### 4. ECONOMIC AND FINANCIAL EVALUATION

#### 4.1 Economic Analysis

# 4.1.1 General

The economic feasibility of a project is usually evaluated on the basis of estimation of the economic internal rate of return (EIRR). Economic cost of the project is calculated based on the conversion factor and financial cost based on the market prices in Mauritius. Economic benefit of the project consists of direct benefit and indirect benefit. Of them indirect benefit covers several intangible benefit such as improvement of public health and decrease of mortality and morbidity. Therefore economic analysis represents only quantitative benefit, which results in rather safety or negative side of economic viability.

For the economic evaluation, the following basic assumptions are applied;

- The project life is taken as 50 years after construction,
- Construction begins in 1990 and operation commences in 1995,
- The current prices as of 1989 are used in this evaluation,
- The exchange rate of Mauritian Rupee is taken to be Rs.13.7 equivalent to US\$ 1.

4.1.2 Construction and O & M costs

(a) Conversion factor for economic prices

Tariff and trade restrictions introduce a distortion in the price relationship between traded goods and non-traded goods. In order to evaluate the project cost and benefit comparable to the international market prices, a standard conversion factor (SCF) is calculated by following equation;

( FOB + CIF ) ( FOB + CIF + ID + OIT + DT )

= 0.82

where,

FOB :	Annual export , FOB price	(5,955,000 F	Rs. in 1984/85)
CIF :	Annual export , CIF price	(7,307,000 F	Rs. in 1984/85)
ID :	Import duties	( 890,000 F	Rs. in 1984/85)
OIT :	Other indirect tax	(1,532,000 F	Rs. in 1984/85)
DT :	Direct tax	( 424,000 F	Rs. in 1984/85)

The construction of the project facilities is carried out by equipment, materials, skilled and unskilled labours. For the economic analysis, the following conversion factors are applied;

- Trade component
   This component includes imported materials. Since it is traded, the conversion factor is 1.00. This category occupies
   66 % of the capital cost.
- 2) Non-trade component

This component includes skilled labour and locally manufactured materials, The SCF of 0.85 is used as the conversion factor, and 32 % of the capital cost belongs to this category.

3) Unskilled labour

Unskilled construction labour for the project would likely come from farm household, for which the opportunity to be sacrificed by the project is agricultural activities. In addition, due consideration would be required to the extent of some extra premium owing to rather severe temporary work despite the existing majority of underemployment in rural area. Thus the wages paid to seasonal farm workers are more indicative of the opportunity costs of unskilled construction labour. Consequently, the economic opportunity cost of unskilled construction labour is determined to be less than financial wage rate.

But, cost of this category covers 7 % of local currency portion and only 2.4 % of total capital cost and this conversion factor does not effect much on total economic cost of the project.

Thus, the conversion factor of 0.82 is applied for local portion of the capital cost of the project. The CCF (the weighted average of the above components) is calculated at 0.94.

(b) Economic cost

Economic cost of construction and 0 & M on the Project are estimated based on the conversion factor mentioned above and the market prices of equipments, materials and labor to be purchased for the implementation of the Project. Construction cost is estimated to be Rs.  $901,480 \times 10^3$  in total, comprising Rs. 660,400  $\times 10^3$  foreign currency and Rs. 241,080  $\times 10^3$  local currency. Assumptions and conditions applied for estimating construction cost were explained in detail in Section 3.5 "Cost Estimate".

Investment cost used in cash flow analysis is based on the disbursement schedule explained in Section 3.5. 0 & M cost is also estimated as explained in Section 3.5.

4.1.3 Benefit of the Project

Quantitative effect of the project on the economy of Mauritius is divided into two items, one is a) Water supply for domestic use. Another is b) Water supply for non-domestic and Government. The former can be estimated by willingness of household to pay. The latter is estimated from the effect on Gross Domestic Product (GDP) of several sectors

which are served by water supply from CWA.

Benefit of the Project is calculated based on the projected incremental volume of water supply by category and appropriate unit economic benefit by categories mentioned above, i.e., a) domestic, b) non-domestic + governmental uses. Water tariff of these to categories is assumed to be constant as in 1989.

Benefit of the Project in each category is calculated as follows:

# (a) Incremental Volume of Water Supply

Incremental volume of water supply in each year is calculated as follows:

Non- Domestic	Govern- ment	Contribution by Project	Domes- tic	<u>DOOm<sup>2</sup>/year</u> Non- Domestic	Govern- ment
					AUGILU
4,507	913	0.020	177.7	90.1	18.3
6,111	913	0.050	559.0	305.5	45.6
7,305	913	0.215	2,552.0	1,570.0	196.0
8,766	913	0.283	3,655.0	2,480.0	258.0
	7,305	7,305 913	7,305 913 0.215	7,305 913 0.215 2,552.0	7,305     913     0.215     2,552.0     1,570.0

### (b) Benefit by domestic use

According to the Country Report for Mauritius and three other neighbouring countries (No.2, 1988) published by the Economist Intelligence Unit,UK, share of water expenditure in the average household income is 2  $\chi$  (2.91 Rs./m<sup>3</sup>). Limit of this share is thought to be 3  $\chi$  (4.37 Rs./m<sup>3</sup>) by CWA as capability to pay for water supply,or, one and half times of present expenditure. Water tariff of domestic use corresponding to willingness-to-pay is hard to assess, therefore capability to pay is applied in place of willingness-to-pay. Thus, incremental economic benefit in the future is expected as follows, Incremental Economic Benefit ( Domestic use )

			( Rs.100	0/year)
	Yea	ar		
1990	2000	2010	2030	
776.5	2,442.8	11,152.2	15,972.4	

(c) Benefit by non-domestic and government activities

Economic benefit, both direct and indirect, created by water supply for non-domestic and government use is reflected in gross domestic product (GDP). GDP is determined by many variables such as water supply, climate, international relations and government policy, et al.

Therefore sensitivity of GDP caused by water supply is, if any, the appropriate economic benefit. The following is the mathematical background of the description;

 $G = G (W, X_1, X_2, X_3, \dots, X_n)$ thus,  $dG = \sum_{i=1, n} D(G, X_i) dX_i$ 

where, G : GDP ( x Rs. 10<sup>6</sup> )
W : Water supply volume ( x 10<sup>3</sup> m<sup>3</sup>/year )
X<sub>i</sub> : i-th variable of G
dG : differentiation of G
D( G,x ) : Partial differentiation on variable X

Letting dW=0 , we can get  $dG_0$  which is differentiation of G under the condition that W=constant. This differentiation means long-term tendency of growth of GDP independent of water supply. Then the second equation can be written as,

 $dG = (D(G,W)) dW + dG_0$ 

transformed this equation to finite-difference form ( annual difference),

 $\Delta G = (D(G,W)) \Delta W + \Delta G_{A}$ 

Relationship between annual growth of GDP at constant 1982 prices (  $\triangle G$  ) and increase of water supply volume for non-domestic and government use (  $\triangle W$  ) from 1982 to 1986 is shown in Table 4.1. Consequently, the linear function can be acceptable to the relation of these two factors. The slope, intercept and correlation coefficient by means of regression analysis are 0.06015, 262.68 and 0.90 respectively.

Thus, net increase of indirect benefit by unit water supply for non-domestic and government use, that is, unit benefit of these water supply categories, is estimated to be  $60.15 \text{ Rs./m}^3$  at constant 1982 prices . unit benefit at 1989 cost is estimated 88.11 Rs./m<sup>3</sup> by multiplying 1.465, consumer price index of 1989 to 1982.

Incremental economic benefit on these categories in the future is as follows,

Incremental	Economic	Benefit	( Non-	domestic	and	Government)
<u></u>				<u>Rs.1000</u>	year	<u>:</u> )
		Yea	r			
199	0 2	2000	2010	203	30	
9,55	1 30,9	935 2	1.55,602	241,2	245	_

4.1.4 Economic and social viability of the project

(a) Economic internal rate of return (EIRR)

Based on the economic cost and benefit streams shown in Table 4.1.2, EIRR is estimated at 8.7 %, which can be considered as a

4 – б

reasonably high value for a water supply project. Sensitivity is tested in Table 4.1.3 to 4.1.5. The sensitivity test indicates EIRR=8.0 % at 15 % cost up, EIRR=7.9 % at 15 % benefit down, and EIRR=7.2 % at the combination of 15 % cost up and 15 % benefit down. As seen, the economic viability is not so sensitive, implying economic soundness.

(b) Intangible benefit

Implementation of the Project would mitigate the water shortage which has occurred quite frequently in the past and would continue to be so in the future unless the Project is realized. The Project, by regulating the river flow during rainy and dry seasons, would guarantee more stable water supply and thereby bring healthy life of the residents and sound development of the industries, though these benefits are difficult to be quantified. The intangible and indirect benefits, which are of significant value, although not quantifiable, include the followings:

- Supply of clean water contributes to the improvement of public health. Mortality and morbidity caused by water-borne and parasitic diseases will be reduced. This will lead to reduced demand for public health facilities.
- ii) Enhanced supply of clean water contributes to accelerating the local economic growth. Local industries will have easier access to stable water supply at lower cost. This will stimulate manufacturing and commercial activities of Port Louis. Taking into account multiplier effect as well, the Project will significantly contribute to the expansion of the local economy.
- iii) The implementation of the Project will contribute to the local economic growth through providing employment opportunities and procuring materials and equipments during construction as well.

# 4.2 Financial Evaluation

### 4.2.1 General

The financial viability of the Project is evaluated by calculating the financial internal rate of return (FIRR) as well as assessing loan repayability of the Project with regard to the loan assumed to be extended for covering the construction costs of the Project.

### 4.2.2 Construction and O & M Costs

Construction and O & M costs of the Project are estimated based on the market prices of equipments, materials and labor to be purchased for the implementation of the Project. Construction cost is estimated to be Rs. 1,152,100 x  $10^3$  in total, comprising Rs. 758,700 x  $10^3$  foreign currency and Rs. 393,300 x  $10^3$  local currency. Assumptions and conditions applied for estimating construction cost were explained in detail in Section 3.5 "Cost Estimate".

Investment cost used in cash flow analysis is based on the disbursement schedule explained in Section 3.5. O & M cost is also estimated as explained in Section 3.5.

# 4.2.3 Revenue of the Project

Revenue of the Project is calculated based on the projected incremental volume of water supply by category and average water charge by category i.e., domestic, non-domestic/industrial and governmental uses. Water tariff or average water charge is assumed to be revised every three years based on the assumed rate of increase of consumer price index (CPI), 7.2 % per annum.

Revenue of the Project in each year is calculated as follows:

(a) Incremental Volume of Water Supply

Incremental volume of water supply in each year is the same as applied for economic analysis .

(b) Water Tariff

Water tariff is assumed to be revised in accordance with the assumed rate of increase of consumer price index, 7.2 % per annum. Then, the tariff is revised as shown below.

Year	Domestic	Non-Domestic	Gov.
1989	2.91	5,94	5.70
2000	6.70	13.68	13.13
2010	15.44	31.51	30.24
2030	53.96	110.15	105.70

(3) Annual Revenue

Annual revenue in each year is calculated as follows:

Year	Description	Domes-	No-	Gov.	Total
	-	tic Domes		stic	
2000	Incremental Vol. (1000 m <sup>3</sup> /year) Water tariff (Rs/m <sup>3</sup> )	559.0	305.5	45.6	
	Water tariff (Rs/m <sup>3</sup> )	6.70	13.68	13.13	
	Annual revenue (Rs 1000)	3,748	4,180	599	8,527
2010	Incremental Vol. (1000 m <sup>3</sup> /year) Water tariff (Rs/m <sup>3</sup> )	2,552.0	1,570.0	196.0	
	Water tariff (Rs/m <sup>3</sup> )	15.44	31.51	30.24	
	Annual revenue (Rs 1000 )	39,396	49,490	5,936	94,823
2030	Incre. Vol. (1000 m <sup>3</sup> /year) Water tariff (Rs/m <sup>3</sup> )	3,655.0	2,480.0	258.0	
	Water tariff (Rs/m <sup>3</sup> )	•	110.15	105.7	
	Annual revenue (Rs 1000)	197,274	273,247	27,271	497,830
			-		

### 4.2.4 Financial viability of the project

### (a) Financial Internal Rate of Return (FIRR)

Based on the financial cost and revenue streams shown in Table 4.2.1, FIRR is estimated at 6.8 %, which can be considered as a reasonably high value for a water supply project. Sensitivity is tested in Table 4.2.2 to 4.2.4. The sensitivity test indicates FIRR=6.2 % at 15 % cost up, FIRR=6.1 % at 15 % revenue down, and FIRR=5.5 % at the combination of 15 % cost up and 15 % revenue down. As seen, the financial viability is not so sensitive, implying financial soundness.

(b) Loan Repayability

The following conditions are assumed to assess the loan repayability of the Project.

Local portion of the construction cost:

To be funded by the Government or financed by CWA through its own funds (internal reserve, depreciation or others)

Foreign portion of the construction cost:

To be financed by a loan with the following condition:

o Repayment period	30 years
o Grace period	6 years
o Interest rate	2.90 %

Cashflow statement is shown in Table 4.2.5.

As seen in the table, annual net revenue goes into black from the 13th year after the commencement of the Project ,and accumulated surplus go into black in the 24th year after the commencement or the last year of repayment period of 30 years, indicating that the loan is repayable, provided that some form of assistance is to be made by the Government, interest-free loan as an example, until the annual balance turns into black.

To further assess the financial viability of the Project, financing capacity of the Government and CWA for funding the local portion of the construction cost as well as the capacity-to-pay for the foreign loan principal and interest are examined based on the macro indices as follows:

- i) The ratio of average annual disbursement of local construction cost to Government total expenditure in 1986/87 fiscal year is, <u>Rs.393.3 million/year</u> 4 Rs.5,918 million = 1.1 % 6 years
- ii) That to Government Capital expenditure in 1986/87 is, <u>Rs.393.3 million/year</u> + Rs. 1,164 million = 5.6 Z 6 years
- - iv) Ratio of repayment of foreign loan to f.o.b value of exports in 1986 is,

Rs.43.6 million  $\downarrow$  Rs. 9,062 million = 0.5  $\chi$ 

- v) That to Government total expenditure in the 1986/87 is, Rs.43.6 million + Rs.5,918 million = 0.7 %
- vi) That to CWA total expenditure in the 1985/86 is,

Rs.43.6 million + Rs.173.5 million = 25.1 %

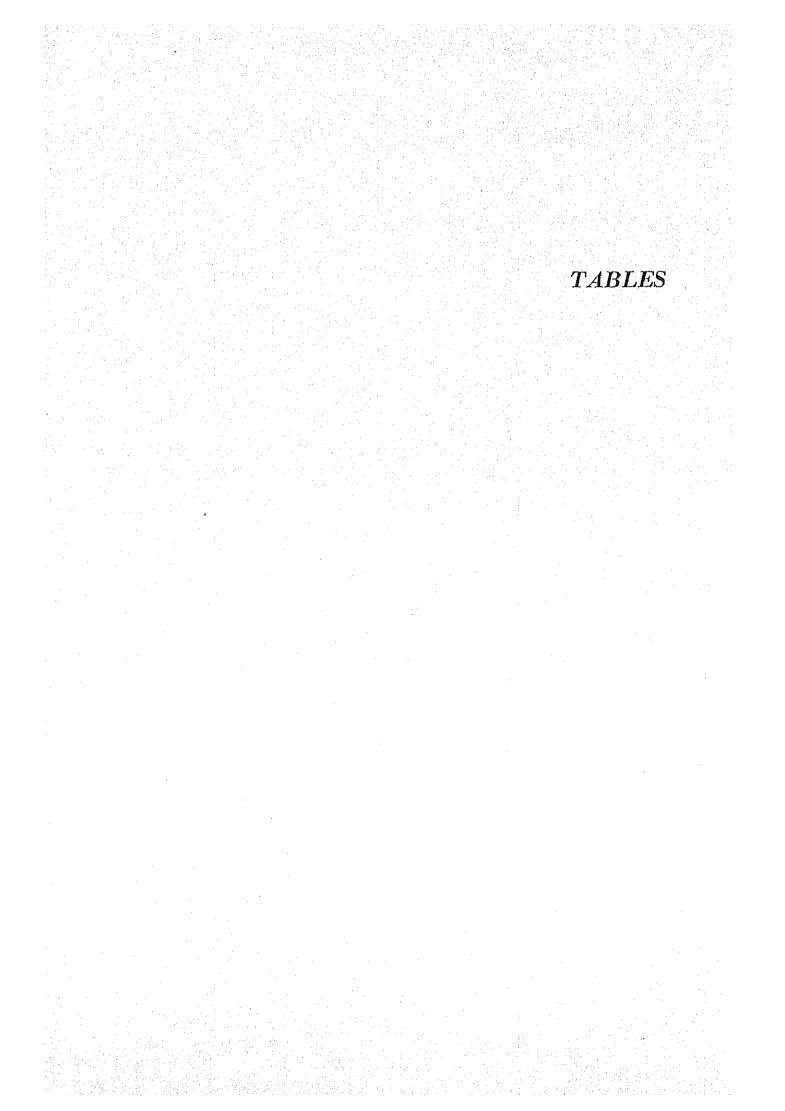

The above ratios are calculated based on the latest figures of the Government and CWA expenditures and exports available at present. These figures are expected to increase in the future, resulting in lowering the above ratios.

The loan repayability is also examined in the severer loan condition for the foreign portion of construction cost as follows:

0	Repayment period	:	20	years	
ο	Grace period	;	6	years	
0	Interest rate	:	7	2 per	annum

The result of examination is given in Table 4.2.6. As seen in the table, the deficit finance will unfavourably continue beyond the repayment period.

As such, it can be said that the loan would reasonably be repayable under a soft loan condition.

	( NON-	DOMESTIC	& GOVERI	MENT SE	CTOR )
Item\ Year	1982	1983	1984	1985	1986

D(W); Annual increase	of W				
	-	<u>-941</u>	<u>550</u>	<u>1320</u>	2068

BENEFIT OF WATER SUPPLY

Result of regression analysis

TABLE 4.1.1

 $D(GDPw) = 0.06015 \times D(W) + D(GDPw)_0$  (corelation coefficient:0.90)

where, D(GDPw)<sub>O</sub>; Annual increase of GDP when W is constant (= 262.68 million Rs.)

Thus, net increase of indirect benefit by unit water supply for nondomestic and government use represented by the following equation;

 $D(GDPw-GDPw_{O})/D(W)$ ,

is estimated to be 0.06015, or,  $60.15 \text{ Rs./m}^3$  at constant 1982 prices. Consumer price index of 1989 to 1982 is  $1.46^{2}$ , therefore benefit of non-domestic and government use at 1989 price is estimated at 88.11 Rs./m<sup>3</sup>.

# 5. ENVIRONMENTAL ASSESSMENT

# 5.1 General

The environmental survey for the Port Louis Water Supply Project had the following objective: to make a detailed study for minimizing possible adverse effects on environmental conditions due to the Project.

Then, the survey and study were carried out in accordance with the following guidelines:

- (a) To review and re-evaluate the previous studies on water supply in Mauritius as well as investigate present situation in Mauritius;
- (b) To conduct literature reviews on environmental aspects resulting from the water resource development in Mauritius and other tropical and subtropical countries relevant to the study;
- (c) To identify any significant effects due to the Port Louis Water Supply Project, utilizing the information obtained;
- (d) To make a detailed study for minimizing possible adverse effects on the environmental conditions.

In accordance with the said guidelines, various data collection and analyses on them have been carried out during the study period. The following summarizes the findings obtained in the field investigation and the results of the study conducted.

# 5.2 Present Status of Water Pollution in Mauritius

### 5.2.1 Present Status

In Mauritius, the urban population has increased and the manufacturing industries have developed in recent years. However, the construction of sewerage facilities is backward here as compared with those of advanced industrial countries. The inadequate treatment of industrial wastes as well as city sewage have caused pollution of public water areas involving the sea, rivers, etc. year after year, giving rise to serious problems. The main problems of water pollution in Mauritius include damage to the river and coastal fisheries by effluent discharged from factories.

Factories in the Project area are widely distributed along the rivers such as Grand River North West, Seche, Perfonde, Terre Rouge and Plaines Wilhelms, particularly Grand River North West and Seche, flowing down to Port Louis area. Effluent discharge into surface waters then poses a health risk to local communities. Industrial wastes may also endanger public health by contaminating irrigated food crops, and by contaminating fishes which are a source of protein.

The flow of effluent may highly be seasonal, particularly from many industries which process agricultural products, and pollution problems will be increased if the peak discharge coincides with the season of low flow in the rivers.

Many different industrial process produce harmful wastes. Food and drink industries tend to discharge heavy organic pollution and oxygen demand to urban streams being used as water sources. A particular problem is dyes discharged from textile factories in Mauritius. With the rapid development of the textile industry, the demand for dye houses has been steadily increasing. During the last four years, the number of dye houses actually operating has increased from six to thirty. Already serious problems of water pollution have taken place along the rivers in which harmful effluents are discharged from dye houses. As mentioned above, in recent years, every industrialized and densely populated area has suffered to some extent from pollution of surface- and ground-water. This is also particularly true in Mauritius.

The pollution can be removed by the self-purification process which takes places in the water. This process has effective limits, however, and when the quantity of effluents introduced exceeds those limits the national economy is impaired.

Some investigations to date have dealt with the effects of ordinary organic pollution derived from domestic effluents and various kinds of ordinary industrial effluents. In this connection, special attention should be paid to the effects of seasonal industries like sugar refinery and of the textile industry including dye houses.

Toxic substances produce effects similar to those from organic pollution. Toxic pollution is caused by the introduction of complex types of effluents such as those discharged from chemical works. It is not only large-scale industry that is responsible for toxic substances affecting the quality of water, but smaller commercial undertakings, which attract less publicity are also often responsible for considerable damage.

It must be noted that the danger resulting from the growth in the number of bacteria per unit volume is also of increasing importance.

5.2.2 Existing Countermeasures by the Government

As pointed out in the paper 1/, Mauritius has experienced rapid expansion of industrial development over the few years and is currently embarking upon a policy of industrial diversification. The Government is fully aware of the associated risk to the environment and the water resources in particular, and intends to introduce countermeasures necessary for environmental protection without inhibiting growth.

In February 1988, the Mauritius Government decided to create a Department of Environment and establish a National Environment Commission after considering a report prepared by the National Environment Committee. A World Bank team also visited Mauritius to carry out a study on the island, issued a report entitled "Economic Development and Environment Management - Strategies for Mauritius". In September 1988, a conference sponsored by the Mauritius Government was held on the Technical Aspects of Environmental Protection:

The responsibility for developing and maintaining water resources lies with the CWA. However, the responsibility for protecting the resources from pollution lies jointly with the Ministry of Health, who should ensure that acceptable water quality is supplied.

5.3 Existing Laws and Regulations on Water Pollution Control

Mauritius has inadequate environmental control legislation, and it is not always clear who has the responsibility, means and authority to enforce it adequately. It might be impossible to lay down standards in advance for all possible pollutants, and the most useful control measure is to empower a single agency such as the national water authority, to decide and enforce the standards to be applied in each case.

According to the information obtained from the Government of Mauritius, at present there is no law to prevent water pollution. Prevention of water pollution has to be undertaken by ministries concerned. Table 5.1 shows a list of respective laws and regulations.

1/: "Managing The Water Cycle" - Water is Life Prepared for the Technical Seminar "Mauritius Environmental Protection Programme" held on 12-15 September 1988.

# 5.4 Specific Problems

### 5.4.1 Forestry and Wildlife

Several types of trees are found in the proposed reservoir area. Several adverse effects would be caused by clearance of forest for reservoir construction. However, this would be localized with minor adverse effects, because the proposed submerged area to be confined with steep gorge is quite small or 30 ha only.

The following is included in species of timbers found in the proposed reservoir areas. Canarium maurtianum, Eugenia glomerata, etc. Mimusops maxima, Cedrela spp., Acacia sp., Gmelina arborea, Dillenia speciosa. Details will be re-investigated in the detailed design stage.

Wildlife in the Project area and its surrounding areas is believed to be quite low in number. Advance impact due to the wildlife loss is relatively negligible.

### 5.4.2 Freshwater Aquaculture

Fishing might not be the main occupation for most villagers in the Project area. Even though fishing is conducted there, they might fish in their spare time and the device used are appropriate for family use.

In Mauritius, its endemic freshwater fauna is very limited. A number of fishes like the gourami (Osphronemua goramy), blackbass (Micropterus sp.), goldfish (Carassius auratus), blue gill (Lepomis macrochirus) were thus introduced and together with locally available species like the freshwater mullet (Agnostomus telfairi), carp (Dules rupestris) and the camaron (Macrobrachiumlar) were cultured by individual hobbyists.

Attempts at aquaculture in Mauritius stated only with the introduction of various species of tilapia (Sarotherodon spp. and

Tilapia spp.) during 1953-57. Experiments were conducted at the Curepipe Experimental Station. The production is about 500 kg/ha with supplemental feeding and fertilization. Tilapias have a prolific breeding habit which results in population explosions and stunted growth. Small sizes attained by these fishes have thus limited their market value.

As mentioned above, freshwater aquaculture has witnessed steady development with the introduction of a giant freshwater prawn (Macrobrachium rosenbergii) in 1972 and six species of Indian and Chinese carps in 1975 and 1976 respectively. There are now about 45 hectares of prawn and fish culture ponds in Mauritius. A commercial hatchery produces camaron postlarvae for stocking in this farm and other ponds on sugar estates.

Since 1984, carp fingerings have been produced in sufficient numbers to stock all aquaculture ponds and a number of water reservoirs with a view to making optimum use of water resources.

# 5.4.3 Water Quality of Reservoirs and Lakes

Water quality of reservoirs and lakes will deteriorate in the first few years of impoundment owing to the degradation of organic matters and others. The high nitrate content indicates probable contamination by human or animal wastes and precautions must be exercised because reservoirs and lakes have to serve for domestic water supply. After five years of impoundment, the phosphate content in the reservoirs and lakes can become comparatively high. This high level of nutrients may exceed assimilation capability, and so-called eutrophication will take place. Close monitoring of their concentration may be required to avoid instability.

Countermeasures to eutrophication of reservoirs and lakes are largely divided into three, namely a) Sewerage construction; b) Aeration and circulation of reservoirs and lakes; and c) Weed control. Natural loadings of P and N are generally high in the tropical zone. Sewerage construction is a direct countermeasure to prevent or restore reservoirs' eutrophication. However, conventional sewage treatment processes cannot remove N and P efficiently.

In comparison with the sewerage construction, algae control and deep water oxygenation are essential for restoration of an eutrophication reservoir. Artificial circulation of impounded water by aeration can achieve both purposes above. Algae contained in the surface water are in turn carried down to deep and dark layers where conditions are not favourable for algae to survive. The odor produced by algae and  $H_2S$  will entirely disappear.

### 5.4.4 Recreation

Recreation activities associated with the Port Louis Project would be confined primarily to the reservoir areas. No specific project facilities will be constructed for recreation purposes. The relative isolation of the reservoirs detracts from their usefulness for recreation. Recreational visitors to the reservoir areas are therefore expected to be limited primarily to people living in the surrounding areas. As local living standards rise and the people have more leisure time for recreation, the use of the Project resources for recreational purposes would increase somewhat. Even with this increase, monetary benefits from recreational activities attributable to the Project are not expected to be significant. The reservoirs would provide intangible benefits as an inexpensive source of recreational for local people.

### 5.4.5 Resettlement

At some of the proposed reservoirs, in the case of the Baptiste area, various facilities would have to be cleared out. Those would include about 20 families and extensive sugarcane fields. The clearance, together with moving cost, temporary living allowance, facilities and administrative costs, etc. must be studied in the detailed design stage.
