Table VII-17
Sheet 1

Unit Water Charge by Crop

Crops	Unit Wat Consumpt (m ³ /ha)	Crop Area (ha)	Water Consumption (m ³ /Year)	O/M Cost (TL/ha)	Repayment Cost (TL/ha)
Wheat	2,295	11,063	25,391,798	18,950	154,299
Balrey	1,831	2,257	4,132,341	15,117	123,086
Sugar beet	3,677	7,512	40,166,664	30,356	247,174
Potato	5,347	1,678	6,011,603	44,147	359,463
Dry bean	6,008	10,429	38,344,304	49,604	403,900
Sunflower	3,011	2,119	6,381,157	24,863	202,447
Alfalfa	3,110	2,973	17,861,784	25,678	209,083
Vegetable	3,583	1,238	3,850,304	29,579	240,847
Fruit	4,003	2,642	10,575,398	33,049	269,096
Vineyard	3,603	880	3,170,552	29,747	242,212
Poplar	4,003	1,239	4,959,469	33,049	269,096
Total		44,030	160,845,374		

1. O/M Cost

Operation and Maintenance Cost	1,126,000,000	TL/Year
Replacement Cost (5,061,000,000 / 25 year)	202,000,000	TL/Year
Total	1,328,000,000	TL/Year

Per m³ 1,328,000,000 / 160,845,374 = 8,256 TL/m³/Year
 Per ha 1,328,000,000 / 44,030 = 30,161 TL/m³/Year

2. Repayment Cost

Per m ³	10,813,100,000 / 160,845,374 = 67,227 TL/m ³ /Year
Per ha	10,813,100,000 / 44,030 = 245,585 TL/m ³ /Year

Appendix IX

Design of Sprinkler Irrigation Systems for the Selected Area

IX-1 Selection of Sprinkler Farm

(1) Selection Criteria

Selection criteria were determined in consultation with DSI as follows:

① 40 ha blocks are to be selected at 3 locations

② Criteria for each block are as follows:

A Block: Site where sprinkler feed from the design canal water level is possible by gravity.

B Block: Site where sprinkler feed from the design canal is possible by pump (pump, pipe, and sprinkler are directly connected).

C Block: Site where sprinkler feed is possible by gravity from storage tank fed from design canal by pump.

③ Sites are to be selected within reasonable distance of DSI office and relatively close to one another for ease of operation and maintenance of facilities.

The area which satisfies the above criteria is limited to that from Afsin to Alitas.

(2) Site Selection

a. The following candidate sites were selected on the basis of the criteria in (1) above and topomapping (1/25,000 scale)

① A Block

An area within the west side benefit area at Alitas was selected due to short distance between canal and target area, availability of 40~50m head, and close proximity to settlement. (vicinity of No.1+000 of Alitas No. 2 main canal)

② B Block

An area in vicinity of No. 55+000 of main canal at south side of Emirilyas was selected due to absence of topographical constraints.

③ C Block

Area is to be either in vicinity of No. 56+000 ~ No. 57+000 of main canal or No. 0+000 of Alitas No. 2 main canal. This is due to requirement for gentle slope, from the standpoints of construction and O/M, for the storage tank to be constructed at elevated location.

- b. Locations of A, B and C blocks are shown in Plate IX-1.

IX-2 Study Items for Design of Sprinkler Facilities

(1) Foundation Features

① Calculation of Water Requirement

To be calculated on the basis of the peak consumption of the design crops. The computation formula most appropriate to the Project area will be selected. In Japan, general requirements for vegetables and fruits are 4~5 mm/day and 4~6 mm/day, respectively.

② Irrigation Period (peak)

It is desirable that the irrigation period be as long as possible to minimize construction cost. For the fixed type facility and the movable type facility, periods of 24 h/day and 16~20 h/day, respectively, are recommended. However, night irrigation is not planned outside of peak consumption periods in view of factors of labor and crop damage.

③ Irrigation Intensity

Designed within the basic intake rate (I_B) to prevent soil wash-off. For slope, a rule of thumb for irrigation intensity is around 1/5 of I_B . For level land, it is to be 1/3 of I_B . However, 10 mm/hr or less is economical from the standpoint of construction cost of facilities.

Allowable irrigation intensity is generally as follows for the soil types below:

Sandy soil: 30 mm/hr (flat) 20 mm/hr (slope)

Normal soil: 15 mm/hr (flat) 10 mm hr (slope)

Clayey soil: 10 mm/hr (flat) 7 mm/hr (slope)

④ Irrigation Efficiency

Irrigation efficiency is the combination of conveyance efficiency and application efficiency. Conveyance efficiency is 95% in the case of pipe, and 85% in the case of lined canal. Application efficiency depends on the field slope:

Steep slope (over 15°): 80%

Gentle slope (3~15°): 85%

Level land (less than 3°): 90%

⑤ One-time Irrigation Requirement

To adopt the highest value among the crop-wise values computed according to the TRAM method as the design value. However, it is recommended in the case of vegetables to reduce the one-time irrigation requirement, and instead increase the number of applications.

⑥ Irrigation Interval

Determined according to TRAM/peak consumption. Irrigation interval is to be uniform for all crops. Number of days is also to be uniform throughout the year. Generally, 5~8 days is common; however, there are cases of 2~3 days for sandy soil.

⑦ Number of Movements, and Time Required

Number of movements at peak consumption is [(one-time irrigation requirement) / (irrigation intensity)]. Movement time is at least 15 minutes for the fixed type and at least 30 min for the transportable type. Number of movements per day is generally 3~5.

(2) Selection of Sprinkler Type

① Type of Sprinkler Application

Sprinkler application can be either overtop of the plant or at the base of the plant. Method will be determined according to whether the former poses the danger of pest occurrence for the particular crop. Application at the base of the plant is generally adopted in the case of fruits such as grape, peach, pear, etc. In the case of apple, citrus, tea, vegetables, etc., application is generally overtop the plant.

② Type of Sprinkler Equipment

Sprinkler head pressure is to be calculated on the basis of type of crop and available head. Nozzle size must be determined with consideration to the size of droplets, so as not to damage the plant. This is particularly true in the case of vegetables. In general, medium pressure ($2.0\sim3.0$ kg/cm 2) is applied on level land and high pressure ($3.0\sim4.5$ kg/cm 2) on slopes. High pressure sprinkling is more effective where wind is strong (average wind velocity over 2m/s)

③ Sprinkler Deployment

Deployment of sprinkler equipment will be such that irrigation intensity and application efficiency adhere to the criteria set out in (1) - ③ and (1) - ④, respectively. Uniformity coefficient for sprinkler amount is general over 0.80 if deployment interval is within 60% of the sprinkle diameter. When applying agro-chemicals, deployment interval should be within 50% of the sprinkle diameter.

④ Riser Pipe

Riser pipe height is 1m in the case of typical vegetables. In the case of fruit trees, height is the average tree height.

⑤ Lateral Pipe (see table)

Transportable type: Ø50 mm aluminum pipe is standard.

Surface fixed type: Flexible polyethylene pip is used. Pipe diameter is determined for each interval on the basis of hydraulic computations.

Diameter for each interval is determined such that sprinkler pressure differential for any one lateral pipe is within 20%.

⑥ Supply Valve Pressure

Necessary pressure is equal to: [required sprinkler pressure] + [riser pipe height] + [head loss along lateral pipe] + [head loss at supply valve].

(3) Pipe

① Distribution Method

To be determined on the basis of comparative study of open, semi-closed, and closed types. However, the latter two types are generally used. In the case of the closed type, range is around 50~300 ha (with the

exception of large trunk lines), and a farm pond is necessary at the upstream extremity (except in the case of 24 hour irrigation).

② Supply System, Network Capacity

On the basis of the above study, pressure distribution will be performed and the supply system determined.

Network capacity will be the sum of sprinkler discharge amounts in the case of small areas, and equal to the theoretical capacity in the case of large areas. The theoretical capacity is computed according to the following formula:

$$Q = 2.78 \times D \times A/H/E$$

where:

Q: theoretical capacity (l/s)

D: net water requirement (mm)

A: irrigated area (ha)

H: irrigation hours per day (hr)

E: irrigation efficiency

③ Hydraulic Study

The Hazen-Williams formula will be applied to hydraulic calculations. In the case of pressure conveyance by pump, pipe diameter is determined according to the following ranges of pipe flow speed.

$\emptyset 75\sim 150$ mm: $V = 0.7\sim 1.0$ m/s

$\emptyset 200\sim 400$ mm: $V = 0.9\sim 1.6$ m/s

$\emptyset 450\sim 800$ mm: $V = 1.2\sim 1.8$ m/s

$\emptyset 900\sim 1500$ mm: $V = 1.3\sim 2.0$ m/s

$\emptyset 1500\sim 3000$ mm: $V = 1.4\sim 2.5$ m/s

④ Appurtenant facilities

Farm pond and pump station will be designed. Appropriate crops and farm management form on sprinkler-type-wise and installation-method-wise bases are indicated in Table IX-1.

IX-3 Terminal Irrigation Facilities for Sprinkler

Terminal irrigation facilities for typical vegetables and fruits will be studied.

(1) Design Criteria

① Peak Consumption

Vegetables: 5.0 mm/day

Fruits: 6.0 mm/day

② Irrigation Hours (peak)

In principle, the transportable type or surface fixed type is to be used for vegetables, and the buried fixed type for fruits. Irrigation hours per day are to be 16 h for the transportable type and 24 h for the surface fixed type and the buried fixed type.

③ Irrigation Intensity

In principle, under 10 mm/hr

④ Irrigation Efficiency

Conveyance efficiency: 85%

Application efficiency: 90%

⑤ One-time Irrigation Requirement

Maximum field capacity is to be 25 mm.

⑥ Movement Time

30 min for transportable type, and 15 min for fixed type.

⑦ One-time Irrigated Area

Vegetable: 0.35 ha (100 m × 35 m)

Fruit: 0.45 ha (100 m × 45 m)

(2) Vegetable

① Irrigation Features

Peak consumption: 5.0 mm/day

Conveyance efficiency: 85%

Application efficiency: 90%

Maximum field capacity: 25 mm

② Irrigation Interval

5 days (25 mm/ 5.0 mm/ day)

③ One-time Net Irrigation Requirement

25 mm (5.0 mm/day × 5 days)

④ Field Irrigation Requirement

27.8 mm (25 mm/ 0.90)

⑤ Sprinkler Features

Type: PILSA Type-1a (twin hole)

Nozzle dia.: 4.5 mm × 4.8 mm

Pressure: 3.0 kg/cm²

Discharge: 47.3 l/min (2.84 m³/hr)

Sprinkler dia.: 31.0 m

Sprinkler placement: 18 m × 18 m (324m²)

Sprinkler intensity: 8.76 mm/hr
(47.31/min × 6min/ 1000/ 324 m² × 1000)

No. of sprinklers: 12 locations (6 locations, 2 lines)

⑥ One-time irrigating hours

3.17 hr (27.8 mm/ 8.76 mm/ hr)

(in the case of transportable type)

⑦ Number of movements per day

Number of movements per day is put at 4 in view of the irrigation hours per day of 16. Time required for 1 movement is 30 min. (3.17 hr + 0.5 hr. = 3.67 hr; 3.67 hr × 4 times = 14.68 hr)

⑧ Irrigation hours and operation hours per day

12.68 hr (3.17 hr × 4 times); 14.68 hr (3.67 × 4 times)

⑨ Sprinkler area per one time and per day

0.35 ha; 1.4 ha (0.35 ha × 4 times)

⑩ One rotation block area

7.0 ha (5 days × 1.4 ha)

11 Network capacity

47.3 l/min × 12 locations/ 60/ 0.85 = 11.13 l/s

(in the case of surface fixed type)

⑦ Number of movements per day

Number of movements per day is put at 7 in view of the irrigation hours per day of 24. Time required for 1 movement is 15 min. (3.17 hr + 0.25 hr. = 3.42 hr; 3.42 hr × 7 times = 23.94 hr)

⑧ Irrigation hours and operation hours per day

22.19 hr (3.17 hr × 7 times); 23.94 hr (3.42 × 7 times)

⑨ Sprinkler area per one time and per day

0.35 ha; 2.45 ha (0.35 ha × 7 times)

⑩ One rotation block area

12.25 ha (5 days × 2.45 ha)

11 Network capacity

47.3 l/min × 12 locations/ 60/ 0.85 = 11.13 l/s

(3) Fruit

① Irrigation Features

Peak consumption: 6.0 mm/day

Conveyance efficiency: 85%

Application efficiency: 90%

Maximum field capacity: 25 mm

② Irrigation Interval

4 days (25 mm/ 6.0 mm/ day)

③ One-time Net Irrigation Requirement

24 mm (6.0 mm/day × 4 days)

④ Field Irrigation Requirement

26.7 mm (24 mm/ 0.90)

⑤ Sprinkler Features

Type: PILSA Type-1a

Nozzle dia.: 5.0 mm × 7.5 mm

Pressure: 3.0 kg/cm²

Discharge: 89.0 l/min

Sprinkler dia.: 38.0 m

Sprinkler placement: 24 m × 24 m (576 m²)

Sprinkler intensity: 9.27 mm/hr
(89.01/min × 60 min/ 1000/ 576 m² × 1000)

No. of sprinklers: 8 locations (4 locations, 2 lines)

⑥ One-time irrigating hours

2.88 hr (26.7 mm/ 9.27 mm/ hr)

⑦ Number of movements per day

Number of movements per day is put at 7 in view of the irrigation hours per day of 24. Time required for 1 movement is 15 min. (2.88 hr + 0.25 hr = 3.13 hr; 3.13 hr × 7 times = 21.91 hr)

⑧ Irrigation hours and operation hours per day

20.16 hr. (2.88 hr \times 7 times); 21.91 hr (3.13 \times 7 times)

⑨ Sprinkler area per one time and per day

0.45 ha; 3.15 ha (0.45 ha \times 7 times)

⑩ One rotation block area

12.6 ha (4 days \times 3.15 ha)

11 Network capacity

89.0 l/min \times 8 locations / 60 / 0.85 = 13.96 l/s

Diagrams of sprinkler deployment for vegetables and fruits as discussed above are shown in Plate IX-2.

IX-4 Design of Sprinkler Facilities

Sprinkler facilities will be designed on the basis of the foregoing irrigation plan. Although both the transportable type and surface fixed type of sprinkler irrigation were discussed in the previous sections, type of irrigation is to be limited to the surface fixed type in the case of vegetables for the following reasons.

For the 3 cases of existing sprinkler irrigation in the vicinity of the Project area, all employed the surface fixed type of sprinkler irrigation. On the basis of soil conditions in the Project area, dismantling and transport of the sprinkler equipment as required for the transportable type would be extremely difficult. This type is accordingly not deemed appropriate for Project area conditions.

Facility design is carried out in the following sequence: on-farm pipe study (hydraulic computations); feed pipe (from water source to supply valve) study; pump study.

(1) Hydraulic Computation Criteria (pipe)

(a) Discharge and Pipe Diameter

A pipe diameter will be adopted which allow for flow velocity inside the pipe to be within the following ranges:

$\varnothing 75 \sim 150: 0.7 \sim 1.0 \text{ m/s}$

$\varnothing 200 \sim 400: 0.9 \sim 1.6 \text{ m/s}$

Discharge ~ pipe diameter relationship based on the above is as follows:

$\varnothing 75: 0.0031 \sim 0.0044 \text{ m}^3/\text{s}$

$\varnothing 100: 0.0055 \sim 0.0079 \text{ m}^3/\text{s}$

$\varnothing 125: 0.0086 \sim 0.0123 \text{ m}^3/\text{s}$

$\varnothing 150: 0.0124 \sim 0.0177 \text{ m}^3/\text{s}$

$\varnothing 200: 0.028 \sim 0.050 \text{ m}^3/\text{s}$

$\varnothing 250: 0.044 \sim 0.079 \text{ m}^3/\text{s}$

(b) Discharge Formula

Hazen-Williams formula is to be adopted.

$$\text{head loss } H = hf \times L = 10.666 \times C^{-1.85} \times D^{-4.87} \times Q^{1.85} \times L$$

where:

C: flow velocity coefficient

D: pipe diameter (m)

Q: discharge (m^3/s)

L: pipe length (m)

Application of flow velocity coefficient C is as follows:

VP and FRPM: $C = 150$ (over $\varnothing 200 \text{ mm}$); adopted value:
 $C=140$

VP and FRPM: $C = 140$ (over $\varnothing 150 \text{ mm}$); adopted value:
 $C=130$

SP: C = 130; adopted value: C' = 130

(C' is the adopted value subtracting 10 to take into consideration other losses besides friction.)

(2) On Farm Pipe

Site names in the hydraulic computation sheet are as shown in the sprinkler layout diagram.

When performing hydraulic computations, in addition to the foregoing section, pipe diameter is determined so as the pressure difference between the most upstream sprinkler (site c) and the most downstream sprinkler (site h) is less than 10% of the operating pressure (30m).

(3) Feed Pipe

Site names in the hydraulic computation sheet are as shown in the farm layout diagram.

Since a detailed topomap of the irrigation area was not available, the aforementioned farm layout diagram was prepared and the feed pipe study is undertaken.

Hydraulic computation procedure is as follows:

- ① The point with the most disadvantageous hydraulic conditions is postulated (since the entire field is assumed to be of the same elevation, this is the point farthest from the water source).
- ② Water pressure necessary at the supply outlet to the field to irrigate the above point is determined, and on this basis the diameter of pipe from the water source to the field is selected and the water level elevation for each point calculated.
- ③ Starting from the point where the water level elevation has been calculated, diameter for pipe leading to points for which water level elevation has not been calculated is postulated, and water level elevation calculated for these subsequent points. Pipe diameter is then corrected on the basis of the differential between the postulated value and the necessary pressure at the supply outlet to the field.

(4) Pump

Study is carried out for B and C blocks.

(a) B-Block

① Distribution Method

By pump (water source is main canal)

② Pump Station

Total head and type:

H_1 (required outlet level): GL+44.69 m

(GL+41.84 m for vegetables and GL+44.69 m for fruits)

H_2 (minimum intake level): GL-1.00 m

H_3 (pump spin loss): 2.00m

$$\begin{aligned} \text{Total head } H &= H_1 - H_2 + H_3 = 44.69 - (-1.00) + 2.00 \\ &= 47.69 \approx 48.0 \text{m} \end{aligned}$$

Pump type is to be horizontal centrifugal.

Diameter and Nos.

$$Q = 0.0330 \text{ m}^3/\text{s} = 1.980 \text{ m}^3/\text{min}$$

A combination of $\emptyset 100 \times 2$ units is to be adopted taking into consideration of economy and dispersion of risk.

Prime Mover Type and Output

An electric motor is to be adopted as the prime mover. Output is calculated as follows: (according to standards for pump station design)

$$P = \frac{K \times Q \times H}{E} \times (1+R)$$

Where:

P: prime mover output (kW or ps)

K: 0.163 for kW; 0.222 for ps

Q: discharge (m^3/min)

H: total head (m)

R: reserve coefficient for prime mover:

electric motor: 0.10 ~ 0.15

engine: 0.15 ~ 0.20

E: pump efficiency:

E = 0.60 for Ø 100

$$P = \frac{0.163 \times 0.990 \times 48.0}{0.60} \times (1 + 0.10) = 14.20 \approx 15 \text{ kW}$$

(b) C Block

① Distribution Method

By natural gravity flow from storage tank.

Low water level (LWL): 44.61 m

High water level (HWL): 46.11 m (effective depth:
1.50 m)

② Pump Station

Total head and type:

H₁ (required outlet level): GL+51.12 m

(GL+47.69 m for vegetables and GL+51.12 m for
fruits)

H₂ (minimum intake level): GL-1.00 m

H₃ (pump spin loss): 2.00m

$$\begin{aligned} \text{Total head } H &= H_1 - H_2 + H_3 = 51.12 - (-1.00) + 2.00 \\ &= 54.12 \approx 55.0 \text{ m} \end{aligned}$$

Pump type is to be horizontal centrifugal.

Diameter and Nos.

$$Q = 0.0330 \text{ m}^3/\text{s} = 1.980 \text{ m}^3/\text{min}$$

A combination of $\varnothing 100 \times 2$ units is to be adopted taking into consideration of economy and dispersion of risk.

Prime Mover Type and Output

An electric motor is to be adopted as the prime mover.

$$P = \frac{0.163 \times 0.990 \times 55.0}{0.60} \times (1 + 0.10) = 16.27 \doteq 18 \text{ kW}$$

③ Storage Tank

Effective capacity of the storage tank is computed as follows:

$$V = \frac{Q \times T}{4}$$

Where:

V: required effective tank capacity (m^3)

Q: pump discharge (m^3/min)

T: pump on-off cycle time (min)

(T = 15 min on the basis of electric motor capacity)

$$P = \frac{0.990 \times 15}{4} = 3.71 \doteq 4.0 \text{ m}^3$$

Since effective depth is 1.5 m as described above:

$$1.8 \text{ m (length)} \times 1.5 \text{ m (width)} \times 1.5 \text{ m (depth)} = 4.05 \text{ m}^3$$

Hydraulic computations for on-farm pipe and feed pipe according to the above criteria are shown in Table IX-2. Field layouts based on hydraulic computations are indicated in Plate IX-3.

Design features for each block are given below:

A Block

① Area and Target Crops

Area: 40 ha

Irrigated area: 36 ha ($40 \times 0.9 = 36$)

Crops: vegetables and fruits

② Distribution Method

By natural gravity flow from Aritas No. 2 main canal. On the basis of hydraulic study, required elevation for main canal in the case of vegetables is GL+44m, and GL+46m in the case of fruits.

③ Irrigation Features

Vegetables

No. of rotation blocks: 3 blocks ($3 \times 12.25 \text{ ha} = 36.75 \text{ ha}$)

Unit irrigation requirement: 11.13 l/s (0.01113 m³/s)

Conveyed volume
0.033 m³/s (3 rotation blocks)
0.022 m³/s (2 rotation blocks)
0.011 m³/s (1 rotation blocks)

Fruits

No. of rotation blocks: 3 blocks ($3 \times 12.60 \text{ ha} = 37.80 \text{ ha}$)

Unit irrigation requirement: 13.96 l/s (0.01396 m³/s)

Conveyed volume
0.042 m³/s (3 rotation blocks)
0.028 m³/s (2 rotation blocks)
0.014 m³/s (1 rotation blocks)

B Block

① Area and Target Crops

Area: 40 ha

Irrigated area: 36 ha ($40 \times 0.9 = 36$)

Crops: vegetables and fruits

② Distribution Method

By pump (water source is main canal)

③ Irrigation Features

Same as A block

C Block

① Area and Target Crops

Area: 40 ha

Irrigated area: 36 ha ($40 \times 0.9 = 36$)

Crops: vegetables and fruits

② Distribution Method

Natural gravity flow from storage tank.

Water tank level

vegetables

Low water level (LWL) 44.61 m

High water level (LWL) 46.11 m (effective depth:
1.50)

fruits

Low water level (LWL) 47.15 m

High water level (LWL) 48.65 m (effective depth:
1.50)

③ Irrigation Features

Same as A block

IX-5 Construction Cost Estimate

Preliminary construction costs (direct construction costs) were calculated for each case, and are indicated in Table IX-3. There is some difference in the totals for each case, despite uniform irrigated area, due to different conveyance methods and block configuration. In the case of both vegetables and fruits, construction cost for A block which is irrigated by natural gravity flow is cheaper, while that for C block is naturally higher due to the need for the storage tank.

INSTALLATION-WISE FARM MANAGEMENT

Installation method	Low pressure sprinkler	Medium pressure sprinkler	High pressure sprinkler	Remarks
Hand movable	① Vegetables (perforated pipe)	① Typical fields, vegetable fields	① Tropical field, orchard, pasture	① Equipment per 10 ha is inexpensive, however, labor is required to move.
		② At least 10~20ha area of concentrated cropping	② At least 50ha area of concentrated cropping	
Embedded	① Intensive cultivation of high grade vegetables	① Orchard	③ Manure application	
		② Application of herbicides, fertilizer	① Application of fertilizer	① Most energy saving.
Fixed on surface	① Rotation cropping of high grade vegetables	① 10~20ha area of concentrated cropping requiring frequent irrigation within an area of rotational cropping	① Large area of concentrated cropping requiring frequent irrigation	① Large energy saving in relation to equipment cost.
	② Orchard on slope (perforated pipe)	② Fields where large machinery is used	② Application of fertilizer	② Pipe breaking due to freezing may easily occur.
Self propelled		③ Application of herbicides, fertilizer	① Pasture	① Energy saving and economical
		① For field preparation on relatively flat land		
		② Pasture	② For field preparation in area of high intensity cultivation
