THE STUDY OF ROAD IMPROVEMENT BETWEEN SAN BORJA AND TRINIDAD IN THE REPUBLIC OF BOLIVIA (PHASE II)

FINAL REPORT

SUMMARY

JANUARY 1989

JAPAN INTERNATIONAL COOPERATION AGENCY

国際協力事業団 19319

PREFACE

In response to a request from the Government of Bolivia, the Government of Japan decided to conduct a study on the Road Improvement between San Borja and Trinidad (Phase II) Project and entrusted the study to the Japan International Cooperation Agency (JICA).

JICA sent to Bolivia a study team headed by Mr. Shunichi Tateishi, comprised of members from Central Consultant Inc. and Kokusai Kogyo Co., Ltd. firstly from September, 1987 to March, 1988, secondly from June to October, 1988.

The team held discussions with officials concerned of the Government of Bolivia, and conducted field surveys. After the team returned to Japan, further studies were made and the present report was prepared.

I hope that this report will contribute to the development of the Project and to the promotion of friendly relations between our two countries.

I wish to express my sincere appreciation to officials concerned of the Government of Bolivia for their close cooperation extended to the team.

January, 1989

Kensuke Yanagiya

President

Japan International Cooperation Agency

January 1989

His Excellency Mr. Kensuke Yanagiya, President, Japan International Cooperation Agancy, Tokyo, Japan

<u>Letter of Transmittal</u>

Dear Sir:

We are pleased to be able to submit herewith the final report of the "Study of Road Improvement between San Borja and Trinidad".

This study report includes executive summaries, main texts, drawings, specifications statements of costs, five (5) technical reports and studies on the Tijamuchi Bridge, and embodies the results of the study undertaken from September 1987 to January 1989.

We hope this study will contribute towards the improvement of the transportation system and the economic development of the project area and will be of value in the future development of the Republic of Bolivia.

We wish to express our appreciation and sincere gratitude to the officials of your Agency, the Advisory Committee and the Embassy of Japan in the Republic of Bolivia, as well as the officials of the agencies concerned in the Government of Bolivia, particularly, the SNC (Servicio Nacional de Caminos), for the assistance and the cooperation extended to the Study Team.

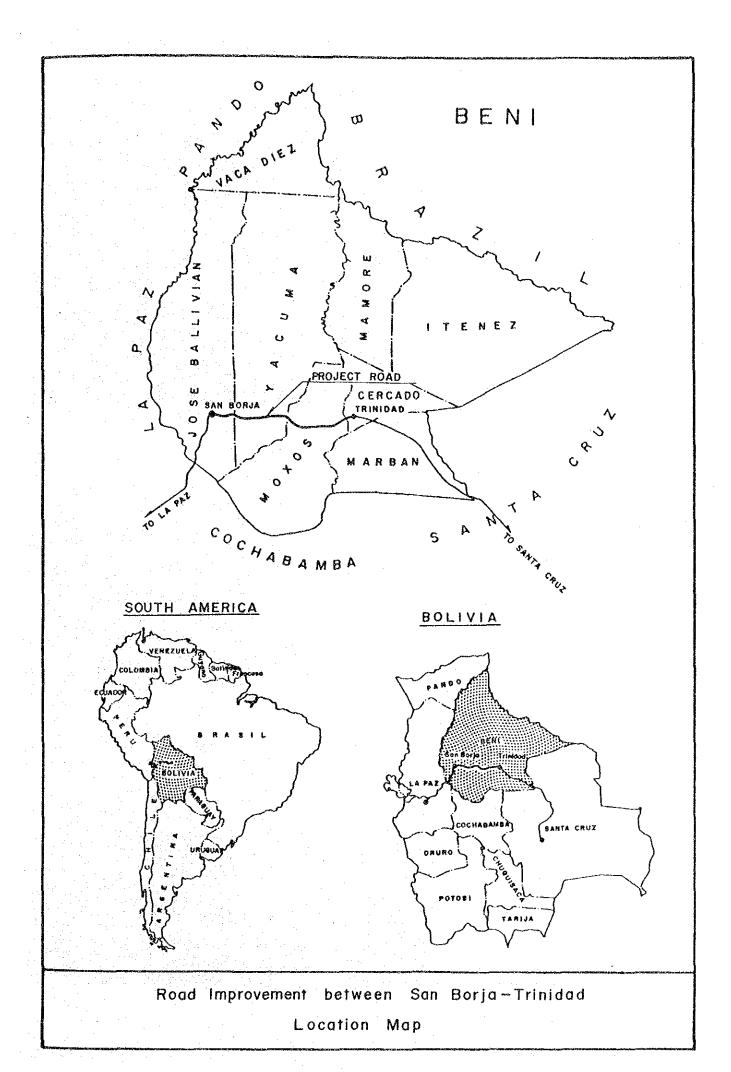

Very Truly Yours,

Shunichi Tateishi,

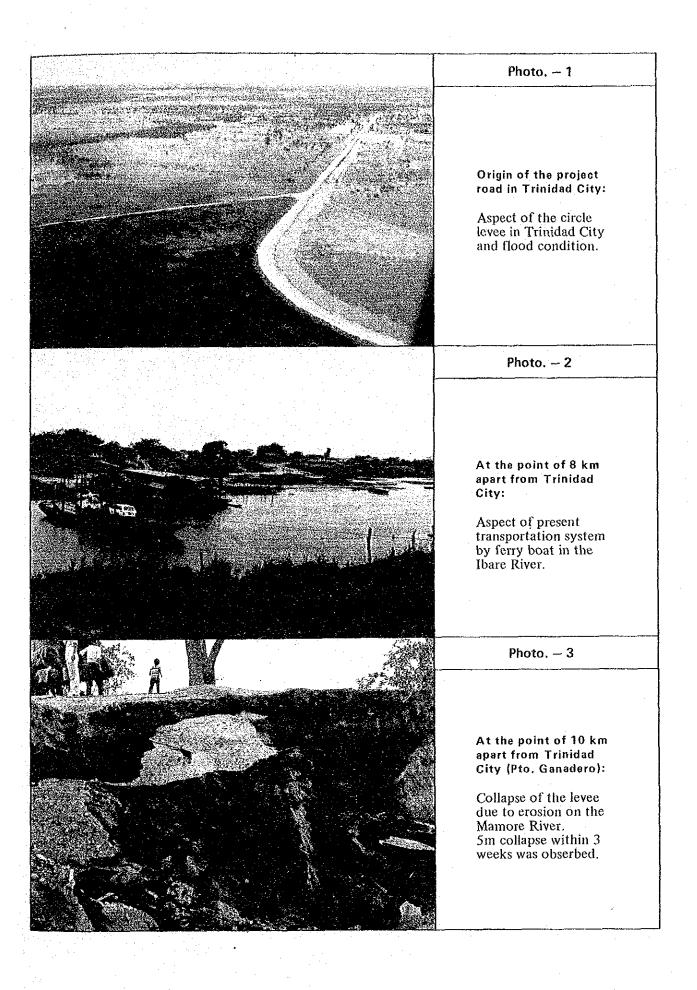

Team Leader.

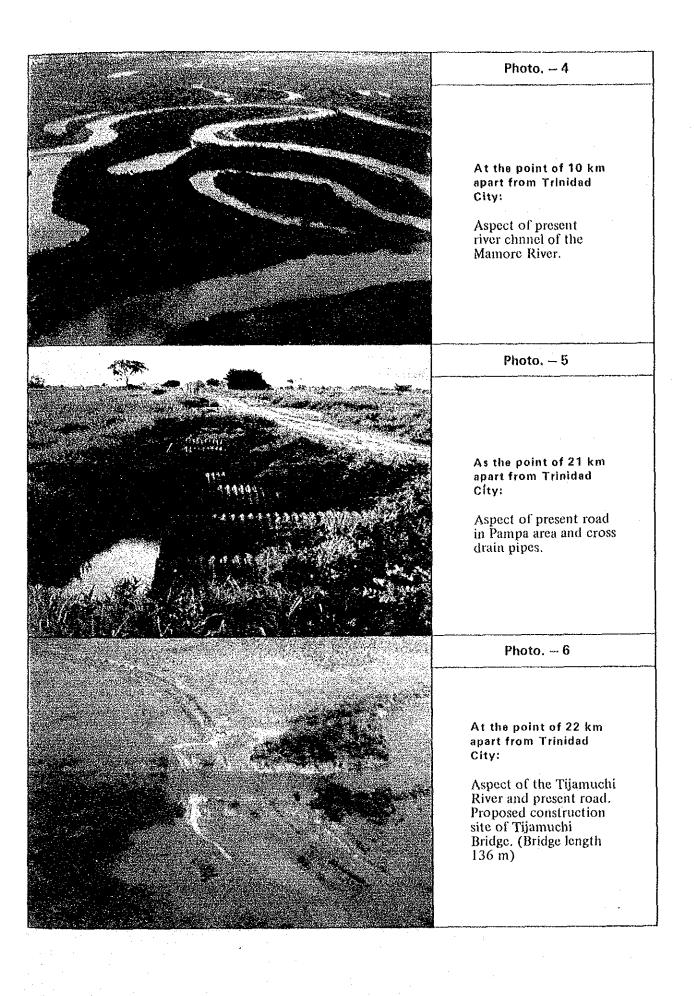

The Study of Road Improvement between San Borja and Trinidad (Central Consultant Inc.)

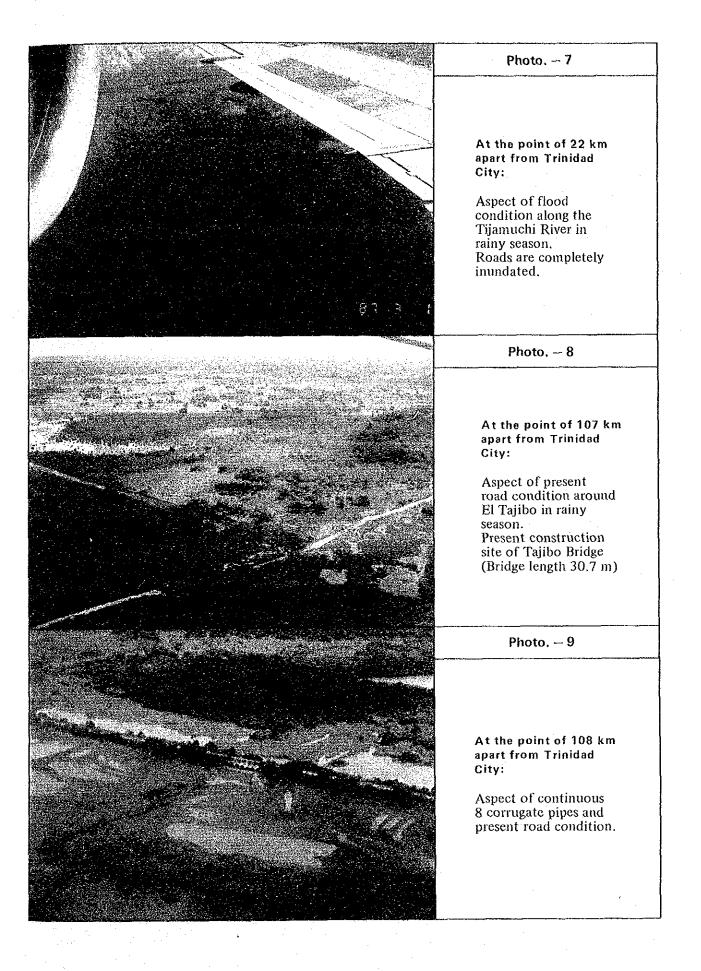

Shunich Fiteri

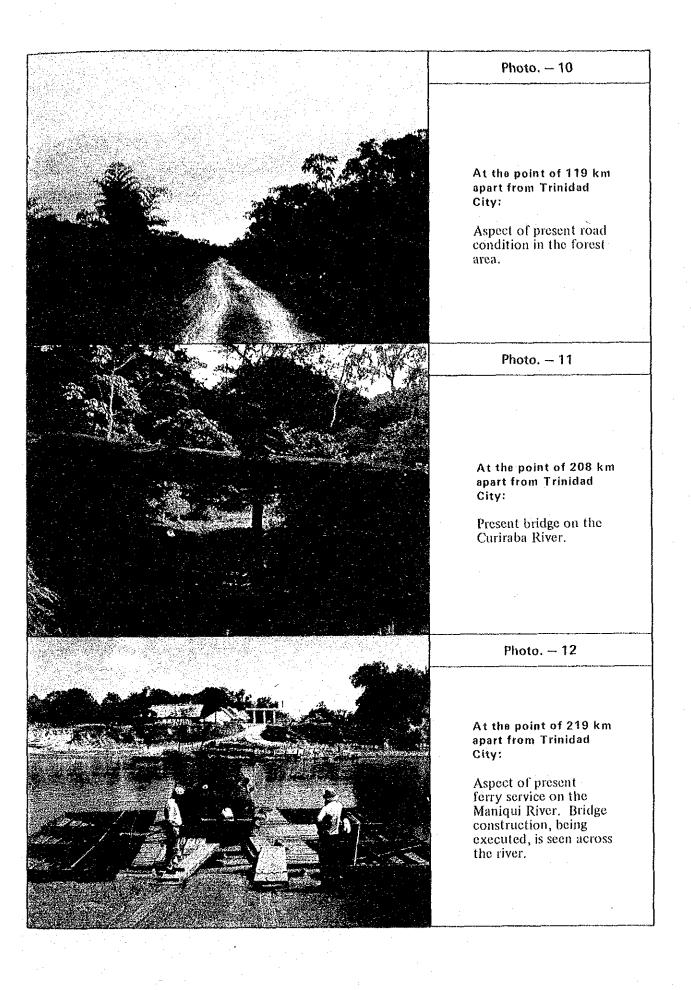

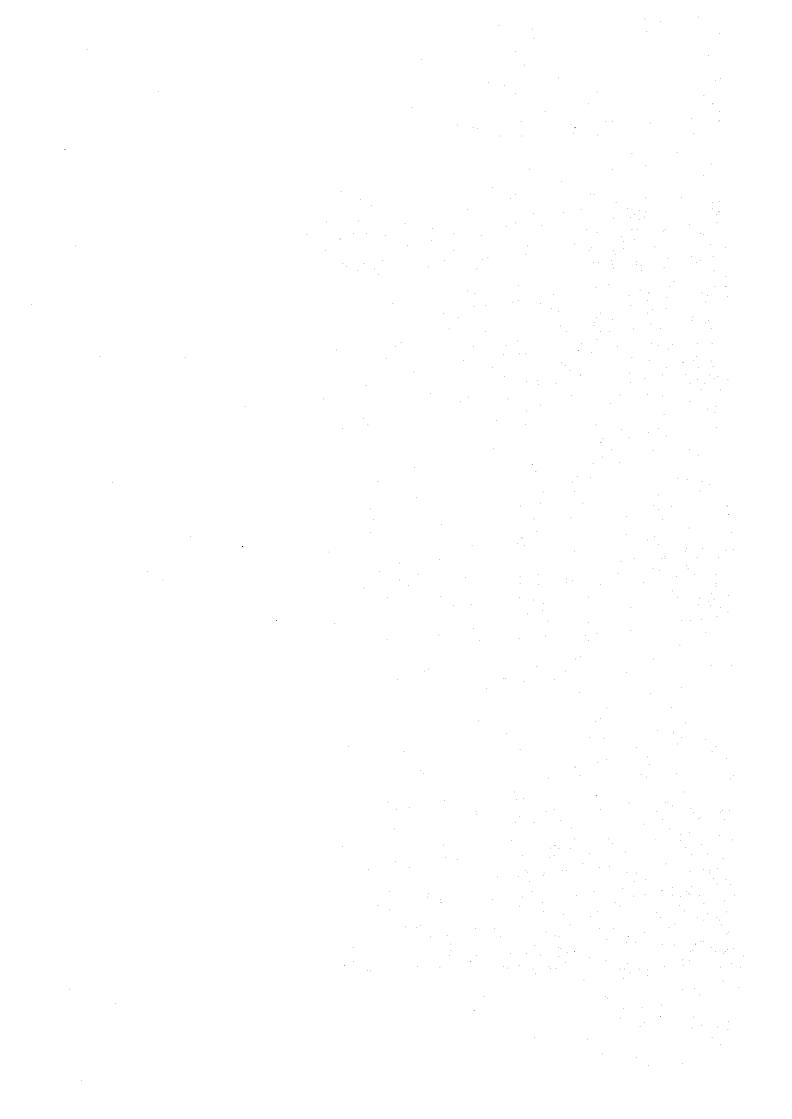

CONCLUSIONS AND RECOMMENDATIONS

1. General

1.1 The substance of this project is the improvement of the 229 km of road connecting the cities of San Borja and Trinidad in the Department of Beni, a food producing region for the capital city of La Paz.

1.2 The Presidential Decree No. 547, of May 1983, considers the completion and the maintenance of the road between San Borja and Trinidad a matter of the highest order of priority for the Nation,

The main reasons for the urgency of the completion of this road are as follows:

- To transport economically and without hindrances to the central marckets the goods produced in the road influence area.
- 2) To facilitate the policy of internal migration for encouraging the future development of this region.
- 3) To establish government control in the frontier areas.
- 1.3 The completion of an all-weather road between the cities of San Borja and Trinidad, besides benefiting the development of Bolivia, is fundamental to the establishment of a national network of roads.

- 1.4 The results of the analysis of the flood and the investigations for the methods of the crossing of the Mamore River indicate that the construction of an all-weather road is technically feasible.
- 1.5 To reduce the construction costs, narrowing of the road shoulders, paving in stages, utilization of the present road, etc. were considered in the design. The cost of the project is estimated at US\$ 61,800,000.

The planned construction period is four years, between 1990 and 1993.

- 1.6 The economic benefits that will be brought about by the completion of this project such as savings on travelling and transportation costs is estimated to total US\$ 25 millone in 2003 and US\$ 41 million in 2013.
- 1.7 It was also established through this study that the project is economically feasible taking into consideration economic indicators such as the internal rate of return (IRR), the Benefit/Cost ratio (B/C) and the present net value (PNV). The above project values are as follows:

1.8 The San Borja - Trinidad road improvement project should be implemented as soon as possible in view of the favourable return on investments and its significant collateral benefits. 1.9 Because of the large economic investment required in a short period of time, it will be reasonable to apply to international financial institutions for the financing of the construction.

The Inter American Development Bank (IDB) seems to be the most appropriate institution for the financing of the Project.

1.10 As a condition for financing of projects, the Inter American Development Bank requires the execution of environmental studies and studies of the different social strata, which were not included in the present study. These studies are due to be carried out by the SNC.

2. Impact of the Project

- 2.1 Besides connecting La Paz and Santa Cruz, the two most important cities in Bolivia, the completion of the planned route will result in the creation of a large circular road connecting the main cities of the country and in the formation of the framework of the national road network.
- 2.2 The completion of the Project, will not only improve communications, and transportation of people and goods, but will also be a positive element in the efficient administration of the region.
- 2.3 After the completion of this Project, Trinidad, the departmental capital of Beni, which has up to the present time had an image of isolated island, will be more fully integrated with other regions of the country. Towns and villages in the neighbourhood of Trinidad will also greatly benefit from the Project.
- Conveyance ofagricultural products such as meat from the area along the existing road to La depends largely on aerial transportation at present. The completion of all-weather road will make an land the prevalent method of trasportation by this change in the method transportation and will result in a significant transportation reduction in transportation costs of goods.
- 2.5 The change from a dry season road to an improved allweather road will stimulate private investments in the large territory covered by the road influence area.

The development of the area along the road will be a demonstration of the strength and stability of the Nation not only to those within the country but also at an international level.

- 3. Aspects Related to the Execution of the Project
- 3.1 The cost of this Project at August 1988 prices, was calculated at US\$61.800.000. The major component of the total cost is that of the transportation of aggregates for the subbase and the pavement, which makes up 42% of the total cost.

Efforts should be made to reduce these transportation costs.

3.2 Since the projected road is a part of the trunk route connecting La Paz, Santa Cruz and Trinidad, its full effect will depend on the condition of the roads at both ends.

For this reason, the improvement of the road sectors La Paz - San Borja, and Santa Cruz - Trinidad, is of high priority in obtaining the planned impact with the present Project.

- 3.3 Seventeen bridges are to be built between San Borja and Trinidad. while ten out of the seventeen are to be constructed under the present project, the remaining seven are to be completed by SNC before the implementation of the Project.
- 3.4 In the execution of the present Project, care must be taken to avoid damages being caused by flooding to parts already constructed and lowering of the quality of the road due to use by traffic during the rainy season. Plans should be made taking sufficient account of the rainy season and adhered to faithfully.

Before the rainy season starts, for example, the earthwork already initiated must be completed up to the subbase work, the drainage pipes started must be completed up to the earthfill and headers, and the abutments of the bridges should be completed up to their protection work.

3.5 In the maintenance and administration of the improved road, special attention should be given to the following: periodic leveling and supply of gravel, cleaning of drainage pipes, inspection and emergency repair of the banking around the abutment of bridges, and dredging and maintenance of the ferryboat terminals and facilities.

OUTLINE OF THE PROJECT

1. Description of the Project

Starting point of the Project: Trinidad

Cercado Province

Departament of Beni

Ending point of the Project: San Borja

Ballivian Province

Departament of Beni.

Length of the Project

Total length of the work: 221.93kms.

(Not including the length of the river crossing)

Length of the road: 220.94kms.

Asphaltic concrete: 10.37kms.

Gravel wearing surface: 210.57kms.

Total length of bridges: 0.99kms.

Length of the Ferryboat

crossing (Mamorė River): 7.06kms.

2. Technical Specifications (Manual and Norms for the geometric design of roads, 1984: SNC)

Road Classification: Class III
Design Speed: 100 km/h
Traffic Lanes: 2
Road Width: 9 m.
Wearing Surface Width 7 m.

3. Quantity of Work

Earthfill: 2,524,963 m3 Pavement: Asphalt t = 6cm. 71,000 m2 Gravel t = 20 cm. 2,032,000 m2 177 locations. Corrugated pipes 17 Bridges (Seven to be completed by 1990) Total length of bridges (17) 987.2 m. Total length of bridges (10) to be built under the Project. 381.9 m. Ferryboat Terminals 2 locations. Total length of channels (3) 2,414 m.

4. Costs of the Project

INTRODUCTION Brownian I a seed to be a ready and per training of

1.1 Background of the Study

The early completion of Route No. 3 of the National Road Network Linking La Paz, the capital of Republic of Bolivia, and Trinidad, the departmental capital of Beni, as an all-weather road has been considered for long time to be the top priority project in the country.

The improvement of Route No.3 has been carried out gradually from La Paz and the improvement work road up to San Borja, with the exception of sections, is within sight of completion. In the section between San Borja and Trinidad, on the other hand, with a distance of approximately 230 km, the existing becomes impassable during the rainy season. This is the last section that requires improvement and the accomplishment of the improvement of this section result in the completion as an all-weather road system of the whole of the circular road network mentioned above covering a wide area of the country.

Under these circumstances, and in response to a request from the Bolivian Government, the Japanese Government in 1985, to execute the Study for decided Improvement of the Trinidad - San Borja Road, within the Technical Cooperation Program between the two countries.

The first phase of the Study (Phase I) was dedicated technical examination and the field investigation at the project site, and was carried out between October 1985 and July 1987. The technical examination at stage was carried out at the level of a feasibility study.

On the basis of the results of Phase I of the Study, the Japanese Government went on to the execution of a second to a further request from the stage, response Bolivian Government. This is the Phase II of the Study investigation, field road design. which entailed evaluation and other aspects of : the road economic improvement project for the above-mentioned road sector.

In order to implement this phase of the Study, the Japan International Cooperation Agency sent (June and July 1987) an official mission to Bolivia to discuss with the Bolivian Government representatives the principle and the substance of Phase II of the Study and the Scope of Work Document (S/W) was signed by both parties.

After the signing of the Scope of Work Document, the Japan International Cooperation Agency sent the study team in charge of the execution of Phase II of the Study to Bolivia in September 1987.

The study team completed the Phase II Study in October 1988 compiling the results in this draft of the Final Report.

It is hoped that this road improvement project will be implemented with the financing of the Interamerican Development Bank.

1.2 Purpose of the Study

The purpose of this Study was to carry out examinations from technical and economic points of view for the improvement of the road between San Borja and Trinidad, making use of the results of the Phase I of the study, to carry out the necessary research and to work out the design for the improvement and equipment of the road at the level of an all-weather road and, at the same time, to extimate and to analyze social and economic impact resulting from the improvement of the road.

Furthermore, the transfer of technology to local Bolivian technicians, through the execution of the Study, was included as another objective of the project.

1.3. Object of the Study

The road sector, which is the object of this Study, starts in the city of Trinidad, located in the Cercado Province of the Departament of Beni, and ends in the city of San Borja, located in the José Ballivian Province of the Departament of Beni. The approximate distance between the two is 230 kms. (Figure 1-1).

It is planned that a ferryboat system should be instituted for the crossing of the Mamoré River which occurs along the road. The length of the road excluding the length of the crossing is 222km. The construction of the terminals and the channels for the Mamoré River crossing, however, were examined in the present study.

A total of 17 bridges have been considered for construction in the road sector of reference. Eight out of these 17 bridges, have been excluded from the present Study, since their designs have already been

completed and it is planned that their construction should be executed before the implementation of the San Borja-Trinidad road improvement project.

During the last year of the Study, however, the Bolivian Government requested that the construction cost and the construction program for the Tijamuchi Bridge proposed by the Bolivian side be included in the study and those items as were requested were accordingly included in the study.

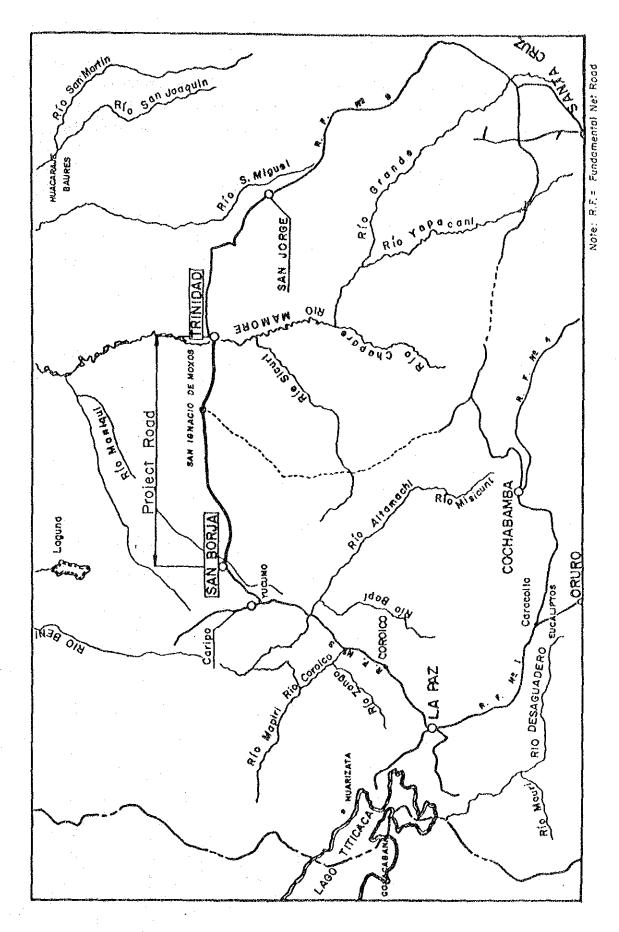

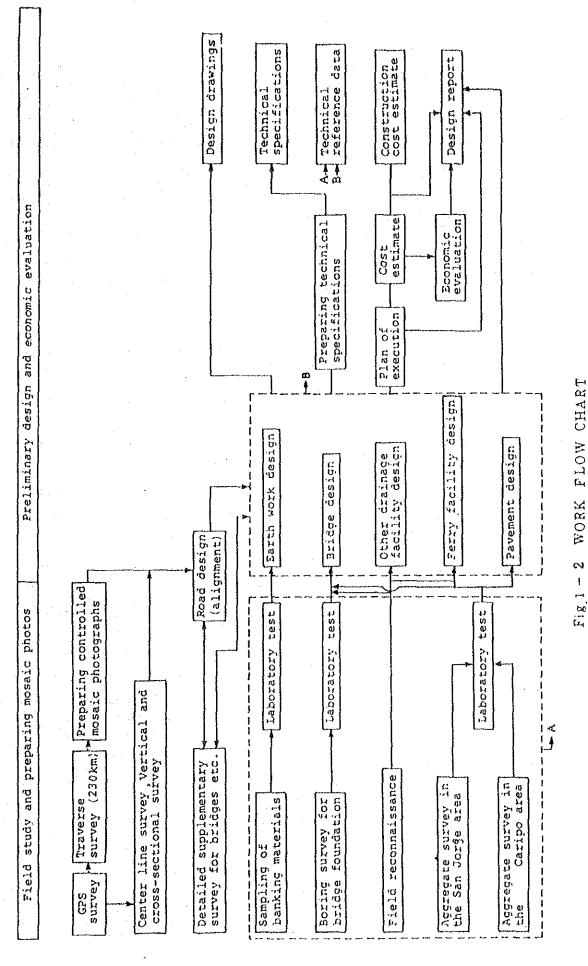

Fig. 1-1 Location Map

1.4 Method of the Study

In order to comply with the above mentioned purpose of the Study, studies under Phase II were carried out according to the flowchart and the schedule described in Figure 1-2.

7

1.5 Proposed Dimensions of the Project

1) Road Sector

City of San Borja - City of Trinidad, both in the Department of Beni.

2) Basic Specifications of the Project.

Road Width: Total

= 9m.

Carriage $3.5 \times 2 = 7m$.

Length of the Project: Road = 221.9km.

Transfer = 7.1km.

(Mamorė River)

TOTAL = 229.0km.

Main Structures: 17 bridges, total length

987.2m. (Seven of them

currently

under

construction and/or with the construction planned prior to the execution of

the present Project).

Ferryboat Terminals:

Channels:

Two (Mamoré River)

Three (Mamore River)

Type of Pavement:

Trinidad-Mamorė River:

Asphalt Concrete

But gravel wearing surface also used between San

Borja and Mamore River.

- 2. PREPARATION OF THE PHOTO-MOSAIC AND FIELD INVESTIGATION
- 2.1. Ground Control Survey and Traverse Survey
 - 1) Ground Control Survey through the Global Positioning System (GPS).

Points Surveyed

Existing Local Triangulation 1 point

New Ground Control Points 8 points

Azimuth Reference Signs 9 points

TOTAL 18 points

2) Traverse with GPS Connected Points

Routes Surveyed: 8 routes (230 linear kms.)

Monumentation: 41 points (approx. every 5km.)

Accuracy of the Observation:

Route
Error of closure

Azimuth -42" +14" -39" -74" -61" -14" -11" -3"

Coordinates 1/13078 1/19491 1/13117 1/10439 1/21811 1/51178 1/13366 1/21196

2.2. Aerial Triangulation and Photo-Mosaic Preparation

1) Aerial Triangulation

Control Points used: 60 points

Stereo Base Models: 20 courses, 104 models

Accuracy

| | Block | | 1 | 2 | 3 | 4 | 5 |
|---------------------|-------------|--------------------|---------|----------|--------------|-----------|--------------|
| | Course No. | | C1 - C7 | C8 - C11 | C12 - C13 | C14 - C15 | F1 - F5 |
| Residual | | Kaxisus | 2.48 | 2.69 | 1.19m | 2.29 | 2.55m |
| at Control | Ilorizontal | Standard Deviation | 8.96 | 1.08 | 0.69 | 1.01 | 1.63 |
| Control - Points | | Maximum | -8.76 | 1.43 | <u>-1.37</u> | 1.89 | <u>-8.78</u> |
| | Elevation | Standard Deviation | 0.39 | 0.36 | 8.53 | 8.59 | 0.42 |

Preparation of the Rectified Photo-mosaic

Photo-mosaic: 176 sheets (84cm. x 59cm. polyester base)

Accuracy: The maximum rectification error is less than 2.5mm. in the 1/2000 scale photomosaic, or within 0.2mm. in the 1/25000 scale negatives.

2.3 Investigation of Soils and Aggregates

(1) Soils Investigation

1) Most of the material in the whole of road sector was clasified as A-7, A-6 and A-4, and there was also a small amount classified as A-2. Each category takes up 45%, 29%, 23% and 3% of the total length of the road, respectively.

All these materials can be used for filling the embankment and also as subgrade material for the projected road, with the exception of the soils clasified as A-7 in some parts of the road sector.

2) The soil (A-7) around the road between Trinidad (Starting Point) and the right margin of the Mamoré River (10.4 km Point) shows low CBR values ranging from 1 to 3 and is unsuitable as subgrade material.

There is, however, high quality soil (A-4) in the last part of this section (in the natural embankment at the right margin of the Mamoré River) which can be used as subgrade material. 3) Most of the soil between the left margin of the Mamorè River (10.4 km Point) and the 19 km point shows low CBR values ranging from 1 to 3 and better quality soil should be used in the top part of the subgrade.

For the material for the top part of the subgrade, the high quality soil of the natural embankment at the left margin of the Mamore River can be used.

2.4 Aggregate Investigation

The quarries, the selected gravel and sand pits, and the types of aggregates are as follows:

- 1) Materials for the Subbase Course
 - San Borja Sector Borrow Pits
 (for the road between San Borja and the 29.1 km station)

Caripo and Dartagñan--pit-run gravel.

The use of a mix of materials both banks is recommended.

- Trinidad Sector Borrow Pits
 (for the road between Trinidad and the 29.1
 km station.)
 Cerro Chico--crusher run.
- 2) Materials for the Base Course and the Surface Layers
 - Trinidad Sector Borrow Pits
 (To be used only between Trinidad and the Mamoré river.)

Cerro San Jorge-graded crushed stone. (Deposit No. 1)

- 3) Aggregates for Concrete in Bridges
 - San Borja Sector Borrow Pits
 Rio Quiquibey--fine aggregate (sand)
 --coarse aggregate (gravel)*
 - * This aggregate should not be used for high strength concretes.

Rio Alto Beni--coarse aggregate (gravel)

- Trinidad Sector Borrow - Pits

Cerro San Jorge--coarse aggregate (crushed (Deposit No. 1) stone)

Rio Blanco-fine aggregate (sand)

(Urubicha)

(2) Typical Cross Section

Trinidad-Mamore River Road Sector

Mamore River-San Borja Road Sector

2nd. Construction Stage

Fig. 3.2-1 Typical Cross Section

(3) Horizontal Alignment

The maximum use of the present road was been considered during the selection of the route.

(4) Principles for the Vertical Alignment Design

1) Geometric Design standards must be conformed to.

- 2) In areas liable to be flooding, the elevation of the designed subbase course must be more than 60cm above the maximum level of the water, which is 154.80m above the sea level, as established in Phase I.
- 3) In areas not liable to be flooding, the elevation of the designed subbase course must be 60cm or more, above the natural level of the present terrain. This criterion, however, does not apply to the road sectors with isolated higher elevations.
- 4) In road sectors close to bridges, the elevations proposed for the bridges will be adopted.
- 5) No excavation of the existing road should be carried out. This criterion, however, does not apply where there are isolated higher elevations on the existing road.

^{\$} Ferry boot purchase cost included

7. ECONOMIC EVALUATION

7.1. Impact of the Present Project

- (1) Impact during the planning and design stage
 - Demonstration effect.
 - Economic and educational benefits accompanying the investigation.

(2) Impact during the construction stage

- Increased demand in equipment and construction materials.
- Creation of new jobs.
- Technology transfer.
- Development of resources.

(3) Impact after completion

- Benefit of the presence of the road
- Benefits for users, such as reduction of travel costs, reduction of travel time, increased comfort during travel, reduction of damage to goods and of packing expenses, reduction of ferry transfer costs, increased reliability and reduction of transportation costs.
- Collateral effects, such as increase in the incomes of the producers, promotion of development along the road and its influence area, stimulation for implementation of other projects in the Department of Beni, expansion of the economic territory of Beni, reliable supply of goods and consequent reduction of storage capacity required.

7.2. Economic Analysis and Evaluation

- (1) Items considered as real benefits
 - Operation costs.
 - Travel time
 - Transportation costs.
 - Increase in the incomes of the producers.
 - Savings in the road maintenance costs and in the river transfer costs.
- (2) Evaluation results

Cost of the Project......US\$ 61,800,000.-Subject Period of the evaluation

From 1994 through 2013 (20 years)

- 1) Internal Rate of Return (IRR)..... 24.75
- 2) Net Present Value (NPV).....US\$ 75.185.000.-

A discount rate of 12% has been adopted, according to the IDB recommendations, which are included in the Loans Form Guide.
