CHAPTER 6 POST-HARVEST AND MARKETING SYSTEM

In the jurisdictions of RID Regional Offices No. 1, 2, 3, 7, 8, 9 and 10, there exist about 3,500 rice mills of various sizes with total capacity of 95,000 tons of paddy/day and 540 paddy/rice warehouses with capacity of 76,000 tons (See Tables 6-1 and 6-2). In Changwat Ayutthya, there exist 55 large rice mills (daily capacity of over 20 tons) with total capacity of 42,720 tons, which occupy nearly a half of the aggregated capacity in the said jurisdictions. This is because the Changwat is located in the central part of the Chao Phraya Delta and Chao Phraya River flows therethrough to play an important role for inland water transportation.

The paddy/rice marketing in Thailand is basically carried out by private sector as shown in Figure 6-1. After reserving their harvested paddy for both home consumption and seeds for next cropping, farmers put the residual on the marketing channel. The local merchants are used to grade farmers' paddy through sample testing on moisture content, size and colour of paddy at procurement stage. After the said grading activity, the procured paddy is transported to rice mills through local merchants, Changwat traders and brokers, and then shipment to consumers and exporters is carried out in the shape of milled rice.

As one of the functions, the agricultural cooperatives are engaged in collecting and selling of the farm products. Since, however, the membership ratio of the agricultural cooperative is as low as 17 percent only throughout the Country, the number of the member farmers for one cooperative is about 800 farmers on an average, and consequently the cooperative can handle only a little amount of farm products for sales. As a matter of fact, the cooperatives can not stand against the merchants in handling volume and prices of the farm products due to less financial power than that of the merchants.

Under the circumstances, the Central Government has intervened into their marketing transaction through Marketing Organization for Farmers (MOF) and Public Warehouse Organization (PWO) (Refer to Table 6.8-1 of Appendix 6.8). MOF was established to eliminate various disadvantages of farmers in marketing for agricultural inputs and products, and in particular, aims at smoothening the marketing transaction of the farm products in specific areas together with providing agricultural inputs with the farmers of the said areas as major activities. The procurement volume, however, is not so large due to financial capacity of MOF.

PWO is an organ under Ministry of Commerce, to make milled rice procurement, public warehouses operation, consumers' goods sales, etc. PWO, due to small financial capacity as well, is not in a position to function well enough in its business transactions.

Since 1984, the rice export from Thailand has tended to be decreased gradually under the adverse effects of the international rice market tread, although had an increasing or steady tendency up to that time.

	Total Paddy Production (1)	Export (2)	$\frac{2/(1) \times 100}{(2)}$
1981	17,368	3,032	17
1982	17,774	3,784	21
1983	16,879	3,476	21
1984	19,549	4,615	23
1985	19,905	4,062	20

Furthermore, the international market conditions give the paddy price at the farm gate in Thailand and has caused the farm gate price to drop since 1986.

According to the information surveyed by Office of Agricultural Economics, Ministry of Agriculture and Cooperatives, about 80% of paddy marketing was handled by local rice millers and traders, while public agencies such as Public Warehouse Organization (PWO) and Marketing Organization for Farmer (MOF) occupied only 7% and 13%, respectively. Regarding marketing of milled rice, rice brokers in Bangkok handled nearly 90% of that, and the said public agencies did 7% and 4%, respectively. While 76% of marketed milled rice was for domestic markets and the rest for export, in 1983 (Refer to Figure 6-1).

In these days, the world market price of rice had stagnated, causing deterioration in Thai financial conditions, by which the said two public agencies could not fully function. And the tendency has been unchanged and continued until the present. During the period, Thai government had intervened in the paddy/rice marketing by introducing the supporting farm price policy for paddy and the premium policy for rice export, however the both policies were abolished and free marketing system is presently prevailing.

Since the sector of post harvest and marketing for an agricultural product is considered significant, which bridges agricultural production side with farmers' income, the market information system is considered an important mechanism for fully and systematically integrating production and marketing in line with the guidelines laid down in the "Programme Development of the Production System, Marketing and Employment" of the 6th NESDP.

Agricultural Market System, September, 1984

7.1 Relations with Farmers' Organization (See Figure 7-1)

There are two organizations for water management as Water Users' Group (WUG) and People's Irrigation (P.I.), both of which have been making even water distribution and proper operation and maintenance of irrigation facilities. P.I., which has long history in its services, has been well operated as reputed organization in the rural community, whereas WUG operation is not so favourable and active as P.I. with small numbers of its unit organization due to many resolutions several years after establishment of the unit organizations.

7.1.1 Water Users Group (WUG)

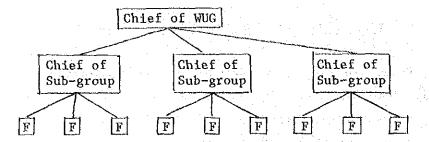

One unit of WUG, composed of about 20 - 30 farm households, can cover about 1,000 rai (about 160 ha), but their activities are not so active due to negligence of necessity for cooperative works and irrigation services for successful farming, in spite that WUGs are organized in the Chao Phraya River Basin where the irrigation systems are well developed.

The present conditions of the organization is shown as follows.

explicated to the second	No. of Units	No. of Members
Region 1	65	1,961
2	77	
3	713	26,444
7	904	18,661
8	388	909
10	1,242	53,981
Total	3,447	102,353
raki (<mark>kuloba</mark> eko		

Figures 7-2 through 7-4 show a typical pattern of water distribution system at on-farm level.

Commonly, one unit of WUG consists of two or three sub-groups, and the one unit WUG has one chief of the Group and each sub-group has its own chief and its members. This is the general formation of the Water Users Group.

As a rule, the diversion works on the lateral canals shall be operated by zoneman and those on the farm ditches by chief of each sub-group. The grass cutting works along the canals and ditches shall be made by group members twice per year. The dredging of the canals, if required by groups, will be conducted by RID by the charge on the groups for rental cost of the dredgers, etc., and such costs shall be borne by the members in proportion to the acreages of their owned land and collected by chief of the sub-group.

Repair works of the facilities like diversion works will be made by RID with RID's machines and procured materials.

7.1.2 People's Irrigation (P.I.) (See Figure 7-5)

The People's Irrigation (P.I.) in the Chiang Mai basin has been the traditionally prestigeous water utilization organization with a long history of about 160 years in serving on the diversion weir basis.

P.I. has about 2,000 units and one unit covers about 3,000 to 5,000 rai of the irrigation areas. And the organization is further divided into sub-groups covering 500 to 1,000 rai by one group. One sub-group has its own chief to control diversion works. As a general rule, the members of the sub-groups shall present paddy to the chief by 7 to 20 kg per rai as remuneration for operation of facilities when they can enjoy the bumper of harvest of paddy.

The operation and maintenance of the water distribution facilities like weirs, canals, etc. are practised habitually by members themselves, and there are some rules imposed on the repair works for the facilities.

Actually, however, the water utilization organizations for the large-scale irrigation projects in the Chao Phraya River Basin have not been well operated, while the People's Irrigation organization have been successfully managed. And this is considered to come from the fact that the P.I. organization has been operated along with the habitual or traditional rule of the local community to keep the good social order.

7.2 Composition and Enhancement of the Organization

The water management/control organizations are primarily established to make the irrigation water distributed as evenly and fairly as possible and to render proper operation and maintenance (0 & M) services of the irrigation facilities. According to the purposes as above, the water users' organizations have been established within the irrigated areas of the Chao Phraya River Basin. At present, however, the water users' organizations established in the middle - and lower reaches of the River have not been so well functioning as expected, although those named as people's Irrigation traditionally in the Chiang Mai Area have been well operated.

Unless the water control/management are made properly and effectively, farm production increase will not be expected and farmers will raise their complaints for the matter. Especially, in the dry season when the water available for irrigation is limited in its amount, the most adequate water intake control must be practised not only by those organizations themselves as each in the upper, middle and lower basins, but also individual members of each organization by stringently observing the rules imposed.

Such farmers' organizations have faced a variety of problems and troubles to solve, among which 1) to accelerate organizing mon-member farmers as many as possible, ii) to strengthen the existing organizations are two major issues in summing-up. And followings are considered as necessary counter-measures to be taken for the above matters.

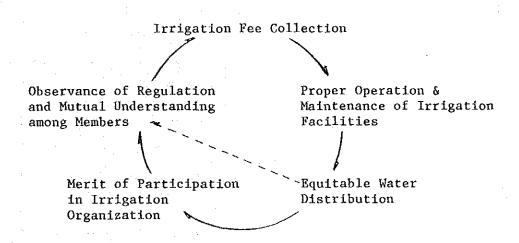

- To deploy the experts/specialist staffs to bring up the water users' organizations in the RID local offices, Project offices,
- To render development services by the above staffs in keeping close and daily contact with village chiefs, and farmers,
- To provide with the RID local offices the service cars with equipment and materials loaded to give education to the farmers on organization/operation of the farmers organization in roving villages,
- To give repeating training to farmers to enhance the existing organizations through stringently observing the rules, mutual understanding, effective and efficient management of the organization, higher leadership, etc.
- To hold farmers' meetings regularly under the guidance of RID staffs in presence so as to grasp and solve the problems which the farmers will take up.
- To give thorough education to the zonemen on paddy cropping and the relations between crops husbandry and irrigation water management so as to make terminal water control successful in meeting the crops requirements of water at their respective growing stages.

The Chiang Mai District well-known the successfully operated traditional People's Irrigation as water users' organization, is not so blessed with physical conditions due to irrigation water shortage in the dry season. The People's Irrigations in Chiang Mai, although long exposed to the unfavourable conditions as above, have been most successfully operated with the background that the local farmers concerned have engaged themselves directly and positively in the operation and management in thinking traditionally both water and the facilities to be common properties of their own and have had a strong conscious for their organization as cooperative community with tight human bonds among members. It takes, however, a long spell of historical time to bring up the aforesaid well-functioning farmers' organizations.

Therefore, the water users' organizations in the vast plain areas of the middle/lower reaches of the Basin are considered essential to be brought up with a series of countermeasures to be taken as above.

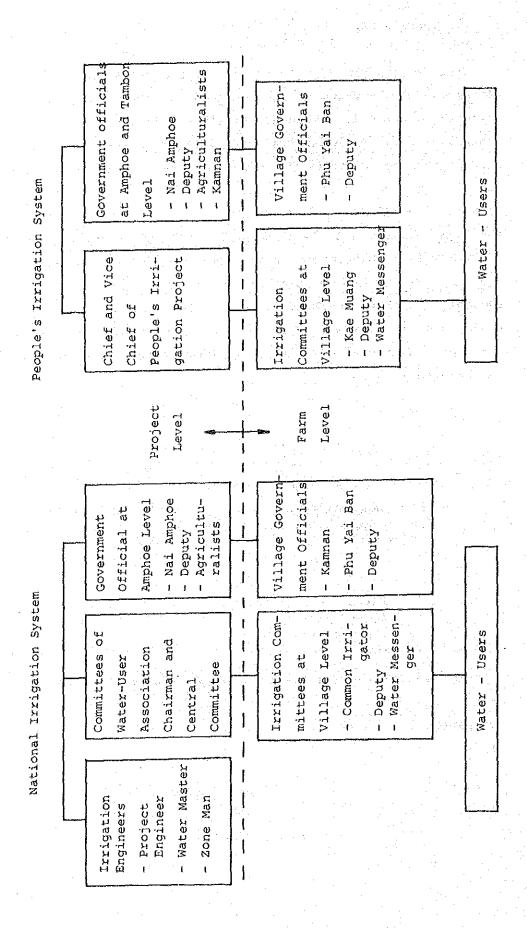

7.3 Irrigation Fee Collection

For successful management of irrigation organization, the irrigation fee revenue which is used for management, has to be collected thoroughly. When irrigation facilities are operationed and managed properly by using collected irrigation fee as a running fund, equitable water distribution which is the fundamental purpose of establishing the irrigation organizations will be realized. They will understand merits of participation in the organized activities, and the organizations will be managed in good condition. The irrigation fee collection, however, is a mean for managing the organizations, and even if the irrigation fee is collected totally from members, equitable irrigation distribution would not be realized with negligence of regulation by members and mutual understanding. Therefore, a kind of circulation system for close communication should be composed as follows.

To realize the circulation system, education and training for members are indispensable in order to instill about necessity for irrigation fee collection and the members shall have thorough knowledge of it.

CHAPTER 8 INSTITUTIONAL SUPPORTING SERVICES

8.1 Agricultural Extension Office

Agricultural extension services in Thailand are mainly rendered by Department of Agricultural Extension which has 10 Divisions, six Regional Extension Offices, 73 Provincial Extension Offices, and 720 District Extension Offices as a terminal extension unit. (Refer to Figure 8-1).

In the Study Area, there are two Regional Extension Offices in Chiang Mai and Chainat, and Provincial Extension Offices are located at each Changwat. And 3,274 extension staffs are deployed in Northern and Central Plain Regions, covering 486 farm households per staff.

Other than the Department of Agricultural Extension, the Department of Livestock Development, Department of Fishery, Department of Land Development, and Department of Cooperative Promotion have also carried out extension activities for farmers in the respective fields.

8.2 Certified Seeds Production

The Department of Agricultural Extension is responsible to produce certified seeds and distribute them. There are 20 seed centers working throughout the Country as of May, 1986, which can produce 30,000 to 40,000 tons of seeds (1,500 - 2,000 tons/center) accounting for 20 to 30 percent of the total seed requirement. As shown in Figure 8-2, there are nine seed centers in the Study Area.

The seed production is made under the system the that the farmers contracted with the seed centers shall plant paddy in using the original seeds and the seed centers purchase produced seeds from farmers. The seed centers are equipped with facilities for drying, sorting, storing, and inspection of the seeds.

8.3 Marketing Organization for Farmers (MOF)

MOF is in charge of purchasing paddy, maize, etc. from farmers in designated areas in which farm-gate price ares lower, and supplying agricultural and daily materials for farmers' organizations and farmers. The following table shows the amount of fertilizers supplied through MOF and indicates that the amount is very small to the national total (Refer to Table 6.8-1 of Appendix 6.8).

Amount of Fertilizers Supplied through MOF

(Unit: tons)

						Fertilizers	
	North- eastern	North	Central	South	Total(1)	Used in Thailand(2)	(1)/(2)x100
1981	40,295	11,849	126,144	10,060	188,348	894,542	21%
1982	19,535	9,822	96,148	8,144	133,649	1,042,503	13
1983	19,774	8,337	73,417	6,743	108,271	1,272,041	9
1984	60,484	14,781	54,207	12,032	141,504	1,246,688	11
1985	81,972	27,243	90,259	22,224	221,698	1,150,000	19

8.4 Agricultural Credit

Banking agencies for farmers are the Bank for Agriculture and Agricultural Cooperatives (BAAC) and commercial banks. BAAC finances farmers, agricultural cooperatives, and agricultural groups as main clients. There are three kinds of credits such as short-term, middle-term and long-term, and the actual financing amount is highest in short-term credit (Refer to Table 6.8-1 of Appendix 6.8).

Following four credits are prepared for the agricultural cooperatives.

- Finance for the members loan
- Finance for purchasing agricultural materials
- Finance for purchasing agricultural products from members
- Finance for the fund for long-termed investments

The Financing items for the Agricultural Groups are similar to those for the Agricultural Cooperative; however, financing for purchase of agricultural products is not provided.

8.5 Agricultural Research Institutes

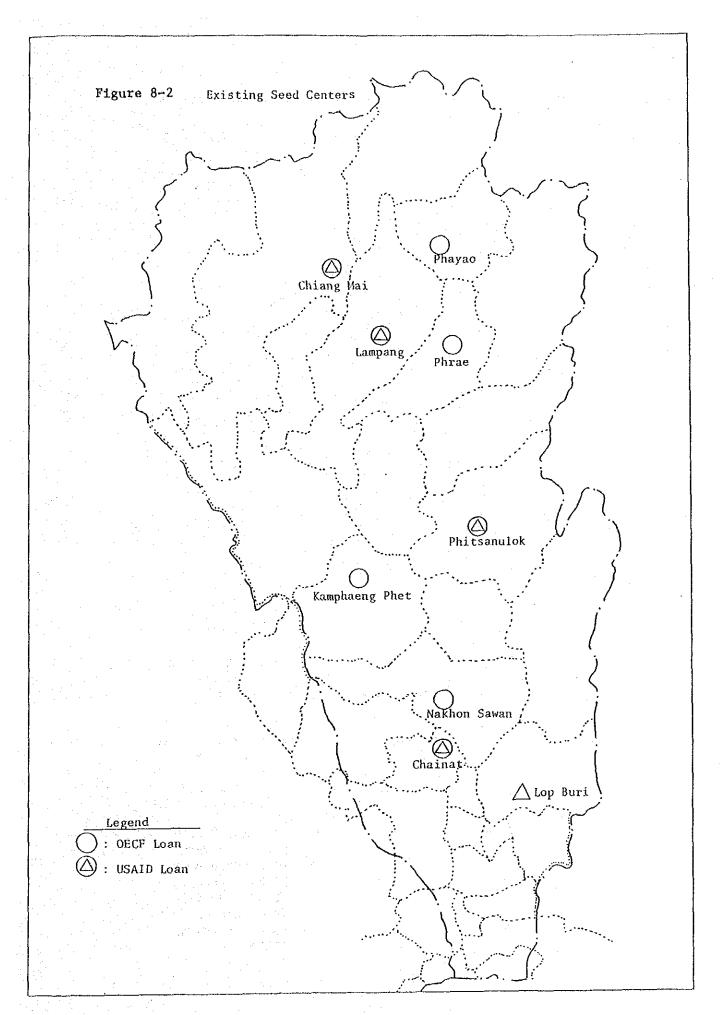

Experiments and researches on agriculture are carried out by each department under the Ministry of Agriculture and Cooperatives; in details, experiments on crops by Department of Agriculture, livestock and forage crops by Department of Livestock, irrigation and drainage by RID, and land improvement by Department of Land Development, respectively.

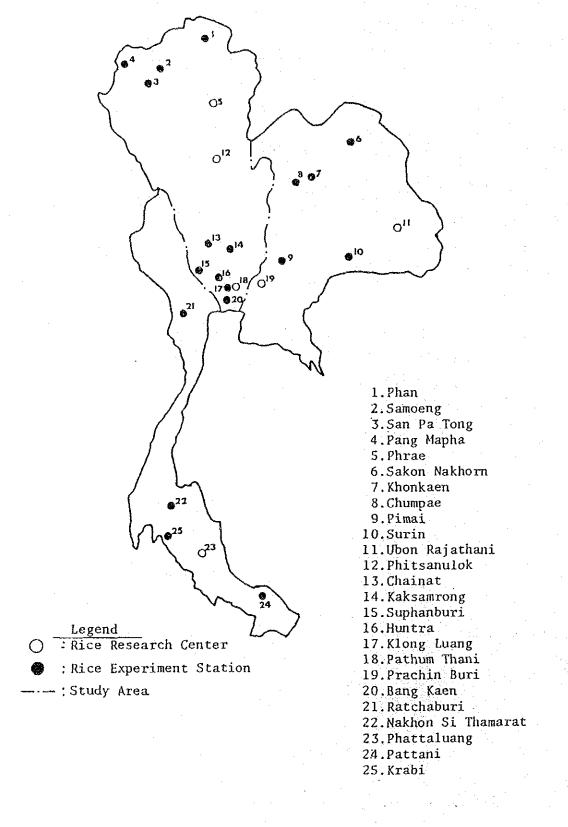

The central experimental station belonging to the Department of Agriculture is located at Bang Kaen neighbouring to Bangkok, and branch stations are deployed throughout the Country in order to research paddy, field crops, horticulture, sericulture and rubber cultivation. As for paddy farming, there are 25 experimental stations as of 1986, out of which 13 stations are located in the Study Area to research paddy farming in various land and soil conditions (See Figure 8-3). The Training Division of the Rice Research Institute is in charge of transfer of technology available by experiments and trial farming of the technicians of the Department of Agriculture and Department of Agricultural Extension (See Figure 8-4).

In addition, there are four Regional Agricultural Development Centers in Thailand, two of which are located at Chiang Mai and Chainat in the Study Area, researching agricultural problems facing with farmers on technical and economic points.

9.1 Background

Due to stagnation in world market price of primary agricultural commodities, especially rice, not only profitability of paddy cropping at farmers' level has been deteriorated, but also Thai export earnings by the primary agricultural commodities has been decreased, resulted in wider deficit in her foreign trade. Taking the prevailing conditions in the world market, especially rice, sugar and tapioca (cassava) into consideration, it can be said that Thai agriculture is now facing its turning point.

On the other hand, dry season paddy cropping acreage has been increasing in parallel with promotion of constructing irrigation facilities in the Chao Phraya river basin, by which available water resources in the basin has become quite tight and marginal under the existing condition. In this context, concept of "Annual Planned Cropping system" is examined and identified from viewpoint of the water management system to be improved. The proposed cropping system is to effectively allocate the limited water resources for both wet and dry season cropping through appropriate reservoir operation in the Bhumipol and the Sirikit dams. In addition to this, higher profitability could be expected by introducing various marketing information into the said reservoir operation.

Although the diversified crop cultivation requires more sophisticated farming practices including irrigation method and water management system, systematic approaches to these subjects has not been initiated yet by anybody else. Only on the individual basis, some advanced farmers or enterpreneur started to change their cropping pattern based on the traditional paddy cropping to diversified one, most of farmer, however, still rely on the traditional paddy cropping. Since the crop diversification is one of biggest subjects attached to the Thai agricultural policy, due consideration should be placed on promotion of the subject.

In order to promote the crop diversification, it is quite essential to secure both domestic and international market for respective diversified crops, however present market information system may, generally, not well function to integrate production and marketing. Primary information sources are limited, and the information is for the specific and diverse purposes of each agency. Consequently, there is no uniformity in the type, standard or data-collection period of the information. As a result, the existing information cannot be used as an effective mechanism for integrating production and marketing plans.

9.2 Basic Requirement

9.2.1 Flow/Stock Management of Crop and Water

For crop cultivation, water resources whether it is controlled or uncontrolled, is one of key elements. Since the wet season cropping is mostly depending on the rainfall pattern, resulted in wide fluctuation of crop production, adjustment could be made in dry season cropping in which an irrigation water is fully controlled. By using rainfall and/or irrigation water, a crop is cultivated and the harvested crop is either marketed or stored in accordance with the market condition.

Since market prices for crops are depending upon the relation between supply and demand, and crop production has seasonality, it is one of key factors to manage flow/stock of crop for the sake of getting higher return. Figure 9-1 shows an image of flow/stock of crop, and if it happens that an overproduction can not be stored in an existing storage facilities, it should be considered to newly construct additional storage facility or to market it out. Usually oversupply causes price decrease.

On the other hand, water is also storable as far as proper facilities are provided. In the Chao Phraya river basin, there are two big storage dams, Bhumipol and Sirikit, so that it should be fully analysed which is more economical to store in shape of either crop or water. In other words, when an oversupply or a weak demand for specific crop is forecasted, production control shall be carried out by

controlling irrigation water supply. In case of storing water in the two dams, only loss of evaporation should be counted, and it is not necessary to invest additional amount for water storage (Refer to Figure 9-2).

9.2.2 Upland Irrigation Technology

The upland irrigation is classified with many irrigation methods as shown in Table 9-1, and efficiency of irrigation water application differs according to physical conditions. Most of all farmers are not familiar with the upland irrigation, it is, therefore, indispensable to research and experiment suitable method with proper crop selection, and then to extend the technology to farmers.

9.3 Objectives

By introducing diversified crops which demand less irrigation water as well as provide more cash income to farmers than paddy, it is planned to increase overall cropping intensity during dry season, resulted in promising more efficient utilization of seasonal under/unemployment, and more employment opportunity through expansion of agribusiness and agro-industry especially in rural areas.

By selecting promising crops both for import substitution such as oilseed crops, and export oriented such as fruits, flowers, fishery products, etc., it is expected to improve the prevailing trade deficit.

9.4 Function

To realize the said primary objective of the crop diversification, the proposed <u>Crop Diversification Promotion Center</u> (Refer to Figure 9-3) will have the following functions;

Diversified Crop Cultivation

- To select suitable crop/plant/fish
- To research and experiment proper irrigation method

- To provide appropriate education and training to farmers

Marketing Information

- To collect and monitor necessary information on marketing
- To arrange and compile the collected data and information
- To analyse and forecast demand for diversified crops
- To provide information services to various target groups

Planning

- To prepare proper zoning for targeted areas
- To coordinate the entire function of the center
- To prepare political directives/recommendations to targeted agencies

9.5 Preliminary Estimate of Cost and Benefit

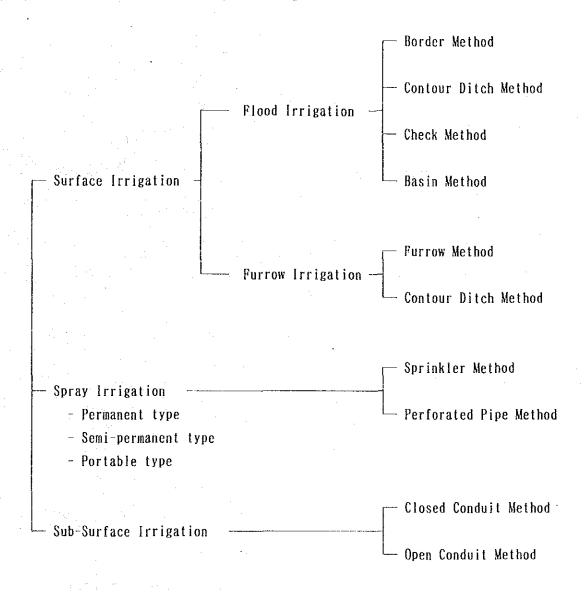

The required cost for establishment of the proposed crop diversification promotion center is composed of a study/design, facilities including building, equipments and supervision for construction. The total cost is roughly estimated at about 580 million bahts including 27 million bahts for the study/design component. Out of 580 million bahts, 520 million bahts is foreign currency portion (Details of the cost estimation is compiled in Appendix 6.9).

Through implementation and operation of the center, the following utility or benefit will be directly/indirectly expected;

- To create new job to moderately and highly educated people with incentives;
- To raise efficiency in land and water utilization;
- To contribute to improve the deficit in trade balance;
- To stabilize farmgate prices of agricultural products;
- To prevent overproduction; and
- To strengthen competitiveness in the world market.

Table 6.2-1

Mapping Unit			
Number	General Description of Soils	Recommended Land Use	Major management required
	AREAS WITH SOILS SUITED FOR UPLAND (CROPS IN LOW RAINFALL ZONE	
L Q H O X	Deep nearly level to gently slop- ing moderately well to well drained, medium to fine textured soils with moderate fertility.	Permanent agricultural land: very suitable for a variety of upland crops, vegetables and fruit trees: suggested crops are maize, sorghum, cotton, tobacco, beans, nuts, sugar cane and castor bean.	Need ordinary management practices to maintain soild fertility and structure: irrigation is required for continuous cultivation of various upland, crops.
2 2 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4	Deep gently sloping, moderately well to well drained, fine textured soil with moderate to high fertility and consisting mainly of montmorillonite clay.	Permanent agricultural and generally suitable for upland crops nad fruit trees but choice of crops may be limited due to unfavorable surface texture (very sticky clay); suggested crops are corn, cotton, sorghum and beans.	Need proper cultivation and suitable fertilizer application of trace element may be required for some crops such as beans.
ကို က်မေး	Deep gently sloping to strongly, sloping well to moderately well drained, fine textured soils with low or moderately low fertility.	Permanent agricultural land; suitable for large varietly of upland crops and fruit trees; suggested crops are corn, sorghum, cotton, castor bean, sugar cane and beans.	Require proper fertilizer application and conservation practices such as contour tillage planting and terracing; (drought may occur during period of little rainfall in the rainfed area).
ძ	Deep, gently sloping to strongly sloping, well to moderately well drained, medium to coarse textured soils with low fertility.	Permanent agricutlural land; generally suitable for upland crops and fruit trees but choice of crops may be limited suggested crops are kenaf beans, nuts, cassava, water melon, sugar cane and pine apple.	In addition to proper fertilization and good management measures to maintain soil fertility and structure, one or more special conservation practices such as contour tillage planting and terracing are required; (drought commonly occurs during periods of little rainfall in growing season of rainfed area).

			No.2
Mapping Unit Number	General Description of Soils	Recommended Land Use	Major management required
'	Shallow to moderately deep, gently sloping to moderately sloping, well to moderately well drained fine or medium textured soils with moderate fertility and high organic matter content in the surface.	Sultable for growing cultivated crops but choice of crops may be limited; suggested crops are maize, sorghum, cotton and beans.	Need ordinary management including fertilizer application to maintain soil fertility and structure; proper conservation practices are required on moderately sloping soils.
	AREAS WITH SOILS SUITED FOR PADDY (V	(WET LAND) RICE	:
v	Deep, level, poorly drained, clayey soils with moderate to high fertility.	Best suited for wet land rice in the rainy season; with irrigation multiple crops of rice, vegetables or other upland crops can be grown.	Ordinary fertilizer application and irrigation to maintain productivity, irrigation suitable variety of rice.
7	Deep, level, poorly drained clayey low to moderately to low fertility.	Well suited for wet-land rice in the rainy season with irrigation multiple crops of rice vegetables or other upland crops can be grown.	Proper fertilizer application irrigation and improved variety of rice.
∞	Shallow to moderately deep, level, poorly drained, gravelly soils that include areas with lateritic outcrops.	Can be used for growing wet-land rice in the rainy season under suitable management.	Require intensive work and high investment to cultivated land; proper fertilizer application is necessary.
6	Deep level poorly drained, extremely acid clayey soils.	Wet-land rice under proper manage- ment is suggested.	Proper fertilizer application especially N and P with lime, irrigation, improved variety of rice.

Mapping Unit Number	General Description of Soils	Recommended Land Use	Major management required
10	Deep, level to nearly level, poorly drained, medium textured or loamy soils with low to moderate fertility.	ly Well suited for wet land rice in the rainy season; with irrigation multiple crops of rice, vegetables or other upland crops can be grown.	Suitable fertilizer application; irrigation improved variety of rice (drought may occur during period of little rainfall in the rainfed area).
11.	Deep, level to nearly level, poorly drained, medium textured or loamy soils of high salt content.	Generally suited for wet-land rice in the rainy season but may be risky due to high concentration of salt in soil during period of insufficient water supply.	Adequate irrigation system to supply enough water in the growing season; proper fertilizer application.
	AREAS WITH SOILS SUITED FOR TREE CROPS	DPS IN HIGH RAINFALL ZONE	
13	Deep to moderately deep gently sloping, moderately well to well drained soils with low fertility and of humid zone.	Well suited for many kinds of fruit trees, beverage crops, industrial oil crops and rubber.	Proper fertilizer application; use of erosion control practices such as cover crops, terracing contour cropping, etc.
	AREAS WITH SOILS GENERALLY UNSUITED	FOR CULTIVATED CROPS	
14	Shallow to very shallow, moderately sloping to steep, well to moderately ately well drained gravelly soils including areas with laterite or bedrock near the surface.	Shallow to very shallow, moderately caperally not suited for cultivated sloping to steep, well to moderately well drained gravelly soils and woodland. Shallow to very shallow, moderately crops with ordinary management practices; best suited for pasture and woodland.	Special conservation practices are required on slopping soils; fertilizer application and proper cultivation practices are required.

No.4 Major management required	nd Proper fertilizer application, well and. prepared growing pit; use of erosion control practices such as cover crops, terracing, contour cropping etc.	crops, Extensive improvement if being did converted into cultivated land.	ps Proper fertilizer application; water irrigation or water conservation. on and ced;	Not suited for any commercial crops, Not recommended to convert into suited for woodland or establishment cultivated land because it required of watershed protective vegetation. Very high input which will impact the environment.
Recommended Land Use	Generally suited for rubber and pasture best suited for woodland.	Not suited for any commercial crops, better maintained for woodland (mangrove) production or construction of shrimp and fish ponds in local areas.	Not suited for cultivated crops except for pasture; but where water supply is adequate, water melon and other vegetables can be produced; on beach area coconut is well adapted.	Not suited for any commercial crops, suited for woodland or establishment of watershed protective vegetation.
General Description of Soils	Shallow, gently sloping to steep, moderately well to well drained; gravelly soils of the numid zone including areas with bedrock, laterite or stone near the surface.	Muddy soils on tidal flat prolonged deep flooding, regular flooding by sea water.	Deep, gently sloping, excessively drained sandy soils on beach or sandy terrace.	Shallow to deep, well to excessively drained, rolling to very steep soils of the hills and mountains.

Table 6.8-1 GENERAL CONDITION OF INSTITUTIONAL SUPPORTING SERVICES

I. Bank for Agriculture and Agricultural Cooperatives (BAAC)

- 1. Establishment: November 1st, 1966
- 2. Jurisdiction: Ministry of Finance
- 3. Fund (as of 31st March, 1986)

1) Deposit from Commercial Banks	\$10,685 million
2) General Deposit	5,548
3) Loan	6,369
4) Own Capital	2,624
5) Bill (BOT)	3,500
6) Others	689
Total	\$29,415 million

4. Lending (Contracted Amount in 1986)

1)	Individual Farmer	\$15,499 million
2)	Agricultural Cooperatives	3,480
3)	Farmers' Group	25
	Total	\$19,004 million

5. No. of Staff: 6,373

II. Public Warehouse Organization (PWO)

- 1. Establishment: 1955
- 2. Jurisdiction: Ministry of Commerce

3. Main Job:

- 1) Purchasing milled rice from millers, and selling it to domestic market as well as exporter
- 2) Selling consumer commodities at low price
- 3) Warehousing to private dealers
- 4. Total Capacity of Warehouse: 170,000 tons
- 5. No. of Staff: 452
- 6. Fund: Government (100%)
- 7. Others: Receiving JICA Technical Assistance of "Feasibility Study on The Comprehensive Storage Facilities Development Project"
- III. Marketing Organization for Farmer (MOF)
- 1. Establishment: October 5th, 1974
- 2. Jurisdiction: Ministry of Agriculture and Cooperatives
- 3. Main Job:
 - 1) Purchasing agricultural products such as paddy, maize, etc
 - 2) Selling input materials such as fertilizers, etc
 - 3) Selling foods to perishable market or supermarket
- 4. Organization: Branch office in changwat level, Farmers group (150 farmers/group) of which member is 600,000
- 5. Fund: Government (100%)
