CHANGWAT, AMPHOE

CHANGWAT - AMPHOE

1. GENERAL

The route proposed to be widened is a part of Route 3 from Amphoe Sattahip to Changwat Rayong with a total length of 44.6 km. The route lies in Changwat Rayong for its entire length.

The terrain is mildly rolling except for short sections at both ends. Present land use along the road is mostly dry land crops such as coconut, cassava, fruits, sugarcane and rubber. Roadside development is heavy at several places. At Km 34 the Map Ta Phut Industrial Complex is under construction, with a large-scale gas separation plant already in operation.

The existing two-lane asphalt road is already carrying relatively heavy traffic. Its surface condition is often poor.

The city of Rayong and its environs have been growing rapidly in recent years due to industrial development and growth in the fishery and tourism industries, as well as the successful development of cash crops. Together with the development of the Map Ta Phut Complex, Changwat Rayong will generate a high demand for road traffic.

There are seven permanent bridges with a total length of 152 m. There are a number of places where horizontal or vertical alignment is poor.

One of the adopted design principles was, as in ML-4, to contain the expanded road within the existing right-of-way width of 40 m in built-up areas so that land acquisition can be avoided as shown in the standard cross section drawing. Sections this principle was applied to are: from the origin (STA 175 + 049) to STA 178 + 500 (approx. 3.5 km), from STA 185 + 000 to STA 185 + 500 (approx. 0.5 km), from STA 193 + 000 to STA 193 + 300 (approx. 2.5 km), from STA 196 + 500 to STA 198 + 500 (approx. 2.0 km), from STA 208 + 000 to STA 209 + 000 (approx. 1.0 km), and from STA 215 + 000 to the end point (STA 219 + 750) (approx. 4.75 km). In all, six sections with a total length of 14.25 km had this principle applied, which is 32% of the total road length of 44.7 km.

Right-of-way widening was considered possible for other sections for an extra width of 15 m. The section from STA 177 + 500 to STA 185 + 000 was decided to be widened on the sea side considering the present conditions of strip development along the existing road, ease of land acquisition, existing cross-road structure (a railway bridge at STA 184 + 500 for the Chachoengsao-Sattahip Railway was built with clearance on the sea side), and so forth.

In the 9 km section from STA 199 + 000 to STA 208 + 000, there are two opposing T-junctions, which will primarily serve the Map Ta Phut Industrial Complex and Map Ta Phut Waterworks Division. Horizontal alignment around STA 201 + 000 is curved and weaving movements of vehicles using the T-junctions will have to be accommodated in this curved section. It was therefore decided that additional lanes were necessary in this section requiring widening on the mountain side.

The section from STA 209 + 000 to STA 215 + 000 was decided to be widened on the sea side considering the existence of a school, the shape of the horizontal alignment around STA 214 + 800, and the shape of the Rayong Bypass Intersection already expanded on the sea side to a four-lane intersection. (No cost estimates were made in this study.)

Vertical alignment of the proposed road was designed to follow the existing road as much as possible, but wherever changes in curvature were found frequent, an attempt was made to make it as smooth as possible.

Among bridges, those at STA 179 + 600, STA 207 + 700 and STA 211 + 700 were found to be substandard and were decided to be replaced.

1. GENERAL

Project ML-9 is an entirely new four-lane highway linking Bangkok with Chon Buri with a total length of 81.7 km. It extends from Bangkok through three Changwats: Samut Prakan, Chachoengsao and Chon Buri.

The Bangkok - Chon Buri New Highway (ML-9) linking up with the Chon Buri - Pattaya New Highway (ML-5) at the south of the Chon Buri municipal area will play a vital role as an arterial highway between Bangkok and Rayong by way of existing Route 36, serving primarily the Eastern Seaboard. These two highways, ML-9 and ML-5, may be classified as a primary highway with the route name of Rt. 36.

Considering the rapid industrial and tourism development in the Bangkok - Chachoengsao - Chon Buri - Rayong corridor in recent years, this highway is of vital importance to support the corridor's continued growth.

Upon completion, much traffic is expected to divert to the new highway from Rt. 34 on which traffic volume is approaching its capacity.

The terrain is generally flat, but there is a 10 km stretch of rolling or gentle hill sections toward the end. Land along the proposed highway is used mostly for paddy fields but cassava and sugarcane fields are dominant in the hilly terrain.

The planned route originates at the junction with Srinakarin Road (Rt. 3344) and runs eastward generally parallel to the Bangkok - Chachoengsao railway up to Amphoe Lat Krabang. Then it goes due southeast heading toward Amphoe Bang Pakong through widespread paddy fields. At around Amphoe Bang Pakong, the new highway crosses the Bang Pakong River at a right angle. Then, the highway turns again to the right to go due south detouring the EGAT power station site. The route passes 3 to 4 km east of the Chon Buri Bypass and finally comes to ML-5 at the south of Chon Buri.

The highway crosses one river and natural or artificial irrigation canals which will require bridges to pass. The Bang Pakong River with a width of about 350 m is the biggest among them.

The new highway also intersects a number of major roads such as the proposed Outer Ring Road, Lat Krabang - Min Buri Road (Rt. 3119), Lat Krabang - Nong Chok, Lat Krabang - Chachoengsao (IM-17), Chachoengsao - Bang Pakong (Rt. 314), Chon Buri - Phanat Nikhom (Rt. 315) and Chon Buri - Klaeng (Rt. 344). Grade-separation control is planned to control traffic flows for some of these intersections.

It is anticipated that the ground condition along the route will be rather soft due to its close location to the sea and also its ill-drained flat terrain. Some countermeasures for ground settlement due to embankment construction are required.

Route alignment was determined taking into account the major physical matters such as large-scale industrial estates, new airport site, location of major road intersections, temples, graveyards and schools, river and canal crossings and densely populated areas. However, demolition of several houses is unavoidable at built-up areas around the Rt. 315 and 344 crossings.

Horizontal and vertical alignments of ML-9 were designed for a design speed of 120 km/h taking controlled access operation in future into account.

PROJECT ML-9

3. ENGINEERING

3.1 Materials and Boring Results

(1) Materials

DESCRIPTION OF MATERIAL SOURCES

Material	Source	Description of Sample	Estimated Quantity cu.m.	Hauling Distance (km)
Soil	Along the Route 344 Near Km 10+000 Both Sides 0.3 km	Silty Sand	Plentiful	95 - 15
Laterite	Along the Route 315 Near Km 20+000 Both Sides 5.0 km	Gravelly Laterite	Plentiful	83 - 15
Crushed Rock	Route 3 Km 99+150 Right Side 1.2 Km	Lime Stone	Plentiful	78 - 15

RESULTS OF LABORATORY TESTS

Sieve Analysis % Passing	Comp.			Plasticity	D.H-T Stand.	Lab. C.B.R.							
	50.0	25.0	19.0	9.5	#4	#10	#40	#200	LL	PI	Opt.	CBR	Swell
Soil	100	79	59	36	32	28	34.3	14.2	7.5	2.19	14	0.4	
Laterite	100	96	93	77	51	26	17	13	29.8	8.8	7.4	2.21	-
Crushed Rock									280				-
