#### 4. Present Air Traffic Analysis

### 4-1 Preparation for the Traffic Data

PIA passenger and freight OD data between airports from 1972/73 to 1980/81 were processed to construct OD tables. As for the embarked/disembarked passengers and the loaded/unloaded cargos at each airport, Civil Aviation Statistics was also applied because some differences were found between PIA OD and Civil Aviation Statistics.

The international OD tables were constructed with the ICAO statistics together with PIA OD, because the former is incomplete due to the sample surveys.

### 4-2 Passenger

Domestic passenger traffic increased rapidly for the last 10 years. The growth rate by airport was checked, estimating the following equations by the least square method.

 $P = a + b \cdot Y$ 

where P : Domestic passengers

Y : Year

a, b Parameters

then b/P: Annual growth rate

Table 4-1 shows the estimation results. Saidu Sharif, Hyderabad and Turbat were not estimated correctly, mainly because of data shortage. The annual growth rate is about 10% at present, with a little variance by airport. As the correlation coefficients are generally large, these equations were adopted to the traffic demand forecasting.

Recent years, the growth of domestic passenger traffic at major airports becomes less steep. Therefore, the estimation was tried, removing the data of recent 3 years. The results show higher growth rate.

The basic unit of domestic passengers per urban population was checked by airport and by route (see Table 4-2). They are large at the airports of Baluchistan, because of the geographical reason. The major airports have also large basic units, indicating the vast hinterland. These basic units were adopted to the projection of new airports.

Fig. 4-1 shows the desire lines for domestic passengers. It is clearly seen that the traffic among major airports is heavy.

As for the international traffic, similar equations were estimated as shown in Table 4-3. The growth rate is higher than the domestic traffic. These equations were adopted to the projection.

Table 4-1 Time-series Analysis of Domestic Passengers by Airport

### 4-3 Freight

The domestic freight traffic is thought to be correlated with the passenger traffic. In fact, the basic unit of freight per passenger is stable for these years as shown in Table 4-4.

Table 4-4 The Basic Unit of Freight/Passenger for Domestic Traffic

(Tons/Passenger)

Year 197	1975	1976	1977	1978	1979	1974–79 (Mean)
Freight/Passenger 11.	25 10.24	11.73	10.17	11.18	10.13	10.78

Source: JICA Study Team estimation.

This basic unit by airport was adopted to the projection of the domestic freight traffic.

The international freight traffic is not always correlated with the passenger traffic. It was, therefore, necessary to estimate the time-series equations, similarly as the estimation of passenger traffic.

### 5. Future Desire Lines

Future Desire Lines are displayed in the following Figs. in order to investigate the justification of the projection results, visually.

Base zones consist of 46 domestic zones and 5 international zones. Domestic zones will be aggregated to 18 zones, as shown in Fig. 5-1, so that the desire lines could be seen clearly.

Desire Lines for passenger OD are shown in Figs. 5-2 and 5-3, for commodity OD in Figs. 5-4 and 5-5 for vehicle OD in Fig. 5-6 and for air OD in Fig. 5-7.

### 6. Land Traffic Comparison

Table 6-1 shows the comparison of Land Traffic Volume between Thailand and Pakistan. The freight transport volume per capita in Pakistan is found to be about the half of the one in Thailand. It should be, however, noted that the volume per GDP is nearly equal. Sea born trade is also strongly correlated with GDP as shown in the main text, and these facts indicates that the freight transport will be explained by GDP, generally.

Table 6-2 shows the transport volume by commodity in Thailand, which is at large similar to the one in Pakistan, as shown in Table 2-8.
