CHAPTER 1 INTRODUCTION

1.1 Objective of the Survey

In accordance with the Record of Discussions on the Japanese technical cooperation for the Agricultural Cooperative Promotion Project in the Kingdom of Thailand (hereinafter referred to as "the project"), the Japan International Cooperation Agency (JICA) dispatched two (2) experts in order to carry out the detail design survey of model infrastructures in Muang model farming group and Pak-Thong-Chai model farming group among five (5) agricultural cooperatives related with the project. And, its objectives include livestock facilities, vegetable farm facilities and irrigation facilities, which will be the foundation of farming activities in two (2) model farming group as mentioned above.

The field survey were carried out from August 15, 1988 to September 23, 1988.

Continuously, based on the results of this field survey, the detailed design works have been carried out from September 24, 1988 to October 23, 1988 as the home work in Japan. This final report is the result of these works.

1.2 List of the Survey Members

Name	Assignment	Position
Mr. Keiji MIYA	Farming Program, Designing of Live-stock Facilities	Senior Design Engineer Manager of Overseas Div. Nippon Giken Inc.
Mr. Yuji OTSUKA	Designing of Irrigation Facilities	Design Engineer Technical Engineering Div. Nippon Giken Inc.

1.3 Progress of the Survey

1.3.1 Field Survey

Aug.	15th	Arrived in Bangkok
	16th	Visit JICA office and meeting Meeting with Japanese experts courtesy call on Cooperative Promotion Department (CPD) and meeting with CPD staff
	17th	Visit JICA office and meeting preparation for survey Movement to the project sites (Bangkok-Korat)
	18th	visit provincial CPD office visit Muang District Coopertative office and Pakthongchai District Cooperative office Reconnaissance in Muang and Pakthongchai
	19th-Sept. 18th	Survey in the project sites Movement to Bangkok (Korat-Bangkok)
Sept.	19th	Meeting with Japanese experts
	20th	Preparation of Interim Report
	21th	visit JICA office and meeting Visit the Embassy of Japan for Submission the report.
	22th	visit CPD for submission the report
	23th	Leave Bangkok for Japan

1.3.2 Home Work in Japan

Sept. 24th-Oct. 23th Working on Detailed Design

1.4 List of the Main Interviewer and Participant in Final Meeting at CPD.

INTERVIEWER LIST

Name	Position	Field Covered
(1) Cooperatives Promotion Department (CPD), MOAC		
Mr. Songyod Narkchamnam	Director General	
Ms. Wannee Ratanawaraha	Chief	Project Manager
Ms. Rachneewan Prathumthong	Senior policy and analyst	Coop. management and communication
Mr. Poonsin Chaitahan	Agronomist	Farm guidance
Mr. Chuchad Losakul	Survey Engineer	Engineering
Mr. Choosak Losagulpong	Civil engineer	
(2) CPD Nakhon Rachasima Office		
Mr. Sangchai Pavabunsiriwong	Chief	Asst. Project Manager
Ms. Sumol Pakakan	Senior coop. technician	Asst. Project Manager
(3) Regional Engineering Center 3		
Mr. Panya Promdee	Chief	Engineering
Mr. Anan Sangchai	Civil engineer	Engineering
Mr. Sanit Pongthongcharoen	Surveyor	Engineering
Mr. Somchai Sarananuson	Engine engineer	Engineering
Mr. Montri Phobangwai	Engine engineer	Engineering
(4) District Cooperative Office		
Mr. Sa-nguan-sak Somparb	Muang dist. coop. officer	Coop. management
Mr. Sangchan Nongchana	Pak-Thong-Chai dist. coop. officer	Coop. management
(5) Agricultural Cooperative Ltd.		
Mr. Too Kamon-na-kin	Muang, President	Coop. management
Mr. Siripong Meeprasert	Muang, Manager	Coop. management
Mr. Chan Tonsamrong	Pak-Thong-Chai, President	Coop. management
Ms. Wanida Chuenarom	Pak-Thong-Chai, Manager	Coop. management
Mr. Somsak Klein-sri-sook	Farm guidance staff	Farm guidance

PARTICIPANT LIST IN FINAL MEETING BETWEEN
 CPD STAFF AND THE DETAIL DESIGN TEAM
 22 September, 1988 (10:00 - 12:00 a.m.)

No.	Name	Position
1.	Mr. Keiji Miya	Expert for detailed design survey
2.	Mr. Yuji Otsuka	Expert (Design Engineer)
3.	Mr. Masahiro Omiya	Expert (Design Engineer)
4.	Mr. Hiroshi Takeuchi	Expert, Team Leader
5.	Mr. Y. Oizumi	Expert
6.	Mr. Wanlop Nisadol	Counterpart on Farm Guidance
7.	Mr. Chuchart Losakul	Survey Engineer 5
8.	Mr. Sanit Pong-Thong-Charean	Survey Engineer 6
9.	Mr. Chusak Losakulpong	Engineer 4
10.	Mr. Panya Promdee	Chief, Regional Engineering Center No.3
11.	Mr. Witaya Chitchantaraevong	Counterpart on Cooperative Management
12.	Mr. Apiwat Wongsomboon	Engine Engineer 5
13.	Mr. Samak Decomyoy	Engine Engineer 6
14.	Mr. Sutep Tanomkitnuwat	Civil Engineer 5
15.	Mr. Chaowalit Kanehana-Chuta	Administration Engineer 7
16.	Mr. Teerapat Kalalai	Director, Engineering Division
17.	Mr. Nikon Tongserm	Chief, Survey Section
18.	Mr. Vichak Reangvises	Engineer
19.	Miss Peerorat Aungurarat	Director, Planning Division
20.	Mrs. Wannee Ratanawaraha	Project Manager
21.	Miss Rachaneewan Prathom-Thong	Policy and Plan Analyst

1.5 Project Leader's Letter

September 22, 1988

Mr. Songyod NARKCHAMNARN

Director General

Cooperatives Promotion Department

Ministry of Agriculture and Cooperatives

The detailed design survey of model infrastructures on The Agricultural Cooperatives Promotion Project.

Dear Sir,

It is my pleasure to send herewith the detailed design survey of model infrastructures on The Agricultural Cooperatives Promotion Project (hereinafter referred to as "the project"). Presently, two(2) experts have been dispatched by JICA in order to carry out the detailed design survey of model infrastructures in both Muang model farming group and Pakthongchai model farming group among.

They have conducted with your staff the field survey on the related area in consideration of natural, social and economic conditions as the concept for the detailed design in the attached papers.

The working contents will be decided in consideration of the survey's result including the domestic work, the working budget by JICA, you will be informed its result through the JICA Thailand office.

Further, for the timely commencement of the construction work, I would like to request you to take the necessary formalities in due consultation with JICA Thailand office.

Finally, I appreciate your great cooperation.

Sincerely yours

Hiroshi TAKEUCHI

Team Leader

The Agricultural Cooperative
Promotion Project

c.c : Mr. Tsutomu SAITO Resident Representative of JICA Thailand office

c.c : Embassy of Japan

The detailed design survey of model infrastructures on the Agricultural cooperatives promotion project.

1. LIST OF MEMBERS

ASSIGNMENT	NAME	PRESENT POSITION
Expert	Mr. Keiji Miya	Senior Design Engineer Manager of Overseas Div. Nippon Giken Inc.
Expert	Mr. Yuji Ohtsuka	Design Engineer Technical Engineering Div. Nippon Giken Inc.

2. Schedule of detailed design survey in Thailand

Aug. 15th	Arrived in Bangkok
16th	Visit JICA office and meeting Meeting with Japanese experts courtesy call on Cooperative Promotion Department (CPD) and meeting with CPD staff
17th	Visit JICA office and meeting preparation for survey Movement to the project sites (Bangkok - Korat)
18th	visit provincial CPD office visit Muang District Cooperative office and Pakthongchai District Cooperative office Reconnaissance in Muang and Pakthongchai
19th	Survey in the project sites
Sept. 18th	Movement to Bangkok (Korat-Bangkok)
19th	Meeting with Japanese experts
20th	Preparation of Interim Report

21th visit JICA office and meeting
Visit the Embassy of Japan for Submission
the report.

22th visit CPD for submission the report

23th Leave Bangkok for Japan

3. Basic concept for the detailed design

3-1. This detail design work is carried out in the area of Muang model farming group and PAKTHONGCHAI model farming group, which are two(2) among five(5) model farming group under the Program of the Agricultural Cooperative Promotion Project. And, in order to promote the compound farming program in two(2) model farming groups, its objectives include swine raising facilities, vegetable farm facilities and irrigation facilities, which will be the foundation of farming activities.

3-2. The detailed design is made in accordance with the plan proposed by CPD and Japanese experts. Which is justified with the purpose of Model Infrastructure Improvement Program promoted by JICA with the consideration of natural, social and economic conditions in the area.

3-3. The wishes and opinions of farmers concerned are respected in the process of determination on the location and scale of the facilities.

3-4. The opinion of the authority concerned to existing facilities is taken in the process of designing of the improvement and repair.

3-5. The working contents is fixed finally with the consideration of the result of the detailed design, the working budget and so on.

4. Facility plan

4-1. Community breeding facilities on swine and poultry raising.
The scale of community breeding facilities is planned as follows;

1) MUANG area

Piggery (multiplication use)...feedable head at ordinary time.. 10 heads

2) PAKTHONGCHAI area

Piggery (multiplication use)...feedable head at ordinary time...20 heads

henhouse (meat use)...feedable number at ordinary time...100 heads

The design of the breeding facilities will be carried out with the consideration of the following points ;

(a) improvement of feeding condition and circumstances.

(b) utilization of excrement for compost use.

(c) establishment on water supply (well or pond)

The planned site of the breeding facilities will be embanked up to the high water level to avoid flooding damages.

4-2. Vegetable farm facilities

MUANG area... vegetable farm facilities is planned.

This farm land (about 1.5 Rai) will install the mothproof net which is used for vegetable cultivation with small agricultural chemicals.

4-3. Irrigation Facilities

(a) canal

1) MUANG area...improvement of canal (about 1 km) is planned, in order to supply irrigation water to model farm land for vegetable.

2) PAKTHONGCHAI area...review on improvement of canal (about 6 km) is planned as water resource for rice and vegetable cultivation in dry season.

(b) pond

- 1) MUANG area...construction of three(3) ponds and improvement of three (3) ponds are planned as irrigation resource for vegetable cultivation in dry season.
- 2) PAKTHONGCHAI area...construction of eighteen (18) ponds and improvement of one (1) pond are planned as irrigation water resource for vegetable cultivation in the consideration of promotion of the compound farming management. The construction of farm land for vegetable and sites for community breeding facilities are planned to reclaim by use of excavated soil of the pond.

5. Proposal on construction costs.

The maximum estimated amount of construction costs for facility plan as mentioned above are ¥25,000,000 (about Bht 4,5000,000). After completion of the detailed design works, the contents of facilities which are constructed are fixed clearly.

6. working Schedule for detailed design survey.

Based on the basic concept of detailed design as mentioned above, the detailed design will be carried out according to the following schedule.

6-1 field works in Thailand (Aug.15 1988 - Sept. 23, 1988)

I. Field survey

The field survey for design have been carried out at the proposed site.

The field survey are as follows,

- (1) Data collection: Collection and confirmation of data on the spot.

(2) Various survey

Topography : Plane table surveying, routes surveying
(Longitudinal leveling, cross leveling)
and surveying of land acquisition on each
planning sites of facilities.

Existing condition: Meteorology, Hydrology, Soil, Soil mechanics,
Groundwater, Water quality, Farm management,
Irrigation and drainage network and facilities.

Confirmation : Necessary procedure for construction of
river, canal, irrigation and drainage
facilities.

Water level, discharge and gate control
during Period of the construction.

Market : A unit price of materials for construction.
Requirement per unit work on labor and
equipment for estimation of construction cost.

Others : Inspection on construction machinery and
equipment etc.

II. Preliminary design works

Based on the results of the field survey,

the preliminary design works have been carried out.

6-2 Domestic works (Sept. 24, 1988 - Oct. 23, 1988)

Based on the results of the works in Thailand, the final detailed
design report will be prepared in Japan.

CHAPTER 2 FIELD INVESTIGATION

2.1 Topography and Geology

2.1.1 Topography

Amphoe Pak-Thong-Chai and Amphoe Muang belong to Chanwat Nakhon Ratchasima and are located at south west south of the Korat Plateau in the Northeast Thailand.

Pak-Thong-Chai area is located at about 30 km south of the Nakhon Ratchasima City (Korat) and paddy field area. In more detail, the proposed project area is located at about 10 km south of Amphoe Pak-Thong-Chai. This area is named "Ban Nong Feap". Muang area is located at about 5 km north of Korat and paddy field and upland field for vegetables area. This area is named "Ban Tang Ta". The water sources for irrigation at Pak-Thong-Chai area are rainfall reserved existing pond and paddy field, which are RID canal and ponds at Muang area.

The proposed project areas are shown in Fig. 1.

2.1.2 Geology

The Kora Plateau is composed of fine-graded sandstone and shale strata which are overlain in the vally depressions with alluvium and river terrace deposit.

The investigation of the solid profile was carried out through the excavation of four (4) test pits in Pak-Thong-Chai area and two (2) test pits in Muang area. Further, supplemental drilling by augerhole was carried out from the bottom of six (6) test pits as mentioned above and from the ground surface of other three (3) points. The results of the investigation are described in Paragraph 2.3.1.

2.2 Meteorology

2.2.1 Precipitation

Rainfall data was collected at near the project sites. Period of observation is shown in Table 1 and those data are summarized in Table 2.

Amount of rainfall at Pak-Thong-Chai area and Muang area vary from 880 mm to 1300 mm of which about 95% of annual rainfall is concentrated in Rainy Season from May to October.

Based on the result of rainfall analysis, the relationship between rainfall and crop cultivation are generally characterized as follows;

- (1) There is no rainfall from November, so that the paddy harvesting is done after this time. Accordingly, the paddy planting is carried out during the rainy season, from May to October.
- (2) The proposed vegetables are planted after paddy harvesting during the dry season from December to April. But, the effective rainfall can not be expected in this time.

2.2.2 Temperature and humidity

Since July 1985, the Pak-Thong-Chai and the Muang Cooperative office have started meteorological observation on the rainfall, temperature and humidity. But observation period is still too short for analysis.

Observation records of rainfall from 1977 at RID Pak-Thong-Chai station are available as shown in Table 2-1.

Average monthly temperature and the others meteorological data at NAKHON RATCHASIMA are also available as shown in Table 3.

Based on the above mentioned data, the crop evapotranspiration was calculated by using the Modified Penman Method. The result of the calculation is shown in Table 4.

2.3 Soil Mechanics

2.3.1 Field tests

Location of the test pits excavation are shown in Fig. 2. Depth and width of those test pits are 2m x 2m x 2m and supplemental drilling was also carried out as mentioned in Paragraph 2.1.2.

Pak-Thong-Chai area

- Test Pit No.1 ----- proposed pond site
- Test Pit No.2 ----- proposed pond site
- Test Pit No.3 ----- proposed pond site
- Test Pit No.4 ----- proposed pond site

Muang area

- Test Pit No.1 ----- proposed piggery site
- Test Pit No.2 ----- proposed pond site
- Test Pit No.3 ----- near proposed pond site
- Test Pit No.4 ----- near proposed pond site
- Test Pit No.5 ----- proposed pond site

Soil profiles are shown in Fig. 3.

2.3.2 Soil test

The items of the soil testing are as follows;

- 1) Specific gravity test
- 2) Liquid limit test
- 3) Plastic limit test
- 4) Grain size analysis
- 5) Standard compaction test
- 6) Field density test

The soil sample was taken from the test pits as mentioned above (2.3.1) at 0.7 m -- 4.0 m depth below the ground surface which was considered as the typical soil in these areas.

According to the grainsize analysis, all of them (Pak-Thong-Chai area Test Pit No. 1 -- No. 4, Muang area Test Pit No. 1 -- No. 4) belong to finegrained soil.

On the other hand, based on the Japanese Unified Soil Classification System, the soil can be classified into the following categories, taking liquid and plastic limit test into account.

Pak-Thong-Chai area (pond site)

Test Pit No.1	(1.5 m depth)	-----	"ML"
Test Pit No.2	(1.5 m depth)	-----	"ML"
Test Pit No.2	(2.0 m depth)	-----	"CL"
Test Pit No.2	(3.1 - 3.5 m depth)	-----	"CL"
Test Pit No.3	(1.5 m depth)	-----	"SM"
Test Pit No.3	(3.5 - 4.0 m depth)	-----	"CL"
Test Pit No.4	(0.7 m depth)	-----	"SM"
Test Pit No.4	(1.2 m depth)	-----	"ML"

Muang area

Test Pit No.1	(1.2 m depth)	-----	"ML"
Test Pit No.2	(1.2 m depth)	-----	"MH"
Test Pit No.2	(2.5 - 2.8 m depth)	-----	"MH"
Test Pit No.3	(0.5 - 1.0 m depth)	-----	"ML"
Test Pit No.3	(2.0 - 2.5 m depth)	-----	"MH"
Test Pit No.4	(2.0 - 2.5 m depth)	-----	"MH"

The results of compaction test are shown as follows;

Test Pit No.	Depth (m)	Wopt (%)	rdmax (g/cm ³)
Pak-Thong-Chai area			
1	1.5	9.40	1.770
2	1.5	13.40	1.852
2	2.0	11.60	1.874
2	3.1 - 3.5	16.40	1.751
3	1.5	9.80	1.828
3	3.5 - 4.0	9.45	1.980
4	0.7	6.40	1.652
4	1.2	11.40	1.892
Muang area			
1	1.2	11.10	1.836
2	1.2	16.20	1.622
2	2.5 - 2.8	17.70	1.508
3	0.5 - 1.0	11.20	1.916
3	2.0 - 2.5	11.10	1.912
4	2.0 - 2.5	17.70	1.510

As for Pak-Thong-Chai area Test Pit No.2 (2.0 m depth), No.3 (3.5 - 4.0 m depth), No.4 (0.7 m depth) and all of Muang Test Pit, natural water content is larger than that of optimum moisture content as mentioned above. Therefore, the moisture content should be carefully checked during construction period.

2.4 Water Quality

The water quality test for irrigation and swine was carried out according to the following sites and their locations are shown in Fig. 2.

Point	Site	Location
Pak-Thong-Chai area		
A	Existing farm pound	----- proposed pond area
B	Ground water	----- existing well H = 30 m
C	Existing pond	----- non-proposed pond
E	Ground water	----- Test Pig No.3 H = 3.8 m
G	Riverhead	----- Ramchiang-sa river
Muang area		
H	Irrigation	----- RID canal
I	Existing pond	----- near proposed pond
J	Drinking water	----- reserved water tank
K	Ground water	----- Test Pit No.1 H = 1.8 m

According to "United State Department of Agriculture (USDA)", water samples are classified into four groups as shown in Table 6 with respect to sodium hazard depending on the sodium absorption ratio (SAR) value and the specific conductance.

The SAR is defined as;
$$SAR = \frac{Na^+}{\sqrt{(Ca^{++} + Mg^{++})/2}} \quad (USDA)$$

Here, the concentration of the ions is expressed in per million (epm). The results of analysis of water samples are summarized as follows:

The Results of Analysis Water Samples

Point Site	E.C. mmhos/cm 25°C degree	pH	SAR	Sodium Hazard	Salinity Hazard
<u>Pak-Thong-Chai area</u>					
A Existing farm pond	0.08	6.8	4.1	S 1	C 1
B Ground water	1.60	6.4	22.5	S 4	C 3
C Existing pond	0.20	6.8	11.8	S 2	C 1
E Ground water	1.01	7.0	43.8	S 4	C 3
G Riverhead	0.10	6.6	4.0	S 1	C 1
<u>Muang area</u>					
H Irrigation canal	0.36	6.8	5.7	S 1	C 2
I Existing pond	4.60	7.1	166.9	S 4	C 4
J Drinking water	0.08	7.0	0.3	S 1	C 1
K Ground water	30.00	6.9	119.9	S 4	C 4

Based on the results of analysis, the water of river, existing pond in Pak-Thong-Chai area and existing irrigation canal in Muang area can be used for the irrigation.

On the other hand, ground water show high EC value and SAR value, so it can not be used for irrigation.

But the ground water at proposed pond site in Pak-Thong-Chai area is not so high value, so the stored water will not increase the salinity caused by the ground water.

The ground water and the water of existing pond in Muang area are so high value, therefore, the stored water of pond should be carefully checked for irrigation.

2.5 Irrigation and Drainage

2.5.1 Irrigation

Pak-Thong-Chai area

The project area is about 6 km far from Ramchiang-sa river. The water sources for irrigation are Ramchiang-sa river when the water level is high in rainy season. However, at present time, the water sources are rain water, because Ramchiang-sa river's water level is low. Therefore, the irrigation water cannot supply from river.

Muang area

The project area is surrounded by RID Canal. The water sources for irrigation are RID Canal in rainy season. However, in dry season (from November to April), the irrigation water supplied from RID Canal is not enough.

2.5.2 Drainage

The drainage system in the project areas (Pak-Thong-Chai and Muang) are not provided. Therefore, the excess water still remains in the fields and small ponds. Especially, in rain season, the drainage conditions become worse.

2.6 Topographical Survey

The topographical survey works were carried out to cover the livestock facilities farm and irrigation area. Item of the survey works are as follows;

(1) Level Survey for Bench Mark

Bench Mark set each proposed pond, canal and livestock facilities

(2) Survey Area

Pak-Thong-Chai area ----- 60 ha

Muang area ----- 18 ha

- (3) Travers Survey
 Closed travers survey for whole area
 Concrete peg ----- 70 pegs

- (4) Level Survey
 Setting a base line and mesh line (25 m x 25 m, 50 m x 50 m)
 Number of points ----- 500 points

- (5) Plane Table Survey
 For whole area

2.7 Farming Condition

Now, in Pak-Thong-Chai and Muang area, the compound farming which include rice, vegetable, swine and poultry raising is planned by farmers.

In order to make the model compound farming program as a target of the farming, the farming condition survey were carried out to farmers related to two (2) model farming group. The result of this survey is shown in Table 7.

Hereafter, this farming program will be prepared as standard the representative farmer in these model farming groups.

CHAPTER 3 FARMING PROGRAM

3.1 Existing Condition Farming

The investigation of existing condition of farming concerning each farmer which take part in the model farming group at both Pak-Thong-Chai and Muang agricultural cooperatives was carried out in the field study.

The existing condition on each farm-house relative to family labor in agriculture, agricultural land area and the number of livestock are as follows.

Model farming group	Number of farmhouse concerning model farming group	Family labor per A farm house	Each crop area per A farmhouse			m ² (Rai)
			Rice	Cassave	Vegetable	Others (Fruit tree Cucalyptus)
Pak-Thong-Chai	houses 19	men 3.8	21,628 (13.5)	11,555 (7.2)	22 (0.01)	4,928 (3.1)
Muang	19	3.9	28,123 (17.5)	8,842 (5.5)	3,048 (1.9)	511 (0.3)

Number of Livestock per A Farm-house					
Total	Buffalo	Cattle	Pig	Chicken	Duck
	heads	heads	heads	birds	birds
38,133 (23.8)	1.7	0.1	0.4	19.9	-
40,524 (25.3)	-	-	1.4	24.8	35.9

An area under vegetable cultivation and number of swinery in Pak-Thong-Chai area, but Fruit tree and Cucalyptus much more than Muang area. The other side, number

of swinery in Muang are much more than Pak-Thong-Chai, but are only 1.4 heads per a farm-house.

Considering on the basis of these studying results, the feature of farming both two (2) area is as follows.

- (1) Farming foundation is rice single cropping depended on rain water in the rainy season.
- (2) The cropping rate of farm in the dry season especially is low because the irrigation system is insufficient.
- (3) Family labor in agriculture is abundant, but the sufficient work in agriculture aren't for these family labors. That matter is remarkable in the dry season especially.
- (4) It is difficult to expand the cultivated land.
- (5) In recent years, many problems awaiting solution befall in vegetable growing, for example, the occurrence of harm by excessive use of agricultural chemicals, retardation of yield by excessive fertilization of chemical manure and so on.

3.2 Target of Farming Program

The consideration on the increase of agricultural income by the improvement of farming condition as is mentioned above is important for the promotion on the living level of the farmers and the strengthen of agricultural cooperative system.

It is necessary to establish the compound farming form with an eye to following matter.

- (1) To utilize effectively in the agriculture the family labor by the promotion of the intensive farming.

- (2) To raise the cropping rate of farm land by the promotion stability of the crop cultivation by means of adjustment and improvement of irrigation facilities.
- (3) To perform the vegetable growing in the little use of agricultural chemicals by means of equipment with moth defense net.
- (4) To promote the improvement of soil fertility by means of the fertilization of farm yard manure to farm land.

The farmer who take part in the model farming group at both Pak-Thong-Chai and Muang agricultural cooperatives promote the compound farming by farming activity of farmers own accord and it is necessary to do extension to around farmers the actual effect of the compound farming.

The target of farming program on each two (2) agricultural cooperatives are as follows.

- (1) Pak-Thong-Chai Area

The plan of compound farming form is follows.

RICE + VEGETABLE + SWINERY + POULTRY

The way to perform this compound farming is as follows.

- (a) The rice cropping in the rainy season continue as ever.
- (b) Nineteen (19) reservoirs are constructed in the farm land which belong to each farmers. The ground of poultry facilities and vegetable farm land are made at around reservoir.

The reservoirs are used as the water source of irrigation for vegetable growing and that of chicken farm.

- (c) The cooperative poultry facilities for hatching and brooding are constructed. These facilities supply each farmers with chick.

The poultry raising houses for each farmers which necessary material are prepared by JICA are constructed by the farmers own effort under guidance of CPD.

- (d) The cooperative swinery facilities for breeding are constructed. These facilities supply each farmers with piglet.

Owing to the performance these matter mentioned above, the increase of average annual income in agriculture (about 10,000B) is expected.

(2) Muang Area

The plan of compound farming form is follows.

RICE + VEGETABLE + SWINERY

The way to perform this compound farming is as follows.

- (a) The rice cropping in the rainy season continue as ever.
- (b) The facilities with the moth defense net is constructed at the model vegetable farm (1.5 Rai).
- (c) The canal is improved and six (6) reservoirs are improved or constructed. The canal and reservoirs are used as the water source of irrigation for vegetable growing.
- (d) The cooperative swinery facilities for breeding are constructed. These facilities supply each farmers with piglet. Owing to the performance these matter mentioned above, the increase of average annual income in agriculture (about 10,000B) is expected.

Consequently, the standard of farming scale per a farm-house is as follows.

Pak-Thong-Chai Area

Rice	(exist)	2 ha	(= 13 Rai)	single cropping in the rainy season yearly
Vegetable	(new)	400 m ²	(= 0.25 Rai)	triple cropping yearly
Swinery	(new)	8 heads		raising usually
Poultry	(new)	100 bird		raising usually

Muang Area

Rice	(exist)	2.8 ha	(= 17 Rai)	single cropping in the rainy season yearly
Vegetable		0.54 ha	(= 3.4 Rai)	triply cropping yearly
	(new)	0.24 ha	(= 1.5 Rai)	
	(exist)	0.30 ha	(= 1.9 Rai)	
Swinery	(new)	4 heads		raising usually

3.3 Effect on Compound Farming

The effect on the production introduced newly in the standard of farming scale mentioned above is as follows.

(1) Pak-Thong-Chai Area

A. Vegetable farm 400 m² (= 0.25 Rai)

Triple cropping yearly (chilli, watermelon, greens vegetable)

(a) Chilli

Yield	500 kg/Rai x 0.25 Rai	= 125 kg
Gross income	10B/kg x 125 kg	= 1.250B
Ratio of net income to gross income	50%	
Income of farm household	1,250B x 0.5	= 625B (1)

(b) Water melon			
Yield	1,000 Pieces/Rai x 0.25 Rai	=	250 Pieces
Gross income	3B/Piece x 250 Piece	=	750B
Ratio of net income to gross income	50%		
Income of farm household	750B x 0.5	=	375B (2)

(c) Greens vegetable			
Yield	800 kg/Rai x 0.25 Rai	=	200 kg
Gross income	4B/kg x 200 kg	=	800B
Ratio of net income to gross income	50%		
Income of farm house-hold	800B x 0.5	=	400B (3)

Consequently, the increase of annual income by the vegetable cultivation is as follows.

$$(1) + (2) + (3) = 1,400B$$

B. Swinery

The cooperation swinery facilities for breeding.	Sow 19 heads boar 1 head total 20 heads raising usually.		
Heads of farrow per one time	11 heads/head of sow		
Ratio of growth	70%		
Heads of growth	11 heads x 0.7	=	8 heads/head of sow
	8 heads x 19 heads	=	152 heads
Delivery, 2 times yearly	152 heads x 2	=	304 heads
Number of farm-house	19 houses		

Raising heads per a house	$152 \text{ heads} \div 19 \text{ houses} = 8 \text{ heads}$
Term of raising	5 months (150 days)
Times of annual raising	2 times
Heads of annual selling	$8 \text{ heads} \times 2 = 16 \text{ heads}$
Alive weight of annual selling	$60 \text{ kg/head} \times 16 \text{ heads} = 960 \text{ kg}$
Gross income	$20\text{B/kg} \times 960 \text{ kg} = 19,200\text{B}$
Ratio of net income to gross income	30%
Income of farm house-hold	$19,200\text{B} \times 0.3 = 5,760\text{B}$

C. Poultry

Raising birds per a house	100 birds
Term of raising	100 days
Times of annual raising	3 times
Birds of annual selling	$100 \text{ birds} \times 3 = 300 \text{ birds}$
Alive weight of annual selling	$2.5 \text{ kg/bird} \times 300 \text{ birds} = 750 \text{ kg}$
Gross income	$15\text{B/kg} \times 750 \text{ kg} = 11,250\text{B}$
Ratio of net income to gross income	40%
Income of farm house-hold	$11,250\text{B} \times 0.4 = 4,500\text{B}$

Consequently, the increase of annual income by the compound farming per a farm-house is as follows.

$$1,400\text{B} + 5,760\text{B} + 4,500\text{B} = 11,660\text{B}$$

(2) Muang Area

A. Vegetable farm 2,400 m² (= 1.5 Rai)

Triple cropping yearly (chilli, watermelon, greens vegetable)

(a) Chilli

Yield	500 kg/Rai x 1.5 Rai	= 750 kg
Gross income	10฿/kg x 750 kg	= 7,500฿
Ratio of net income to gross income	50%	
Income of farm household	7,500฿ x 0.5	= 3,750฿ (1)

(b) Water melon

Yield	1,000 Pieces/Rai x 1.5 Rai	= 1,500 Pieces
Gross income	3฿/Piece x 1,500 Pieces	= 4,500฿
Ratio of net income to gross income	50%	
Income of farm household	4,500฿ x 0.5	= 2,250฿ (2)

(c) Greens vegetable

Yield	800 kg/Rai x 1.5 Rai	= 1,200 kg
Gross income	4฿kg x 1,200 kg	= 4,800฿
Ratio of net income to gross income	50%	
Income of farm house-hold	4,800฿ x 0.5	= 2,400฿ (3)

Consequently, the increase of annual income by the vegetable cultivation is as follows.

$$(1) + (2) + (3) = 8,400\text{B}$$

B. Swinery

The cooperation swinery facilities for breeding.	Sow 10 heads boar 1 head total 11 heads raising usually.	
Heads of farrow per one time	11 head/head of sow	
Ratio of growth	70%	
Heads of growth	11 heads x 0.7	= 8 heads/head of sow
	8 heads x 10 heads	= 80 heads
Delivery, 2 times yearly	80 heads x 2	= 160 heads
Number of farm-house	19 houses	
Raising heads per a house	80 heads ÷ 19 houses	= 4 heads
Term of raising	5 months (150 days)	
Times of annual raising	2 times	
Heads of annual selling	4 heads x 2	= 8 heads
Alive weight of annual selling	60 kg/head x 8 heads	= 480 kg
Gross income	20B/kg x 480 kg	= 9,600B
Ratio of net income to gross income	30%	
Income of farm house-hold	9,600B x 0.3	= 2,880B

Consequently, the increase of annual income by the compound farming per a farm-house is as follows.

$$8,400\text{B} + 2,880\text{B} = 11,280\text{B}$$

CHAPTER 4 PLANNING AND DESIGN OF FACILITIES

4.1 Generality

One of the project aims is to promote compound farming management (combination between livestock raising and crop cultivation) in the project area in order to increase farms income and to establish the cooperative farming system.

For this purpose, construction of livestock raising facilities, vegetable farm facilities and irrigation facilities have been planned. The proposed plan include the following components.

Construction of Livestock Raising Facilities

- (a) Livestock Raising Facilities -- construction of Piggery, Hen house, Compost barnyard, Hatchery and Urine treatment basin
- (b) Related Facilities -- construction of Well

Construction of Vegetable farm Facilities installing of mothproof net

Construction of Irrigation Facilities

- (a) Pond (include improvement)
- (b) Canal (improvement)

The location of the proposed project sites are shown in Fig. 1-1~4.

4.2 Livestock Facilities Plan

4.2.1 Basic conception in planning

The livestock facilities plan include swine and poultry raising facilities which are used as community ones.

The scale of the facilities is planned as follows:

(1) Pak-Thong-Chai area

Swine raising facilities is planned to feed 20 heads at ordinary time.

The design of these facilities is carried out with the consideration of the following points;

- (a) improvement of feeding condition and circumstance
- (b) utilization of excrement for compost use
- (c) establishment on water supply (well and pond)

(2) Muang area

Swine raising facilities is planned to feed 10 heads at ordinary time. Poultry raising facilities is planned to feed 100 heads.

4.2.2 Planning and design of livestock facilities

In order to integrate the livestock raising, the following facilities are planned.

- (a) Piggery (Pak-Thong-Chai) -- feedable head at ordinary time ... 20 heads
- (b) Piggery (Muang) -- feedable head at ordinary time ... 10 heads
- (c) Hen house (Pak-Thong-Chai) -- feedable head at ordinary time ... 100 heads
- (d) Compost barnyard (Muang, Pak-Thong-Chai)
- (e) Hatchery (Pak-Thong-Chai)
- (f) Water tank (Pak-Thong-Chai, Muang)
- (g) Well (Muang)

(h) Urine treatment basin (Pak-Thong-Chai, Muang)

The major dimensions of the facilities are summarized as below:

Item	Dimension	Structure
Piggery (Pak-Thong-Chai)	6m x 6m 3 units	floor -- concrete roof -- yahka (grass)
Piggery (Muang)	6m x 6m 2 units	floor -- earth roof -- yahka (grass)
Hen house (Pak-Thong-Chai)	13.3m x 8m 4 units	floor -- earth roof -- yahka (grass)
Compost barnyard (Pak-Thong-Chai) (Muang)	3m x 6m 1 unit	floor -- earth roof -- yahka (grass)
Hatchery (Pak-Thong-Chai)	4m x 8m 1 unit	floor -- concrete roof -- yahka (grass)
Water tank (Pak-Thong-Chai) (Muang)	1500 L, 4 units 1500 L, 2 units	
Well (Muang)	$\phi = 1.0\text{m}$, Depth = 2-3m	
Urine treatment basin (Pak-Thong-Chai, Muang)	$\phi = 1.0\text{m}$, Depth = 3-5m	R.C. concrete

4.3 Vegetable Farm Facilities Plan

In Muang area, model farm facilities for vegetable (about 1.5 Rai) are planned. This farm facilities install the mothproof net which is used for vegetable cultivation with small agricultural chemicals. It's dimensions are as follows:

mothproof net facilities (5 m x 100 m x 3 set) made by steel pipe

4.4 Irrigation Facilities Plan

4.4.1 Basic conception in planning

The irrigation facilities plan include the construction of pond, improvement of pond and canal for water resource to vegetable farm during dry season from November to April. The water resource for vegetable farm is direct use of rain water, the pond which reserve rain water from surrounding area and the canal. But, water of canal in dry season is unstable and there is no dependable canal water as stable resource for irrigation.

Therefore, in this area, keep of water resource by means of the construction and improvement of pond is important matter for vegetable farming in dry season. At Muang and Pak-Thong-Chai area, water is reserved in the pond in rainy season from May to October and is used as the resource of vegetable farm in dry season from November to April.

4.4.2 Irrigation water requirement

Potential Evapotranspiration (ET_o) is estimated on the monthly basis by applying the Modified Penman Method based on the climatological data at Nakhon Ratchasima meteorological station. The results of calculation are shown below, and its detailed estimation is shown in Table 6.

Potential Evapotranspiration

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total
Daily basis	4.5	5.4	6.0	6.2	5.8	5.4	5.2	5.0	4.3	4.5	4.6	4.3	-
Monthly basis	140	151	186	186	180	162	161	155	129	140	138	133	1861

After the determination of ET_o, crop evapotranspiration (ET crop) can be estimated by multiplying the estimated ET_o values by crop efficient (K_c). The K_c values vary depending upon a growing period of crops and locality. Thus, this K_c values are selected

for proposed crop in "Irrigation and Drainage Paper 24, FAO". But, in this time, the ET crop values adopt same ETo values.

Crop Evapotranspiration (ET crop)

	Nov	Dec	Jan	Feb	Mar	Apr	Ave.
ETo	4.6	4.3	4.5	5.4	6.0	6.2	5.0
ET crop	4.6	4.3	4.5	5.4	6.0	6.2	5.0

The value of effective rainfall is neglected as a safety factor in consideration of the irregular distribution of rainfall. Therefore, the irrigation water requirements can be obtained from following equation.

$$V = \frac{ET \text{ crop}}{1000} \times A \times N$$

where; V : Volume of water requirement m³
A : Cropped acreage of crop 20 m x 20 m
ET crop : Crop evapotranspiration Ave. 5.0 mm/day
N : Number of days 180 days (from Nov. to Apr.)

$$V = \frac{5.0}{1000} \times 20 \times 20 \times 180 = 360 \text{ m}^3$$

4.4.3 Planning and design of irrigation facilities

The proposed irrigation facilities to be constructed are as follows:

Pond (include Big Pond)
Canal (include Lateral canal)

(1) Pond

The pond is constructed as follows;

- 1) Pak-Thong-Chai area construction of eighteen (18) ponds and improvement of one (1) pond are planned as irrigation water resource for vegetable cultivation in the consideration of promotion of the compound farming management. The construction of farm land for vegetable and sites for community breeding facilities are planned to reclaim by use of excavated soil of the pond.
- 2) Muang area construction of three (3) ponds and improvement of three (3) ponds are planned as irrigation resource for vegetable cultivation in dry season.

The pond size is calculated as follows;

The evaporation from pond surface will be about same irrigation water requirement. The necessary volume of pond (720 m³ (360 x 2) which is double volume of irrigation water requirement.

a) Pak-Thong-Chai area

Pond Surface	20 m x 20 m
Depth	3.5 m
Side slope	1:2.0
Pond Bottom	6 m x 6 m

$$\text{Volume} = \frac{20 \times 20 + 6 \times 6}{2} \times 3.5 = 763 \text{ m}^3 > 720 \text{ m}^3$$

b) Muang area

Pond Surface	15 m x 30 m
Depth	3.0 m
Side slope	1:2.0
Pond Bottom	3 m x 18 m

$$\text{Volume} = \frac{15 \times 30 + 3 \times 18}{2} \times 3.0 = 756 \text{ m}^3 > 720 \text{ m}^3$$

(2) Big Pond

The big pond is existing pond at Pak-Thong-Chai. The plan is new size as follows;

Present and Plan of Big Pond

Item	Present	Plan
Top Elevation	EL 208.5 m → EL 211.1 m	EL 211.0 m
Bottom Elevation	EL 208.0 m → EL 209.2 m	EL 208.0 m
Depth	1.0 m → 1.9 m	3.0 m
Side slope	1:1.5 → 1:30	1:2.0
Volume	17000 m ³	32000 m ³

(3) Canal

The canal is existing canal at Muang. The plan is new size as follows;

Present and Plan of Big Pond

Item	Present	Plan
Width (bottom)	6.0 m	2.0 m
Width (top)	9.0 m	14.0 m
Depth	1.5 m	3.0 m
Side slope	1:1.0	1:2.0

(4) Lateral canal

Present and Plan of Standard at Lateral Canal

Item	Present	Plan
Width (bottom)	0.5 m	0.3 m
Width (top)	2.5 m	2.3 m
Depth	0.5 m	0.5 m
Side slope	1:2.0	1:2.0
Bottom slope	-	1:2,000

CHAPTER 5 CONSTRUCTION PLANNING

5.1 Construction Method

The project involves mainly earth works such as construction of ponds and canal so that a huge number of earth volume should be carried out by machines.

Construction equipments were already donated by JICA under the Agricultural Cooperative Promotion Project for the purpose of construction of project works and improvement of heavy equipments operation technique and construction administration ability for CPD's personal.

Therefore, for this project, the construction of ponds, canal (earth works) and embankment for livestock facilities sites will be executed by CPD force by using the donated construction equipments.

Also the construction of livestock facilities and concrete works for appendant structure will be executed by CPD force.

5.2 Construction Schedule

The time required for construction of the project would be about 6 months including about one month of preparation of tender documents tender calling and tender award and Final Inspection.

The construction schedule for the project was worked out on the basis the following consideration:

(a) Workable days

Mean workable day is decided as 21 days per month, considering the suspension days caused by rainfall, Sundays and national holidays.

(b) Conversion rate of earth volume

The conversion rate of earth volume for making the earth moving plan is decided as 1 vs 1.

(c) Earth moving plan

In principle, the earth materials necessary for embankment are supplied by a excavated earth materials in the site.

(d) Application of manpower and construction machinery

Manpower is applied for the detail work, because the work scale is the comparatively small and the employment opportunity for local labour can be increased.

The construction equipment is selected as follows;

Dump Truck (11 ton)	transportation
Bull Dozor (11 ton)	excavation and spreading
Back-hoe Shovel (0.5 m ³)	excavation and loading
Tire Roller (12 ton)	compaction
Vibration Roller (3 ton)	compaction
Portable Concrete Mixer	mixing of concrete

The proposed construction schedule is shown as follows;

CHAPTER 6 COST ESTIMATE

6.1 GENERALITY

The construction cost of the project is estimated by using bill of quantities taken from the detail designs, drawings, and reasonable unit costs. The construction cost is including tax, profit and overhead, and also including contingency for price escalation and physical measures of bill of quantities.

The bill of quantities of the construction works are shown in Table 8.

Cost for civil works is estimated taking account of various factors such as construction method, earth moving plan, workable days and so on.

Unit cost of each work item is estimated by using labour cost and material cost which are current prices surveyed in September 1988.

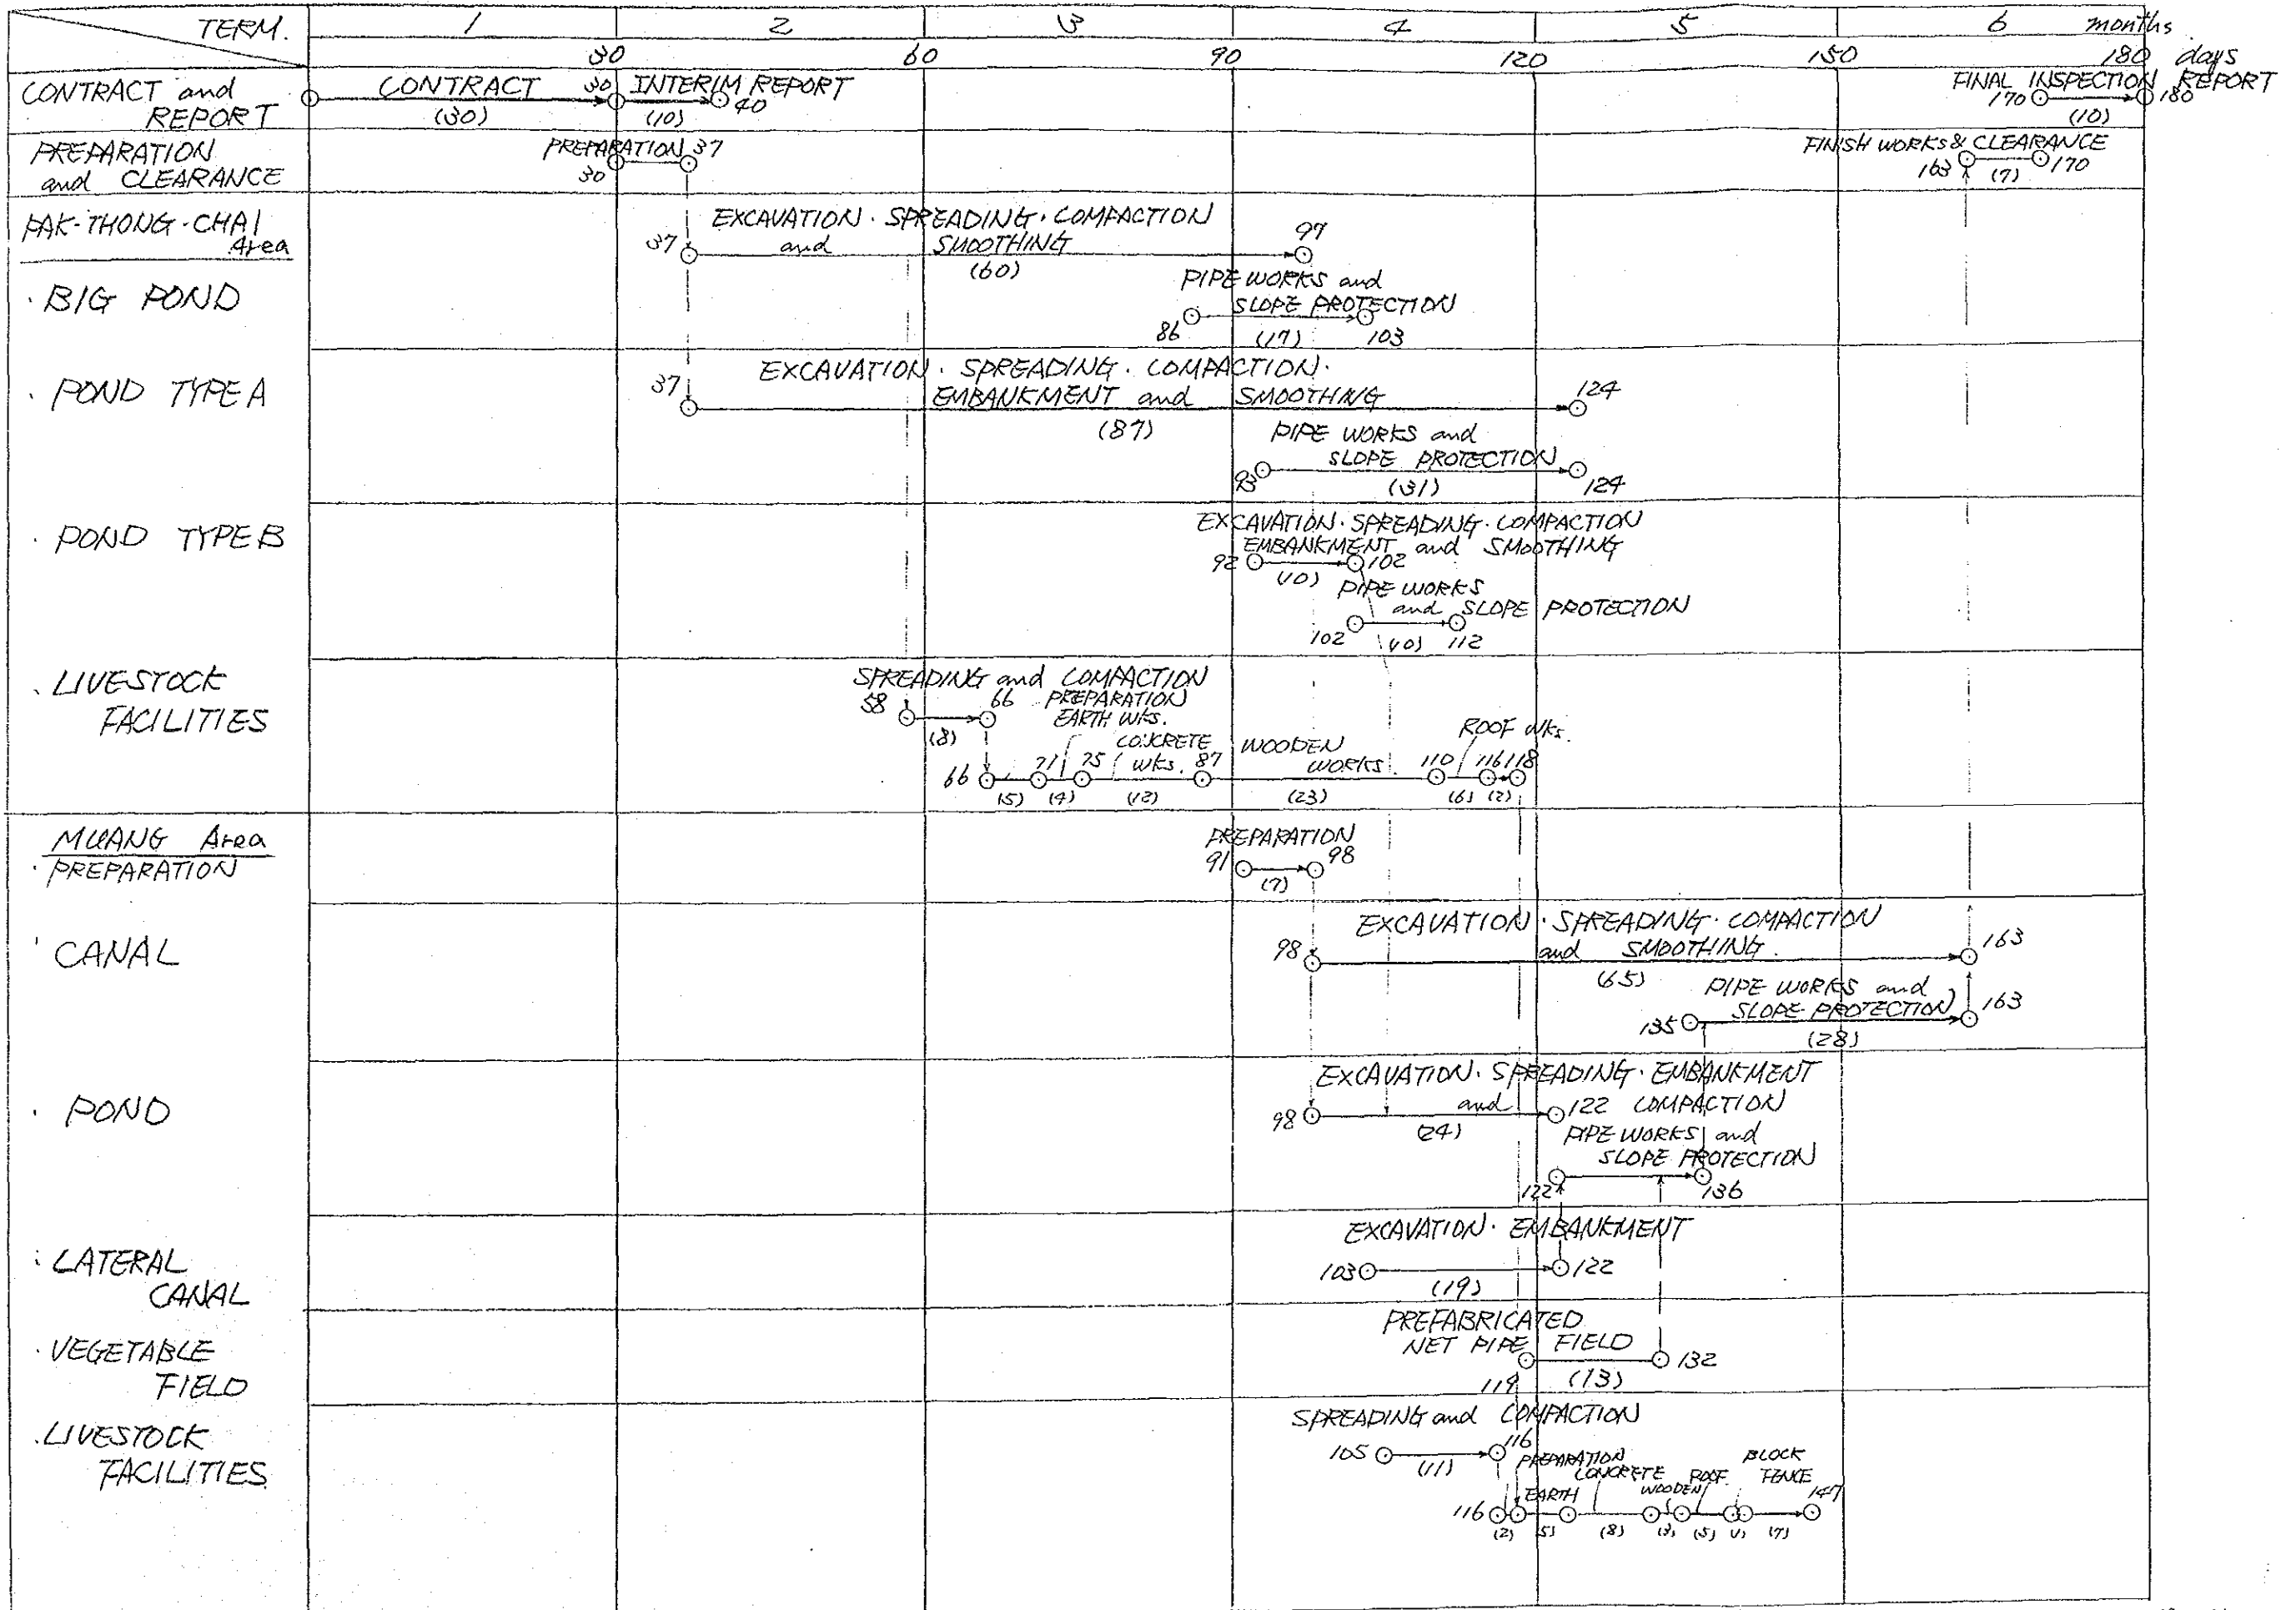

The exchange rate used in the estimate is 1B = ¥5.292

6.2 Construction Cost

The total construction cost of the project of Pak-Thong-Chai area and Muaug area is developed, are estimated at Baht 4,735,000 (¥25,000,000 equivalent) including price contingencies.

The construction cost are summarized as follows and surveyed prices of labour and material are shown in Table. 9 to 13, respectively.

Table. CONSTRUCTION SCHEDULE

PROJECT COST

Item No.	Item	Quantities	Construction Cost (B)	Remarks
I	Construction Cost			
I	Direct Cost			
1-1	PAK - THONG - CHAI Area			
1-1-1	Construction of livestock facilities			
1)	Piggery	3 set	120,000

*1, *2, *3,

ET₀ (Reference crop evapotranspiration) = K_p · E_{pan}

where E_{pan} = pan evaporation in mm/day and represents the mean daily value of the period considered.

K_p = pan coefficient

= 0.85 (see FAO IRRIGATION AND DRAINAGE PAPER 24 Table 18

; case A, RH mean high, wind light, windward side distance of green crop 1000 m)

Table 5.

Suitability of soil for banking and foundation

Symbol	Suitability for banking	Compaction	Dry density (t/m^3)	Permeability cm/sec.	Suitability for foundation	Adjustment for permeability
GM	Very good used for pervious zone of bank or dam	Good by tractor, rubber tired roller, steel wheel roller	2.00 ~ 2.16	$> 10^{-2}$	Good	Cut off wall required
GP	Good used for pervious zone of bank or dam	Good by tractor, rubber tired roller, steel wheel roller	1.84 ~ 2.00	$> 10^{-2}$	Good	Cut off wall required
GK	Fair not so suitable as impervious zone, but used for impervious core or blanket	Good by close management, by rubber tired roller, sheeps foot roller etc.	1.92 ~ 2.15	10^{-3} ~ 10^{-4}	Good	Toe trench required ~ needless
GC	Barely fair used for impervious core	Fair by rubber tired roller, sheeps foot roller	1.84 ~ 2.08	10^{-4} ~ 10^{-4}	Good	Needless
SW	Very good used for pervious zone with slope protection	Good by tractor	1.76 ~ 2.08	$> 10^{-1}$	Good	Upstream blanket, toe drain or drain well required
SP	Fair used for gentle slope banking	Good by tractor	1.60 ~ 1.92	$> 10^{-1}$	Good-poor according their density	Upstream blanket, toe drain or drain well required
SN	Barely fair not so suitable for impervious zone, used for impervious core or bank	Good careful operation required, by rubber tired roller, sheeps foot roller	1.72 ~ 2.00	10^{-1} ~ 10^{-5}	Good-poor according their density	Upstream blanket, toe drain or drain well required
SC	Barely fair used for impervious core of flood protection bank	Fair by sheeps foot roller, rubber tired roller	1.68 ~ 2.00	10^{-4} ~ 10^{-1}	Good-poor	Needless
ML	Poor used on proper adjustment	Good - poor careful operation is important, by rubber tired roller, sheeps foot roller	1.52 ~ 1.92	10^{-1} ~ 10^{-5}	Very poor in danger of liquefaction	Toe drain ~ needless
CL	Barely fair used for impervious core or blanket	Fair - good by sheeps foot roller, rubber tired roller	1.52 ~ 1.92	10^{-4} ~ 10^{-1}	Good-poor	Needless
OL	Unsuitable for banking materials	Fair - poor by sheeps foot roller	1.28 ~ 1.60	10^{-4} ~ 10^{-6}	Fair-poor in danger large seepage	Needless
SH	Poor used for core in hydraulic fill but unsuitable for roll fill	Poor - unsuitable by sheeps foot roller	1.12 ~ 1.52	10^{-4} ~ 10^{-6}	Poor	Needless
CH	Fair for gentle slope, used for thin core, blanket	Fair - poor by sheeps foot roller	1.20 ~ 1.58	10^{-4} ~ 10^{-1}	Fair-poor	Needless
OH	Unsuitable for banking materials	Poor - unsuitable by sheeps foot roller	1.04 ~ 1.60	10^{-4} ~ 10^{-6}	Very poor	Needless
PT	Can't use for construction materials	Practically impossible	-	-	Can't use for foundation	-

S ₁	Low sodium water can be used for irrigation in almost all soils with little danger of the development of harmful levels of exchangeable sodium. However, sodium sensitive crops such as stonefruit trees and avocados may accumulate injurious concentrations of sodium.	C ₁	Low salinity water can be used for irrigation with most crops on most soils with little likelihood, that soil salinity will develop. Some leaching is required but this occurs under normal irrigation practices, except in soils of extremely low permeability.
S ₂	Medium water will present an appreciable sodium hazard in fine textured soils having high cation exchange capacity, especially under low leaching conditions unless gypsum is present in the soil. This water may be used on coarse textured or organic soils with good permeability.	C ₂	Medium salinity water can be used if a moderate amount of leaching occurs. Plants with moderate salt tolerance can be grown in most cases without special practices for salinity control.
S ₃	High sodium water may produce harmful levels of exchangeable sodium in most soils, and will require special soils management; good drainage, high leaching, and organic matter conditions. Gypsiferous soils may not develop harmful levels of exchangeable sodium from such waters. Chemical amendments may be required for replacement of exchangeable sodium, except that amendments may not be feasible in the case of waters of very high salinity.	C ₃	High salinity water cannot be used on soils with restricted drainage, even with adequate drainage, special treatment for salinity control may be required, and plants with good salt tolerance should be selected.
S ₄	Very-high sodium water is generally unsatisfactory for irrigation purposes, except at low and perhaps medium salinity where the solution of calcium from the soil or used of gypsum or other amendments may make the use of these waters feasible.	C ₄	Very high salinity water is not suitable for irrigation under ordinary conditions, but may be used occasionally under very special circumstances. The soils must be permeable, drainage condition must be adequate, irrigated water must be applied in excess to provide considerable leaching and very salt-tolerance crops should be selected.

28	Nylon Mesh Sheet (20m × 1 m)	pec	70	
29	Coupling 1"	pec	20	

Table // LIST OF UNIT COST

No.	Item	Unit	Unit COST(Baht)
1	Excavation by Manpower		
	Sand	m ³	23
	Common Soil	m ³	35
	Gravel	m ³	46
2	Hauling by Manpower		
	L = 20m	m ³	25
	L = 40m	m ³	33
	L = 60m	m ³	37.5
	L = 80m	m ³	42.8
	L = 100m	m ³	50
	L = 120m	m ³	60
3	Compacting		
3-1	Compacting by Manpower	m ²	26.25
3-2	Compacting by Compactor	m ²	17.50
4	Smoothing of face excavated of filled up by Manpower	m ²	1.4
5	Concrete + Labour		
5-1	Plain concrete	m ³	1.250
5-2	Lean concrete	m ³	1.000
5-3	Lining concrete	m ³	1.300
6	Mortar (C:S=1:3) + Labour	m ³	1.000
7	Wooden form of concrete by Manpower	m ²	415
8	Processing and assembling of steel bar + Labour	ton	17.320
9	Wooden scaffolding by Manpower	m ²	300
10	Drainage by pump + Labour	day	329

No.	Item	Unit	Unit COST(Baht)
11	Smoothing face of concrete by Manpower	m ²	1.25
12	Curing for concrete by Manpower	m ²	4.90
13	Installation of concrete block + Labour	m ²	170
14	Roofing Grass + Labour	m ²	70.5
15	Roofing iron sheet + Labour	m ²	122.5
16	Wooden structure for house + Labour	m ²	10.020
17	Installation of fence by Manpower	m	67.5

Table 12 LIST OF UNIT COST BY USING CONSTRUCTION EQUIPMENTS

No.	I t e m	Unit	Unit COST (Baht)	
			CPD	Contractor
EQ-1	Excavation by Bull-dozer (11ton)			
	Sand	m ³	11.4	17.6
	Common soil	m ³	13.6	21.1
	Gravel and weathered rock	m ³	19.4	30.2
EQ-2	Excavation by Bull-dozer (21ton)			
	Sand	m ³	15.9	20.0
	Common soil	m ³	19.0	23.9
	Gravel and weathered rock	m ³	27.0	34.0
EQ-3	Excavation by Back-hoe Shovel (0.55m ³)			
	Sand	m ³	11.4	17.1
	Common soil	m ³	15.2	22.8
	Gravel and weathered rock	m ³	18.2	27.4
EQ-4	Loading by Tractor Shovel			
	Sand	m ³	17.6	22.2
	Common soil	m ³	23.5	29.6
	Gravel and weathered rock	m ³	28.2	35.5
EQ-5	Hauling by Dump Truck (8ton)			
	Sand	m ³ /km	7.0	8.8
	Common soil	m ³ /mk		
	Gravel and weathered rock	m ³ /km	8.0	10.0
EQ-6	Spreading by Bull-dozer (12ton)			
	Sand	m ³ /km	7.0	8.8
	Common soil	m ³ /km		
	Gravel and weathered rock	m ³ /km	8.0	10.0
EQ-7	Compaction by Tire Roller (12ton)	m ²	17.0	21.4
EQ-8	Compaction by Vibration Roller (1-3 ton)	m ²	25.0	31.5
EQ-9	Compaction by Bull-dozer (12ton)	m ²	7.0	8.0

Table 3 HOURLY PRODUCTION

1. Bull-dozer

(1) For excavation

Spec.	Work Item	Q (m ³ /hr)
	Excavation	
Eq1-1	Sand	60
Eq1-2	Common soil	50

(2) For Spreading

Spec.	Work Item	thickness(cm)	Q (m ³ /hr)
12 ton	Spreading		
Eq8-1	Sand	25	70
Eq8-2	Common soil	25	55

2. Back-hoe Shovel

Spec.	Material	Q (m ³ /hr)
	Excavation	
Eq3-1	Sand	60
Eq3-2	Common soil	50
Eq3-3	Gravel or weathered rock	30

3. Tractor Shovel

Spec.	Material	Q (m ³ /hr)
Eq5-1 1.2 m ²	Sand	60
Eq5-2	Common soil	50
Eq5-3	Gravel or weathered rock	30

4. Dump Truck

Spec.	Material	Q (m ³ /hr)
Eq6-1	Sand	36
Eq6-2	Common soil	
Eq6-3	Gravel or weathered rock	25

5. Compacting Equipment

Spec.	Material	Q (m ³ /hr)
Eq 9	Tire Roller	100
Eq10	Vibration roller (1-3 ton)	20
Eq11	Bull dorzer (12 ton)	50

6. Concrete Work

1.5 m³/day
