### 5.5. Required fund

Of these required fund for sawmill facilities investment, those for machines and cubicle need foreign currency. Breakdown by domestic and foreign currencies is as follows.

Table 9. Breakdown by domestic and foreign currencies for sawmill facilities investment (US\$)

|  | A Plant |  | B Plant |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Foreign C. | Domestic C. | Foreign C. | Domestic C. |
| Machines | 299,320 |  | 114,450 |  |
| Cubicles | 35,370 |  | 15,980 |  |
| Building and foundation |  | 452,480 |  | 135,840 |
| 787,170 |  | 266,270 |  |  |

(US\$1 $=$ Yen $220=7.82 \mathrm{ksh}$ )

### 5.6. Operating plan of sawmill

The estimated profit and loss account of the sawmill is prepared based on the following assumption.
(1) The sale price of sawn-wood, not considering the annual increase based on the rising percentage of commodity price, is assumed to rise from the fourth year $5 \%$ every year.
(2) The recovery percentage of the product is assumed as follows.

| 1st year: |  | $45 \%$ |
| :--- | :--- | :--- |
| 2nd year: |  | $55 \%$ |
| 3rd year: |  | $60 \%$ |

This recovery rate, if sawmill equipments of the current plan are introduced, the percentage in Japan would be higher but considering the condition of Kenya, the percentage to this extent could be attained.
(3) Of the $\log$ cost, the stumpage licence fee, considering the advice of the World Bank, is to rise $10 \%$ every year for 10 years and $8 \%$ from the 11 th year. The present situation seems to be considerably low from the world standard.
(4) The wage rate of sawmill and logging workers is to increase $8 \%$ annually. Apart from the general wage, the remuneration and salaries of the officers is to increase $8 \%$ from the fourth ycar.
(5) Items of oil and maintenance are needed for felling and hauling of saw logs from the felling site to the mill. They include the fuel such as heavy oil, light oil and gasoline for hauling facilities as lorry and caterpillars and repairing of these facilitics.

In the field, these items are counted in a lump as general expenses and they are hard to grasp in detail but from the view point of management, it is reasonable to list separately as direct expenses of materials.
For this reason, considering the ficld situation, $70 \%$ of stumpage licence fee is alloted to the fuel and repair expenses needed for $\log$ hauling.
(6) The power expenses are the electric power for operation of sawmill machines. On reference to Prices for Electricity Supplies in Kenya (The East African Power and Lighting Co., Ltd.), the electric power charge is calculated as power expenses.
(7) Maintenance cost and others are those for reparing machines and equipments and others in the sawmill which are equivalent to the power expenses.
(8) General expenses are equivalent to general management and sales expenses of Japan but considering the classification of items in Kenya, such expenses are to double the personnel expenses as the officers' remunaration and salaries.
(9) Profit and loss of outside business include interest to the loaned capital and miscellaneous profit and loss of outside business but for calculation, the invested money to each mill is divided into foreign and domestic money and the interest is $4 \%$ and $10 \%$ respectively and the sum is accounted.
(10) Net profit is $70 \%$ of net income before tax. (Remark: Estimated from the corporation tax of Japan.)
(11) When the profit and loss account of sawmill is made, if the local balance sheet and a statement of profit and loss account were available, it was convenient but as no such information was available, the estimate was made based on the result of the survey and the situation of Japan.

## CHAPTER VI. IMPROVEMENT OF LOGGING AND SKIDDING FACILITIES OF SAWMILLS

Each sawmill procures logs every year on the basis of stumpage sale from the plantations of the national forest under felling licence of short term (1 year) or long term ( 5 years).

This logging operation is carried out directly by each mill for which an operation group is organized.

Of 18 mills surveyed, we visited felling site of 2 mills and following points are desirable to improve.

### 6.1. Improvement of logging operation

(1) The operation crew is not properly allocated to commensurate with the operation process. This operation process is divided into felling crew (felling-limbing-bucking), skidding crew (preyarding-tractor-loading - tractor-skidding \& driving-unloading) - and log transportation crew (loading on truck-transportation-unloading at mill-log piling at mill). It is an ideal that its process proceeds like the conveyor system. For this purpose, based on measurement and grasp of standard operational volume needed for proper implementation of process control, arrangement of personnel required and machineries required should be decided. Needless to say, particular consideration is needed for arrangement of machines suitable to size and quality of logs as well as the number of personnel required.
(2) Re-consideration is needed for introduction of machines fit for materials. Furthermore, the system to re-educate the driver of the machine is needed.
At each mill surveyed, when we heard of the actual condition of the machine for works near forest, a set of truck for yearding and transporting has many troubles in trailer and owing to incapability of repair due to lack of parts, nearly $1 / 2$ or $1 / 3$ of the machines are not in work and the operational rate of these machines is quite low. As a result, as yarding and transporting operation by these machines do not proceed smoothly, the system of $\log$ procurement is uneven and it is noticed that the rate of operation is greatly affected.
(3) Of the working process, the point which particularly needs improvement is lack of operational tools used in preyarding work (log turner, hook and pick). Yarding tractor is not provided with winch for pulling felled trees. It is desired that truck with winch for yarding is provided.
It is also necessary to pay attention that erosion of forest land by disturbance of ground surface by the traditional operation is brought about.
(4) Loading of logs on transportation lorry at the mill near the forest is almost exclusively done by man power but it is necessary to increase the efficiency of loading and load per 1 lorry by the introduction of proper machines such as loaders.
(5) Introduction of machine to pile up raw materials in the mill and improvement of road surface which is the main transport road in the mill are necessary. At least, in order to make the machine work efficiently, it is desirable that drainage as well as gravelling are carried out and if possible, pavement too.
(6) In order to make the repair of logging machines smoothly, repairing equipment should be prepared as annex to the repair shop of sawmill machines and it is needed to establish the facilities for parts control and training of skilled workers.

### 6.2. Required fund for improvement of logging facilities

Introduction of new machines for logging or its required fund is calculated respectively based on the sawmilling capacity and operation degree of each mill.

There is no peculiar new machine for logging and it is enough to increase the number of existing machines. The required fund is calculated based on the above and the local price. In all mills surveyed, 12 mills reported the number of machines posessed. Since the possession is consisted of some 30 lorries and some 25 tractors. An estimation was made assuming the increase of facilities by twice as much as they are.

$$
\begin{array}{cr}
\text { Required fund } \\
\text { Lorry, etc. } & 16 \times \mathrm{ksh} 100,000=\mathrm{ksh} 1,600,000 \\
\text { Tractor, etc. } & 24 \times \mathrm{ksh} 200,000=\mathrm{ksh} 4,800,000 \\
\text { Total: } & \mathrm{ksh} 6,400,000
\end{array}
$$

These required fund is included in construction of sawmills.
Logging facilities are multiple use machines and as it is considered that they are available in the country, calculation was made with local cost but those of modern good performance are now being developed in many countries.

Generally, tools of workers at the felling site (log turner, hook and pick) are lacking which is the cause of lowering of operation degree. Without insisting to the traditional felling method, there is a need to consider an introduction of small tractor and crane for loading at the felling site.

## CHAPTER VII. INTRODUCTION OF NEW WOOD BASED INDUSTRY

In order to attain the modernization of wood industry, it is basically necessary to replace existing machines and equipments of sawmill by modern ones but that is not all for the attainment of modernization of all wood industry. It is necessary to develop the industries which contribute to the effective utilization of mill residues or secondary process sawn timber. In this chapter, consideration on the matter related to the above and as a result, the industry which is considered suitable to introduce are discussed.

### 7.1. Manufacture of wood waste briquette

One of the big problems which existing sawmill confronted is to find out the effective utilization of mill residues. At present, in every mill, large volume of sawdust and off-cuts are left unused. Some of them are used as local household fuels but the degree of their utilization is low and they not only hamper the management of sawmill but in many cases, incur some cost because of thrown-away.

The amount of mill waste including saw dust will reduce remarkably by the introduction of new sawmill machinery but still more, effective utilization of saw dust is quite necessary.

We recommend the production of wood waste briquette for effective utilization of mill residues, particularly saw dust.

Wood waste briquette is produced, moulding saw dust and other wood slips under high temperature and high pressure and used for household fuel and industrial purpose. This is one of intelligent utilizations of saw dust and other mill waste.

In Kenya of today, most of timber felled are consumed as fuel and the utilization of timber as fuel, viewed from supply of town gas and other home use energy, is expected to increase along with swell of population. On the other hand, harvesting of fuel wood by local people is a hindrance to rational forestry management, protection of forest resources and land conservation. Production and supply of highly efficient household fuels and industrial fuels from wasted sawdust heretofore is considered quite a meaningful industry from the viewpoint of national economy.

However, it may take some time that the wood waste briquette, which is not quite familiar with the people of this country, is accepted by the market. It is considered that the briquette can be used for some industrial purpose, particularly for soap manufacturing and tea production. In this case too, it may take some time to get popularity. In some case, some modification of burning apparatus may be needed.

In this sense, construction of briquette plant is to be promoted coping with expansion of demand. Under this plan, 3 plants are to be built in 3 years.

### 7.1.1. Outline of wood waste briquette plant

| Expected production | Annual production | 900 ton |
| :--- | :--- | :--- |
| Input of materials | Yearly | $1,800 \mathrm{~m}^{3}$ |
| Number of employees | 8 |  |
| Major machines and equipments |  |  |

(a) Furnace
(b) Rotary drier 1
(c) Screw conveyor 1 set
(d) Forming machine

1
Total
US $\$ 86,310$ (CIF MOMBASA, including import duty)
Building area $\quad 150 \mathrm{~m}^{2}$
Required fund for construction $1,025,650 \mathrm{ksh}$.
7.1.2. Investment for construction of wood waste briquette.
(1) Machines and equipments of briquette plant is stated in 7.1.1. (US $\$ 86,310=k \operatorname{sh} 675,000$ )
(2) Details of cubicle are as follows.

| Cubicle | 37,000 ksh |
| :--- | :--- |
| First wiring | 8,000 |
| Cabinet panel | 23,000 |
| Second wiring | 15,000 |
| Control panel | Included in machines |
| Total | 83,000 |

(3) Cost of foundation work

Foundation work of major machines $\quad 20 \mathrm{~m}^{3} \times 1,300 \mathrm{ksh}=26,000 \mathrm{ksh}$
(4) Cost of installation work

Although the installation work in Japan needs forklift or wrecker, in Kenya, such work is being done by workers.

Workers wage $\quad 10$ person $\times 50$ days $=500$ course 500 course $\times 20 \mathrm{ksh} /$ day $=10,000 \mathrm{ksh}$
(5) Plant construction work

Size of briquette plant is $15 \mathrm{~m} \times 10 \mathrm{~m}=150 \mathrm{~m}^{2}$.

| Roofing work | $43,600 \mathrm{ksh}$ |
| :--- | ---: |
| Steel frame work | $130,800 \mathrm{ksh}$ |
| Building foundation work | $43,600 \mathrm{ksh}$ |
| $\quad$ Total | 218,000 |
| (Work expenses per $\mathrm{m}^{2}$ is $1,450 \mathrm{ksh}$ ) |  |

(6) Domestic transportation cost of machines

Domestic transportation cost of machines is calculated on the assumption of 639 km from MOMBASA to NYERI.

$$
8.5 \mathrm{ton} \times 430 \mathrm{ksh}=3,655 \mathrm{ksh}
$$

(7) Other expenses

Other expenses for plant construction is calculated taking consideration of the condition of the spot when the field survey was made.

Total investment required is shown in Table 16.

Table 16. Briquette plant investment and its recovery (ksh)

| Item | Invested am't | Recovery years | Annual recovery |
| :--- | :---: | :---: | :---: |
| Machines \& equipments | 675,000 | 10 | 67,500 |
| Cubicles | 83,000 | 10 | 8,300 |
| Foundation work cost | 26,000 | 10 | 2,600 |
| Installation work cost | 10,000 | 10 | 1,000 |
| Building | 218,000 | 24 | 9,083 |
| Miscellaneous | 10,000 | 2 | 5,000 |
| Domestic carriage of machine | 2,650 | 2 | 1,330 |
| $\quad$ Total | $1,025,650$ |  | 94,820 |

### 7.1.3. Required fund

The investment for plant construction is stated in 7.1 .2 of which breakdown by domestic and foreign currencies is as follows.
Machines \& equipments
Cubicte
Buildings \& others
$\quad$ Total

Foreign currency (USS)
Domestic currency (USS)
86,310
10,620

US\$145;230

### 7.1.4. Operating plan of briquette plant

Of the profit and loss account of briquette plant, the sale price, considering the charcoal price, is 10 ksh per 15 kg .

Because of a new product, the sale price is deferred 3 years and since then, the annual increase of $5 \%$ is estimated. Sawdust as material though unused up to now, is valued 40 ksh per $\mathrm{m}^{3}$. With rise of price of the product, the valuation of the material is to rise. The rising percentage of general manufacturing cost is $8 \%$ per year.

The profit ratio of briquette plant is relatively high.

Table 17. Operating plan of briquette plant (Constructed in the first year)

### 7.2. Construction of secondary processing mill

For rationalized utilization of sawnwood and improvement of management of sawmill, it is a pertinent measure to construct a secondary processing mill to produce parts of furniture or housing components.

Nevertheless, the scale of sawmill, in general, is relatively small and even if the facilities are planned to modernize, the scale is not at all large. In consequence, it is not always considered pertinent that each sawmill install processing mill of its own. If respective sawmill has such mill, quite small process facilities are reasonable.

It is considered reasonable that the processing mill of a scale to some extent be constructed in the area where sawmills are relatively concentrated, managed by the cooperative society of sawmills or a certain company organized under joint investment in order to produce and supply furniture or its parts or housing components.

### 7.2.1. Items of products and production

Because of diversified items of secondary processed goods and the number of process in manufacturing, there is a difference in the number of workers engaged. And depending on the arrangement of processing order, the efficiency is influenced and the selection of design and the precision of process have much influence on the value added of the products.

Therefore, a reasonable number of workers including machinists required in the facilities of the preceding paragraph and assemblers and others are set up and representative item of processed goods are shown and a rough estimate is made on the assumption of the required personnel to process respective goods and the monthly production.
(a) Workers (machines, assembly and painting)
(b) Items of products and production capacity

| 1. Dining room set | 1 table 4 chairs | 60 workers | 400 sets $/ \mathrm{month}$ |
| :--- | :--- | :--- | :--- |
| 2. Dressor | $1.5 \mathrm{~m} \times 2 \mathrm{~m} \times 0.6 \mathrm{~m}$ with drawers | 60 workers | $300 \mathrm{pcs} / \mathrm{month}$ |
| 3. Wooden door | $1 \mathrm{~m} \times 2 \mathrm{~m}$ with frame | 30 workers | $600 \mathrm{pcs} / \mathrm{month}$ |
| 4. Flooring block | $30 \mathrm{~cm} \times 30 \mathrm{~cm}$ | 30 workers | $2,000 \mathrm{~m}^{2} / \mathrm{month}$ |
| 5. Blockboard | Lumber core $1 \mathrm{~m} \times 2 \mathrm{~m}$ | 15 workers | 1,500 sheets $/ \mathrm{month}$ |
| 6. Housing wall panel | $4 \mathrm{~m} \times 6 \mathrm{~m}$ Banding panel | 30 workers | 300 sheets $/ \mathrm{month}$ |

60 workers

$$
300 \mathrm{~m}^{3}
$$

4,055,960 ksh
(c) Building area
Plant $1,000 \mathrm{~m}^{3}$

Warehouse
(d) Required fund for construction

### 7.2.2. Investment in equipments

Of the secondary processing plant, considering the result of the survey, it is desirable to establish new plants of moderate size. Therefore, the machine and equipments of paragraph 1 will be suitable for this purpose considering the conditions of Kenya. Since these machines are easy to install, the installation cost is almost included in the construction cost of building.

The plant building, calculated based on the required work site, is $1,000 \mathrm{~m}^{2}$. An incidental material warehouse of $100 \mathrm{~m}^{2}$ and a product warehouse of $200 \mathrm{~m}^{2}$ are needed.
(1) Machines and equipments

Major machines and equipments and their prices are as follows.
The price of machine is CIF MOMBASA including import duty.
Machines and equipments of secondary processing mill
(CIF MOMBASA \& included import duty)

| Machines | No. | US $\$$ |
| :--- | ---: | ---: |
| 1. Cross-cut saw | 1 | 11,900 |
| 2. Four side planning \& moulding machine | 1 | 66,200 |
| 3. Hand feed planer | 1 | 6,500 |
| 4. Single surface planer | 1 | 15,000 |
| 5. Rise \& fall circular saw mill | 3 | 11,900 |
| 6. Wood lathe | 1 | 6,830 |
| 7. Cramp carrier | 1 | 52,700 |
| 8. Grease spreader | 1 | 9,000 |
| 9. Hot press | 1 | 38,100 |
| 10. Band-saw mill | 1 | 5,850 |
| 11. Hollowchisel mortiser | 2 | 11,460 |
| 12. Router | 1 | 5,730 |
| 13. Moulder | 1 | 7,030 |
| 14. Stroke sander |  | 3,420 |
| 15. Tool grinder \& sharpener |  | 3,360 |
| 16. Knife grinder \& sharpener | 1 | 6,120 |
| 17. Double sizer | 20 | 20,600 |
| 18. Trolley | 1 | 6,100 |
| 19. Painting facilities | 5 | 7,930 |
| 20. Portable dust collector |  | 7,650 |

(2) Cubicle

Required power for secondary processing equipments is 128 kw and required cubicle, including first and second wirings is $1,700 \mathrm{ksh} / \mathrm{kw}$.
$1,700 \mathrm{ksh} \times 128 \mathrm{kw}=217,600 \mathrm{ksh}$
(3) Investment in building

Construction cost of plant building is:

| $1,000 \mathrm{~m}^{2} \times 1,450 \mathrm{ksh}=$ | $1,450,000 \mathrm{ksh}$ |
| :--- | :---: |
| Roofing work | 290,000 |
| Steel frame work | 870,000 |
| Building foundation work | 290,000 |
| Total |  |

(4) Domestic transportation of machines

Domestic carriage of machines for secondary processing is assumed the land carriage from MOMBASA to NYERI.
37.05 ton $\times 430 \mathrm{ksh}=15,932 \mathrm{ksh}$

### 72.3. Required fund

The required fund for construction of secondary processing plant is as follows.

| Item | Investment | Recovery year | Annual recovery (ksh) |
| :---: | :---: | :---: | :---: |
| Machines \& equipments | 2,372,430 | 10 years | 237,250 |
| Cubicle | 217,600 | 10 years | 21,760 |
| Building | 1,450,000 | 24 years | 60,420 |
| Domestic carriage of machines | 15,930 | 2 years | 8,000 |
| Total | 4,055,960 |  | 327,430 |
| Breakdown by currency is as follows. |  |  |  |
| Foreign money | Machines \& equipments \& cubicle |  | ,210 |
| Domestic money | Buildings |  | ,460 |

### 7.2.4. Operating plan of secondary processing plant

As stated in the above, the value to be added of the secondary processed goods greatly differs depending on selection of products, setting up of progress of work and skill of workers. Keeping these in mind, the products are assumed the dining room's articles as daily necessities and the price of the product is figured out taking reference to the price delivered at plant inside of Kenya.

Of the depreciation of machines and equipments of plant, the year is set at 10 years.
In actual production, the products are of mixed items.
The profit and loss account of the secondary processing plant is made based on the following assumption.
(1) Production of secondary processed goods, considering the skill of the workers, is assumed to increase by following steps.

First year $\quad 60 \%$ of the whole production capacity
Second year $\quad 80 \%$ of the whole production capacity
Third year $\quad 100 \%$ of the whole production capacity
(2) The sales price of the secondary processed goods is fixed for the first 3 years and from the fourth year it is raised up by $5 \%$ every year. As a result, the net income will show a sharp increase.
(3) Sawn wood as a major material are purchased from outside. Therefore, the purchased price of sawn wood is deferred for first 3 years and from the fourth year, it rises by $5 \%$ every year and $6 \%$ from the 11 th year.
(4) The cost of sub-materials which are utensil, metal fittings, nails and adhesives needed for manufacture of secondary processed goods is estimated at a half of the cost of major material.
(5) Plant labour cost of 60 workers is to increase by $8 \%$ every year.
(6) Processing cost includes those of operation, power and fuels and is estimated 4 times as much as plant labour cost.
(7) General management and sales cost includes those expenses as for personnel and office work and estimated at $10 \%$ of the revenues.
(8) Depreciation cost and profit and loss outside business are estimated based on investment in plant facilities of every fiscal year.
Profit and loss outside business, the interest is divided into foreign and domestic currencies and estimated $4 \%$ and $10 \%$ respectively and the sum is calculated.
(9) As a result of profit and loss account of secondary processing plant, a large amount of profit was gained which is resulted from the assumption of uniform increase of unit price of secondary processed goods as with sawn wood, i.e., $5 \%$ from the 4 th year, and $6 \%$ from the 11 th year.

### 7.3. Construction of tea-chest mill

Sufficient informations on availability of peeler logs from indigenous forests were not obfained during this survey but according to the obtained informations, the amount of possible supply of peeler logs of Kenya is on the increase. On the other hand, the production and exports of tea are steadily increasing which contribute much to the progress of national economy. In this sense, the design of plywood mill for manufacturing tea-chest was attempted.

Although, it is considered necessary to construct a tea-chest mill for future development of tea industry, for construction of a mill, it is necessary to make detailed survey on availability of $\log$, mill site, marketability of products and other items. In this report we describe only outlines of tea-chest plant.

The outline of planned tea-chest mill is as follows.

### 7.3.1. Outline of tea-chest mill

| 21. Wide belt sander | 1 set | 68,500 |  |
| 22. | Boiler | 1 set | 148,200 |
| 23. | Dust collector | 3 set | 3,420 |
| 24. (including option) |  | 30,330 |  |
|  |  | CIF MOMBASA | $1,691,680$ |

The total amount of machines and equipments is about U.S. $\$ 1,700,000$ ( 1978 price: 1 US $\$=220$ ) in which the import duty at Kenya is included but not local cost for mill construction and expenses for dispatching engineers for guidance of construction and production.

Mill building requires 15 m wide, 117 m long, and total area $1,755 \mathrm{~m}^{2}$ (minimum overhead 4.5 m ). When the mill is actually constructed, it is necessary to include these costs beside the price of machinery. These costs are considered to be approximately the same amount to the necessary fund for preparing machines and equipments.

### 7.4. Construction of particle board mill

Manufacture of particle board is one of the most reasonable industries for utilization of residues of wood processing mills and we examined the possibility of construction of particle board mill to utilize effectively waste wood of sawmills.

Notwithstanding, construction of particle board mill in Kenya involves some difficulties and we can not recommend the construction for the time being. The reasons are as follows.

## (1) Material problem

From the world standards, the rational scale of particle board production is $30,000 \sim$ 50,000 ton per year which is on the increase in recent years. Suppose the annual production is 50,000 ton, the required material is nearly $100,000 \mathrm{~m}^{3}$ a year.
Even if the sawmill attained the modernization, the production scale is relatively small and the degree of regional concentration is low. Under such conditions, collection of large amount of waste wood is difficult from the viewpoint of cost. Even if the materials include thinned wood, for management of particle board mill of average production scale, it is difficult to collect required materials at reasonable price.
Particularly, a particle board mill is generally a highly automated industry which requires various installations. In order to reduce the production cost, it is absolutely necessary to maintain high degree of operation.

## (2) Market of product

The important market of particle board is the production of furniture. Recently, in the U.S. and Scandinavian countries (Japan too), the product is increasingly used for construction, particularly shingle and sub-flooring board, but in Kenya the product is used for nothing but furniture. But the particle board in this country is not much used for furniture and even if much efforts are devoted to the development of demand, it is dangerous to expect that the market for particle board expands rapidly. If the overseas market is expected, the dominant market will be in the European countries. In the European countries, the tendency of surplus production facilities of particle board continues and such situation reflects on the price of product and considered to continue for some years to come and in the sector of particle board, it is considered extremely difficult that the product of Kenya can hold competitive power in the European market.
Particle board in itself is a product of less bearable burden of freight and the international trade in recent years are dominant within the European region, and in developing countries particle board mills were constructed so far in an expectation of exports but in many cases ended in disappointment and prudence is particularly needed in construction of particle board mill.
Lately, a small scale particle board mill is designed in an attempt to attach to wood processing mill and such mill is considered to attach to large scale wood processing complex to relyfor its raw material supply on its ownlwaste wood only, but such undertaking does notiseem to meet the present situation of Kenya.

For above reasons, construction of particle board mill is to wait until these difficulties are solved.

## CHAPTER VIII. MARKETING OF WOOD PRODUCTS

It goes without saying that at present, each mill is doing nothing for marketing. It should be done that the manufacturing cost of own product is accurately grasped and based on it, sale activity to be developed.

### 8.1. Domestic market

It is considered that sawmills in Kenya in respect to sale are under relatively favorable condition. Lately, with improvement of national life, the demand for sawnwood is increased and they do not feel any difficulty in selling their own products without doing particular sale campaign and resultantly, it is considered that cognizance of mill manager on the importance of marketing is lowered. In fact, we witnessed many customers were waiting the delivery of ordered goods.

Sufficient knowledge on timber demand and timber market is necessary for profitable sale of sawnwood and for this purpose, the market research is needed.

Nevertheless, it is difficult for mills scattered in various districts to do proper market research and employ sales-men for selling of the products. Therefore, it is desirable that provision of necessary basic materials for sawmill marketing or any assistance to actual sale are to be done by the joint enterprise of the industry or the government or the competent agencies.

The recommendable enterprise related to marketing is the construction of a timber yard. That is, a timber yard is constructed and products of many mills are collected there and sold to customers in Nairobi or in selected municipalities where more sawnwood products are consumed.

Merits of construction of timber yard are as follows.
(1) To ensure saw millers of a stable operation by taking regular delivery of the member saw miller's production;
(2) To establish a joint marketing system which would strengthen the bargaining position of their products, thus promoting the profitability of member sawmills and their sound management;
(3) To provide the buyers with a variety of timber products, both in specifications and species, which each individual sawmiller would not be able to supply alone and thereby contribute to the improvement of marketing powers of the member sawmillers;
(4) To facilitate one-stop-shopping for the benefits of the buyers.

It is suggested that the site and scale of timber yard should be decided taking consideration of scale of sawmill in each municipality and possibility of collection from sawmills.

The thinest board which the sawmill in Kenya can produce is 25 mm board. That is one of reasons for few demand for thin board but the main reason is considered that present sawmilling facilities can not produce thiner board than that of 25 mm . Virtually, in components of housing construction materials, there should be considerable demand for board of 1 cm or less in thickness.

With application of modern band-saw mill, production of thin board is fully attainable. At present, wood from which 25 mm board can not be produced is wasted. If sawmilling is developed to produce 10 mm thick of board, recovery ratio can raise up higher than planned $60 \%$ and for expansion of market for new materials which could be produced through modernization of mill, the whole industry should devote their efforts toward enhancing marketing.

### 8.2. Overseas market

In recent years, Kenya is exporting sawnwood products of $15,000-30,000 \mathrm{~m}^{3}$ yearly to Tanzania, Uganda, the European countries and others. Although the exports to the major market; Europe one of the major market, is on the decrease lately, this is considered due to severe requirement on quality on the part of Europe and the domestic consumption is on the increase.

In spite of the Kenyan export of timber for the European market being decreasing, from the long term point of view, the European market, especially that of the EEC countries, is still of the greatest importance.

The supply/demand situation in the European countries differs among them and the United Kingdom and the Netherlands are very much dependent on their imports of timber. Furthermore, the Federal Republic of Germany, endowed with large forest resources, imports a large portion of consumption of forest products and, for instance, one third of its consumption of softwood lumber comes from abroad. Sawnwood production of France including sawnwood from imported logs is nearly $85 \%$ of domestic demand. It is predicted that in future, timber consumption in European countries increases to a large extent and according to "European Timber Trends And Prospects, 1950-2000 (1977)" published as findings of joint survey of ECE and FAO, while the total timber consumption (roundwood equivalent) in Europe was 400 million $\mathrm{m}^{3}$ in 1970 , it is estimated at 765 million $\mathrm{m}^{3}$ in 2000 and accompanied by such situation, more imports of sawn softwood is anticipated and it is expected that there will be a possibility of increased exports of Kenyan sawnwood.

The important items in sawnwood consumption in Europe, especially among the EEC countries are construction, furniture and joinery materials. Construction timber, particularly structural timber is supplied from Canada and Nordic countries. Some countries, especially the United Kingdom, the largest importer, requires stress graded timber.

Considering species and characteristics of Kenyan wood, interior joinery and furniture
facture furniture and joinery are demanding quality controlled products based on a given specifications. The exportable products, not to say about necessity of reasonable price, should meet the requirement of the consumer country in species, size, quality and precision of dimension.

The sawnwood produced in Kenya can not meet with the requirement of processing mill of industrialized country in quality and precison of dimension. Unless the product is fully managed by the modern facilities, it can not develop the export market.

The second requirement in the overseas market is the continuous supply. Selection of materials by the industrialized processing mill is dependent upon whether or not the materials can be supplied in stabilized quantity and price. The materials supplied sporadically or of unreliable delivery, even if the price is reasonable, can not be used at the highly mechanized plant. Continuity and stability of supply are the important factors. To ensure these factors, the timber yard plays an effective roll.

Sufficient market research is needed for development of overseas market of Kenyan sawnwood and under the cooperation of International Trade Center (Geneva) and other international agencies, it is necessary to carry out the market research or sale promotion of Kenyan wood. It is important to know what the market wants.

### 8.3. Construction of timber yard

Construction of timber yard requires building and land. The land price differs greatly among big cities, local towns and their vicinities and as the site is not yet decided now, the required fund is hard to estimate.

The building's area and required fund for construction in the local city is as follows. (Domestic money)

| Monthly lumber sales | $2,000 \mathrm{~m}^{3}$ |
| :--- | :--- |
| Rotation | 2 times $/ \mathrm{month}$ |
| Capacity per unit area | $2 \mathrm{~m}^{3} / \mathrm{m}^{2}$ |
| Required area for building | $500 \mathrm{~m}^{2}$ |
| Required fund for construction | $725,000 \mathrm{ksh}(\mathrm{US} \$ 92,710)$ |
| $\left(500 \mathrm{~m}^{2} \times 1,450 \mathrm{ksh}=725,000 \mathrm{ksh}\right)$ |  |

Remark: Unit price of construction is subject to ICDC proposed price.

## CHAPTER IX. TRAINING CENTER

As organizations of training skill, FITC (Forest Industries Training Centre) and KITI (Kenya Industrial Training Institute) are available. The woodworking sector of KITI is provided with necessary facilities for training of woodworking technique and is considered to contribute to the training of leaders of wood processing sector in future but FITI which is responsible for sawmilling sector does not fulfill its function because most of facilities were lost by firc.

For the training of employees who support the development of wood industry, it should play more positive role. For this purpose, machines and equipments of Type A sawmill level now under planning should be installed, with and if possible, it is desired that some of woodworking machinery is attached to. It is a matter of government decision whether the facilities are installed in FITI or the facilities are transferred to the control of the proposed TDC. Anyway, proper consideration should be paid that the sale of products which might be carried out as secondary business of the training organization will not hinder the private enterprise. In order to implement modernization of sawmill effectively, it is necessary to introduce the technology of advanced nations positively and it is also necessary to accept the dispatch of technical leaders for a long term for construction of mills or to dispatch specialists to developed countries for training.

The training centre will have to provide other machines and equipments than the sawimill but for the current purpose to educate sawmill workers at FITC, the machines and equipments of Type A sawmill are provided.

In this case, the required fund for machines and equipments and construction is the same as shown in 5.2.1 and 5.5. The total required fund is as follows.

| Required fund for construction |  |
| :---: | :---: |
| Foreign currency | US\$334,690 |
| Domestic currency | US\$452,480 |
| Sub-total | US\$787,170 |
| Cost of dispatching construction experts | US \$ . 9,940 (3rd class one 3 months) |
|  | ( $¥ 2,187,000$ ) |
| Cost of dispatching instructors | US $\$ 115,800$ (2nd class one 2 months) <br> (3rd class one 2 months) |
|  | ( $¥ 25,467,000$ ) |
| Total $\quad$ US\$912,910 |  |

Training course
a. Sawmilling techniques course

Trainees: $\quad 10$ (graduates of middle school)
Period:
Major items: $\quad$ General knowledge on timber - wood conversion - quality control inspection
Machine operation
Machine structure
b. Saw doctoring course Trainees:

10 (graduates of middie school)
Period:
Major items:
One year
General knowledge on timber
Machine structure
Machine operation
Saw doctoring - saw welding - stretching - tensioning - swage and shaper

## CHAPTER X. PLANNED IMPLEMENTATION OF MODERNIZATION

It is necessary by all means to introduce new and efficient machines and equipments for modernization of existing sawmills. Notwithstanding, this is not all the means to attain modernization of wood industry. For effective management of modern facilities, appropriate guidance of experienced leaders and training of employees on skill are needed. In the wood industry of Kenya, experienced workers in charge of mill management are extremely in deficit and it is urgently needed to fill up the organization to perform these trainings.

For modernization of sawmill and introduction of new wood industry, and well balanced, prudent and planned development progress of market are desired.

### 10.1. Annual plan for modernization

When the machines and equipments of sawmill are improved and effective band-saw mill is introduced instead of circular saw mill, the recovery ratio is raised up and supply of sawnwood is increased, while it is natural to consider that input of log rises due to improvement of facilities. This means a remarkable increase of supply of sawnwood.

When rationalization and modernization of planned sawmill are implemented almost simultaneously, it is clear that there is a possibility to invite rapid increase of supply of sawnwood to the market and as a result, there is another possibility that over-supply brings about confusion of sawnwood market.

In consequence, in implementing modernization of existing sawmill, facility increase well balanced with the expansion of market, is desirable. Then, the annual plan for improvement of facilities is needed.

In the case of introduction of a new industry, acceptance of products by the market and training of employees need fairly a long term. Based on careful annual plan, systematic implementation is desired.

In this report, suppose the modernization of timber industry is implemented in 3 years, the required fund is figured out as follows. According to this plan, the details of mill construction plan is as follows.

Table 23. Yearly plan of establishment of mills

|  | First Year | Second Year | Third Year | Total |
| :--- | :---: | :---: | :---: | :---: |
| Sawmill (A Type) | 3 | 3 | 2 | 8 |
| Sawmill (B Type) | 3 | 3 | 2 | 8 |
| Briquette mill | 1 | 1 | 1 | 3 |
| Secondary processing mill | 1 | 1 | 1 | 3 |
| Tea-chest factory |  | (Survey) |  | 1 |

Remarks: Expansion of logging facilities should be carried out one-third of the total planned equipments accompanied with the modernization of sawmills.

In regard to mill site, particularly in case of sawmill, mills should be scattered in NYAHURURU, NAKURU and NYERI where existing mills are somewhat concentrated and construction of modern mills should be selectively promoted.

It is considered pertinent that waste wood briquette mill would be built at each mill in NYAHURURU, NAKURU and NYERI where sawmills are rather gathered.

Construction of secondary processing mill should take consideration of market of products. Preferably, mills are located in the center of wood industry or densely populated cities as NAIROBI, NYERI and NAKURU.

Construction of tea-chest mill will need further survey but considering tea production and possibility of supply of national forest timber, EMBU or MERU would be recommendable.

## CHAPTER XI. REQUIRED FUND FOR MODERNIZATION

For implementation of modernization of wood processing industry, a large amount of money is required. Such fund for construction of each industry and the management account are shown in respective section. The required fund for construction under the annual plan is shown in 11.1 .

When the modernization is implemented based on the annual plan, it is necessary to estimate the rise of the price of machines and other expenses in future. In the trial calculation tion of this plan, the price is on the estimation of annual increase of $7 \%$. However, it is considered that local cost as construction will increase faster than the above and in this plan, the calculation is made on the assumption of annual increase of $8 \%$.

### 11.1. Construction fund for plant, etc.

Table 24. Required fund for modernization of timber industry (US\$)

| Facilities | No. of Construction | Required fund |  |
| :---: | :---: | :---: | :---: |
|  |  | Foreign moncy | Domestic money for construction, etc. |
| First year |  |  |  |
| Training center | 1 | 299,320 | . 452,480 |
| Sawmill A | 3 | $\begin{gathered} 1,004,070 \\ (334690 \times 3) \end{gathered}$ | $\begin{gathered} 1,357,440 \\ (452480 \times 3) \end{gathered}$ |
| Sawnill B | 3 | $\begin{gathered} 391,290 \\ (130430 \times 3) \end{gathered}$ | $\begin{gathered} 407,520 \\ (135840 \times 3) \end{gathered}$ |
| Briquette plant | 1 | 96,930 | 48,300 |
| Secondary processing plant | 1 | 331,210 | 187,460 |
| Timber yard | 1 |  | . 92,710 |
| Total of the first year |  | 2,122,820 | 2,545,910 |
| Second year |  |  |  |
| Sawmill A | 3 | 1,074,360 | 1,466,040 |
| Sawmill B | 3 | 418,680 | 440,120 |
| Briquette plant | 1 | 103;720 | 52,170 |
| Secondary processing plant | 1 | 354,400 | 202,460 |
| Timber yard | 1 |  | 100,130 |
| Total of the second year |  | 1,951,200 | 2,260,920 |

| Third year |  |  |  |
| :--- | :--- | :--- | :--- |
| Sawmill A | 2 |  |  |
| Sawmill B | 2 | 685,380 | 298,660 |
| Briquette plant | 1 | $1,055,550$ |  |
| Secondary processing plant | 1 | 316,900 |  |
| Timber yard | 1 | 379,200 | 56,350 |
| Total of the third year |  | 218,660 |  |
| Chest plant | 1 | $1,474,220$ | 108,140 |
| Total |  | $1,936,800$ | $1,755,600$ |
| Grand Total |  | $1,900,000$ (Est.) |  |
|  |  | $7,411,020$ | $3,655,600$ |

Remarks: Cost of logging facilities is included in sawmill.

Summarization of the above for planned three years is as follows.
Table 25. Total cost for modernization of plants (Unit: USS)

|  | No. of plant | Foreign money | Domestic money | Total |
| :--- | :---: | :---: | :---: | :---: |
| Training center | 1 | 299,320 | 452,480 | 751,800 |
| Sawmill A | 8 | $2,763,810$ | $3,845,990$ | $6,608,800$ |
| Sawmill B | 8 | $1,108,630$ | $1,154,620$ | $2,263,250$ |
| Briquette plant | 3 | 311,630 | 155,280 | 466,910 |
| Secondary processing plant | 3 | $1,064,810$ | 602,660 | $1,673,390$ |
| Timber yard | 3 |  | 298,060 | 298,060 |
| Sub-total |  |  | $6,562,430$ | $12,110,630$ |
| Chest plant | 1 | $1,936,800$ | $1,900,000$ | $3,836,800$ |
| $\quad$ Total |  | $7,485,040$ | $8,462,430$ | $15,947,470$ |

Beside the above, if the expenses for dispatching engineers for plant construction and operational guidance amounting about US $\$ 230,000$ is added, except the tea-chest plant which needs survey, the total of about US $\$ 12,300,000$ is required.

### 11.2. Dispatching engineers for plant construction, etc.

Dispatching of experts is needed for installation of machines in sawmill $A$ and $B$ types, briquette plant and secondary processing plant, trial operation and training of skilled workers.

### 11.2.1. Basic idea of dispatching experts

(1) Training center

From installation of sawmill machine, experts are dispatched to educate basic technology of sawmilling for training of instructors of sawmill and saw-doctoring in Kenya.

Period: Two years (long term)
Qualification: One senior engineer (sawmill technique)
One technical expert (saw doctoring)
(2) Sawmills Type A and B

Experts are dispatched for installation of machine, trial operation and education of skilled workers for sawmills A and B inclusively.

Period: One year (long term)
Qualification: Two technical engineers
Selected: From private enterprise
(3) Briquette plant

Experts are dispatched to educate skilled workers and instruct machine installation and trial operation.

No. of expert: 1
Period: $\quad 6$ months ( 3 times in the $1 \mathrm{st}, 2$ nd and 3 rd years)
Selected: From private enterprise
(4) Processing plant

Experts are dispatched for machine installation, trial operation and training of skilled workers.

No. of expert: i
Period: $\quad 2$ months ( 3 times in the 1 st, 2 nd and 3 rd years)
Qualification: Technical engineers
Selected: From private enterprise

### 11.2.2. Rough estimate of cost of dispatching experts

The cost of dispatching experts to each plant of the preceding paragraph is as under based on the standard of JICA.

Table 26. Cost of dispatching experts (Unit: $¥ 1,000$ )

| Item | Unit price | Training centre |  | Sawmill |  | Briquette |  | Second. processing |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Experts |  | Class 2, 1 person Class 3, 1 person |  | Class 3, 2 persons |  | Class 3, 1 person |  | Class 3, 1 person |  |
| Outfitting allowance | $\begin{array}{ll}\text { Class } 2 & 180.0 \\ \text { Class } 3 & 165.0\end{array}$ |  | $\begin{aligned} & 180.0 \\ & 165.0 \end{aligned}$ | 2 | 330.0 | 1 | 165.0 | 1 | 165.0 |
| Air freight | - 426.0 | 2 | 1,704.0 | 2 | 1,704.0 | 1 | 852.0 |  | 852.0 |
| Daily allowance |   <br> Class 2 3.8 <br> Class 3 3.2 | $\begin{gathered} \text { days } \\ 6 \end{gathered}$ | $\begin{aligned} & 22.8 \\ & 19.2 \end{aligned}$ | $\begin{gathered} \text { days } \\ 6 \end{gathered}$ | 38.4 | days 90 | 288.0 | $\begin{gathered} \text { days } \\ 60 \end{gathered}$ | 192.0 |

| Domestic allowance | Class 2228.0 <br> Class 3194.0 | $\begin{gathered} \text { Mon. } \\ 24 \\ \hline \end{gathered}$ | $\begin{aligned} & 5,472.0 \\ & 4,656.0 \end{aligned}$ | $\begin{array}{r} 2 \\ 12 \end{array}$ | 4,656.0 |  | - |  | - |
| Total |  |  | 25,476.2 |  | 13,302.0 |  | 2,187 |  | 1,979 |
| Grand total | $\therefore$ |  | 25,476.2 | $\begin{gathered} \text { times } \\ 1 \\ \hline \end{gathered}$ | 39,906.0 | $\begin{gathered} \text { times } \\ 3 \\ \hline \end{gathered}$ | 656.1 | $\begin{gathered} \text { times } \\ 3 \end{gathered}$ | 5,391 |

|  | $(\not ¥ 1,000)$ | $1,000 \mathrm{ksh}$ | USS |
| :--- | ---: | ---: | ---: |
| Training centre | 25,476 | 906 | 115,800 |
| Sawmill | 39,906 | 473 | 60,500 |
| Briquette plant | 6,561 | 233 | 29,800 |
| Secondary processing plant | 5,391 | 192 | 24,600 |
| Total | 77,334 | 1,804 | 230,700 |

Note: (1) Subject to JICA standards
(2) Share of sawmill is $2 / 3$ of $A$ mill and $1 / 3$ of $B$ mill
(3) Exchange rate: USSI $=7.82 \mathrm{ksh}=¥ 220$

## CHAPTER XII. REDEMPTION OF INVESTMENT

The investment in equipment of sawmill, briquette plant and secondary processing plant is covered by loan and the interest rate is assumed to be $4 \%$ per annum for forcign money and $10 \%$ per annum for domestic money.

Loan condition

| Interest | Foreign money | $4 \%$ per annum <br>  <br> Term |
| :--- | :--- | :--- |
| Domestic money | $10 \%$ per annum |  |
| Redemption | 15 years |  |$\quad$| Deferment of 2 years: uniform redemption of the principal for |

## CHAPTER XIII. ECONOMIC EFFECT AND PROBLEMS OF MODERNIZATION OF TIMBER INDUSTRY

For promotion of modernization of timber industry, a large amount of money is required and its effect upon the national economy is quite large. It is not always easy to evaluate quantatively but the profitability of sawmill, briquette plant and processing plant is considerably high and the ability of redemption to the investment is considered enough.

Some of effects of modernization of timber industry are as follows.
(1) Effective utilization of timber resources

Most of sawmills at present are old-fashioned and the yield percentage of conversion is quite low and much residuals like saw-dust are unused and thrown away. The modernization of sawmill almost doubles the products from valuable timber resources and gives a large merit to the national economy.
In addition, the manufacture of briquettes with sawdust is quite important to the national economy since it produces daily necessities through the effective utilization of unused resources and it controls the uncontrolled timber felling for fuel collection which contributes to the national land safeguard.
(2) Improvement of quality of products

When the timber mill is modernized, the quality of timber products is greatly improved and the stable supply of best products can be attained to the housing construction and furniture industry.
(3) Raising up of licence fee

When the sawmill is modernized and timber recovery rate is made higher, it is possible to raise the licence fee for felling of national timber and then, with this fund, intensive forest management can be attained.
(4) When new mills are constructed, the local employment is promoted and they contribute to the development of local economy.
(5) The introduction of new techniques to the sector of timber processing, stimulates the existing mills and contributes to the improvement of overall technology.
Notwithstanding, the implementation of such modernization plan accompanies some problems.
(1) The core of such project is the private enterprise and its scale is relatively small and in order that the government may afford aid smoothly to such enterprises, there will be more difficulties than the usual project.
(2) Beside the timber mills to be modernized, there are some mills of market-oriented timber industry in big cities.
(3) Unless the project of non-profitmaking sector such as reinforcement of training facilities is implemented simultaneously, the effectiveness of modernization can not be manifested.
(4) When modernization plan is realized, stable supply of logs of $150,000 \mathrm{~m}^{3}$ is needed every year and eventually, more intensive forest management is required.

## CHAPTER XIV. GOVERNMENT'S MEASURES TO BE TAKEN FOR IMPLEMENTATION OF MODERNIZATION PLAN

While we have discussed on the present situation, problems and modernization of sawmill, in order to solve various problems and promote modernization, there are many difficulties in the sectors of funds and technology.

For smooth promotion of the modernization, the pertinent guidance to be taken by the Government of Kenya is desired for. Important measures now being considered are as follows.

### 14.1 Promotion of joint-ownership of sawmill and joint venture

The mills surveyed have their own problems and the common problems which each mill confronts the solution. The common problems are:
a. Repair system of sawmill machines and logging facilities
b. Establishment of timber yard for sale of products.
c. Utilization of residues as sawdust.

It is quite effective that neighbouring mills cooperate in solution of these problems.
There would be two ways for solution. The one is to establish new facilities at the present location and promote the solution of common problems and the other is that each mill concentrates in one complex and coordinates the production items of each mill and establish the facility for solution of common problems at the same site.

In case of promotion of joint enterprise, the members share the cost and expenses of construction, machines and equipments and when the fund is in short, it would be necessary that the Government will finance the fund or subsidize the interest. In order to expedite the enterprise effectively, preferential taxation would be desirable.

When the complex is established for promotion, the State build up the sawmill complex and ineffective sawmills near the forest are removed and concentrated in one complex where the electricity is available.

In this case, the State bears the expenses of procurement and establishment of site and the mill pays the expenses of procurement of mill site, construction of sawmill, machines and equipments and installation of joint facilities. It would be effective if the State takes measures of loan or subsidy for these expenses.

The followings are considered particularly necessary to recommend or subsidize in the joint facilities of sawmills.
a. Joint saw doctoring shop
b. Joint repair shop of sawmill machines
c. Joint repair shop of logging facilities
d. Common yard of sawnwood products.
e. If necessary, joint processing mill for flooring board, panel parquett and components of furniture.
It would be effective that these joint facilities are established in and near NAKURU, MOLO, HYAHURURU, NYERI, EMBU and MERU. Sawmill complex is supposed to be near NAKURU and NYERI.

### 14.2. Measures to renew the facilities of sawmill

For rationalization and modernization of machines and equipments of sawmill, the government's positive policy and aids are desired for.

The policies under consideration are as follows.

### 14.2.1. System of a long term loan at low interest

Along with modernization plan of sawmill, when machines and equipments are renewed or a new mill is built, it is desired that the government establishes a system to loan a whole or a part of the fund for construction.

Samples of such loan are as follows.
(1) Debtor - Sawmillers having felling licence or their cooperative society
(2) Term of a loan - within 15 years
(3) Interest rate per annum - $4 \%$ for foreign money, $10 \%$ for domestic money
(4) Redemption - deferment of 2 years. Payment by uniform installments - 13 years

### 14.2.2. Lease system of machines and equipments

For promotion of modernization of machines and equipments of sawmill, it is desirable to take a system that the government purchases such machines and equipments and lends them sawmills and after a given period, transfers them.

An example of this system is shown below.
(1) Borrower - Sawmiller or their cooperative society
(2) Term of loan - within 10 years
(3) Rent $-7 \%$ interest per annum for balance of loan
(4) With the proposal of the sawmiller during the term, the government sells the machine and equipments at balanced price.
(5) Machines and equipments considered pertinent for loan will be:

Carriage with setworks (circular head saw)
Bandsaw mill with carriage
Auto table

Table band-saw mill with roller
Table band-saw mill
Cross-cut saw
Ripper
Log transport facilities
Conveyor
Saw sharpener
Forklift
Insectcide injection can
Wood working machine (including sander)
Lorry
Tractor
Loader
Chainsaw
Chipper
Shearing machine
Press machine
Briquette manufacturing machine

### 14.2.3. Preferential measures for taxation

When machines and equipments of sawmill are in need of rationalization or modernization, it is desirable to take a preferential measures as reduction of years of depreciation or tax reduction for certain types of machines and equipments.

In this survey, machines and equipments in need of modernization are as follows.
(a) Band-saw mill
(b) Carriage with setwork
(c) Forklift
(d) Electric receiving board
(e) Vehicle such as lorry, tractor
(f) Wood waste briquette manufacturing machine

It would also be effective that measures to shorten the depreciation year, exemption or reduction of taxes for designated machines and equipments.

### 14.3. Expansion of training facilities for sawmilling technique

As the mills we visited are scattered near the forest or in the urban area, it is difficult for a mill to know the situation of other mills. Still more, it is more difficult to learn sawmilling technique of other mills to contribute to the improvement of technology of its own.

For this purpose, it is advisable that the State completes the training facilities of sawmilling techniques to help the sawmill and efforts are made to train and educate sawyers.

The training centre for sawmilling is to be provided with following machines and equipments. However, for the time being, at least sawmill facilities are required.
(a) Modern line

1. Band-saw mill with auto carriage
2. Auto table band-saw mill
3. Roller band-saw mill
4. Table band-saw mill
5. Cross-cut saw
(b) Existing line
6. Circular head saw
7. Circular saw mill for resawing
8. Cross cue saw
(c) A set of saw sharpening machines
(d) Insecticide impregnation can
(e) Woodworking machines
(f) Circular saw mill for firewood
(g) Chipper
(h) Wood waste briquette manufacturing facilities
(i) Grading and assorting place for sawnwood
(j) Arrangement of sawnwood and storage
(k) Trainees' lodging
(l) Establishment of a system to send each mill instructors of sawmilling technique
(m) Introduction of sawmilling technique of overseas, for example, from Japan
9. Visit to Japanese sawmills should be seriously considered, and training of managers and foreman of major sawmills in Japan should also be considered.
10. A system to invite experts from Japan is to consider.

### 14.4. Reinforcement of guidance and subsidization to marketing activity

The sawmill is generally small in scale and still more, each mill is scattered in many parts of the country and as a result, there are various problems.

Although reinforcement of marketing is preferably promoted by individual mill, it is rather difficult to appoint a salesman at each mill and collect market information. It is desired that the State would make its efforts toward helping the market promotion activities of sawmill as well as the progressive guidance and strong subsidization for the improvement of machines and equipments.

As for marketing, the following matters are in need.
(a) Subsidization to yard facilities of sawnwood.
(b) Reinforcement of guidance on transport and distribution structure of sawnwood.
(c) Reinforcement of guidance on quality and specifications of sawnwood.
(d) Promotion of development of demand and extension of sawnwood.
(e) Implementation of informative measures of market information of sawnwood.
(f) Development of market of wood products and collection of market information abroad.

## CHAPTER XV. OPINION TO THE ESTABLISHMENT OF PROPOSED TDC

The government should give direction and appropriate measures for the modernization of wood industry. The institutional requirement for such modernization should be left to the descretion of the government.

However, the establishment of a specialized agency will be essential for achieving the modernization. Particularly in the present situation where there is no association of sawmillers and related industries, the creation of an organization like the proposed TDC may indeed be imperative. TDC should be empowered to take such measures to be taken by the government as discussed in Chapter X.

The operation of TDC should not, however, kinder the activities of privatc enterprises.

## CONCLUSION AND RECOMMENDATIONS

The forest area of Kenya is small. The country can not be regarded rich in forest resources. Among the wood based industry, sawmilling is a dominant sector. In addition a considerable number of wood processing mills are also in operation. Most of the machinery and equipments are out of date and their performance lacks efficiency. Modernizing the industry will lead to the more effective utilization of forest resources and the better operation results of sawmills and other wood based industry.

For the modernization of timber industry, the following actions are recommended:
(1) The old type circular saw mill of existing sawmills should be switched over to efficient bandsaw mill to improve production efficiency and recovery rate.
(2) Logging facilities of sawmill is extremely inadequate and should be improved.
(3) It is advisable to establish briquette plant for utilization of waste wood, particularly saw dust. Such action would also be effective in preventing uncontrolled felling tree for fuel and conserving the forest resources.
(4) For overall development of wood industry, processing plants for secondary timber products should be build as a joint enterprise of sawmillers to manufacture components of furniture and housing.
(5) It is considered reasonable that tea-chest plant should be constructed to support the promotion of tea exports. For this purpose, further detailed survey is needed.
(6) The construction of particle board plant for utilization of wood waste poses a problem of collection of materials and market of product, and therefore, should be defered for future considerations.
(7) Training of employees in factory operations is essential and therefore, training centres should be equipped to provide effective training.
(8) A phased approach based on annual planning is necessary for the implementation of the modernization plan. If all the above-mentioned 16 sawmills are modernized at the same time, it may result in excessive supply of products. Hence, the tempo of modernization should be set against the rate of increase in demand.
(9) Action by the government is also called for; The establishment of proposed TDC as an executive organ would be appropriate. However, the function of TDC should be defined in such a way as to avoid undermining of private industry initiatives.

The objective of the modernization of the wood industry is to enhance the national economy by utilizing effectively the present and future timber products and hereby supplying at a stable basis essential goods for the living. Therefore, the expansion of the production capacity of wood industry should be closely correspondent with the lumber supplying capacity of the forest.

Particularly, most of raw materials of wood industry of Kenya are softwood from manmade forest. The demand of softwood timber in the world as a whole has been increased quite rapidly in recent years for construction and paper production materials. By the end of this century, it is estimated that there would be deficit in supply in some industrialized area. Softwood in Kenya has a possibility to contribute to the national economy in future far much more than now. While the effective utilization of timber is promoted, more efforts should be made toward intensification of the management of forests including man-made forest to accumulate the forest resources. If the modernization of wood industry brings about the depletion of forest resources and erosion of land, the modernization of wood industry would not only be meaningless but also would result in the irrecoverable loss to the nation.
