draining material incorporated in backfilling behind retaining walls shall be measured and paid for separately.

The Contract Rate for backfilling shall include for the cost of supplying suitable material, placing by hand tools or machines, mixing, harrowing (if required), spreading, trimming, watering and compacting, and the cost of all other works connected therewith. The Contract

Rates shall apply whatever the source of the material.

1-6 Foundation Preparation for Embankment

The foundation where embankments are to be built shall be prepared by ploughing or ripping to an appropriate depth. If the foundation in any area is not suitable in the opinion of the Engineer for placing the fill, the Contractor shall excavate this area to such a depth, and dispose of the excavated material, as directed by the Engineer.

1-7 Finish to Embankments

The side slopes of all embankments are to be in accordance with those shown on the Drawings or such other slope as may be approved or ordered by the Engineer.

The finished surfaces of the top and sides of the embankments shall present an even and neat appearance. The alignment, bank heights and regularity of surface shall be to the satisfaction of the Engineer and shall be trimmed as necessary.

2. CONCRETEWORKS

2-1 Cement

The cement to be used throughout the Works shall be obtained from manufactures approved in writing by the Engineer.

The cement shall be ordinary Portland cement conforming to the requirements for the Portland cement.

The name and brand of manufacturer, the type of cement, the year and month produced and the weight contained shall be clearly marked on each bag.

2-2 Concrete Aggregates

All concrete aggregates are to be obtained from sources approved by the Engineer.

They shall be free from eath, clay, chalk, lime, peat, loam, soft clayey shaly or decomposed stone, vegetable and organic matter and other impurities. The stone shall be hard and dense.

2-3 Mixing Water

Water for mixing concrete, mortar, rendering and grout (if required), shall be subject to the approval of the Engineer, it shall be clean, fresh and free from oil, acid, alkali, sugar and vegetable substances, and it shall, anyhow, be free of organic or inorganic matter in solution or suspension in such amounts that it may impair their strength, appearance or durability.

If required by the Engineer, samples shall be taken from the proposed sources of supply and tested by comparison with distilled water. Comparison shall be made by means of standard cement test for soundness, time of setting and mortar strength. Indication of un-soundness, change in time of setting plus or minus 30 minutes or more, or decrease of mortar strength more than ten (10) per cent compared with distilled water shall be sufficient cause for rejection of the water being tested.

2-4 Concrete Mixes

The table below gives the different types of concrete mixes contemplated by the Engineer to be used in principle in the various structures, and, for each minimum compressive strength at a 28 days age, the maximum sizes of aggregates and the cement content per cubic meter of concrete placed, it being understood that the cement content shown herein is not final but is indicated tentatively for enabling the Contractor to prepare his bid estimate:

Types of concrete mixes	Minimum compressive strength at a 28 days age (kg/cm ²)	Maximum size of aggregates (mm)	Maximum water/cement ratio	Cement content (kg)
AA	240	20	57.5	350
A	210	40	60	300
BB	180	80	70	250
B	180	40	70	250
C	130	40	80	180

The actual proportions of the various gradings of coarse and fine aggregates will be determined from analysis and tests by the Engineer, and he may vary these proportions - from time to time - should the materials appear to render this advisable in order to obtain a concrete of maximum density, workability, consistency and strength with the minimum water/cement ratio.

Only sufficient water shall be added to the cement and aggregates during mixing to ensure proper hydration of the cement and to produce a mixture of workability such that it can be well consolidated, worked into the corners of the forms and around the reinforcement, give a satisfactory finish and achieve the specified strength specified in the above table.

The following types of concrete mixes shall be in principle used in the various structures specified below, but the Engineer reserves the right to change the concrete mix proportions from time to time in order to achieve a workable mix in accordance with the above requirements and also the actual site requirements:

<u>Description</u>	Mix types
1. Reinforced concrete for main body in structures	A
2. Such ancillary works as concrete pipes, piles, etc.	AA
3. Unreinforced concrete for canal lining, flooring, etc.	B
4. Unreinforced concrete for weir body, aprons, bridge pier etc.	BB
5. Foundation concrete	C

The slump of the concrete shall not exceed 7.5 centimeters for concrete in slabs that are horizontal or nearly horizontal and 10 centimeters for all other concrete.

The amount of water added at the mixer shall take into account the moisture contents of the aggregates at the time of mixing, and shall be changed as required to secure concrete of proper consistency.

2-5 Mixing Concrete by Machine

(1) Mixing by mechanical mixer

The materials for concrete shall be mixed in an approved mechanical mixer. The mixing time for each batch shall not be less than the minimum mixing time, shall not exceed three (3) times the minimum time, and shall be constant for a series of batches of concrete for a particular structure. The mixing time shall start when all the ingredients are in the mixer and shall, unless otherwise directed by the Engineer, be longer than one and half ($1\frac{1}{2}$) minutes.

The mixers shall not be loaded beyond their rated capacity, nor shall they be operated at a speed in excess of that recommended by the manufacturer. They shall produce a concrete of uniform consistency and appearance, at a continuous rate approved by the Engineer.

All mixing equipment shall be clean, before commencing mixing, and shall be kept free from set concrete. The first mix, after each cleaning of the mixing equipment, shall not be used in the works. Pick-up and throw-over blades inside the mixers shall be replaced, when worn down two (2) centimeters.

(2) Truck mixing

The materials for concrete may also be mixed in an approved truck mixer (agitator truck). The drums on truck mixer shall revolve at the speed recommended by the manufacturer.

When the materials are mixed in a truck mixer, the mixing operation shall start within thirty (30) minutes after the cement and aggregates are in the mixer, and the concrete shall be delivered to the site of the works and its discharge be completed within one (1) hour after the introduction of the mixing water into cement and aggregates.

In hot weather, or under conditions contributing to quick stiffening of the concrete, a mixing time less than one (1) hour may be ordered by the Engineer.

2-6 Mixing Concrete by Hand

Where it is not possible to employ machine mixing and approval has been obtained from the Engineer, concrete shall be mixed by hand as near as practicable to the site where it is to be deposited. Clean mixing bankers or platforms of sufficient areas for the proper execution of the work shall be provided. These platforms if constructed of timber shall consist of planks closely jointed so as to avoid the loss of any grout or liquid from the wet concrete. The whole of the aggregate and cement shall be turned over on the banker in a dry state at least twice. The water shall then be added gradually through a rose head, after which the materials shall again be entirely turned over in a wet state at least three times before leaving the banker.

2-7 No Concreting during Unsuitable Weather

No concreting will be allowed in the open during storms or heavy rains. All concreting materials and plant are to be adequately protected against the effect of heavy storms and strong winds.

2-8 No Partially Set Material to be Used

All concrete and mortar must be placed and compacted within 30 minutes of its being mixed; and no partially set material shall be used in the work.

2-9 Depositing Concrete

The arrangements for placing concrete are to be such that in all cases the material may be conveniently handled and placed in the required position without re-handling or segregation. Wherever possible the concrete is to be deposited from bottom opening skips and in all cases shall be deposited in layers of such depth that each layer can be easily incorporated with the layer below with the use of internal vibrators or by spading, slicing, and ramming. In no case is any layer to slope except where specified and all temporary joints are to be formed square to the work. Concrete shall not be delivered by chute or dropped from barrows or otherwise through a greater height than 1.5 meters except with the approval of the Engineer who may order the concrete to be dropped on to a banker and it shall be turned over by hand before being placed. The height of any lift shall not exceed 1.5 meters unless otherwise permitted by the Engineer.

The area on which any concrete is to be deposited must be made and maintained free from standing water during concreting operations unless otherwise approved. Running water crossing or entering such areas must be brought under control before concreting proceeds.

Before depositing any concrete resting or abutting on work previously executed the surface and ends are to be thoroughly roughened with a chisel-pointed pick to such an extent that no smooth skin of concrete that may be left from the previous work is visible.

These roughened surfaces must be thoroughly cleaned by compressed air and water jets or other approved means, brushed and watered immediately before depositing concrete and if so instructed by the Engineer are to be covered with cement mortar 1.0 centimeter thick immediately before proceeding with the next layer of concrete. The cost of all roughening of surfaces shall be deemed to be included in the Contract Rates for concrete in the Bill of Quantities.

Where new concrete is to be deposited on or against rock or old concrete, the surface of the rock or old work must be toothed to form an adequate bond, roughened if necessary, cleaned, washed and all loose material removed from it. The faces shall then be mortared as specified for joints in new concrete.

Concrete in reinforced concrete work shall be deposited in small quantities in a plastic state with a water-cement ratio such as to give the specified strength. The depositing of concrete in individual members shall be continued without stoppage up to an approved pre-arranged construction joint or until the member is completed and shall be finished off in such manner that the junction of members shall be monolithic unless otherwise specified.

Mass concreting shall be carried out in sections previously ordered or approved by the Engineer and shall proceed continuously in each section until completed and no interval shall be allowed to lapse while the work is in hand. As it may be necessary to work beyond the ordinary hours to enable this condition to be fulfilled the Contractor must allow for this in the Contract Rates in the Bill of Quantities.

2-10 Vibration of Concrete

Except where otherwise permitted by the Engineer concrete shall, during placing, be compacted by approved pattern internal vibrators. The vibrators shall be of the rotary out-of-balance type or the electro-magnetic type and shall operate at a frequency of not less than 6,000 cycles per minute. The vibrators shall be designed for continuous operation. The vibrators shall be disposed in such a

manner that the whole of the mass under treatment shall be adequately compacted at a speed commensurate with the supply of concrete from the mixers. Vibration shall continue until the concrete being placed shall be judged to be compacted by the appearance of a blistening and even surface except for slight irregularities where the coarse aggregate breaks through. All air shall be this time have been expelled.

Vibration is not to be applied directly or through the reinforcement to sections or masses of concrete which have hardened or after the initial set has taken place. Vibration must not be used to make the concrete flow in the formwork so as to cause segregation.

2-11 Curing and Protection

The Contractor shall take adequate measures to ensure that the concrete is cured. These shall include covering the concrete with burlap matting or other effective means which shall be kept damp continuously for a minimum period of three days after casting or for such other time as the Engineer may direct. After removal of this covering, the concrete shall then be sprayed with water for a minimum period of a further seven days. Other methods of preventing the water of hydration in the concrete from evaporating may be used with the approval of the Engineer.

All concrete liable to be affected by running water or wave action shall be adequately protected from damage during the setting period and all temporary protective works shall be to the satisfaction of the Engineer.

2-12 Formwork - General

Forms shall be simple; they shall be rigidly constructed of approved materials and shall conform to the shapes, lines and dimensions shown on the Drawings. Forms shall be braced and strutted to withstand the pressure resulting from placing and vibrating the concrete, constructional loads, wind and other forces without appreciable deformation.

The Contractor shall submit to the approval of the Engineer, before commencing construction, a set of forms complying with the above requirements, but such submission to the Engineer or approval by him shall not relieve the Contractor of any of his responsibilities under the Contract for the successful completion of the structure.

Surfaces of the forms to be in contact with concrete shall be free from adhering foreign matter, projecting nails and the like, grooves, splits or other defects. Shuttering boards shall be carefully jointed and so arranged as to be able to swell under the influence of humidity of the concrete, without causing any deformation to the forms, interstices shall be properly filled with glazier's putty and the waterproofing of the forms shall be sufficient to prevent escape of cement resulting from excess of water in the concrete. However, the use of paper tamping shall be strictly forbidden.

Openings (if required) for inspection of the inside of the forms and for removal of water used for washing down shall be provided and so formed as to be easily closed before placing the concrete.

Before placing any concrete, all bolts and the like (if required and which are to be built in) shall be fixed in their correct positions, and cores and other devices for forming holes, openings, etc., shall be fixed to the forms. No holes shall be cut in any concrete unless approved by the Engineer. The use of wire ties for supporting the forms shall not be permitted in concrete walls which are to be subject to water, or when the finished surface -- required as determined by the Engineer -- is to be permanently exposed; wire ties used for other concrete works shall be cut off flush with the concrete surface, after the forms are removed. In case embedded metal rods are used for holding forms, the rods shall terminate not less than 3 centimeters from the formed surface of the concrete in which the maximum size of aggregate is 40 millimeters and not less than 5 centimeters from the same concrete surface in which the maximum size of aggregate is 80 millimeters.

A non-staining commercial mineral oil or other approved material shall be applied to the faces of the forms before concreting to prevent adherence to the concrete. Care must be exercised to prevent the material applied to the faces of the forms from coming in contact with the reinforcement, but if this should inadvertently occur, the reinforcement must be cleaned.

When forms have been built and have been prepared ready for concreting, they will be inspected by the Engineer and no concrete shall be placed until the forms have been approved by him. In order to avoid delays in obtaining approval, the Contractor shall inform the Engineer, at least 24 hours in advance, of his intention to have the forms ready for inspection.

2-13 Removal of Forms

The Contractor shall take full responsibility that the time has elapsed for the concrete to attain sufficient strength before forms are removed. Nevertheless, the forms shall not be struck without the prior approval of the Engineer, and in any case at least three (3) days shall elapse before forms are struck.

Connections shall be so formed as to permit the easy removal of the forms without hammering, etc., and without the necessity of levering against the surface of the concrete.

2-14 Reinforcement Steel

Reinforcement steel shall consist of round deformed bars rolled from new billet stock, and shall conform to the requirements of the appropriate standards referred to Clause 2.21 hereof. Steel shall have a tensile strength of 39 to 53 kg/mm² and a minimum yield point of 24 kg/mm² and a minimum yield point of 24 kg/mm². A cross section of any bar to be delivered shall be exact shape and have the specified diameter at any point of the bar. The average diameter of 20 bars which are to be selected at random from each shipment of the same size, shall not be bigger or smaller by 2 percent than the specified diameter. Bars shall be free of scale, oil, dirt and structural defects.

When required by the Engineer the Contractor shall submit three copies of mill sheets of steel bars issued by the iron and steel works for the approval of the Engineer before each shipment, and inspection at site will be made by the Engineer in accordance with the Specification and the above mill sheets.

2-15 Placing Reinforcement Steel

The number, size, form and position of all reinforcement steel bars, fabric, ties, links, stirrups and other parts of the reinforcement are to be placed in exact accordance with the Drawings and kept in the correct position in the forms without displacement during the process of vibrating, tamping and ramming the concrete in place. The Contractor shall provide all necessary distance pieces and space bars at his own cost to maintain the reinforcement in the correct position.

Any ties, links or stirrups connecting the bars shall be taunt so that the bars are properly braced, the inside of their curved parts shall be in actual contact with the bars around which they are intended to fit. Bars shall be bound together with best black annealed mild steel wire which is subject to the Engineer's approval, and the binding shall be twisted tight with proper pliers. The free ends of the binding wire shall be bent inwards.

The Contractor shall provide at his own cost and to the approval of the Engineer working drawings of all reinforcement accompanied by bending schedules and copies of the orders placed for bars.

Before any steel reinforcement is embedded in the concrete any scale, loose rust, oil, grease or other deleterious matter shall be removed. Partially set concrete which may be adhering to the exposed bars during concreting operations shall likewise be removed.

When reinforcement has been placed and is ready for concreting, it will be inspected by the Engineer and no concrete shall be placed until the reinforcement has been improved by him. The Contractor shall inform the Engineer at least 24 hours in advance of his intention to have the reinforcement ready for inspection.

3. PIPE LINE

3-1 Earth Foundation and Sand Foundation

3-1-1 Things like rock shall not be out cropped on the section contacting with pipes on the foundation and be trimmed so as to contact equally through the whole length of pipes. Specially, a condition of bearing one point shall not be allowed to raise at the collar and socket of the joint of pipes.

3-1-2 The foundation of pipe canal shall be sand foundation in accordance with the provision of design drawings.

3-1-3 In case of being a change of ground water flowing along sand foundation, the flowing shall be stopped with impervious earth and likes to conform with the instruction of engineer.

3-2 Concrete Foundation

The placement of concrete shall be made so that concrete may completely spread over the surface of perimeter of pipes.

3-3 Laying and Connection of Pipes

3-3-1 Laying of pipes shall be consulted with the engineer in regard to methods of transport and connection of pipes.

3-3-2 The sequence of laying and connecting pipes shall be, as a rule, made to direct from low position to high position.

3-3-3 The connection of pipes shall be inspected in regard with the position of rubber rings for joints and the space of connecting parts to use gauge on the whole circular of each pipe, and the results shall be submitted to the engineer.

3-3-4 In connecting pipes, an attention shall be paid for so that foreign matter as sand may not enter into the inside and connecting part of pipes.

3-4 Steel Pipe and Ductile iron pipe

The durability of steel pipes ductile pipe shall be more than design internal pressure and thickness of pipes.

3-5 Vinyl Chloride Pipe

The durability of vinyl chloride pipes shall be more than design internal pressure.

4. FARM ROADS

4-1 Setting Out

The Contractor is entirely responsible for the accurate setting out of the works from the information supplied on the Drawings and the instructions given by the Engineer.

4-2 Tolerance in Earthwork Dimensions

Unless otherwise specified, no point on the surface of the completed earthworks shall be less than -0.10 meter and more than 0.10 meter in distance from the designated surface. However, it is understood that height of road embankments shall always be subject to Clause 3D.01 hereof, and the dimensions of farm road which form canal embankments shall be within the tolerances set out in Clause 3C.03 hereof.

4-3 Site Clearing and Preparation of Foundation

The area to be occupied by the roads shall be cleared in accordance with Clause 3A.03 hereof.

Foundation on which embankments are to be placed shall be prepared in accordance with Clause 3A.11 hereof, and no materials shall be placed on any portion of the foundations until such foundation has been approved by the Engineer for placing fill. Test pits, trenches and cavities made for the removal of unsound foundation materials or for the inspection of subsurface foundations shall be filled with selected material and properly compacted.

4-4 Placing and Compaction of Material

Fill material shall be compacted to at least 95% of the maximum dry density and in addition have a C.B.R. (the California Bearing Ratio) of not less than 10% or such lower value that the Engineer may decide. Compaction of all filling material shall be carried out at moisture contents as directed by the Engineer from time to time as the work proceeds in order to reduce as far as possible any subsequent consolidation or swelling. Water shall be added as and where necessary by a water cart fitted with an approved sprinkler.

Compaction shall be carried out by means of approved by the Engineer. All construction equipment must operate over the whole area to ensure uniform compaction. All filling shall be compacted in layers of not greater than 15 centimeters compacted thickness, or such other thickness as may be approved by the Engineer. Longitudinal and transverse joints in any two successive layers shall be staggered by a minimum distance of 3.0 meters.

4-5 Gravel Pavement

Unless otherwise specified, material for road pavement shall be gravel or broken stone extracted from the quarries shown on the Drawings or other sources approved by the Engineer. The material shall be free from earth, clay loam, soft clayey shaley stone, vegetable and organic matters. The stone shall be hard and dense.

The material shall be free from flat and elongated particles, and generally, particles of the material shall be spherical or cubical in shape. Unless otherwise specified, the maximum size of the material shall be 80 millimeters, and the material shall be well graded. The quality and grading of the material shall be subject to the approval of the Engineer.

The material shall be spread in such quantity that, when levelled and finished, the surface shall be free from irregularities or loose material, true to cross-section, line and level shown on the Drawings or established by the Engineer.

5. Metalwork

If required the Contractor shall prepare dimensioned drawings showing all details of such metalworks as the intake bridge, steel handrails, ladders, steps etc. and the materials to be used for such purposes in accordance with the drawings or the instructions given by the Engineer. Such dimensioned drawings shall be submitted to the Engineer for his approval prior to the commencement of such metalworks.

All the metalwork supplied by the Contractor for permanent works shall conform to the applicable standards showed by the Engineer, unless otherwise specified.

The Contractor shall furnish all pipes, pipe fittings and pipe specials, bolts, ragbolts (if required), nuts, washers and the like for assembling any other steel pipe handrails and steelwork if required; each bolt shall be provided with two washers and bolts shall be long enough to show a full thread through the nut after fixing.

Galvanizing of the galvanized items provided by the Contractor is to be of the first quality and finish. Rough edges and burrs are to be neatly filed off before the works go into place, but in filing off, the parent metal must not be exposed.

The Contractor shall not use fixture and fittings for metalwork (including pipework) in which dissimilar metals likely to lead galvanic action, are placed in permanent contact with each other.

6. Welding

Details of weld preparation and the proposed welding procedure shall be subject to the approval of the Engineer, before welding operation commences. Sample welds shall be prepared by each welder, before he commences work on the construction and during construction as required by the Engineer. No constructional welds will be permitted until the Engineer is satisfied with welding procedure, with workmanship of the welders and with the system of weld testing.

7. Timberwork

Timber species both for temporary and permanent works shall be the most suitable for each particular purpose, and shall, in all cases, be thoroughly seasoned, sound, dry, straight, and free from saps, shakes, dead knots, dogmarks or other defects. Timber shall be sawn into scantlings not less than one (1) month before use, such that the scantlings will be of the specified dimensions after planning and preparing.

Timber for piles and carpentry work shall, except as specified otherwise, be of the best quality available within the locality, sound, round or sawn square as shown on the drawings, straight and well seasoned, free from rot, worm, beetle, decayed knot or other defects.

All timber shall be properly stacked and protected from the weather. Timber shall be wrought and prepared for painting, unless otherwise specified.

8. Painting

All paints and materials for painting shall be furnished by the Contractor and used in accordance with the manufacturer's recommendation for the particular location where the paints are to be applied. The quality of such paints and materials shall be subject to the Engineer's approval.

Undercoats shall be of distinctive tints and finishing colours are to be approved by the Engineer. Except as required for certain water thinned paints, paints shall be applied only to surfaces that are thoroughly clean and dry, and only under such combination of humidity and temperatures of the atmosphere and of the surfaces to be painted as will cause evaporation of moisture rather than condensation.

Surfaces, which have been cleaned, pretreated and/or otherwise prepared for painting, shall be primed as soon as practicable after such preparation has been completed, but in any event prior to deterioration of the prepared surface.

Paint shall not be applied to any surface, which is excessively hot for the type of paint being used, and freshly painted surfaces shall be shaded and protected from overheating, until sufficiently hardened, to prevent the occurrence of cracking or blistering.

Painted timberwork and metalwork shall be lightly rubbed down with glass paper between coats and dusted down. At least 24 hours shall elapse between the application of successive coats, unless otherwise specified by the manufacturers. On completion of painting, the Contractor shall remove all paint spots and shall touch up or re-paint imperfect work. Painted exterior surfaces shall be protected from the weather, until the paint is thoroughly dry and hard.

Timberwork to be painted shall be rubbed down with glass paper, knotted and primed. Any holes, cracks and joints shall then be neatly stopped with putty. Joinery shall be primed before assembly. After stopping, all timber-work shall be given undercoat and finishing coat as directed by the Engineer.

9. Waterstop

Waterstop shall be placed in joints shown on the Drawings and directed by the Engineer. The waterstop shall be 150 mm or 230 mm in width and 10 mm in web thickness and be made of rubber or plastics conforming to the following requirements.

	<u>Rubber</u>	<u>Plastics</u>
Specific weight	1.15 or more	1.35 or more
Tensile strength, kg/cm ²	200 or more	120 or more
Elongation, %	400 or more	300 or more
Hardness	60 - 70	60 - 70
Shape (of both types);	Center hallow bulb type with solid bulbs at both ends	

All waterstops shall be stored in as cool a place as practicable and in no case rubber be stored in the place open or exposed to the rays of the sun. All rubber shall be stored so as to permit free circulation of air about the rubber.

All field splices and intersections of waterstops shall be made so as to provide watertight connection with such means as specified by manufacturer of the waterstops. The Contractor shall provide suitable support and protection during the progress of the work to protect the waterstops from damage, deterioration, or warping.

The waterstops shall be installed with equal widths of the material embedded in the concrete on each side of the joint. The concrete shall be carefully placed and vibrated around the waterstops to secure a complete bond between the concrete and all embedded areas of the waterstops.

Measurement for payment for furnishing and placing waterstops will be made only of the length of the waterstops placed at the joints in accordance with the Drawings or as directed by the Engineer. No allowance will be made for lap at splice. Payment for furnishing and placing waterstops will be made at the Contract Rate per linear meter in the Bill of Quantities, which Contract Rate shall include the cost of furnishing waterstops, and of delivering, unloading, handling, storing, cutting, cleaning, placing and maintaining in position all waterstops as shown on the Drawings or as directed by the Engineer.

6-2-2 Specifications of Machinery

1) Bulldozer

Type	: D50A CRAWLER
Engine	: Water-cooled, 4-cycle, overhead valve distribution type diesel engine
Starting method	: Motor-driven
Output and rated speed	: 90 HP, 1750 RPM
Maximum tractive force	: 10,340 kg
Earth-moving devices	
Weight during operation	: 11,000 kg
Overall length	: 4,700 mm
Overall width	: 3,350 mm
Overall height	: 2,690 mm
Contact pressure	: 0.66 kg/cm ²
Bowl	
Operation method	: Hydraulic operation
Width	: 3,350 mm
Height	: 855 mm
Lifting limit	: 1,050 mm
Lowering limit	: 380 mm

2) Drawing Pump at Sericulture Centre

-1 Pump Specification

Type	: Multistage volute pump
Suction Bore	: 80 mm
Delivery Bore	: 65 mm
Capacity	: 0.5 m ³ /m
Total Head	: 172 m
Speed	: 3200 R.P.M
Efficiency of pump	: 52%
Generating power	: 50 PS
Method of Coupling	: flexible
Quantity	: 2 sets
Method of operation	: hand-operate

-2 Material of Pump Main Parts

Suction cover	: Cast iron
Casing	: "
Impeller	: Bronze
Main Shaft	: Carbon steel
Sleeve	: Bronze
Liner Ring	: "
Side plate	: Cast iron
Bracket	: "
Packing	: Graphate cotton

-3 Accessories for Pump Set

Common Bed	1	Pressure Gauge	1
Foundation Bolts Nuts	1	Vacuum Gauge	1
Coupling	1	Compound gauge	1
Funnel with cock	1	Foot valve (100 mm)	1
Air vent cock	1	Sluice valve (65 mm)	1
Drain cock	1	Check valve (65 mm)	1
Companion flange	1	Flywheel	1

II Diesel Engine Specification

Cooling system	: Radiator
Continuous output	: 50 HP
No. of cylinder	: 4
Speed	: 1800 R.P.M
Accessories	: Gear units 1800 R.P.M/3200 R.P.M
"	: Tmyblex coupling
Quantity	: 2 sets

3) Drawing Pump at Sericulture Sub-Centre

-1 Pump Specification

Type	: Multistage volute pump
Suction Bore	: 100 mm
Delivery Bore	: 85 mm
Capacity	: 1.18 m ³ /min
Total head	: 14 m
Speed	: 1800 R.P.M
Efficiency of pump	: 73%
Generating power	: 8 PS
Method of Coupling	: Flexible
Quantity	: 2 sets
Method of operation	: Hand-operate

-2 Material of Pump Main Parts

Suction cover	: Cast iron
Casing	: "
Impeller	: Bronze
Main shaft	: Carbon steel
Sleeve	: Bronze
Liner ring	: "
Side plate	: Cast iron
Bracket	: "
Packing	: Graphate cotton

-3 Accessories per Pump Set

Common bed	1	Pressure gauge	1
Foundation bolts nuts	1	Vacuum gauge	1
Automatic centrifugal crutch	1	Foot valve (100 mm)	1
Funnel with cock	1	Sluice valve (100 mm)	1
Air vent cock	1	Check valve (100 mm)	1

II Gasoline Engine Specification

Type	: 4 cycle air-cooled engine	
Cooling system	: Radiator	
Continuous output	: 8 HP	
No. of cylinder	: 1	
Cylinder bore	: 90 mm	
Speed	: 1800 R.P.M	
Starting system	: Cell-motor	
Accessories	: Fuel tank	1
	Fuel filter	1
	Lubrication oil filter	1
	Muffler	1
	Battery	1

4) Pump for Irrigation at Sericulture Centre

-1 Pump Specification

Type	:	Multistage volute pump
Suction bore	:	80 mm
Delivery bore	:	80 mm
Capacity	:	0.74 m ³ /m
Total head	:	51 m
Speed	:	1750 R.P.M
Efficiency of pump	:	75%
Generating power	:	11 KW
Method of coupling	:	Flexible
Quantity	:	2 sets
Method of operation	:	Hand operate

-2 Accessories per Pump Set

Common bed	1	Pressure gauge
Foundation bolts nuts	1	Vacuum gauge
Coupling	1	Foot valve (80 mm)
Funnel with cock	1	Sluice valve (80 mm)
Air vent cock	1	Check valve (80 mm)
Drain cock	1	Companion flange

-3 Motor

Power	:	11 kW
Voltage	:	220V
Cycle	:	60 Hz

5) Pump for Irrigation at Sericulture Sub-Centre

-1 Pump Specification

Type	: Multistage volute pump
Suction bore	: 125 mm
Delivery bore	: 125 mm
Capacity	: 1.79 m ³ /min
Total head	: 61 m
Speed	: 1750 R.P.M
Efficiency of pump	: 75%
Generating power	: 30 kW
Method of coupling	: Flexible
Quantity	: 2 sets
Method of operation	: Hand-operate

-2 Accessories per Pump Set

Common bed	1	Pressure gauge	1
Foundation bolts nuts	1	Vacuum gauge	1
Coupling	1	Foot valve (125 mm)	1
Funnel with cock	1	Sluice valve (125 mm)	1
Air vent cock	1	Check valve (125 mm)	1
Drain cock	1	Companion flange	1

-3 Motor

Power	: 30 kW
Voltage	: 220 V
Cycle	: 60 Hz

6) Pump for Supply Drinking Water

-1 Pump Specification

Type	:	Volute pump with pressure tank
Suction bore	:	40 mm
Delivery bore	:	40 mm
Capacity	:	0.10 m ³ /min.
Total head	:	10 m
Speed	:	1750 R.P.M
Efficiency of pump	:	90%
Generating power	:	0.75 kW
Method of coupling	:	Flexible
Quantity	:	Total 3 sets Center - 1 set, Sub-centre New field - 1 set Station - 1 set
Method of operation	:	Hand operate

-2 Accessories per Pump Set

Common bed	1	
Foundation bolts nuts	1	
Sluice valve (40 mm)	1	
Check valve (40 mm)	1	
Companion flange	1	
Pressure tank	1	with Pressure gauge with vacuum gauge with foundation bolt nuts with controller

7) Generator

-1 Generator specification (at centre)

Type : Diesel engine
Generating power : 40 K.V.A
Voltage : 220 V
Cycle : 60 Hz
Quantity : 3 sets

Accessories per Generator Set

Transformer (220V/100V) : 1 set
Electric control panel : 1
Oil Tank (8 m³) : 2 sets

-2 Generator Specification (for Refrigerator at centre)

Type : Diesel engine
Generating power : 60 kVA
Voltage : 220 V
Cycle : 60 Hz
Quantity : 2 sets
Accessories : Oil tank (4 m³ - 2 sets)

-3 Generator Specification (New Field at Sub-Centre)

Type : Diesel engine
Generating power : 70 kVA & 10 kVA
Voltage : 220 kVA
Cycle : 60 Hz

Quantity	: 2 sets (for irrigation pump)	
	1 set (for supply water pump)	
Accessories	: Transformer (220V/100V)	1 set
	(for 70 kVA generator)	
	Oil tank 8 m ³	2 sets

-4 Generator Specification (Station at Sub-Centre)

Type	: Diesel engine	
Generating power	: 30 kVA	
Voltage	: 220V	
Cycle	: 60 Hz	
Quantity	: 2 sets	
Accessories	: Transformer (220V/100V)	1 set
	Oil tank 8 m ³	1 set

-5 Generator Specification (for Refrigerator at Sub-Centre)

Type	: Diesel engine	
Generating Power	: 65 kVA	
Voltage	: 220V	
Cycle	: 60 Hz	
Quantity	: 2 sets	
Accessories	: Transformer (220V/100V)	1 set
	Oil tank 4 m ³	2 sets

Calculation of bulldozer operation fee (excavation)

Work Capacity of Bulldozer (m^3/H)

$$V = v \times f \times w \times s$$
$$= 36 \times 1.0 \times 0.5 \times 1.0 = 18 \text{ m}^3/H$$

Note, v: work capacity of 1lt Bulldozer = $36 \text{ m}^3/H$
f: changing ratio of gravel soil = 1.0
w: efficiency of Bulldozer for scit condition at the site = 0.5
s: efficiency of Bulldozer for slope at the site = 1.0

Estimated by Japanese standard

1. Cost of excanation by Bulldozer

Rental Fee 13,000 RP/H

Including operater

Cost of fuel

items	consumption	unit price	total
light oil	6 ℓ/H	36 RP/ ℓ	216 RP
other oil	30% of above coste		65

281 RP

Bulldozer operation fee

$$1H = 13,000 + 281 = 13,281 \text{ RP/H}$$

$$13,281 \text{ RP/H} \div 18 \text{ m}^3/H = 738 \text{ RP/m}^3$$

2. In case of provided Bulldozer from Japan

items	amount	unit price	total
operater	0.17 person/h	675 RP/person	115
assistant	0.17 "	500 "	85
fuel fee	1 hr	281 RP/H	281
			481 RP

Per 1 m³, 481/16 = 30 RP/m³
