1.3. Runoff Data

Runoff data available in the vicinity of the Project Area are tabulated in Figure B-3, and out of these data, three runoff discharge data observed at Khanpur, Cherah and Chahan stations are collected as shown in Table B-31 to Table B-33, of which location is shown in Figure B-4.

These data on daily basis will be necessary to build the Tank Model for analyzing runoff discharge in the Kurang River basin, of which detail descriptions are given in subsequent chapter.

CHAPTER II. RUNOFF ANALYSIS

2.1. Runoff Discharge Estimated by SDO

Small Dams Organization (SDO) dealing with water management and control of the Rawal Dam since 1962 has an estimated inflow discharge to the Rawal Dam on the daily basis for the period of 25 years, 1962 to 1986. These inflow discharges are estimated based on the daily observation data such as released discharges from the Rawal Dam, spilled discharges and variation of storage volume of Rawal Reservoir as expressed in the following equation;

$$\text{Inflow Discharge (Q}_i\text{)} = \Delta V + Q_1 + Q_s$$

where; ΔV = Variation of Storage Volume

Q_1 = Released Discharge

Q_s = Spilled Discharge

Table B-34 tabulates the estimated inflow discharge to the Rawal Dam on monthly basis. Out of these inflow discharges, five-years data, 1962 to 1966, are of monthly basis and the remaining 20-years data, 1967 to 1986, are of daily basis. According to these data, inflow discharge to the Rawal Dam is estimated at about 81.7 MCM on average for the period of 25 years, 1963 to 1986. Based on these data, runoff discharge at the Rawal damsite could be estimated at about 100.9 MCM on average as shown in Table B-38, depending upon the following considerations;

- Water losses in the Rawal Dam consisting of water seepage and evaporation are assumed to be 9.2 MCM in total, 0.9 MCM of seepage and 8.3 MCM of evaporation.
- Diverted water of 7.6 MCM/annum at the upstream of Rawal Dam for the domestic water supply purposes should be added to inflow discharge thus estimated.
- Negative inflow discharge in the tabulation of daily calculation prepared by SDO is assumed as follows;
 - ° If total discharge adding water losses to negative inflow is smaller than zero, inflow discharge is assumed to be zero.

2.2. Estimation of Runoff Discharge by Tank Model Method

Runoff discharges of the Kurang River at the Rawal and proposed K-2 damsites, which have the catchment area of 275.1 sq.km and 137.0 sq.km respectively have been estimated by applying the theoretical method so as called Tank Model Method because reliable long term observation data are not available at the both sites. Subsequent paragraph discusses the estimation of runoff discharge by Tank Model Method.

2.2.1. Procedures of Runoff Analysis

The catchment area of the Kurang River has a fault between the Kurang River and Margalla Hill. Northern parts of the fault in the Kurang River basin consist of limestone in geology and is quite similar to those of upstream area of Khanpur in the Haro River basin. On the other hand, southern parts of the fault consist of sand stone and mudstone, and their topography is formed with complicated formation by mountain and alluvial plain. These mountainous areas are similar to those in the upstream of Cherah in the Soan River. Furthermore, alluvial plain areas are similar to those in Chahan of the Sil River.

Taking into consideration the above mentioned, the runoff discharges of the Kurang River were analyzed for a 35-year period from 1952 to 1986 by the Tank Model Method, which was designed for the stations of Khanpur in the Haro River, Cherah in the Soan River and Chahan in the Sil River. Their results were applied to estimate the runoff discharge of the Kurang River, considering the following elements of each river basin.

Element of Run-off Discharge Estimation

Classification of Kurang River Basin	Catchment Area (sq. km)	Areal Rainfall (mm)	Northern	Southern Parts of Fault	
			Parts of Fault Mountainous Area Haro River, Khanpur Model (%)	Mountainous Area Soan River, Cherah Model (%)	Plain Area Sil River, Chahan Model (%)
Upstream of Rawal Dam ^{1/}	138.1	1,267	33.1	26.6	40.3
Upstream of K-2 Dam	137.0	1,556	22.0	67.7	10.3

^{1/}: exclusive of K-2 Dam catchment area.

Figure B-5 shows the Tank Model built in three river basins mentioned above, which are formulated based on the verification between rainfall and discharge in each river basin. Figure B-6 to Figure B-8 indicate the relationship between computed and observed runoff discharge in the three river basins.

2.2.2. Areal Rainfall

Areal rainfalls in each catchment area of Rawal Dam and K-2 Dam was estimated on the daily basis for the periods of 35 years, 1952 to 1986, by applying Thiessen method as shown in Table B-39 and Table B-41, and they are summarized as follows;

Estimated Areal Rainfall

<u>Item</u>	<u>Catchment Area of Rawal Dam</u>	<u>Catchment Area of K-2 Dam</u>	<u>Total</u>
Catchment Area (sq.km)	138.1	137.0	275.1
Annual Areal Rainfall (mm) ^{1/}	1,267.4	1,555.6	1,410.9

^{1/}: Used rainfall stations;

Rawal Dam: Rawal Damsite and Barkot

K-2 Dam : Rawal Damsite, Barkot and Murree

2.2.3. Results of Runoff Analysis

By using the above mentioned procedures, the runoff discharges at the both damsites are analyzed for the periods of 35 years as shown in Table B-42 to Table B-44, and they are summarized as follows;

Estimated Runoff Discharges

<u>Item</u>	<u>Rawal Damsite</u>	<u>K-2 Damsite</u>	<u>Total</u>
Catchment Area (sq.km)	138.1	137.0	275.1
Annual Runoff Discharge (MCM)	40.9	62.1	103.0

2.3. Evaluation of Estimated Runoff Discharge

Runoff discharges estimated by the both methods mentioned above are summarized as shown belows;

Estimated Runoff Discharges in Kurang River

Item	W/O Project		W/Project		Total
	Rawal Damsite	Rawal Damsite	D-2 Damsite	D-2 Damsite	
Catchment Area (sq.km)	275.1	138.1	137.0		275.1
Annual Areal Rainfall (mm)	1,410.9	1,267.4	1,555.6		1,410.9
Annual Runoff Discharge (MCM)					
By SDO Estimation	100.9	-	-		-
By Tank Model Estimation	103.0	40.9	62.1		103.0

As is observed in the above figures, about 2.1 MCM of runoff discharges equivalent about two percent of the estimated discharge are different between both figures. However, it can be considered that the usage of the runoff discharges estimated by applying Tank Model Method would be more practicable and reasonable in case that the project plan inclusive of K-2 Dam is formulated, because of the following reasons;

- Runoff discharge at the proposed K-2 Dam could not be estimated by using the specific discharge based on the Rawal damsite data calculated by SDO, because the rainfall magnitude in the catchment area of K-2 Dam is quite different from that of Rawal Dam catchment area.
- Considerable unreliable observed and calculated data are included in the SDO record.
- Unreasonable runoff discharges are observed in SDO data during the periods of January and February as shown in Figure B-10.
- Difference of estimated discharge of about two percent is deemed to be permissible extent in the terms of calculation.

In the project plan, therefore, the estimated runoff discharge by the Tank Model Method will be used for hydrological study such as reservoir operation study.

Note: Water losses are estimated by following criteria:

Water seepage: 2 percent x Effective storage capacity (47.0 MCM)

Evaporation: Pan evaporation rate x 0.7 x water surface area (6 sq.km)

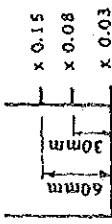

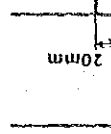

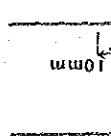

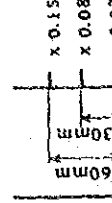

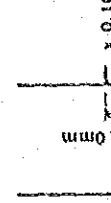

1/: No inclusive of 1962 data in mean, max. and min. figures.

^{1/}: ESTIMATED BY THIESSEN METHOD ON THE BASIN OF RAINFALL STATIONS OF RAWAL DAMSITE, BARKOT AND MURREE

FIGURE B-9 5-YEAR MOVING AVERAGE OF AREAL RAINFALL

Note: Areal rainfall above mentioned both basins are estimated by applying Thiessen method based on the following data:

- K-2 Dam Basin ; Dam site and Barkot
- Rawal Dam Basin ; Dam site, Barkot and Murree

TABLE B-42. MONTHLY RUNOFF DISCHARGE OF KURANG RIVER AT RAWAL DAMSITE ^{1/}

FIGURE B-10 COMPARISON OF RUNOFF DISCHARGE

CHAPTER III. WATER QUALITY ANALYSIS

Water quality analyses for the Kurang River and its related water were made by the Study Team in the course of field work from irrigation and bacteriological view points. As the results, following data are collected;

- i) Results of water quality analysis for two samples for irrigation purposes (see Table B-46)
- ii) Results of water quality analysis for five samples for domestic water purposes (see Table B-47)
- iii) Results of water quality analysis for nine samples for domestic water purposes (see Table B-48 and Table B-49)

TABLE B-46. RESULT OF WATER QUALITY ANALYSIS

Item	Results of Analysis	
	No.1	No.2
pH		
Conductivity mmhos/cm	0.29	0.32
Nitrate (N) ppm	0.50	1.20
Phosphate (P) ppm	0.003	0.050
Potassium (K) ppm	21.00	28.00
Sodium (Na) ppm	1.40	1.40
Iron ppm	0.20	0.01
Calcium + Magnesium mg/lit	0.40	0.44
Chloride mg/lit	1.80	3.00

- Note: 1/... Chemical analysis of above items was conducted by National Agriculture Research Center(NARC)
- 2/... Above water is sampled at the following points by Study Team;
- No.1: A little upstream of the proposed K-2 damsite
- No.2: Proposed Kc-2 head work

TABLE B-47. RESULTS OF CHEMICAL ANALYSIS OF KURANG RIVER WATER

Item	Results of Analysis				
	No.1	No.2	No.3	No.4	No.5
1. Temperature	12.0°C	12.0°C	12.0°C	12.0°C	12.0°C

Data Source; Regional Research Laboratory, Public Health Engineering Department (PHED)

Note; Sampled Water:

- No.1: Sampled at overhead tank of Ayub Park on August 4, 1987
- No.2: Sampled at Topl Water Works on August 4, 1987
- No.3: Sampled at bifurcation point on August 4, 1987
- No.4: Sampled at Tret on June 1, 1987

TABLE B-49. BACTERIOLOGICAL ANALYSIS OF KURANG RIVER WATER

Most Probable Number of Coliforms
per 100 ml of Sampled Water

No. 1 ^{1/}	:	Infinite
No. 2	:	300
No. 3	:	100
No. 4	:	Infinite
No. 5	:	200

Note: Analyses were made by Central Engineering Laboratory, CDA on February 14, 1988.

1/: Location of water sampling sites is same to the site mentioned in Table B-47.

ANNEX C. GEOLOGY AND CONSTRUCTION MATERIALS

In this Feasibility study stage, the following investigation was conducted to obtain information relating to dam foundation and to the property of construction materials.

1) Core Drilling

- Core Drilling

Left Abutment	Depth	40 m	(131 ft)
River Bed	"	51.3	(168 ")
Right Abutment	"	40	(131 ")
Right Abutment, Saddle	"	30	(98 ")
<u>Total</u>		<u>161.3 m (528 ft)</u>	

- Permeability Tests in Drill Holes 30 Nos.
- Rock Tests of Rock Cores
 - Specific Gravity/Absorption Test 12 Nos.
 - Unconfined Compression Test 12 Nos.

2) Test Pits and Hand Auger Borings

- Test Pits

- in Borrow area 5 Nos.
- along Canal Alignment 7 Nos.

- Hand Auger Boring

- in Borrow Area 5 Nos.

3) Soil Tests

- Physical Tests

- Specific Gravity ASTM D854 5 Nos.
- Moisture Content ASTM D2216 5 Nos.
- Gradation ASTM D422 5 Nos.
- Liquid Limit ASTM D423 5 Nos.
- Plastic Limit ASTM D242 5 Nos.

- Mechanical Tests

- Compaction Test ASTM D698 5 Nos.
- Compaction Test ASTM D1557 2 Nos.
- Permeability Test ASTM D2434 5 Nos.

FIGURE C-14 LOGS OF TEST PITS FOR BORROW AREA (1/3)

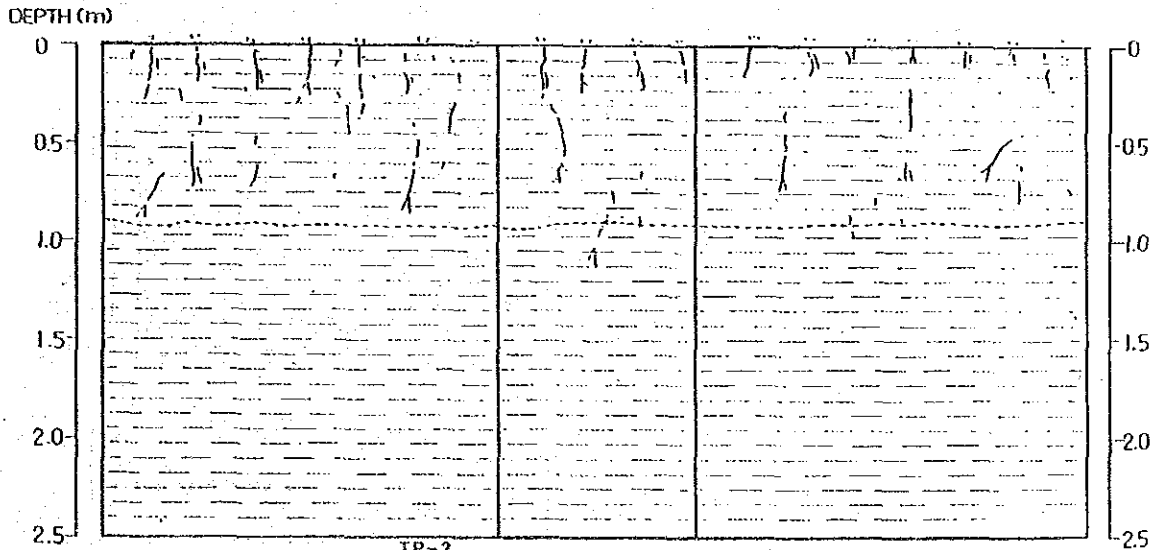

T.P. 1

TP-1

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0 0.65	Gravelly Silt	Lower TERRACE DEPOSIT	Light Brown	Contains grass-root. Firm and Dry. Percent of Gravel : 10 ~20% Dia of Gravel : 5-10cm Gravel type : Dark gray ~gray silicious rock-sandstone, generally hard and tight, rounded-subrounded.
0.65 1.50	Silty GRAVEL		Brown	Firm and Dry. Percent of Gravel : approx. 70% average Dia of Gravel : 20-25cm Maximum Dia of Gravel : approx. 50cm Gravel Type : Dark gray ~gray silicious rock-sandstone etc., hard and tight, rounded ~subrounded.

T.P. 2

TP-2

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0 2.50	Clayey Silt	LOESS	Tan	0 ~ 0.3m : Contains substantial amounts of grass-root. 0 ~ 0.9m : very dry & Firm. 0.9 ~ 2.5m : A little higher moisture content than upper part When wet, possible to make it ball, but impossible to make it string.

FIGURE C-15 LOGS OF TEST PITS FOR BORROW AREA (2/3)

T.P.3

TP-3

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0	Gravelly silty CLAY	RESIDUALS	Reddish Brown	0 ~ 0.3m : Plowed Soil Contains substantial amounts of grass-root. A small quantity of rock fragment. Percent of rock fragment : 5~10% Dia of rock fragment : 1~20cm very dry and firm.
1.50				0.3 ~ 1.5m : Partly rock-block included. Dia of rock-block : 10~35cm A little higher moisture content than upper part.
1.50		SANDSTONE	Reddish Brown	1.5m ~ : Very hard and tight. High cementation.

T.P.4

TP-4

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0	Gravelly Clayey SILT	Upper TERRACE DEPOSIT	Reddish Brown	0 ~ 0.10 m : Contains grass-root. Very dry and firm. Percent of Gravel : 30~40% Dia of Gravel : 2~10cm
1.05				Very dry and firm. Percent of Gravel : 60~65% Dia of Gravel : 2~10cm Maximum Dia of Gravel : approx. 25 cm Gravel type; hard siliceous rock-sandstone-radiolite etc. surface of gravels is a little weathered but wholly very hard, rounded.

FIGURE C-16 LOGS OF TEST PITS FOR BORROW AREA (3/3)

T.P.5

TP-5

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0	Clayey SILT	LOESS	Light	0~0.5m: TOP Soil Oxidized and brownized
0.50			Brown	Some part is organic and dark grayized Contains a little grass-root. Relatively loose and wet a little.
1.10	Silty CLAY	LOESS	Tan	Relatively dry. Very firm and hard. Impossible to break it by hand. Contains a lot of ant's nest Soil mass becomes approx. 20cm dia of soil block. Contains many Pin-holes.
1.10			Roddish	Relatively wet. High viscosity.
2.00	Brown	Possible to make it string.		

FIGURE C-17 LOCATION OF TEST PITS ALONG CANAL ALIGNMENT

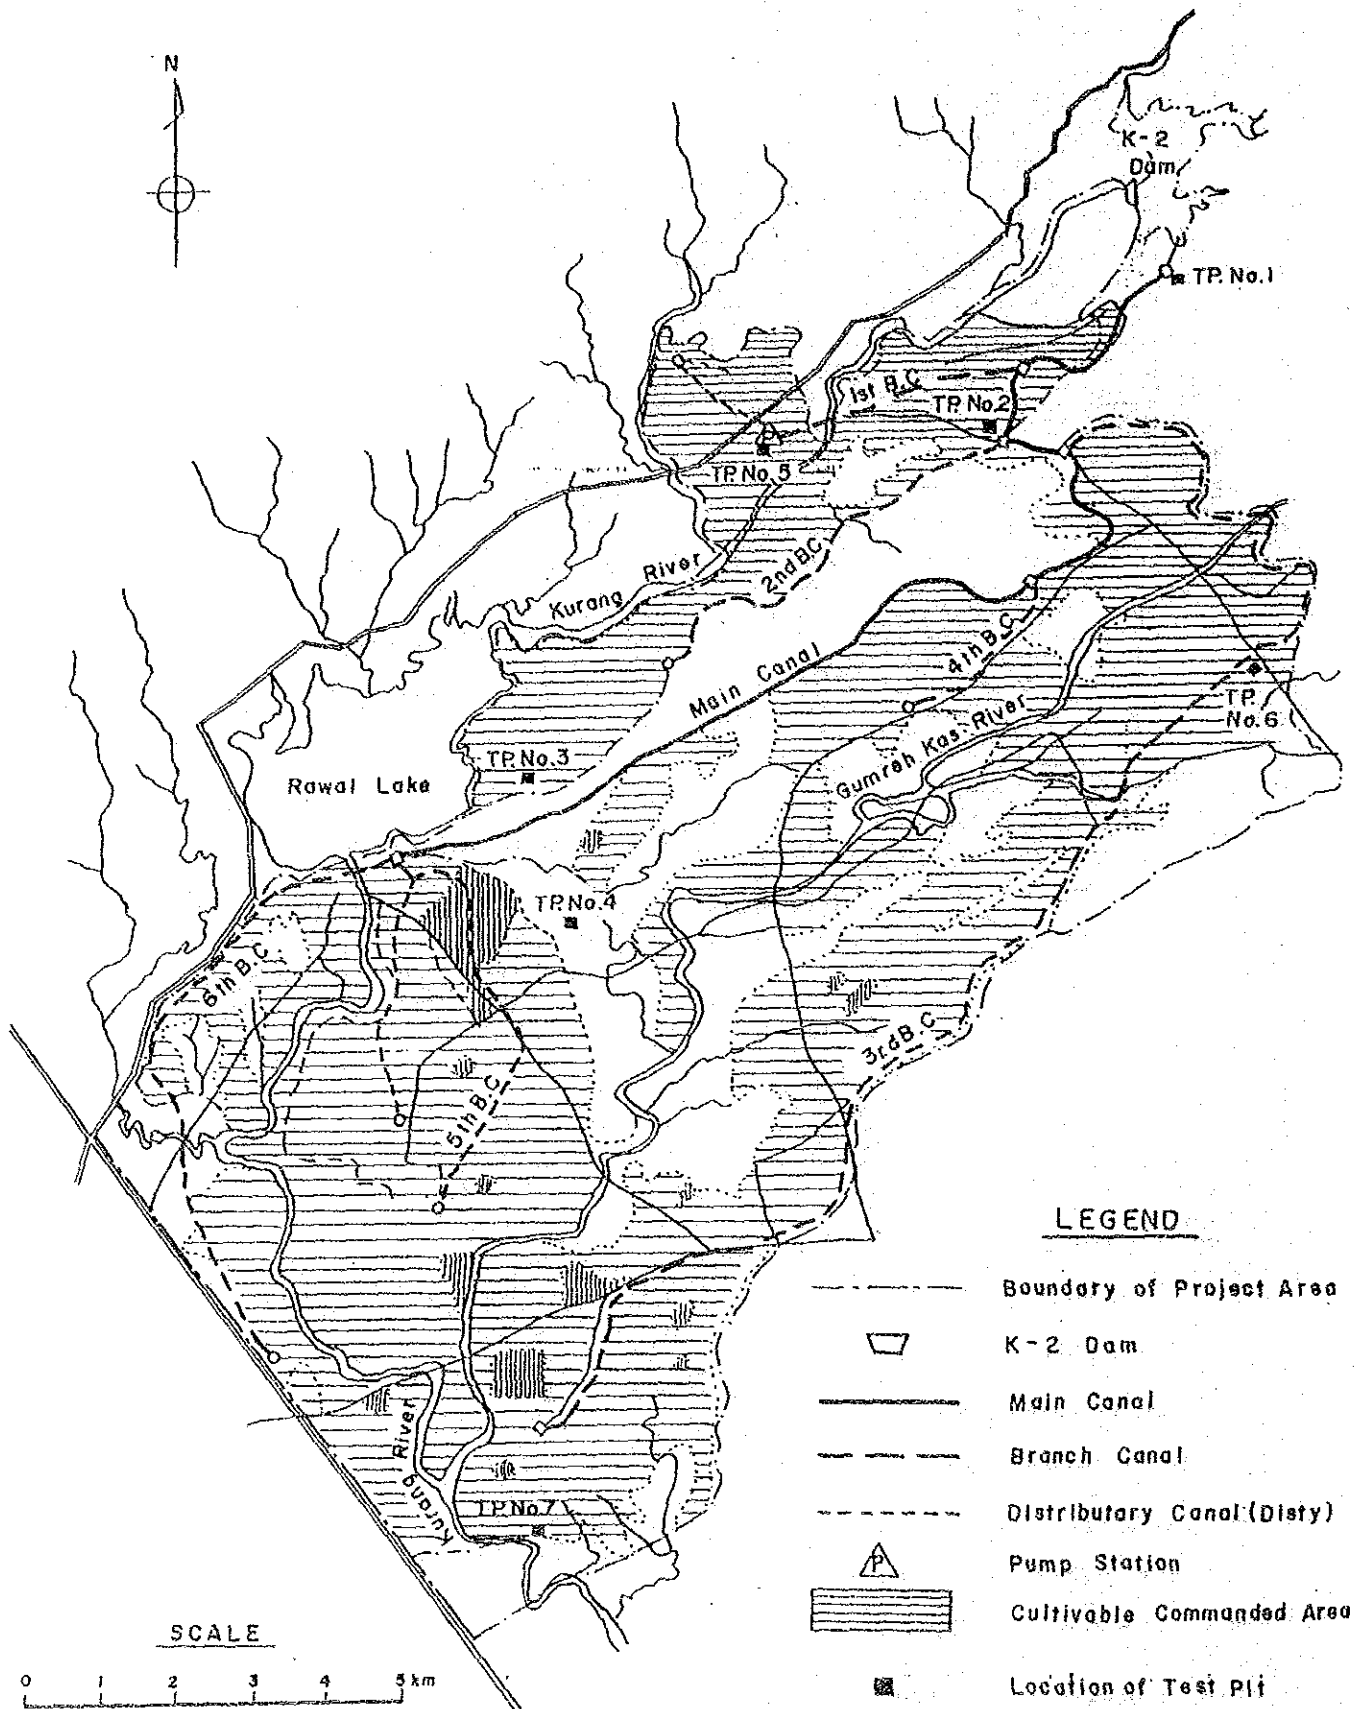

FIGURE C-18 LOGS OF TEST PITS ALONG CANAL ALIGNMENT (1/4)

TPNo.1

TPNo-1

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0~0.7	CLAY	RESIDUALS	Reddish Brown	A little organic material included. Contains many grass-root. Relatively loose. few percent of small subangular gravel. Dia 1~2cm. sandstone.
0.7~1.0	Clayey silt	LOESS	Reddish Brown	A little loose.
1.0~1.8	CLAY			Very firm. High consistency.

TPNo.2

TPNo-2

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0~0.1	SILTY CLAY	TOP SOIL	Reddish Brown	Contains many grass-root. loose.
0.1~0.7			Tan	firm.
0.7~0.9	SILTY CLAY	LOESS	Reddish Brown	0.1~0.8m : a little clay-rich.
0.9~1.6			Reddish Brown ~ Tan	A lot of small hole. Dia being less than 1 cm.
1.6~1.8			Reddish Brown	

FIGURE C-19 LOGS OF TEST PITS ALONG CANAL ALIGNMENT (2/4)

TPNo.3

TPNo.3

DEPTH (water)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0~ 0.5m	Clayey Silt	LOESS	Reddish Brown	Contains many grass-root. Relatively loose.
0.5~ 1.0	Silty CLAY		Dark Brown	High Consistency. A lot of small hole.

TPNo.4

TPNo.4

DEPTH (water)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0~ 0.5	Silty CLAY	TOP SOIL	Reddish Brown	Contains many grass-root, a lot of grass-root.
0.5~ 1.0	Silty CLAY	ALLUVIALS	Brownish Gray	Relatively high Viscosity, interfinger with Organic Soils.
1.0~ 1.1			Reddish Brown	Relatively loose.
1.1~ 2.0			Brownish Gray	

FIGURE C-20 LOGS OF TEST PITS ALONG CANAL ALIGNMENT (3/4)
TPNo.5

TPNo-5

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0 ~ 0.3	Organic silt	TOP SOIL	Light Brown	Contains many grass-root. Relatively loose. Contains angular fine gravels; approx. 5% Dry and very firm.
0.3 ~ 1.25	Silty CLAY	LOESS	Brownish Gray	Contains a little grass-root. Numerous vertical partings. Contains soft angular fine gravels.
1.25 ~ 1.7	Silty GRAVEL	ELUVIAL DEPOSIT	Dark Brown	Percent of Gravel : 60 ~ 70% Dia of Gravel : 5 ~ 15cm Rounded ~ Subrounded Contains appreciable amount of weathered sandstone gravels which are easily broken by weak hammer shock. Gravel type : black hard silicious rock-sandstone etc. Average dia of hard pebble : approx. 5cm

TPNo.6

TPNo.6

DEPTH (meter)	SOIL TYPE	GEOLOGIC CLASSIFICATION	COLOR	DESCRIPTION
0 ~ 0.2	Silt	PLOWED SOIL	Reddish Brown	Contains many grass-root. Loose.
0.2 ~ 0.8	Organic silt	TOP SOIL	Blackish Brown Dark Brown	A lot of rude vertical partings opening width being 0.2 ~ 0.5cm. Very dry & firm Contains little grass-root.
0.8 ~ 0.9	Clayey silt	LOESS	Reddish Brown	Very dry and very firm.
0.9 ~ 1.4	Silty CLAY	RESIDUALS	Reddish Brown	Very dry and very firm. Contains little rock-fragment.
1.4 ~ 1.9	Gravelly silty CLAY			Very dry and very firm. Dia of Gravel : approx. 1cm Gravel type : Angular - hard clay or weathered mudstone.
