I-1. PROJECT IMPLEMENTATION

I-1-1. Executing Body

The South Hosainia Valley Agricultural Development Project, which is a land reclamation project, is different in nature from those projects for provision and improvement of the irrigation/drainage facilities in existing farm lands; in short, the land reclamation project is an integrated development project involving farm land formation and provision of adequate irrigation/drainage facilities together with social infrastructures for settlers in the area concerned.

The executing body of the Project is the Ministry of Irrigation and the Ministry of Land Reclamation, the former of which is responsible for constructing major facilities of irrigation/drainage and the latter for making on-farm facilities including land reclamations and constructing the necessary social infrastructures for the settlers. An executing committee consisting of the representatives of the respective organizations will be established for efficiently operating the Project under close coordination with each other.

On the other hand, the both organization shall provide their own project offices at site with the Project Managers to be assigned by the respective departments for carrying out the works in their responsibility. The project offices will have three divisions such as construction, administrative and agricultural divisions.

The construction division shall be responsible for smooth implementation of the construction works to meet the local conditions according to the plans and designs to be given by the headquarters (Central Office). This division will have three sections; one of which is the equipment section to be responsible for operation and maintenance of construction equipment and machinery during the implementation period.

The administrative division will be responsible for personnel affairs, documents and records management, accounting, property custody, procurement of goods and materials and other miscellaneous services.

The agricultural division will be responsible for carrying out physical planning and design of the agri-related works in the Project Area as well as be indirectly responsible for construction works of the facilities concerned.

The Project Manager shall be responsible in particular for coordinating among these divisions so as to execute the Project works efficiently and effectively. The organization chart for implementation is shown in Fig. I-1.

I-1-2. Construction Method and Implementation Schedule

1) Construction

The contract-basis construction is considered recommendable in view of the Project requirements in a variety of construction works such as irrigation/drainage facilities, roads, etc., and construction schedule including many coordination works. And it will be the best way to implement the Project works by the respective ministry-related construction companies, the organization of which is illustrated in Fig. I-2 as what they are now in Egypt, although it is deemed most effective that import of various equipment and materials should be made by the respective ministries in charge.

2) Implementation Schedule

The Project Area covers 31,400 ha of the land area in gross, including about 20,900 ha of the net irrigable area. Construction works for the Project can be roughly stages into four; construction for main and lateral canals for irrigation/drainage, for pumping stations, for on-farm development and for roads.

The construction period for such project works commonly depends upon meteorological conditions prevailing in the job-sites, social environment surrounding the area and the work volumes. Advantageously, however, no obstacles nor difficulties can be observed in the Project. As a result of due considerations - the construction period is proposed

to take seven years including preparatory stages, two years of which will be consumed for financial preparation (about one year) according to the result of the feasibility study and detail design (about six months from Sept. 1982). And in parallel with these preparatory works, construction of project office building and other pre-engineering works will be proceeded.

Procurement should be started in early 1983 for the construction machinery and equipment for irrigation/drainage canals (main and secondary) and the pumping facilities so that the implementation can be commenced from August 1983 for these works. In other words, the implementation of this Project should coincide in its possibly early commencement with completion of the El Salam canal for the part relating to the Project by 1983. The construction works are planned to take five years for the whole project facilities. This construction period is determined according to the average period applied by the international financing agencies to the similar natured projects (commonly 5 - 7 years applicable).

The construction works shall be implemented on the block-by-block basis (three irrigation blocks) from the upstream block No.1 along the El Salam canal to the downstream blocks of No.2 and 3 in order. In the schedule, the earliest implementation is required for the main drainage canal and the drainage pumping station, among many in due consideration of carrying out the leaching works for the newly-reclaimed farm lands.

The construction works for the on-farm facilities will be started in the site where the construction of the basic facilities for irrigation/drainage will be completed.

The construction works for agricultural development will be started in 1985 and completed in 1988. In the agricultural development plan, the animal breeding should be commenced around 1986 and be gradually increased in raising head to cope with production increase in fodder crops.

The construction schedule is outlined in Fig. I-3.

Fig. I-1 Organization Chart for the Project Implementation

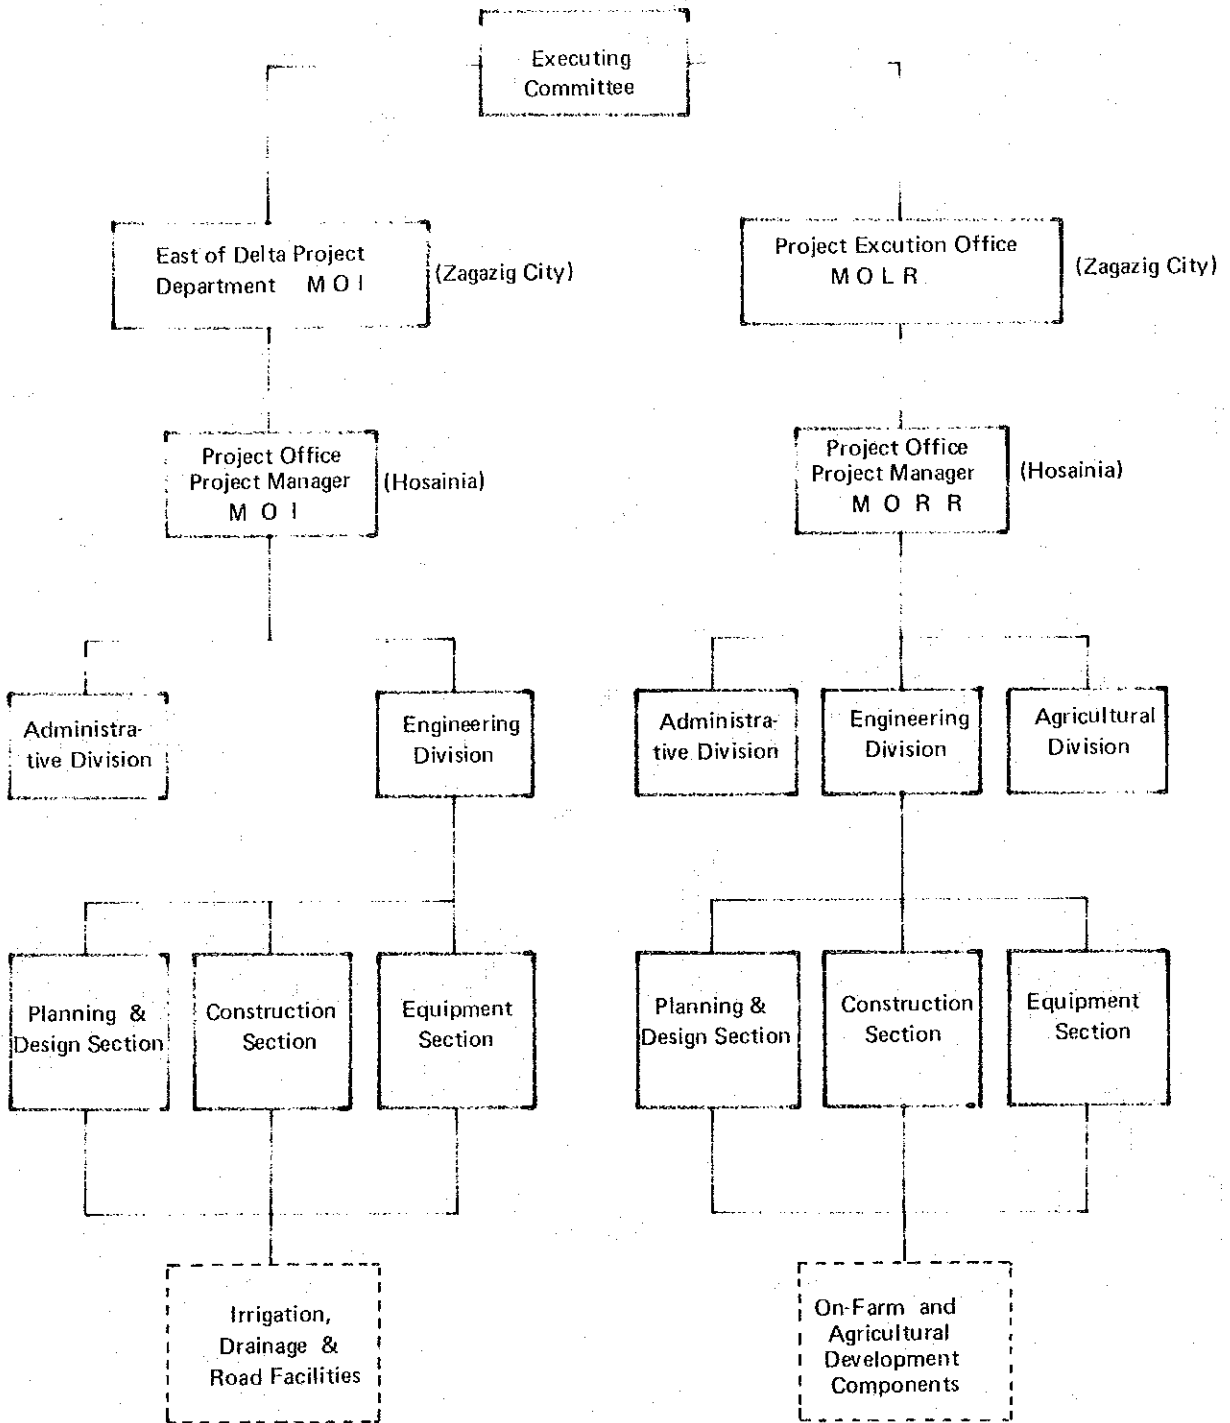

Fig. I-2

Organization Chart of the Ministry of Irrigation

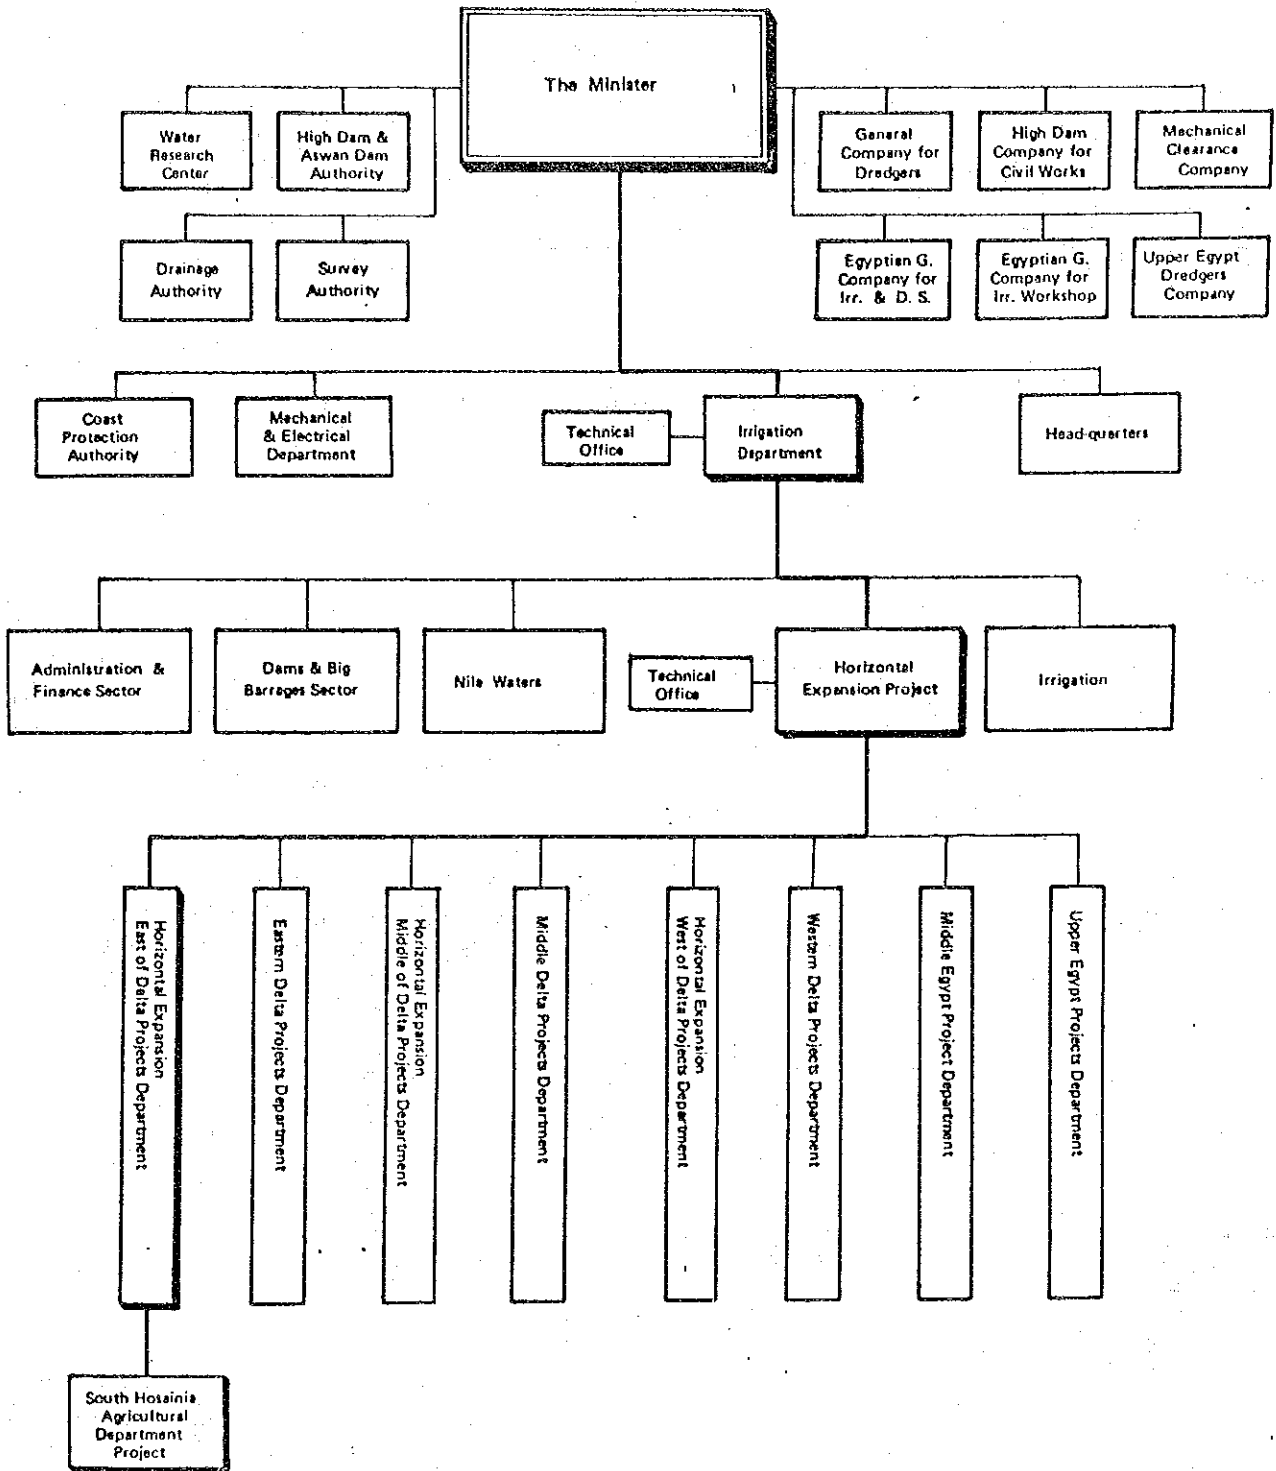

Fig. I-3 Proposed Implementation Schedule for the Project

I-2. Operation and Maintenance

I-2-1. Organization

The responsibility for operation and maintenance of all the Project facilities should be transferred to the government agencies concerned after the implementation of the Project. At present the provincial government office located at Zagazig city has taken charge of local administration whereas the regional office of the Central Government has been directly responsible for operation and maintenance of irrigation and drainage systems. Under the situations, these two existing offices have been focused, to the maximum extent, in formulating the organization for operation and maintenance of agricultural facilities.

Taking into consideration the above-mentioned circumstances, the establishment of the irrigation system office has been planned. This office will be open for activities and services of not only the Ministry of Irrigation but also the Ministry of Land Reclamation and the Ministry of Agriculture. The maintenance of field offices, sub-organization of the irrigation system office, has been planned specially in consideration of the importance of water management in the Project Area.

No field office of the Ministry of Land Reclamation will be established since, after the implementation of the Project, stress should be laid on the direct management of livestock centers, water management on the on-farm level, guidance to farmers for farm management and extension services, etc.

Furthermore, the responsibility for water management on the on-farm level would be gradually transferred to farmers' organization. Therefore, this kind of practices will come under the jurisdiction of field offices. In addition, the water management on the on-farm level should be carried out with the participation of all farmers in the Project Area, in one to two-year period shift, so that all farmers might fully recognize the necessity and importance of water management. In this sense, it is not desirable that some selected farmers will

Fig. 1-4 Organization Chart for Operation and Maintenance

permanently take charge water management. The Ministry of Land Reclamation and the Ministry of Irrigation should make continuous effort to impart education on water management to farmers so that every farmer would learn the importance of water management, will be under

The irrigation system office will have the operation & maintenance section, engineering section and administration section. The field offices whose routine works will be the water management, will be under the control of this operation & maintenance section.

As for farm management, agricultural extension services and water management on the on-farm level, the farmers' organization mentioned in the Annex D "Agriculture" will be effectively operated for this purpose. The organization chart is shown in Figure I-4 for clear understanding of the relationship between the water management organization and the farmers' organization.

I-2-2. Operation & Maintenance of Facilities

The operation & maintenance of irrigation and drainage systems will be made by two organizations, that is, the Governmental organization and the farmers' organization.

The Governmental organization such as the Ministry of Irrigation and the Ministry of Land Reclamation will be responsible for the operation & maintenance of all roads and facilities to be realized under the Project with the exception of main and secondary irrigation and drainage canals, pumping facilities and on-farm roads whereas the farmers' organization will take charge of the operation & maintenance of all facilities on the on-farm level.

The communication among offices for operation & maintenance will be made through the telephone system to be installed in connecting villages. Jeeps and motorcycles will be used for transportation necessary for operation and maintenance.

I-2-3. Operation & Maintenance Cost

The operation and maintenance cost of the mentioned facilities is computed as follows;

Operation and Maintenance Cost

1) Salary and Wage

(i) Irrigation System Office 5-person x 2-office = 10-person
10-person x 150 L.E. x 12
= 18,000 L.E.

(ii) Field Office

a) Water management technologist

10-person x 3-office = 30-person
30-person x 150 L.E. x 12 = 54,000 L.E.

b) Gate keeper

10-person x 3-office = 30-person
30-person x 100 L.E. x 12 = 36,000 L.E.

c) Ditch tender

60-person x 3-office = 180-person
180-person x 100 L.E. x 10 = 180,000 L.E.

d) Pump station

16-person x 100 L.E. x 10 = 16,000 L.E.

(iii) Labour Cost (main and secondary canals)

L = 60 km, Unit cost: 1.0 L.E./m

600,000 m x 1.0 L.E. = 600,000 L.E.

Sub-total 904,000 L.E.

2) Electric Power Charge

(Unit Cost: 2.5 PT/KWH)

(i) Drainage pumping station 220 KW 48,500 L.E.

(ii) Return flow pumping station
120 + 95 = 215 KW 4,000 L.E.

(iii) Booster pumping station 149 KW 29,500 L.E.

(iv) Office equipment 400 KW
(100 KW x 4-office) 79,000 L.E.

<u>Sub-total</u>	<u>161,000 L.E.</u>
<u>Total</u>	<u>1,065,000 L.E.</u>

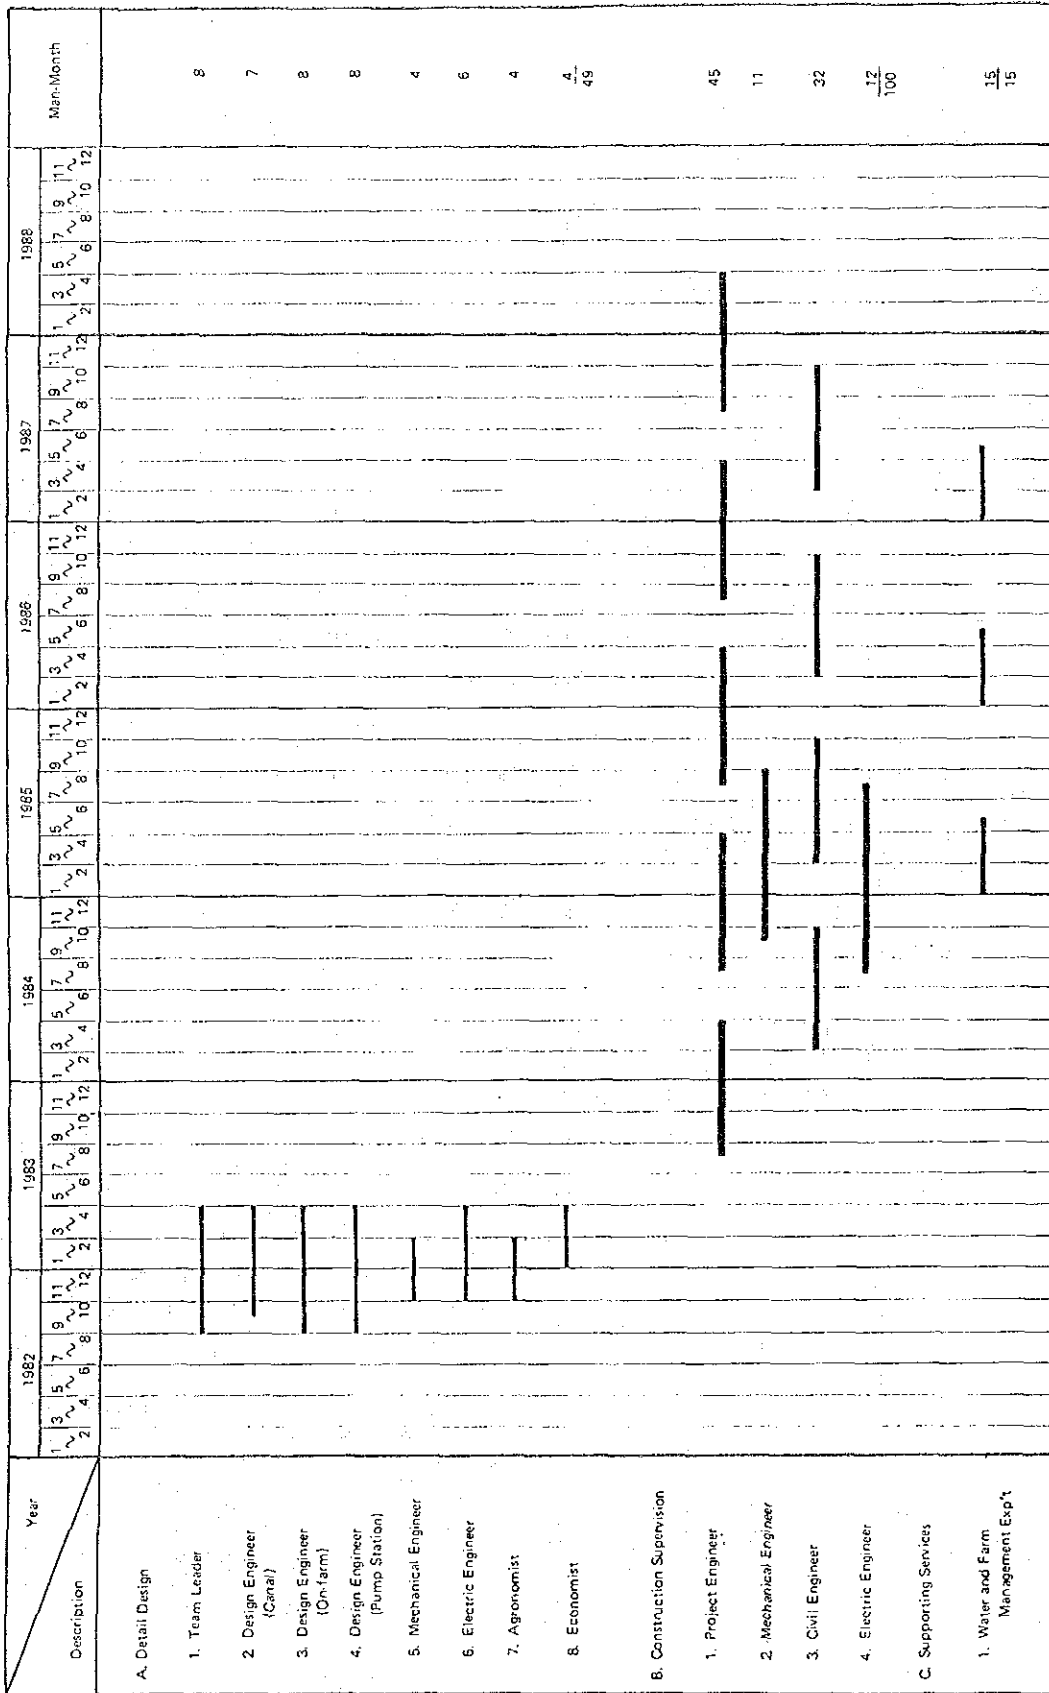

(Unit cost per ha: 51 L.E.)

I-2-4. Consultant Services

The consultancy services required for implementation of the Project are divided as follows;

- 1) Final design of the Project as well as preparation of tender documents. The service period would be 43-month period from September 1982. Highly qualified experts will be employed such as an irrigation engineer, a mechanical engineer, a design engineer and an economist.
- 2) Construction supervision and training of local counterpart personnel in all phases of the Project activities. The service period would be from August 1983 to April 1988. The required experts would be a project engineer, a mechanical engineer and a civil engineer.
- 3) Agri-institutional establishment covering all agricultural institutional development program and training will be made within a 15-month period highly qualified experts will required to participate in the services such as an agronomist, an agri-institutional expert, a water management expert and a farm management expert. The proposed schedule is shown in Fig. I-5.

List of Figure

Fig. J-2-1	Plot of PW of Benefit and Cost	J-52
------------	--------------------------------	------

J-1. GENERAL DESCRIPTION

J-1-1. Objective

The main objective of the proposed project is an agricultural development for 31,400 ha (74,700 feddan) of desert land where no economic activity is prevailing except some limited cultivated land of 2,500 ha (6,000 feddan).

The objective follows the government's agricultural policy which aims both horizontal and vertical expansion, because the following agricultural outputs would be expected after full development of the project.

<u>Item</u>	<u>Production</u> (ton)
Paddy	48,969
Cotton	20,691
Maize	18,831
Wheat	29,657
Beef	7,956

J-1-2. Project Component

The project component is mainly divided into two, namely, development of agricultural infrastructures and agricultural development (livestock), and the former is subdivided into pumping facilities, canals, roads and on-farm facilities. It is proposed in this report that the proposed livestock center will be operated and managed under the government.

J-1-3. Project Benefit

Since the main objective of the proposed project is an agricultural development of about 70,000 feddans of desert land by newly providing such agricultural infrastructures as irrigation and drainage facilities, on-farm facilities and so on with social infrastructures,

its primary benefit would be measured through an incremental agricultural production between two cases of "with project" and "without project".

Beside the primary benefit, there would be some secondary and other benefit in the Project, and these benefit would be incorporated into the project benefit as far as they can be measured in monetary terms. Usually, it is rather difficult to measure those benefits in monetary terms which are arising from such social infrastructures as hospital, school, police station, mosque, etc.

J-2. ECONOMIC EVALUATION

J-2-1. Method of Evaluation

For the economic evaluation of the project, it seems presently most appropriate to compute an economic internal rate of return which can be obtained by discounting both streams of economic cost and benefit over a project life.

In order to decide the project life, it must be considered that there are various project facilities which have respective durable life. In this project, it is assumed that most of all project facilities except pumping equipment has enough durable life to evaluate the project over 50 years as far as maintenance works for these facilities will be sufficiently implemented. For pumping equipment, some replacement cost will be required once every 15 years after installation. Thus, the project life is considered to be 50 years.

In the economic evaluation, an application of accounting prices has been recently theorized even for an agricultural development project. The accounting prices are to be computed under the concept that all goods and services to be needed for, as well as to be produced by the proposed project must be valued in the world market where more free competition is considered to be prevailing.

In order to compute accounting prices, it requires several conversion factors like a standard conversion factor, conversion factors for capital goods, consumption, transportation, and so on, but only a standard conversion factor has been estimated in this report due to limitation of data availability.

While it has been attempted in this report to convert all prices into their accounting prices as much as possible, by applying a standard conversion factor, the term of economic price is still used instead of accounting price.

J-2-2. Economic Price

1) Standard Conversion Factor (SCF)

A standard conversion factor is given by the following formula:

$$SCF = (Im + Ex) / (Im + Ex + TIm - TEx + SEx)$$

where;

SCF : Standard Conversion Factor

Im : Total Amount of Import (C.I.F.)

Ex : Total Amount of Export (F.O.B.)

TIm : Total Amount of Import Duties and Taxes

TEx : Total Amount of Export Duties and Taxes

SEx : Total Amount of Export Subsidy

The custom tariff in Egypt is divided into 22 sections and further subdivided into 99 chapters. In the monthly bulletin of foreign trade published by Central Agency for Public Mobilization and Statistics, both amount of import and export is available for years of 1978 and 1979 by the chapter, based on which tariff amount in respective year and their weighted tariff rates by section are calculated as shown in Tables J-2-1 and J-2-2.

By applying the weighted tariff rates for the other years, both import and export tariffs are calculated by section (See Tables J-2-3 and J-2-4).

On the basis of the above formula and Tables J-2-3 and J-2-4, a standard conversion factor is estimated at 0.835 as show in Table J-2-5.

2) Foreign Trade of Selected Agricultural Products

In Egyptian agricultural export, raw cotton is playing very important role followed by milled rice. Table J-2-6 and J-2-7 show quantity and value of agricultural export, respectively, and Table J-2-8 does the respective export price of selected agricultural products.

On the other hand, Egypt is importing many basic foodstuffs, like, wheat, wheat flour, maize, sugar, edible oils and meat to meet with their domestic demand (See Tables J-2-9 and J-2-10). Table J-2-11 also shows import prices for selected agricultural products. From Tables J-2-8 and J-2-11, both export and import prices fluctuate depending upon their world market prices.

As a result, all project output, paddy, cotton, maize, wheat and beef are considered to be internationally traded goods.

3) Farmgate Prices

In Egypt, farmgate prices of both input and output are depending upon the government pricing policy. Recently, the government has introduced her economic policy of liberalization, hence, the government's controlled prices would be more closely reflected by the prevailing market condition.

Table J-2-12 shows both financial and economic farmgate prices of project output as well as input. For the financial prices, they are mostly based on current market price except agricultural chemicals which are derived from international prices with assumption that they must be subsidized by the government. Table J-2-13 indicates estimated financial prices of agricultural chemicals without government subsidy.

For the economic prices, they are derived from IBRD Commodity Price Forecast, and details of these price structure are given in Appendix J-1. Table J-2-14 shows estimated economic prices of agricultural chemicals

J-2-3. Economic Benefit

1) Without Project

As mentioned in Annex D "Agriculture" there are presently 2,500 ha of cultivated land and its production is as follows;

<u>Crop</u>	<u>Area</u> (ha)	<u>Yield</u> (ton/ha)	<u>Production</u> (tons)
Cotton	800	1.1	880
Rice	1,600	2.9	4,640
Wheat	800	1.6	1,280
Vegetables ^{1/}	200	8.0	1,600

Note: ^{1/} Mainly tomatoes

From these lands, L.E. 921 thousand of net production value is brought out as shown in Table J-2-15, and further increase of N.P.V. is not expected, because these land is cultivated illegally and has limitation of water resources for irrigation.

2) With Project

(i) Beneficial area

Although total project area is 31,400 ha, net irrigable area is estimated at 20,900 ha, and the balance is considered to be those area for canals, roads, new villages and so on.

Cropped area after full development is shown below;

<u>Crop</u>	<u>Summer</u>	<u>Winter</u>	<u>Total</u>
Paddy	6,900	-	6,900
Cotton	6,900	-	6,900
Maize	3,550	-	3,550
Soiling Corn	3,550	-	3,550
Full-term Berseem	-	6,900	6,900
Catch-cropping Berseem	-	7,100	7,100
Wheat	-	6,900	6,900
Total	20,900	20,900	41,800

Note: Figures are rounded.

Thus, cropping intensity after full development is 200 percent against the net irrigable area.

(ii) Cost of mechanized farming

As stated in Annex D "Agriculture", it is proposed to introduce mechanized farming. An alternative study on harvesting works for paddy and wheat by combine or by labor with sickle, has been made, and conclusively harvesting works by labor is cheaper than that by combine. Therefore, crop production cost is calculated on the basis of not using combine.

Table J-2-16 shows monthly unit requirement of labor and agricultural machinery by crop, and Table J-2-17 does crop-wise monthly requirement of them. Also, Table J-2-18 gives total monthly requirement for cultivation of 20,900 ha after full development.

Table J-2-19 indicates required number of agricultural machineries and their useful life, taking into consideration their total durable hours and annual operation hours of them.

On the basis of Tables J-2-20, J-2-21 and J-2-22 hourly fixed cost of each machinery is estimated.

(iii) Net production value

Since benefit arising from such fodder crops as soiling corn and berseem is evaluated in the livestock development, total net production value of paddy, cotton, maize and wheat is estimated at L.E. 17,693 thousand after full development, of which details are given in Table J-2-23.

(iv) Net production value (livestock development)

As mentioned in Annex D "Agriculture", total 88,400 heads of beef cattle will be fed by the project production of soiling corn, berseem and paddy straw after full development of the project.

It is planned to feed 100 heads of beef cattle as one herd, and thus total 884 herds will be fed, and composition per herd is 30 heads of calves, 30 heads of up-bringing cattle and 40 heads of cattle.

Net production value is estimated at L.E.2,150 per herd, of which details are given in Table J-2-24. Thus, total net production value of livestock development will be L.E. 1,900 thousand after full development of the project.

(v) Economic benefit

An economic benefit after full development of the project can be estimated as follows;

N.P.V. with project	(L.E. thousand)
crop production	17,693
livestock production	1,900
<u>Sub-total</u>	<u>19,593</u>
N.P.V. without project	<u>921</u>
Incremental N.P.V.	<u>18,672</u>

Thus, it is expected that L.E. 18,672 thousand will be arising from the project as the economic benefit after its full development.

(vi) Benefit accrual

It is planned to develop 31,400 ha of the project area by phasing, and it is expected to obtain the first project output in the 5th project year. Details of the phasing are given in Annex D, "Agriculture".

In the economic evaluation, the following benefit accrual is assumed to reach its full benefit.

<u>Project Year</u>	<u>Percent to full benefit</u> (%)
5	5
6	15
7	30
8	40
9	50
10	60
11	70
12	80
13	85
14	90
15	95
16	100

J-2-4. Economic Cost

1) General

An economic cost to be used in the economic evaluation must be real cost to the national economy, and then transfer payments such as taxes, subsidy, cost for land acquisition and compensation, price contingency and so on, are deducted from the financial cost.

In the financial cost, costs of construction equipments are valued from their purchasing prices, but in the economic cost, such equipment costs are valued at their depreciation costs.

Further, a local currency portion in the financial cost is converted into its border price by applying the standard conversion factor.

2) Initial Cost

The initial cost consists of those costs for civil works, agricultural development (livestock development), operation and maintenance during construction period, project facilities, project administration, consulting services and physical contingency.

The estimated total economic cost is L.E. 51,111 thousand of which about 57 percent or L.E. 29,332 thousand is foreign currency portion and the rest, L.E. 21,779 thousand is local currency portion (See Table J-2-25).

Table J-2-26 shows annual disbursement schedule of the economic cost over seven years of construction period.

3) Operation and Maintenance Cost

To successfully manage the project, an operation and maintenance cost will be recurrently required, which is estimated at L.E. 1,065 thousand, and it is assumed to expend the O & M cost by the following schedule;

Project Year	<u>4th</u>	<u>5th</u>	<u>6th</u>	<u>7th</u>	<u>8th</u>	<u>9th & further</u>
Percen of O & M cost (%)	5	10	25	50	90	100
O & M cost (L.E. thousand)	53	107	266	533	959	1,065

4) Replacement Cost

Since some of pumping facilities have lesser durable life than the project life, total amount of L.E. 1,427 thousand would be required as a replacement cost once every 15 years after their installation.

5) On-Farm Development Cost (Farm drain)

It is assumed that costs for digging farm drains on-farm level are born by farmers themselves, of which unit cost is estimated at L.E. 230.7 per ha (L.E. 96.9 per feddan) for gross irrigable lands (26,800 ha), and the total cost would be L.E. 6,183 thousand.

All the costs of L.E. 6,183 thousand are considered local currency portion, thus the total economic cost would be L.E. 5,163 thousand by applying the standard conversion factor which will be equally disbursed in five years after the 3rd project year.

Also, it is assumed that the government will expend these cost in the beginning and be repaid by farmers in four years after the second year of farmers' settlement.

J-2-5. Economic Internal Rate of Return (EIRR)

By discounting both streams of economic benefit and cost at several discount rates, the economic internal rate of return can be worked out. Table J-2-27 shows streams of economic benefit and cost over project life, and Tables J-2-28 and J-2-29 give annual present worth of benefit and cost at several discount rates, respectively. Summarizing these Table J-2-28 and J-2-29, 16.3 percent of economic internal rate of return for the project has been worked out as shown in Table J-2-30 and Figure J-2-1.

The EIRR of 16.3 percent shows definitely that the proposed project is economically feasible.

J-2-6. Sensitivity Analysis

Sensitivity analysis is an effective measure to examine riskness of the proposed project. The analysis is usually made on change of key factors in the project. In this report the following items are taken for the sensitivity analysis.

- | | |
|--------------------------------------|------------------|
| I. Initial Investment Cost | 10% increase |
| II. Construction Period | 1 year extension |
| III. Crop Yields | 10% decrease |
| IV. Prices of Project Outputs | 10% decrease |
| V. Including Costs of El Salam Canal | |

By calculating EIRRs for the above items, results of the sensitivity analysis are summarized below and the details are compiled in Appendix J-3.

<u>Case</u>	<u>Item</u>	<u>EIRR</u> <u>(%)</u>
I	10% increase of initial cost	15.4
II	one year extension of construction period	15.4
III	10% decrease of crop yields	13.6
IV	10% decrease of project output prices	13.6
V	Including Costs of El Salam Canal	11.8

J-3. FARM BUDGET ANALYSIS

1) Representative Farm Size

In the proposed project, most of all cultivable lands is newly reclaimed, and it is planned to provide five feddans of gross cultivable area to every new settlers under the government policy. Therefore, a representative farm size can be considered 2.1 ha (5 feddans) of gross area, of which net irrigable area is 1.64 ha (3.9 feddans).

2) Family Size

On the basis of interview to farmers who are dwelling nearby the project area, an average family size is six and workable person can be accounted for two in a family during peak period for cultivation and 1.5 during usual period.

3) Labor Balance

Table J-3-1 gives monthly labor requirement per farm which cultivates 1.64 ha of net irrigable area with the proposed cropping pattern. In this Table J-3-1, peak requirement happens month of September, accounting for 363 man-hours, which can be met by two men with workable days of 25 per month and working hours of eight per day. Therefore, each family does not require any hired labor in his cultivation throughout a year.

4) Farm Income

Table J-3-2 shows financial crop returns per ha after full development of the project, in which all prices are valued at their financial prices. As for financial prices of agricultural chemicals, it is assumed that 80 percent of their prices which are derived from international prices (See Table J-2-13), would be subsidized by the government.

After full development of the project, total of L.E. 1,009 will be gained by farmers through their cultivation of project crops such

as paddy, cotton, maize, soiling corn, berseem and wheat with their farm size of five feddans in gross and the proposed cropping pattern (See Table J-3-3).

5) Off-farm Income

It is planned to take two years for leaching after settlement and three years for the tentative cropping pattern, during which farmers will have chance to work for construction works of the project as an unskilled labor.

Assuming that one and half man-day per family is considered workable for 25 days per month, it is expected that one farm family will obtain L.E. 675 of wage in the first two years after settlement and L.E. 467 in the following three years.

6) Other Expenses

Assuming that farmers will purchase their farm land at cost of L.E. 1,000 per feddan and their house at L.E. 1,000 per house, their mortgage repayment would be L.E. 278 as full burden from the 8th year after settlement. The payment upto 7th year is shown in Table J-3-4 by following the Cabinet Decree Nr. 288.1979 which is shown in Appendix J-6.

Loan repayment for the costs of on farm drains will be L.E. 121 annually in four years from the second year after settlement. The loan is expected to be made through the Principal Bank for Development and Agricultural Credit.

Land tax will be chargeable from the seventh year after settlement as verified in Table J-3-4, of which total amount is L.E. 25 per farm or L.E. 5 per feddan.

The operation and maintenance cost has been estimated at L.E. 1,075 thousand annually, which is equivalent to L.E. 51 per ha or L.E. 107 per farm. Farmers will be able to bear the amount of L.E. 107 from

the ninth year after settlement.

7) Cost of Living

According to interviews to farmers adjacent to the project area, the following costs of living for family member of six are obtained.

(Unit: L.E.)

<u>Item</u>	<u>Subsistence Level</u>		<u>Desirable Level</u>	
	<u>per month</u>	<u>Total</u>	<u>per month</u>	<u>Total</u>
Foods	25	300	45	540
Cloths	5	60	10	120
Lights & Fuel	2	24	3	36
Others	5	60	9	108
<u>Total</u>	-	<u>444</u>	-	<u>804</u>

8) Conclusion

As shown in Tables J-3-3 and J-3-4, farmers can maintain their subsistence level of living upto 26th year after settlement and enjoy the desirable level of living from 27th year and further.

	<u>Paddy</u>	<u>Cotton</u>	<u>Maize</u>	<u>Wheat</u>	<u>Total</u>
Cropped Area (ha)	6,900	6,900	3,550	6,900	24,250
N.P.V. per ha (L.E./ha)	851.32	1,053.19	428.28	429.35	-
Total N.P.V. (L.E.1,000)	5,874	7,267	1,520	3,032	17,693

Note: ^{1/} Details are referred to Appendix J-2.

^{2/} Including cost for operator

Table J-2-24 Net Production Value per herd

I. Gross Production Value (per herd)

Beef Production

Number of cattle to be slaughtered -----	40 nos
Live weight -----	450 kg
Yield of meat -----	50 %
Beef production -----	9 tons
Unit price of beef -----	L.E. 1,200 per ton
G.P.V. -----	L.E. 10,800

Hide Production

Number of hide -----	40 peices
Unit price of hide -----	L.E. 10 per peice
G.P.V. -----	L.E. 400

Total G.P.V. L.E. 11,200

II. Production Cost

	<u>Requirement/herd</u> (ton)	<u>Unit Cost</u> (L.E./ton)	<u>Total Cost</u> (L.E.)
Feed ^{1/}			
Soiling Corn	241	7.13	1,718
Full-term Berseem	445	6.09	2,710
Catch-cropping Berseem	229	10.03	2,297
Sub-total	-	-	6,725
Labor	-	-	700
Artificial Insemination	-	-	467
Medicine, etc	-	-	333
Miscellaneous	-	-	825
<u>Total</u>	-	-	<u>9,050</u>

III. Net Production Value per herd L.E. 2,150

Note: ^{1/} Direct economic production cost and see Appendix J-2.
