

Chapter 3

PRESENT TRAFFIC CONDITION OF THE STUDY AREA

3-1 TRANSPORT NETWORK

3-1-1 General

Transport Network in the Study Area consists of road, river, air and coastal shipping. As is shown in Fig. 3-1 the roads at present serve only very limited parts of the area while the rivers provide the only real mode of transport in the remainder of the area. Although the main population centres in the Study Area are served by regular MAS air service, its capacity is very limited.

Coastal shipping plays an important role in transporting goods between the Study Area and other areas such as to Kuching, Sibul, Sabah and to foreign countries rather more than the three existing ports of Miri, Marudi and Limbang. A land linkage utilizing two ferries and a passenger ferry operating between Miri and Limbang via Brunei exists.

3-1-2 Present Conditions

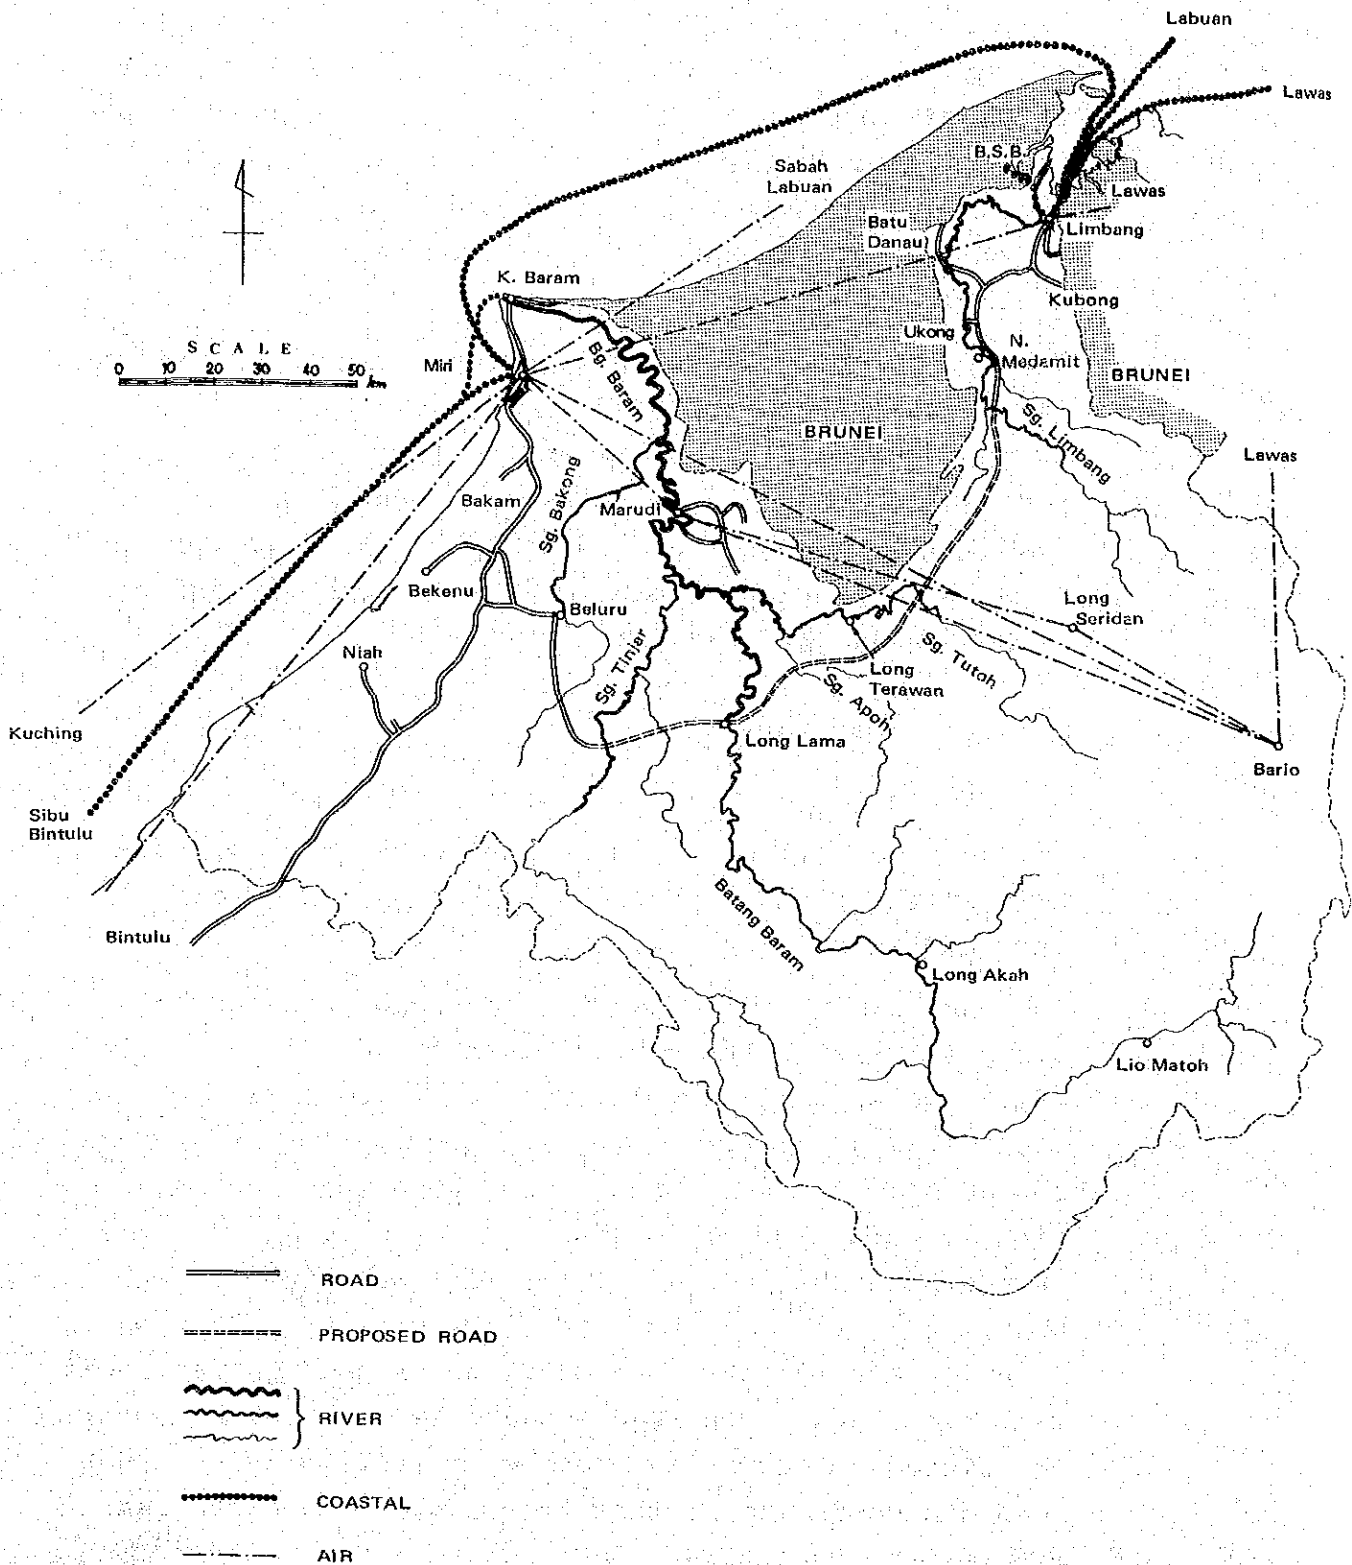

(1) Roads

Roads serve most of the Miri Districts, the northern half of the Limbang District and the isolated Marudi area and its near vicinities.

The Miri-Bintulu Road having been completed in the early 1970s with the trunk road standard, is a 130 km (81.3 miles) long gravel road except for some 10 km (6.3 miles) from Miri which is surfaced.

The feeder roads branching from there link Bakamu, Niah, Beluru etc. This road further extends to Kuala Baram where the ferry operates from and then to the Brunei border where the road links with a trunk road in Brunei. Most of the road sections are bitumen surfaced with two lanes. The road section between Beluru and Sg. Tinjar is currently under construction using trunk road standards and at this time only a few miles remain before its completion. The Limbang - Ng. Medamit Road

Fig. 3-1 TRANSPORT NETWORK OF THE STUDY AREA

covering 41 km(25.6 miles) utilizing a feeder road standard has several feeder roads branching from it serving the major population centres of the Limbang District. Most of the sections of these roads are of gravel except those in Limbang town and its vicinity. Feeder roads of some 30 km(18.8 miles) exist in the Marudi areas of which the main link is between Marudi and Lubok Nibong with some sections in Marudi town being bitumen surfaced.

(2) River

The river system extensively covers most of the Study Area. The Bg. Baram and its major tributaries of Sg. Bakon, Sg. Tinjar, Sg. Apoh and Sg. Tutoh serve nearly the whole of the Baram District while Sg. Limbang and its tributaries serve the Limbang District. In these areas natural communities have been developed along these navigable water ways.

Bg. Baram, the second largest river in Sarawak, is abundant in water throughout the year and provides a reliable water transport channel for the maximum 400 ton motor vessels, barges etc. from Kuala Baram to Long Lama, 225 km(141 miles) upriver. The passenger express launches with capacities of 60-80 passengers are also operating daily on the K. Baram - Marudi - Long Lama section. Other major sections of the system are also navigable for smaller vessels with capacities of 10 to 30 tons depending on the water level. For long boats which are the most popular personal means of transport, most of the rivers are navigable all the year round. The Sg. Limbang is also a relatively sizable river system and plays an important role in transporting logs from Ng. Medamit to Limbang over 100 km(62.5 miles).

The Sg. Limbang system is navigable for longboats though some sections in the upper reaches have navigational difficulties during periods when the water level

is low as also occurs in the upper reaches of the Bg. Baram system as well.

(3) Coastal Shipping

The ports in the Study Area being located in Miri, Marudi and Limbang are the basis of external trade of which Miri is the most important. Shipping between Miri and destinations within the South China Sea is at present mainly served by 1,500 to 3,000 ton vessels employing literage service in transporting goods to and from Miri to the open anchorage outside Miri. Shallow draft vessels able to cross the Miri sand bar with 300 to 400 ton cargo goods at high tides are also being operated between Miri, Kuching, Sibul and neighbouring countries.

The small coasters having shallow draft can avoid the difficult stevedoring operation at Miri Roads therefore being able to compete with larger ships in economy even for the section between Singapore and Miri. Kuala Baram is better situated having a water depth at the Baram bar of about 2.7 m. (9 feet) at high tide which can facilitate the use of shallow draft vessels with up to 1,500 tons loading capacity but however Kuala Baram is situated some 25 km (15.6 miles) from Miri, which necessitates the need for trucking to Miri at a cost of some M\$5 to M\$6 per ton.

Marudi is at present served by shipping services to Singapore and Peninsular Malaysia via trans-shipment Labuan with frequent launch services to/from Kuching, Sibul and Miri via Kuala Baram being also available. The Bg. Baram is sufficiently wide and deep at Marudi to facilitate calls of shallow draft vessels with loading capacity of up to about 1,000 to 1,500 tons. It would, however, be necessary to construct new and better port facilities to accommodate the larger vessels. Goods transport demand through Marudi port was approximately 24,000 tons in 1977, thus the most popular kind of

vessels are those with loading capacity of up to 200 tons.

Limbang is at present also served by shipping services as has been described for Marudi. The bar at the mouth of the Sg. Limbang restricts calls of vessels with loading capacities of more than 300 to 500 tons depending on the vessel type. During the "landas season" the vessels often face difficulties in crossing the bar with the result that ship calls are reduced to approximately 40 percent of normal operation.

(4) Air

At present, five airports exist in the Study Area, these being Miri, Marudi, Limbang, Long Seridan and Bario. Miri Airport has facilities to handle aircraft types up to that of the Boeing 737, which began utilizing the airport in 1977, but at the remainder of the airports only small aircraft such as the BN2 with a limited passenger capacity of only eight can be facilitated. Augmenting the regular service by MAS, frequent charter flights operated by other companies are available. Expansion of Limbang Airport currently under study envisage facilities having the ability to handle aircraft of the Boeing 737 type.

3-2 OUTLINE OF THE TRAFFIC SURVEYS

At present comprehensive traffic data, covering the Study Area, is scarce in its availability. As of road traffic, however, the traffic count figures at major points have been adequately prepared with traffic counts covering a complete week during each census period having been carried out twice a year since the early 1970s, although no origin and destination surveys have been conducted. Statistics of air passenger and cargo movements were available at the Department of Civil Aviation in each of the Districts. Statistics of imports and exports by port were compiled by the Statistical Department in the form of computer outputs. However the port statistics indicate only the external movements of goods. Information on river traffic and coastal shipping traffic in the Study Area was actually not at all available.

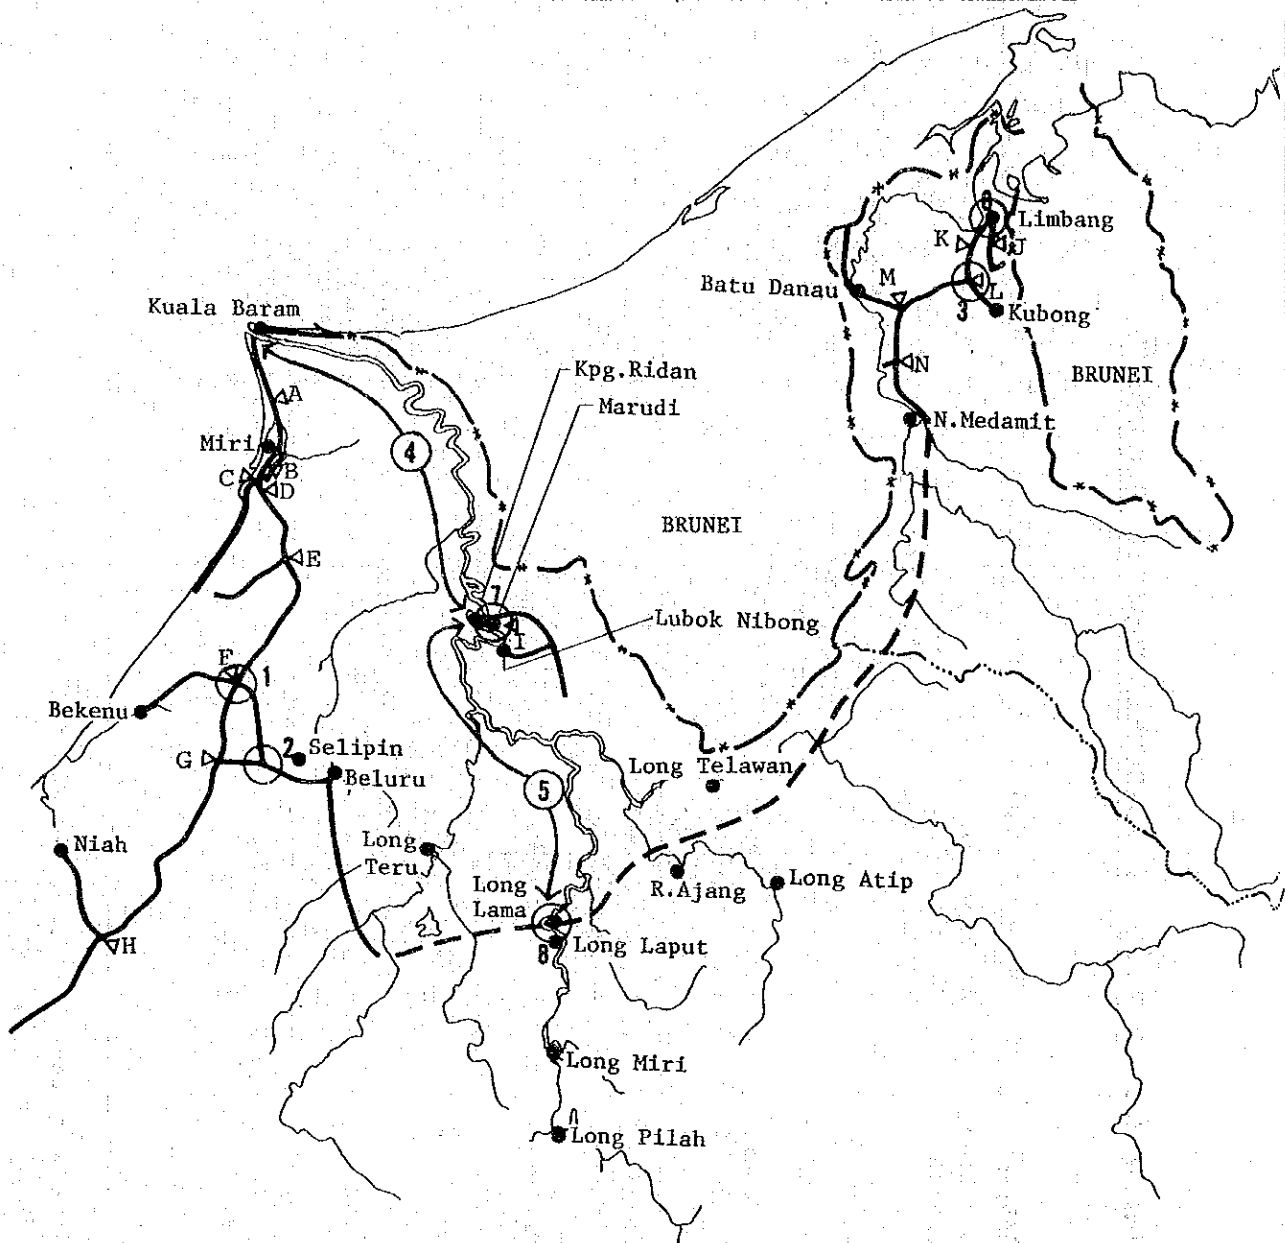

In order, therefore, to obtain characteristics and distribution of traffic particularly by river and road, different types of traffic surveys were conducted as shown in Table 3-1. The location of the survey stations is shown in Fig. 3-2.

Table 3-1 OUTLINE OF CONDUCTED TRAFFIC SURVEYS

Traffic Type	Survey Station	Survey Period	Survey Method	Major Survey Items
Road Traffic	1 Miri-Bintulu Road, Bekenu Junction	27 July (Thu.), 28 July (Fri.) 7 a.m. - 5 p.m.	traffic count	- vehicle type - orig. and dest. - vehicle characteristics
	2 Beluru Road, B. Peninjau Junction	- do -	interviews with drivers by stop- ping the vehicles	- No. of passengers - tonnage and type of goods carried
	3 Limbang-N. Medamit Rd., Kubong Junction	1 Aug. (Tue.) 2 Aug. (Wed.) 7 a.m. - 5 p.m.		
Express Launch Passenger Traffic	4 On the launches, K. Baram - Marudi	5 Aug. (Sat.) -8 Aug. (Tue.)	traffic count	- orig. and dest. - trip purpose
	5 On the launches, Marudi - L. Lama	6 Aug. (Sun.) -12 Aug. (Sat.)	interviews with passengers	- passenger characteristics
River Goods Traffic	7 Marudi Wharf	6 Aug. (Sun.) -12 Aug. (Sat.)		- orig. and dest. - No. of passengers - tonnage and type of goods carried - average travel time
	8 L. Lama Wharf	7 Aug. (Mon.) -10 Aug. (Thu.)	interviews with vessel operators	
Speed Boat Passenger Traffic	9 Limbang Customs Wharf	1 Aug. (Tue.) 2 Aug. (Wed.)	interviews with passengers	- orig. and dest. - trip purpose - travel time - passenger character- istics

1/ samples of survey sheets used for the surveys above mentioned are contained in Appendix Fig. A-3-1 ~ 4.

3-3 ROAD TRAFFIC

3-3-1 Road Traffic Volume

(1) Average Daily Traffic

The results of the traffic census being carried out by P.W.D. twice a year indicate fairly good ADT level on the major road sections in the Study Area as shown in Table 3-2. ADT on the Miri - Bintulu Road varies approximately from 300 to 5,000 and its annual increase rate becomes higher in the vicinity of Miri. ADT on the Limbang - Ng. Medamit Road is much lower and is only about 120 to 230 except the section near Limbang Town where the ADT reaches approximately 1,500.

Table 3-2 AVERAGE DAILY TRAFFIC AT CENSUS STATIONS ON EXISTING MAJOR ROADS IN THE STUDY AREA 1/

Survey 3/ Station	Name of Road	1974	1975	1976	1977	1978 ^{2/}	Average Annual Growth Rate (%)
A	Miri - K. Baram road	1,066	1,053	823	1,002	891	44.0
B	Lutong - Miri road	4,436	5,568	6,697	9,095	8,696	20.2
C	Miri - Tg. Lobang road	3,095	3,742	3,211	3,091	3,484	0.5
D	Miri - Bintulu road (Miri town)	1,852	2,206	2,294	3,333	5,363	28.9
E	Miri - Bintulu road (Bakam junction)	542	469	468	575	1,513	25.3
F	Miri - Bintulu road (Bekenu junction)	466	452	398	753	716	14.7
G	Miri - Bintulu road (Beluru junction)	307	342	299	515	356	7.3
H	Miri - Bintulu road (Batu Niah junction)	246	255	260	305	n.a.	6.9
I	Marudi - Ulu Linei road	1,036	588	706	537	984	41.9

M	Limbang - N. Medamit road (Batu Danan junction)	111	96	118	102	121	2.2
N	Limbang - N. Medamit road (Ukong junction)	81	73	83	73	71	43.3

Source: P.W.D. traffic census

1/ 12-hour traffic for both directions excluding motor cycles

2/ First-half year data only

3/ Location of survey stations is shown in Fig. 3-2.

(2) Traffic Composition

Traffic composition by vehicle type is summarized in Table 3-3 which indicates that passenger cars generally have a share of nearly 70% in the immediate vicinity of towns like Miri and Limbang but with their shares being reduced to 30% to 50% in the suburban or rural areas while trucks share higher percentages.

Table 3-3 TRAFFIC COMPOSITION BY VEHICLE TYPE, 1978

Survey Station	Name of Road	Car/Taxi			Van and Trucks			Others (%)
		Car	Taxi	Bus	Van	Truck Trailer	Truck	
A	Miri - K. Baram road	56.0	13.5	2.7	-	-	11.6	16.2
B	Miri - Lutong road	63.8	5.6	2.7	4.0	0.3	14.0	9.6
C	Miri - Tg. Lobang road	78.9	1.4	3.2	1.1	-	5.2	10.2
D	Miri - Bintulu road (Miri town)	36.0	7.4	4.8	8.4	0.7	24.9	17.8
E	Miri - Bintulu road (Bakam junc.)	32.7	17.4	3.1	0.3	6.9	29.3	10.3
F	Miri - Bintulu road (Bekenu junc.)	26.4	16.1	1.6	8.3	-	33.5	14.1
G	Miri - Bintulu road (Beluru junc.)	22.8	10.9	2.7	4.8	1.1	43.8	13.9
I	Marudi-Ulu Linei road	58.8	5.8	3.8	-	0.4	11.4	19.8
J	Limbang - Pandaruan road	46.5	7.8	2.8	6.1	0.2	15.9	20.7
K	Kubong - Limbang road	58.9	9.6	3.0	4.6	12.8	-	11.1
L	Limbang - N. Medamit road (Kubong junc.)	28.0	30.6	11.8	3.9	2.6	6.1	17.0
M	Limbang - N. Medamit road (Batu Danau junc.)	21.9	35.2	8.6	-	7.0	1.6	25.8

Source: PWD traffic census

(3) Traffic Variation

Daily variation of the road traffic at major census stations is illustrated in the Appendix Fig. A-3-5 and Table 3-4 shows the ratio of 12 hour traffic to 24 hour traffic. The ratio is higher in the vicinity of towns where the hours of activities are longer.

Table 3-4 DAYTIME TRAFFIC RATIO

Name of Road	Survey Station	Traffic Volume		Daytime Traffic Ratio
		Daytime 6 a.m.-6 p.m.	24 Hours	
Miri - K. Baram road	A	893	1,011	1.13
Miri - Lutong road	B	8,697	11,841	1.36
Miri - Bintulu road (Miri town)	D	5,363	6,002	1.12
Miri - Bintulu road (Bakam Junc.)	E	1,513	1,584	1.05
Miri - Bintulu road (Bekenu Junc.)	F	717	1,003	1.40

The weekly variation of the road traffic does not necessarily show any distinctive patterns as shown in Appendix Fig. A-3-6.

(4) Estimated ADT on the Project Road Sections

Based on the results of PWD traffic census and those of the traffic surveys conducted by the Survey Team, the ADT on the existing sections of the Project Road was estimated as shown in the Table 3-5.

Table 3-5 ADT ON THE EXISTING PROJECT ROAD, 1978

Section	Length (km.)	Van/ Car Pick up Truck				Bus	Total
		Car	Pick up	Truck	Bus		
Miri/Bintulu Rd. - Beluru	18.0	60	17	97	2	176	
N. Medamit - Ukong Junc.	10.7	35	5	22	7	69	
Ukong Junc. - Batu Danau Junc.	8.3	46	6	30	6	88	
Batu Danau Junc. - Kubong Junc.	13.4	96	13	65	9	183	
Kubong Junc. - Limbang	8.6	565	42	200	25	832	

3-3-2 Road Transport

(1) Bus Transport/Taxi

At present five bus companies are operating in the Study Area of which three are in Miri and one in Limbang and Marudi respectively. Of the three bus companies in Miri, two operate mostly in Miri Town. Table 3-6 summarizes the operating conditions of buses in the Study Area.

Table 3-6 BUS TRANSPORT IN THE STUDY AREA

Area	Year	No. of Buses	Total Kilometrage	Average Kilometrage per Bus	Total Passengers
Miri	1968	30	1,115,550	101.9	1,721,392
	1973	32	1,935,900	165.7	2,390,508
	1977	45	2,680,600	163.32	4,575,144
Limbang	1968	5	348,820	191.1	77,732
	1973	3	547,060	499.6	30,000
	1977	9	353,070	107.5	161,518
Marudi	1977	3	66,670	60.9	52,500

Source; Land Transport Department

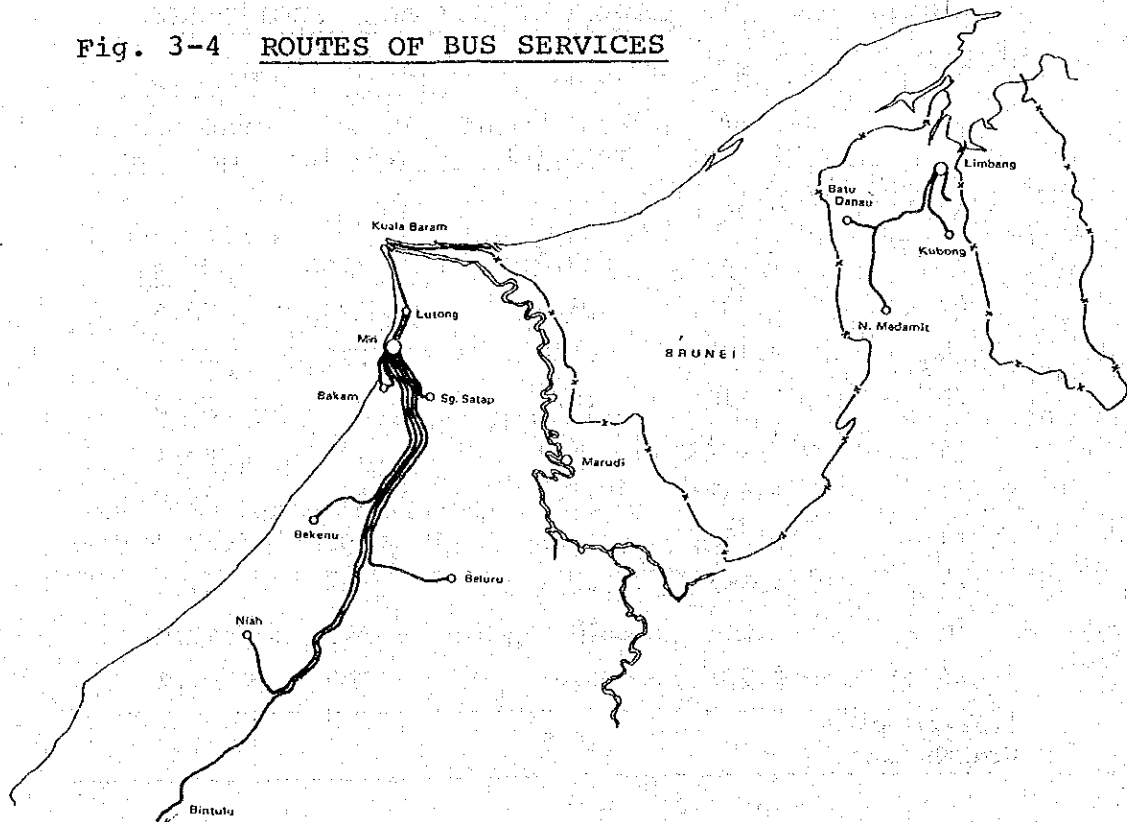

Bus fare is established in proportion to the distance travelled being M\$0.1 per mile or M\$0.062 per kilometer with a basic minimum fare of M\$0.20. Bus routes and fares outside of towns are summarized in Table 3-7 and Fig. 3-4.

In the Study Area, the taxi service plays an important role not only in towns but also outside of them mainly due to the fact that the taxi fare per person with four to five passengers carried together equals the bus fare on longer distances and also partly due to the low frequency of bus services.

Table 3-7 BUS ROUTES AND FARE

Route	Distance km. (miles)	Fare (M\$)	Frequency of Services (vehicle/day)
Miri ↔ Lutong	11.3 (7)	0.70	60
Miri ↔ Sungei Satap	48.3 (30)	3.00	4
Miri ↔ Bakam	17.7 (11)	1.20	4
Miri ↔ Batu Niah	112.6 (70)	7.00	8
Miri ↔ Beluru	80.5 (50)	5.00	4
Miri ↔ Bekenu	64.4 (40)	4.00	18
Miri ↔ Bintulu	202.7 (126)	10.00	1
Limbang ↔ Kubong	19.3 (12)	1.20	18
Limbang ↔ N. Medamit	40.2 (25)	2.50	6

Fig. 3-4 ROUTES OF BUS SERVICES

(2) Truck Transport

Trucks in usage in the Study Area usually have only a loading capacity of five to six tons, although PWD along with some oil companies have a few truck-trailers with higher loading capacity while some timber companies have articulated vehicles with up to 20 ton loading capacities operating on their own timber roads but the number is very limited.

The main reason for limiting trucks to five to six ton loading capacity is the existence of numerous temporary bridges, mostly of the Bailey-bridge type.

(3) Number of vehicles

Statistics on vehicle registration are available only by Division. Table 3-8 shows the trend of the number of vehicles in the 4th and 5th Divisions.

Table 3-8 THE NUMBER OF VEHICLES REGISTERED

	<u>Fourth Division</u>		<u>Fifth Division</u>	
	<u>No. of Vehicles</u>	<u>Annual Growth rate (%)</u>	<u>No. of Vehicles</u>	<u>Annual Growth rate (%)</u>
1967	1,709	-	137	-
68	2,188	28.0	179	30.6
69	2,704	23.6	223	24.6
70	3,191	18.0	313	40.4
71	3,720	16.6	389	24.3
72	4,000	7.5	436	12.1
73	4,452	11.3	462	6.0
74	5,241	17.7	500	8.2
75	5,887	12.3	538	7.6
76	7,686	30.6	690	28.3
77	8,879	15.5	719	4.2
Average Annual Growth Rate %		16.5		17.2

3-4 PASSENGER TRAFFIC BY RIVER/COASTAL SHIPPING

3-4-1 River Passenger Traffic in the Baram Areas

Passenger transport in the Baram Area totally rely on river traffic with the exception of a very small number of passengers utilizing air services. Transport of passengers is at present being done by express launches operated by the shipping companies and also with speed boats/long boats owned by individuals/long houses.

(1) River Passenger Traffic by Express Launches

Express launches are being operated twice a day per direction between K. Baram and Marudi and once a day per direction between Marudi and Long Lama. 4 launches owned by two companies are in service for K. Baram - Marudi section while 3 launches owned by three companies for Marudi - Long Lama section. Outline of the express launch operation is seen in the Table 3-9 below.

Table 3-9 OUTLINE OF EXPRESS LAUNCH OPERATION

	K. Baram-Marudi	Marudi-L. Lama
Distance (km.)	100 (64 miles)	120 (75 miles)
Average Travel Time (hr.)	3.0 ~ 3.5	5.0 ~ 5.5
Average Speed (km./hr.)	29 ~ 33	22 ~ 24
Fare per passenger (M\$) ^{1/}	10,5,3	9,8,7,6,5,4,3
Capacity (No. of passenger seats)	70 ~ 80	60 ~ 70
No. of ships in service	4	3
Average No. of passengers per trip in 1977	40	35

Source: Interviews with operators

^{1/} Fare varies depending on the travel distance.

Although the time table is stated as shown in the Table 3-10, delays of half an hour to one hour occur frequently mainly because of the fact that launches stop wherever the passenger want to embark or disembark.

Table 3-10 TIME SCHEDULE OF EXPRESS LAUNCHES

Direction	Departure	Arrival	Departure	Arrival
Kuala Baram → Marudi	7:30	10:30	13:00	16:00
Marudi → K. Baram	10:00	13:00	13:30	16.30
Marudi → Long Lama	7:30	12:30	-	-
Long Lama → Marudi	8:00	13:00	-	-

Table 3-11 shows the total number of passengers estimated by summarizing the records of shipping companies in Marudi. Average annual growth rate is as high as 18.9 percent.

Table 3-11 NUMBER OF PASSENGERS MOVING BY EXPRESS LAUNCHES

Year	No. of passengers	Growth
1974	50,400	-
1975	64,800	129
1976	72,000	111
1977	79,200	110
1978 ^{1/}	100,800	127

Source: Interviews with shipping companies

^{1/} Estimated based on the actual data of Jan. through July.

The distribution of the passenger traffic by express launch is summarized in the Table 3-12.

(2) River Passenger Traffic by Speed Boats/Long Boats

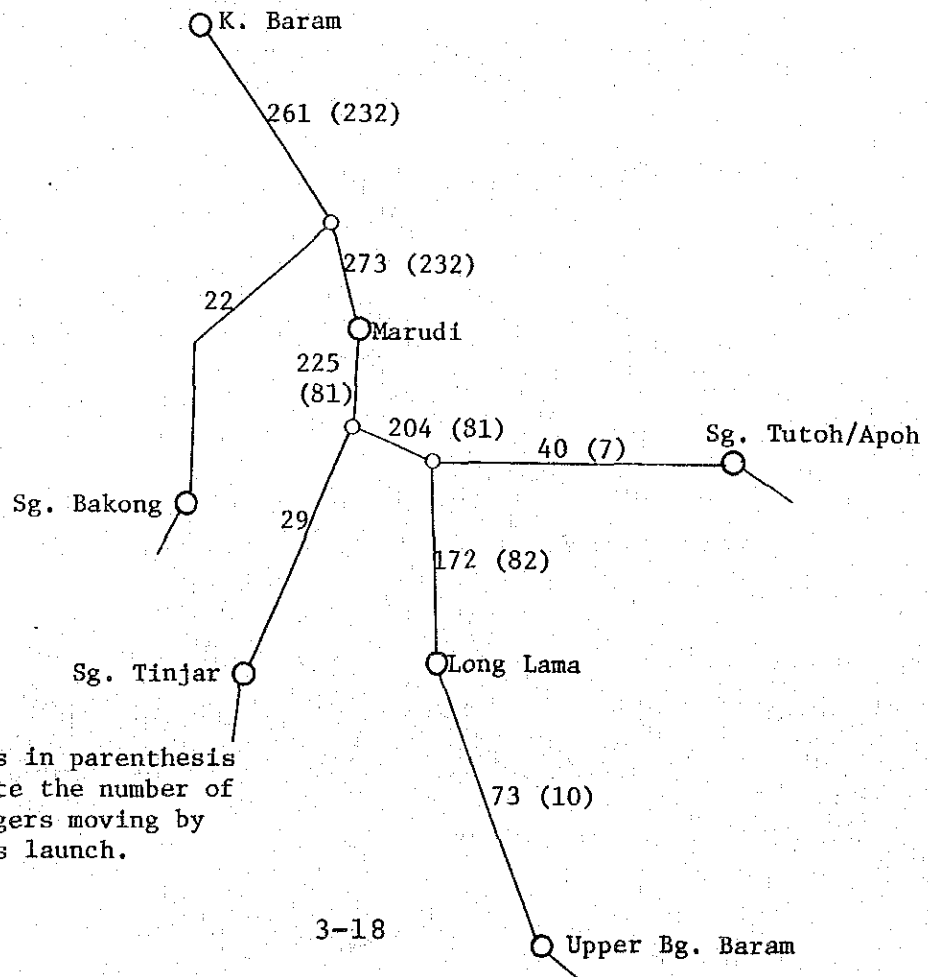

Beside the regular services of passenger express launches, numerous small vessels like speed boats and long boats are operating throughout the Bg. Baram system. Traffic surveys were carried out in Marudi and Long Lama in order to obtain the level of such traffic. As is shown in Table 3-12 which summarizes the interzonal traffic level by speed boats/long boats, trips are distributed quite extensively in spite of the considerably expensive operating cost, long travel time and inconveniences. During the survey period, it was often observed that people travel over long distances taking up to several days.

Table 3-12 DISTRIBUTION OF RIVER PASSENGER TRAFFIC
IN THE STUDY AREA, 1978 1/

		person/day							
		Sg. Bakong	Sg. Tinjar	Marudi	Long Lama	Upper Baram	Tutoh/Apoh	Total

BARAM AREA 1/

1/ Figures in parenthesis indicate the number of passengers moving by express launch.

3-4-2 Passenger Movement between Limbang and Brunei by SPEED BOAT

Frequent daily services by a number of small speed boats are available between Limbang and Brunei.

Table 3-13 shows the number of passengers moving along the section.

Table 3-13 NUMBER OF PASSENGERS MOVING BY SPEED BOAT BETWEEN LIMBANG AND BRUNEI

Year	Out (to Brunei)		In (from Brunei)	
	Persons/ year	Average/day	Persons/ year	Average/day
1973	87,060	239	90,997	249
1974	41,792	114	43,170	118
1975	62,330	171	60,327	165
1976	88,952	244	93,981	257
1977	83,020	277	87,196	239
1978	n.a.	388 ^{1/}	n.a.	317 ^{1/}

Source: Immigration Office, Limbang

^{1/} Estimated based on the sample survey carried out on 1st. 2nd. Aug. at Customs Wharf, Limbang

The speed boats with an average capacity of 15 passengers are operating daily between 7a.m. and 6p.m., taking only about 20 minutes to reach the other side. According to the survey results, trip purposes of passengers are mainly shopping, recreation and visiting while those of bussiness are scarce.

Of these passengers, those who travel between Miri and Limbang via Brunei are included and are estimated to share 2.7 percent or 13 passengers per day in 1977 or 18 passengers per day in 1978.

3-5 RIVER GOODS TRAFFIC

Information concerning goods movement on the river system in the Study Area was difficult to discern even though interviews with the operators of vessels were carried out, the reasons being that the goods transported are diverse and operators often do not know how much tonnage they are actually carrying.

Table 3-14 shows the tonnage of goods handled at the Port of Marudi of which certain amounts are transported by smaller vessels/longboats between Marudi and other regions in the Baram Area. As is shown in Appendix Table A-3-1 most of the vessels calling at Marudi are those with a loading capacity of up to 30 tons while those with a loading capacity greater than 100 tons are scarcely seen.

Table 3-14 TONNAGE OF INCOMING CARGO HANDLED AT THE PORT OF MARUDI, 1977

Commodity Group/Item	EXTERNAL ^{1/}	INTERNAL ^{2/}
Food	262	1,600
Milled Wheat	132	110
Sugar	340	400

^{2/} Consultant's estimate based on the results of interview survey etc.

3-6 AIR TRAFFIC

Table 3-15 shows the air traffic volume both of passengers and cargos for major airports in the Study Area. Significant growth rates in air passenger traffic both at the airports of Miri and Limbang have been experienced since 1973 or 1974. Air cargo traffic has been increasing at much higher growth rates for all airports with particular growth of air cargo traffic at Miri from 1976 to 1977.

Miri Airport, being one of the most busiest airports in Sarawak, handles about 170,000 passengers and 630,000 tons of cargo while Marudi and Limbang handles 8,000 passengers and 150 tons of cargo, and 14,000 passengers and 90 tons of cargo in 1977 respectively.

Table 3-15 AIR TRAFFIC OF MAJOR AIRPORTS IN THE STUDY AREA

Year		Miri		Marudi		Limbang	
		Passenger	Cargo (tons)	Passenger	Cargo (tons)	Passenger	Cargo (tons)
1973	Dep.	51,408	48,529	-	-	-	-
	Arriv.	52,180	93,199	-	-	-	-
	Total	103,588	141,728	-	-	-	-

Of the airway routes, those which relate with the Project Road are given in Table 3-16. Traffic for each of these routes has been increasing considerably, with its growth being greatly affected by its capacity. Types of aircraft are limited to those of up to the BN2 class with capacity of a maximum of 8 passengers depending upon the loading weights of cargo. Therefore the actual occupancy rates will be higher than those shown in Table 3-16.

Table 3-16 OPERATING CHARACTERISTICS OF AIR ROUTES IN THE STUDY AREA

Air Route	No. of Passengers		Average Annual Growth Rate(%)	Frequency of Services	Occupancy Rate(%)
	1973	1977			
Miri - Marudi	5,728	6,302	2.4	24/week	81.7
Miri - Limbang	4,252	10,179	24.4	40/week	75.3
Marudi - Long Seridan	n.a.	205	n.a.	4/week	29.0

Source; Dept. of Civil Aviation

Distribution of air passenger traffic is estimated based on the statistics shown in Appendix Table A-3-2, A-3-3 as follows:

<u>Routes</u>	<u>Daily Passenger Flow</u>
Miri - Marudi:	20
Miri - Limbang:	30
Miri - Bario:	1
Marudi - Bario:	3
Marudi - Long Seridan:	1

Chapter 4

ESTIMATION OF FUTURE TRAFFIC DEMAND

4-1 METHODOLOGY

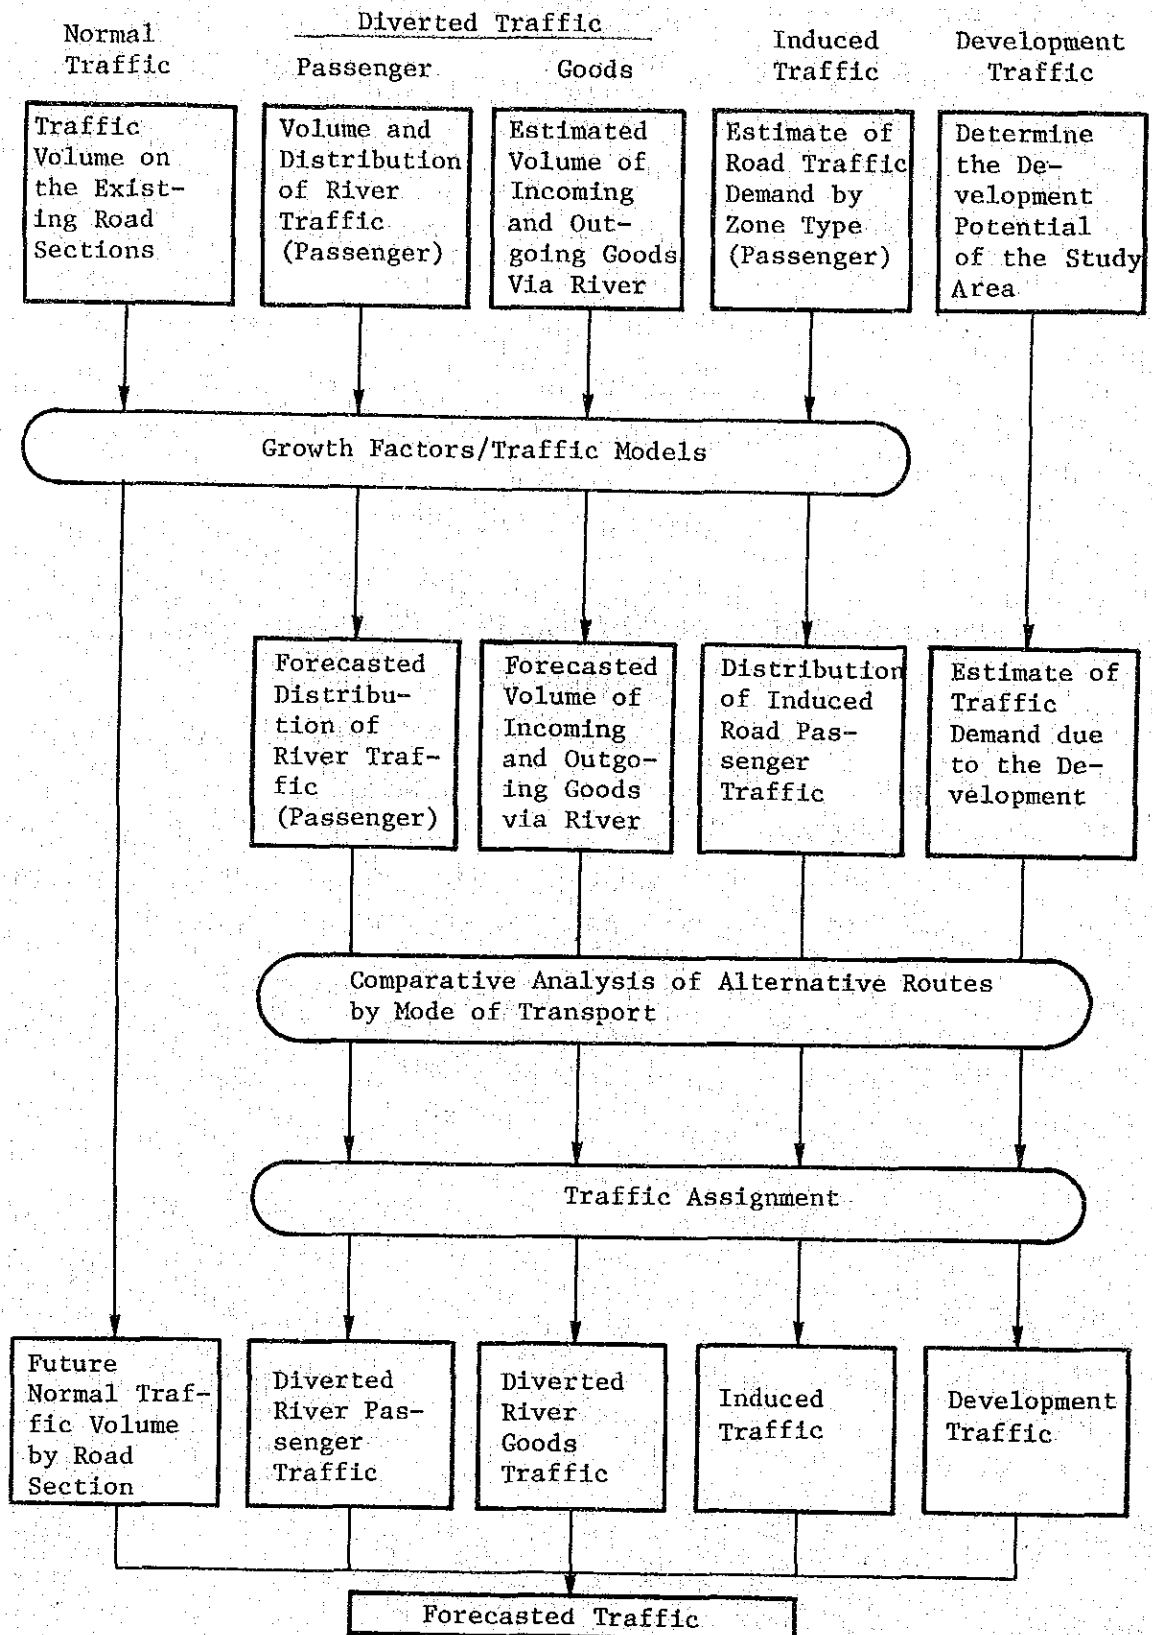

4-1-1 Traffic Forecast Methodology Outline

Future traffic volume on the Project Road is forecasted for each of four different types of traffic defined as follows:

- (1) Normal Traffic; traffic existing and continuing to do so on the present roads regardless of the completion of the Project Road.
- (2) Diverted Traffic; normal traffic existing on the present transport network but to divert to the Project Road on its completion due to the reduction in travel time and/or transportation cost.
- (3) Induced Traffic; traffic not in existence before the completion of the Project Road but which will be generated after its completion.
- (4) Development Traffic; traffic not in existence before the completion of the Project Road but which will be generated after its completion due to the development of any projects which will be realized with regard to the completion of the Project Road.

Although the details of forecast methods for the respective type of traffic are described in the following papers, the outline is presented in Fig. 4-1.

Fig. 4-1 OUTLINE OF THE TRAFFIC FORECAST METHOD

4-1-2 Zoning of the Study Area

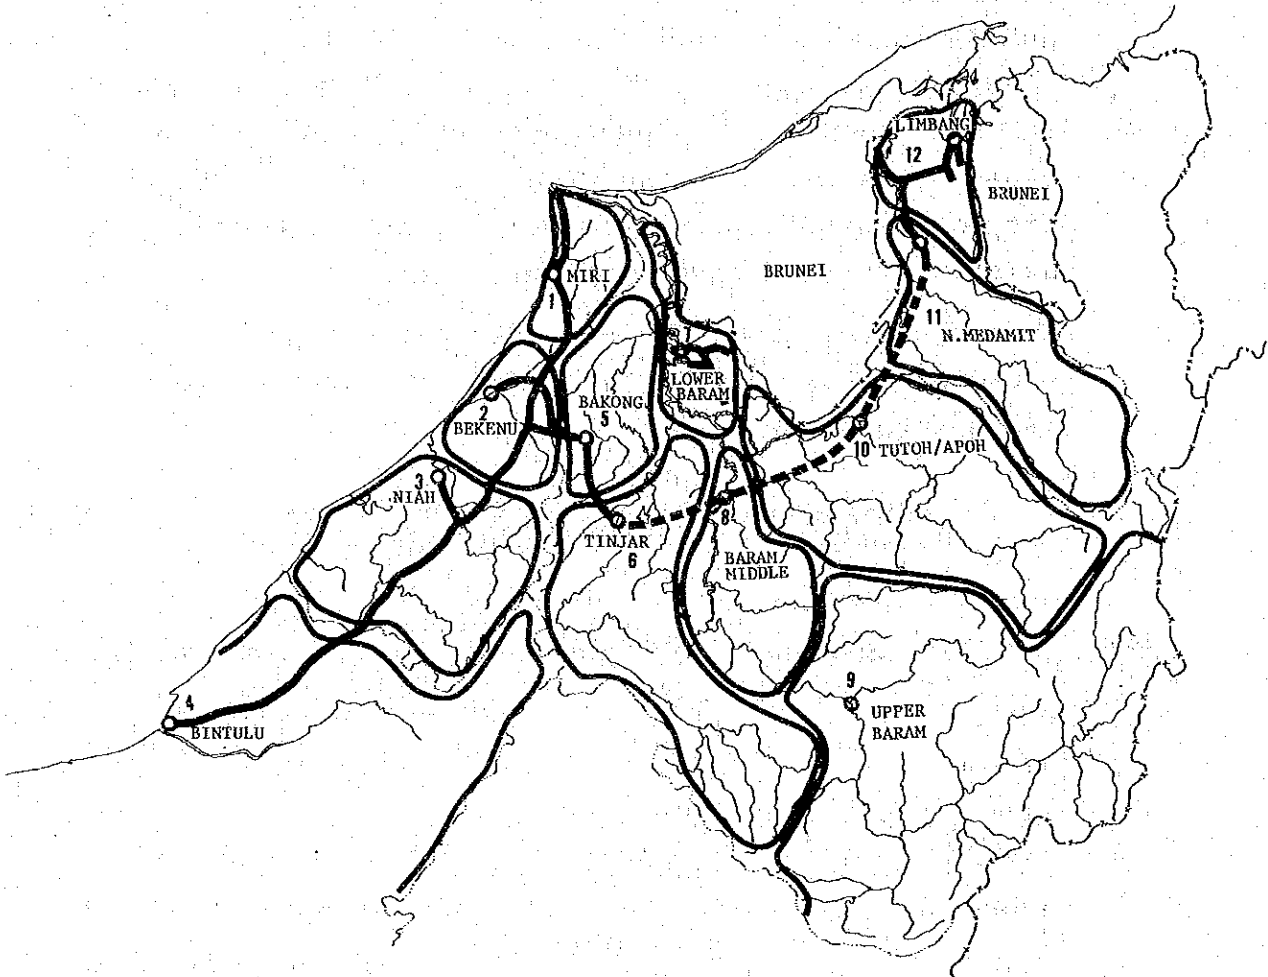

For the purpose of traffic analysis, the Study Area and its neighbouring areas were divided into twelve traffic zones as shown in Fig. 4-2. Niah sub-district and Bintulu sub-district were included in this study due to the fact that the proposed development of the Bintulu area is expected to strengthen the relations between it and the Study Area with the possibility of additional traffic being generated and/or the existing traffic flow undergoing change.

In zoning the areas the administrative boundary of the sub-districts, roads, rivers and their basins were taken into account.

Table 4-1 ZONING OF THE STUDY AREA

Zone	Name of Zone	Centre of Zone	River Basin/Road

Fig. 4-2 ZONING MAP FOR
TRAFFIC ANALYSIS

4-1-3 Population Estimates by Traffic Zone

As population is the most reliable economic indicator of which area-wise statistics are available, the population figures estimated by the administrative sub-districts as shown in Table 2-5 of Chapter 2, were modified based on the estimated population of major river basins as shown in Appendix Table A-4-7 and Appendix Figure A-4-1. The population of the Bintulu area was estimated based on the Bintulu Master Plan Study. The results being shown in Table 4-2 below.

Table 4-2 ESTIMATED POPULATION BY TRAFFIC ZONE

Traffic Zone	Name	1977	1982	1987	1992	2002
1	Miri	50,700	63,300	78,600	95,300	137,500
2	Bekenu	12,900	14,600	16,400	18,100	21,600
5	Sg. Bakong	5,780	6,750	7,800	8,800	11,100

12	Limbang	18,000	20,400	23,000	25,500	30,800
Total	Study Area	136,000	159,200	185,900	213,600	278,900
3	B. Niah	14,200	16,100	18,100	20,000	23,900
4	Bintulu	18,200	24,200	32,300	43,000	76,300

4-2 NORMAL TRAFFIC

Future traffic volume on the existing road sections along the Project Road was forecasted by estimating the most likely growth rates of the road traffic in the project area and multiplying these rates by the present A.D.T.

As the past road traffic figures do not show a consistent trend and also as they vary by year considerably due to the low level of absolute amount of traffic, the future growth rates for different road sections were determined by comparing the growth rates of other economic parameters such as vehicle ownership, population and GDP with each other to gain their relationship with the traffic level. The following table summarizes the results of the forecast.

Table 4-3 FORECASTED NORMAL ROAD TRAFFIC (ADT) ON THE EXISTING PROJECT ROAD SECTIONS

Road Section	Base year (1978)	1982	1987	1992	2002	Average Annual Growth Rate (%)		
						1978-1982	1982-1992	1992-2002
Miri/Bintulu Rd. - Beluru (18km)	176	258	379	557	907	10.0	8.0	5.0
Beluru - Sg. Tinjar (38km)	10	12	14	17	23	4.0	3.8	2.9
N. Medamit - Ukong Junc. (10.7km)	69	77	86	96	115	2.7	2.3	1.8
Ukong Junc. - Batu Danau Junc. (8.3km)	88	97	107	118	137	2.4	2.0	1.5
Batu Danau Junc. - Kubong Junc. (13.4km)	183	202	224	249	301	2.5	2.1	1.9
Kubong Junc. - Limbang (8.6km)	832	1,162	1,540	2,041	2,935	8.7	5.8	3.7

Traffic composition by vehicle type was estimated based on its past trends on the existing road sections and with the forecasted future vehicle ownership figures. Table 4-4 shows the forecasted traffic composition by vehicle type and Table 4-5 shows the forecasted normal traffic by vehicle type.

4-3 DIVERTED TRAFFIC

4-3-1 Diverted River Passenger Traffic

(1) Future Demand of River Passenger Traffic

The past trend of the number of passengers transported by express launches is the most reliable indicator as a basis of computing future traffic demand.

As can be seen in 3-4-1 of Chapter 3, the growth rates for the last several years are very high appearing at first sight to be unrealistic. However, considering that the recent high growth was brought about partly by accelerated timber activities which have and are expected to continue to provide additional employment opportunities and partly by the general increment of income level in the internal areas, the growth rates assumed as shown in Table 4-6 below can be viewed as not being over optimistic.

Table 4-6 FUTURE GROWTH RATE OF PASSENGER RIVER TRAFFIC IN THE BARAM AREA

	1974/75- 1977/78	1978-1982	1982-1992	1992-2002
Annual Average Growth Rate (%)	19.7	10.0	8.0	5.0

Table 4-7 shows the future demand and distribution patterns of river passenger traffic estimated by applying the growth rates determined in Table 4-6.

1/ Figures in parenthesis are those of passenger express launches

(2) Comparison of Competitive Routes

With the completion of the Project Road, the present areas where the river is the only mode of transport will also be served by road as well. Comparative analysis of passenger movement between those using river and those using road forms of transportation was made as of distance, estimated travel time and estimated fares/transportation cost for the respective pairs of zones. Table 4-8 shows the characteristics of river and road between major traffic zones.

As is shown in Table 4-9 the comparative ratio of time distance and of cost of those using the route via the Project Road is distinctively superior than those utilizing the existing route. It is therefore expected that the river passenger traffic will be diverted to the Project Road from most of the internal areas. Table 4-10 shows the estimated diversion rate for the respective zone pairs.

(3) Diverted Passenger Traffic from River Transport
 Based on the figures shown in Table 4-7 and Table 4-10, the passenger traffic expected to divert to the Project Road from the existing river system was calculated as is shown in Table 4-11. This traffic was then assigned to the Project Road of which results are shown in Table 4-12.

4-3-2 Diverted River Goods Traffic

(1) Estimate of Goods Traffic Demand by River

Goods movement to and from the Study Area consists mainly of exports of agricultural products, timber and stones while imports are general consumer goods, construction materials, fertilizer, animal feed and fuels. The goods movement which relate to the Project Road will be mainly those transported to and from the Baram

District and partly of those to and from the Limbang District.

1) Estimate of Goods Requirement in the Baram and Limbang Districts.

Most of the goods required for consumption in the Baram and Limbang Districts are those needing to be imported. In order therefore to estimate the amount of goods to these Districts the per capita consumption level of food, milled wheat, sugar, beverages, cement, iron and steel, fuels and other general goods was determined based on the available statistics and the results of the field survey as is shown in Table 4-14. Table 4-15 shows the assumed consumption of animal feed and fertilizer usage in terms of per livestock head and per ha. respectively. Appendix Table A-4-2 shows the comparative figures of per capita consumption of major import items for Sarawak, Miri, Marudi and Limbang. Table 4-16 summarizes the estimated consumption of goods in the Baram and Limbang Districts.

Table 4-14 ESTIMATED PER CAPITA CONSUMPTION BY COMMODITY
ITEM/GROUP FOR BARAM AND LIMBANG DISTRICTS 1/

Commodity Group/ Item	kg/person									
	Baram					Limbang				
	1977	1982	1987	1992	2002	1977	1982	1987	1992	2002
Food	40	44.2	48.8	53.8	65.6	40	44.2	48.8	53.8	65.6
Milled Wheat	5	5.5	6.1	6.7	8.2	7	7.7	8.5	9.4	11.5

^{1/} Annual growth rate of 2% throughout the years is assumed.

2) Estimate of Outgoing Agricultural Products

Major agricultural products in the areas are rice, rubber and pepper. Nearly all the production of rubber and pepper is exported mainly via Miri, Marudi or Limbang and partly via Kuching. The surplus of rice in Baram District is transported to Miri.

Table 4-17 shows the estimated future deficit/surplus balance of rice in the Study Area. The surplus tonnage of Baram and Limbang Districts will be transported to the Miri area where a deficit of rice is expected to continue.

Table 4-17 ESTIMATED FUTURE DEFICIT/SURPLUS BALANCE OF RICE IN THE STUDY AREA

		tons				
		1977	1982	1987	1992	2002

	Balance	Δ1,659	Δ3,975	Δ4,682	Δ6,943	Δ11,497

^{1/} Includes Miri and Sibuti sub-districts

^{2/} Per capita consumption is assumed as follows:

Miri : 120 kg. for 1977 and 1982, 115 kg. for 1987 and 1992 and 110 kg. for 2002.

Baram : 160 kg. for 1977 and 1982, 150 kg. for 1987 and 1992 and 145 kg. for 2002.

Limbang: 155 kg. for 1977 and 1982, 145 kg. for 1987 and 1992 and 140 kg. for 2002.

Table 4-18 shows the tonnage of rubber and pepper to be exported by export point. Export amount tonnage by port were determined with consideration to the present amount levels of the ports.

Table 4-18 PRODUCTION AND EXPORTS OF RUBBER AND PEPPER OF BARAM AND LIMBANG DISTRICTS

Area	Rubber					Pepper					tons
	1977	1982	1987	1992	2002	1977	1982	1987	1992	2002

	Export:										
	Limbang	788	869	960	1,060	1,292	60	274	326	387	546
	Kuching	962	1,063	1,173	1,295	1,579	25	118	140	166	234

3) Transport of Stones

At present stones are being produced in Batu Gadin near Long Lama. Current production is approximately 150,000 tons per year and nearly all are transported in 300 to 400 ton barges down to Marudi, Miri and Brunei.

Roughly 15,000 tons are utilized in Marudi, while the rest are transported mostly to the Miri areas and partly to Brunei. It has been confirmed that the reserves are large enough to supply stones for the next 20 years at the present production level and it is expected that even after this period stones will be readily available. Production and export of stones were estimated as shown in Table 4-19.

Table 4-19 PRODUCTION AND EXPORT OF STONES
FROM BATU GADING

	1978	1982	1987	1992	000tons 2002
Production ^{1/} :	150	168.8	195.7	226.9	304.9
Export:					
Marudi ^{2/}	15	15.9	17.2	18.5	21.4
Miri/Brunei	135	152.9	178.5	208.4	283.5

^{1/} Annual growth rate of 3% is assumed.

^{2/} Annual growth rate of 1.5% is assumed.

4) Transport of Timber

Of the whole timber production of the Baram District, the tonnage produced upriver of the Project Road will be affected by the implementation of the Project Road as shown in Table 4-20. Production of hill timber in the upriver areas of the Project Road is assumed to increase.

Table 4-20 PRODUCTION AND EXPORT OF HILL TIMBER
OF THE BARAM DISTRICT

Area	1977	1982	1987	1992	H/T 2002
Whole of Baram	600	600	625	650	700
Area upriver of the Project Road	150	180	219	260	350
(% of whole of Baram)	(25)	(30)	(35)	(40)	(50)

5) Summary of Potential Tonnage of Outgoing and Incoming Goods

Table 4-21 summarizes the potential tonnage of outgoing and incoming goods that might be transported to/from the Miri areas. Table 4-22 and Table 4-23 show the estimated tonnage of incoming goods by traffic zone.

Table 4-21 SUMMARY OF TRANSPORT DEMANDS

		000tons

(2) Comparison of Transportation Cost between Road and River/Coastal Shipping for Major Sections

Transportation costs between road and river/coastal shipping were compared for major sections in order to know the advantages and disadvantages in transporting goods to and from the Study Area via the Project Road. Table 4-24 through Table 4-29 show the results of comparative analysis made, based on the operating costs of various types of vessels and vehicles estimated as shown in the Appendix A-4-5 through Appendix A-4-6. Time value is not taken into consideration in the analysis at all. The outlined results for the major sections are summarized as follows:

Long Lama - Miri

- a) In transporting general goods even 6 ton trucks are advantageous.
- b) 20 ton truck-trailers are able to compete with river transport in the movement of sinkers or

sawn timbers only if the goods are for local consumption in Miri and not for export.

- c) Roads are unable to compete with log rafting at all.

Long Lama - Bintulu

- a) The transporting of logs or sawn timbers by barge is approximately 20 per cent less in transportation cost than by utilizing 20 ton truck-trailers.
- b) General goods can be transported at less cost by truck than by motor vessel.

Limbang - Miri

Transportation cost of general goods by coastal shipping (motor vessel) is approximately half of that by 20 ton truck-trailer. Therefore coastal shipping will be very advantageous even if the influence of "landas" is taken into consideration.

Limbang - Bintulu

Same results derived as explained for Limbang - Miri.

N. Medamit - Miri

Larger trucks such as 20 ton truck-trailer can compete with coastal shipping due to the necessity of trucking at both ends.

Table 4-24 COMPARISON OF TRANSPORTATION COSTS
(Long Lama-Miri, General Goods)

Section	Long Lama - Miri	
Commodity Type	General Goods	
Mode	Road	vs. River
Vessel/vehicle Type	6 ton Truck	40ton/150ton Motor Vessel
Route: Distance(km.) Conditions	132 gradient 0-3% (1/2), 3-5% (1/2), paved road	River + Road (K. Baram-Miri) 220 + 25 Bg. Baram, flat paved road
Transportation Cost (M\$/ton)	<p>full load</p> <p>Line Haul: $M\\$0.6611/km \times 132km \times 1/6 \text{ tone} = M\\$14.54/ton$ Handling: $M\\$3.9/ton$ Total $M\\$18.44$</p>	<p>full load</p> <p><u>40 ton Motor Vessel</u> Line Haul, River: $M\\$266.01/day \times 2 \text{ days} (110km/day) \times 1/40 \text{ tons} = M\\$13.30/ton$ Line Haul, Road: $M\\$0.5226/km (6 \text{ ton truck}) \times 25km \times 1/6 \text{ ton} = M\\$2.18/ton$ Handling Cost: $M\\$5.5 + M\\$3.9/2 = M\\$7.45/ton$ Total $M\\$22.93/ton$</p> <p><u>150 ton Motor Vessel</u> Line Haul, River: $M\\$1,517.89/day \times \frac{220km}{300km/day} \times 1/150 \text{ tons} = M\\$9.28/ton$ Line Haul, Road: $M\\$1.83/ton$ Handling Cost: $M\\$7.45/ton$ Total $M\\$18.56/ton$</p>
Comments	Road is advantageous.	Average Transport Cost in use of fifty-fifty basis: $(M\$22.93 + M\$18.56) \times 1/2 = M\$20.75/ton$

Table 4-25 COMPARISON OF TRANSPORTATION COSTS
(Long Lama-Miri, Log (Sinker)/Stones)

Section	Long Lama - Miri

Vessel/vehicle Type	20 ton Truck - trailer	2 x 300ton Barge + 500HP Tug
Route: Distance(km.) Conditions	132 gradient 0-3% (1/2), 3-5% (1/2), paved road	River + Road (K. Baram-Miri) 220 + 25 Bg. Baram, flat paved road
Transportation Cost (M\$/ton)	<p>full load</p> <p>Line Haul: $M\\$1.3912 \times 132km \times 1/20 \text{ tons} = M\\$9.18/ton$ Handling Cost: $M\\$3.90/ton$ Total $M\\$13.08/ton$</p>	<p>full load</p> <p>Line Haul, River: $(M\\$355.40 \times 2 \times 220km/112km + M\\$664.96 \times 220km/90km) \times 1/600 \text{ tons} = M\\$5.04/ton$ Line Haul, Road: (Stones only, 6 ton Truck) $M\\$2.18/ton$ Handling Cost, (Log): $M\\$5.50/ton$ Handling Cost (Stones): $M\\$7.45/ton$ Total Log for Export: $M\\$10.54/ton$ Stones and log: $M\\$14.67/ton$ for local market</p>
Comments	20 ton truck trailer can compete with barges in transporting stones and logs for consumption of local market in Miri if road transport from K. Baram to Miri is necessitated.	

Cf. Cost of log (floater) rafting: two rachets (200logs or 700tons)
 + 500HP Tug = rafting + tug + handling cost
 = $M\$1.31/ton + M\$2.32 (M\$664.96/day \times 220km \times 1/90km \times 1/700 \text{ tons}) + M\$5.5/2 = M\$6.38/ton$

Table 4-26 COMPARISON OF TRANSPORTATION COSTS
(Long Lama-Bintulu, Log (Sinker), Sawn Timber)

Section	Long Lama - Bintulu	
Commodity Type	Log (Sinker), Sawn Timber	
Mode	Road	vs. River + Coastal Shipping
Vessel/Vehicle Type	20 ton truck - trailer	2 x 500 barges + 800HP Tug
Route: Distance (km.) Conditions	230 gradient 0-3%, paved road	River + Sea 220 + 220
Transportation Cost (M\$/ton)	<p>full load</p> <p>Line Haul: M\$1.2098 x 230km x 1/20tons = M\$13.91/ton</p> <p>Handling Cost = M\$3.90/ton</p> <hr/> <p>Total M\$17.81/ton</p>	<p>full load</p> <p>Line Haul: (M\$582.79 x 2 x 440km/112km + M\$831.03 x 440km/90km) x 1/1000tons = M\$8.64/ton</p> <p>Handling Cost: M\$5.50/ton</p> <hr/> <p>Total M\$14.14/ton</p>
Comments	20 ton truck=trailer cannot compete with barges unless the goods carried by barge necessitate unloading at Bintulu and subsequent transportation in the Bintulu area for local use.

Table 4-29 COMPARISON OF TRANSPORTATION COSTS
(N. Medamit-Miri, General Goods)

Section	N. Medamit - Miri	
Commodity Type	General Goods	
Mode	Road	vs. Coastal Shipping
Vessel/vehicle Type	6 ton Truck 20 ton Truck - trailer	200 ton Motor Vessel + 6 ton Truck
Route: Distance(km.) Conditions	244 gradient 0-3% (1/2), 3-5% (1/2) paved road	Road + Sea + Road 4 + 210 + 25
Transportation Cost (M\$/ton)	<p>full load</p> <p>20 ton truck trailer = M\$23.72/ton</p> <p>6 ton truck: $M\\$0.6611 \times 244\text{km} \times 1/6\text{tons} = M\\$26.88/\text{ton} + M\\$3.90/\text{ton}$ (Handling Cost) = M\$30.78/ton</p>	<p>full load</p> <p>Line Haul, Sea = M\$7.27/ton</p> <p>Line Haul, Road: $M\\$0.5226 \times (41 + 25)\text{km} \times 1/6\text{tons} = M\\$5.75/\text{ton}$</p> <p>Handling Costs: $M\\$5.50 + M\\$3.90 = M\\$9.40/\text{ton}$</p> <hr/> <p>Total M\$22.42/ton</p>
Comments	6 ton truck cannot compete with motor vessel plus 6 ton truck, while 20 ton truck-trailer can compete fairly well.	

(3) Estimate of Diverted Traffic

Based on the analysis made in the previous section, it was concluded that the goods being transported at present either from Miri or via Marudi into the zones of 6 (Tinjari), 8 (Baram Middle), 9 (Upper Baram) and 10 (Tutoh/Apoh) will totally divert to the Project Road, with all agricultural goods being brought out from zone 6, 8, 9 and 10 with approximately 10 per cent of timber transport diverting to the Project Road. Table 4-30 summarizes the tonnage and the number of vehicles as to the diverted goods traffic.

Table 4-30 DIVERTED RIVER GOODS TRAFFIC

Item	tons				Vehicle Type
	1982	1987	1992	2002	
Incoming Goods	17,541	21,950	27,274	42,371	6 ton truck
Outgoing Goods					
Agri. products	3,180	3,660	3,600	3,660	6 ton truck
Timber	18,000	21,880	26,000	35,000	20 ton truck-trailer
Vehicle/day					
Incoming	16	20	25	39	6 ton truck
Agri. products	3	3	3	3	6 ton truck
Timber	5	6	7	10	20 ton truck-trailer
Total	24	29	35	52	

4-4 ESTIMATE OF INDUCED TRAFFIC

The implementation of the Project Road will definitely induce a certain volume of traffic due to the drastically improved accessibility in the areas where the only mode of transport is by river. Though great difficulties were met, the induced traffic has been estimated as follows:

4-4-1 Estimate of Tripends of Interzonal Road Passenger Traffic

In order to estimate the level of generating road passenger trips for each of the zones which currently are not served by roads, typical communities or areas being served by roads in the Study Area were selected. Since most of these selected communities/areas are connected with other areas by a rather simple road network, the interzonal passenger traffic volume to and from each of the areas can be estimated with reasonable accuracy based on the vehicular traffic volumes by vehicle type counted at zone boundary and by the average number of passengers aboard by vehicle type. The former was obtained from the PWD traffic census while the latter being gained from the results of field surveys.

Table 4-31 here following shows the results of the analysis.

Table 4-31 TRIPENDS OF INTERZONAL ROAD PASSENGER TRAFFIC PER 1000 POPULATION, 1978

Traffic Zone	Population	Interzonal Passenger Trips	Tripends per 1,000 Population
Miri	50,700	7,638	150.7
Bekenu	12,900	1,616	125.3
Limbang	18,000	610	33.9
N. Medamit	6,200	207	33.4
Beluru	5,780	139	24.0
Niah	14,200	846	59.6

Though it is considered that close relations will exist between the size of population and the magnitude of traffic generated, other factors such as the level of economic activities, availability of alternative transport modes, existence and the size of population centres etc. will also show the co-relationships. Type of areas were classified as shown in the Table 4-32, although the number of samples are limited.

Table 4-32 TRIPENDS OF INTERZONAL ROAD PASSENGER TRAFFIC PER 1,000 POPULATION BY TYPE OF ZONE

Type of Zone	Characteristics	Zone	Tripends per 1000 Population per Day
A	- existence of cities population centres	Miri	140
	- high dependency on cars	Bekenu	
B	- existence of population centres	Niah	60
C	- existence of population centres	Limbang	30
	- existence of river as alternative transport mode	N. Medamit	
	- limited extent of driving areas	Beluru	
D	- no population centres		15 ^{1/}
	- existence of river as alternative transport mode	-	

^{1/} Assumed

With the Project Road to be constructed, the area type for each traffic zone in the Study Area was determined as follows:

Table 4-33 THE AREA TYPE FOR EACH TRAFFIC ZONE

Zone No.	Name of Zone	Area Type
1	Miri	A
2	Bekenu	A
5	Sg. Bakong	C
6	Sg. Tinjar	D
8	Bg. Baram Middle	C
10	Sg. Tutoh/Apoh	D
11	N. Medamit	C
12	Limbang	C
3	Niah	B
4	Bintulu	B

* Upper Baram was excluded as it seems the Project Road will induce very little traffic

The tripends of future interzonal passenger traffic can be calculated by multiplying the population of each zone by the estimated tripends per 1,000 population. Table 4-34 shows the results.

Table 4-34 FORECASTED TRIPENDS OF INTERZONAL PASSENGER TRAFFIC

Zone No.	Zone Name	1982	1987	1992	2002
1	Miri	10,761	16,270	24,016	40,150
2	Bekenu	2,482	3,395	4,561	6,307
5	Sg. Bakong	243	343	475	699
6	Sg. Tinjar	212	297	413	595
8	Bg. Baram Middle	266	370	502	718
10	Sg. Tutoh/Apoh	128	176	240	341
11	N. Medamit	241	317	410	523
12	Limbang	734	1,012	1,377	1,940
3	Niah	1,175	1,611	2,160	2,988
4	Bintulu	1,767	2,875	4,644	9,538

4-4-2 Estimate of Distribution Pattern of Induced Interzonal Road Passenger Traffic

Based on the results of O-D survey conducted during the field survey period, a gravity model has been developed as follows:

$$T_{ij} = K \frac{(P_i \cdot P_j)^\alpha}{D_{ij}^\beta}$$

where; T_{ij} = Distribution traffic between 'i' and 'j' zones

P_i = Population of 'i' zone

P_j = Population of 'j' zone

D_{ij} = Time distance between 'i' and 'j' zones

K = 0.03295

α = 1.73253

β = 2.59915

R = 0.92301

By applying this model, the distribution patterns of interzonal road passenger traffic in the Study Area including Niah and Bintulu zones are able to be estimated. Population figures of each zone and time distance for each pair of zones used as inputs of this model are shown in Table 4-2 and Appendix Table A-4-3 respectively. Table 4-35 shows the forecasted distribution of interzonal road passenger traffic and indicates that considerable volume of traffic will be induced between Miri and each of the zones.

4-4-3 Induced Traffic on the Project Road Sections

Table 4-36 shows the number of induced passengers assigned on the Project Road sections and Table 4-37 shows the vehicular traffic volume by vehicle type. The number of passengers was converted into buses and cars. It was assumed that 70% of the passengers utilizing buses have an average number of passengers of 25, while 30% of the passengers utilizing cars have an average number of passengers of 3.4.

ESTIMATE OF DEVELOPMENT TRAFFIC

Types of development traffic considered in the Phase I study stage consist of;

- (1) Traffic being generated due to the development of agricultural development potential blocks as described in 2-3-2 of Chapter 2.
- (2) Traffic being generated due to the tourism development of G. Mulu National Park.

The former type of development traffic was estimated by converting the agricultural production forecasted in the Table 2-17 of Chapter 2 into the number of trucks. All the products expected in the Long Lama and Tutoh/Apoh areas will be transported to Miri while approximately 66,000 tons of surplus paddy will be more economically transported through the port of Limbang because the major deficit areas will be the First and Third Divisions. Assuming that the necessary inputs for agriculture development are carried by returning truck, their number on the major road section of the Project Road can be forecasted as shown in the Table 4-38.

The latter tourism development traffic was estimated based on the fact that the present number of visitors is approximately 3,000 to 4,000 a year. Development of G. Mulu into a first class tourism area will not only attract international tourists but also provide recreational opportunities for the local people particularly for those living in the isolated Limbang Area. With the opening to the public of G. Mulu in 1992 a figure of roughly 10,000 visitors can be expected to use the necessary facilities provisioned. It was assumed that approximately 3,000 tourists and 7,000 tourists will visit G. Mulu from Limbang and from Miri respectively. These visitors were converted into terms of the number of vehicles as shown in Table 4-38.

Table 4-38 ESTIMATED DEVELOPMENT TRAFFIC

Section	Type of Traffic	1987	1992	2002	Vehicle Type
Miri - L. Lama	Agriculture	2	3	3	6 ton truck
Miri - Apoh/Tutoh	- do -	-	2	3	6 ton truck
Miri - G. Mulu	Tourism	-	8+1	21+3	Car + Bus ^{1/}
G. Mulu - Limbang	- do -	-	4+1	10+3	Car + Bus ^{1/}
Total		2	19	43	

^{1/} It was assumed that 70% of visitors will utilize cars while 30% buses with the annual growth rate being 10% after 1992.

Although the development of the Limbang Valley Project, which covers an area of approximately 27,000ha. is expected to generate considerable traffic particularly on most of the sections of the Limbang - N. Medamit Road, it has not been taken into consideration in the Phase I Study, due to the fact that the Project necessitates the need of approximately 20,000 families for agricultural production but depending on the cultivation methods, it is unlikely to expect that such a population will move to the Limbang Area. Therefore the matter has been put aside for further study.

4-6 SUMMARY OF FORECASTED TRAFFIC

Table 4-39 summarizes the forecasted traffic volume on the Project Road by section for the years of 1982, 1987, 1992 and 2002. Though the sections between Long Lama and N. Medamit particularly would not be completed by 1982 according to the construction schedule tentatively proposed, the traffic was forecasted in order to have an indication for the purpose of this study. This table shows the traffic volume and its growth rates will vary considerably by road section.

Table 4-39 SUMMARY OF FORECASTED TRAFFIC ON THE PROJECT ROAD

Road Section	Vehicles/Day				Growth rate (%)		
	1982	1987	1992	2002	82-87	87-92	92-02
1. Miri/Bintulu Road - Beluru	403	579	845	1,346	7.52	7.85	4.77
2. Beluru - Sg. Tinjar	156	212	302	447	6.33	7.33	4.00
3. Sg. Tinjar - Long Lama	127	173	249	367	6.38	7.56	3.96

These forecasted traffic volumes worked out in the Phase I Study stage will be further analysed to refine the figures. It is considered that the refinement work in the Phase II Study stage will mainly cover the following aspects.

- a) to refine the development traffic by determining the development programs or at least the more realistic assumptions on which the traffic analysis depends based on further discussions with relevant Government Departments. Particular attention will be placed on agriculture development, timber based industry development and the development of new community centres/sub-regional centres.
- b) comparative case study on the changes of transport activities and regional socio-economic activities due to the construction of trunk road on a "before" and "after" completion basis.
- c) forecast of induced traffic on the existing road sections due to their upgrading and improvement.
