

5

BASIC IDEA OF IMPROVEMENT

5 BASIC IDEA OF IMPROVEMENT

5-1 SHIP REPAIR

5-1-1 Planning Conditions

(1) Current Ship Repair Capacity

In order to study the future improvement plan, it is indispensable to understand the current ship repair capacity of CDD by analyzing the past docking performances.

1) Seagoing vessels

Based on the "Docking-Undocking Record" of CDD, docking vessels by customers during 1984/85 - 87/88 is summarized as shown in Table 5-1-1.

Table 5-1-1 Past Docking Record of Seagoing Vessel

Year Customer	1984/85	1985/86	1986/87	1987/88	Total
BSC					
Docked vessels	9	6	5	11	31
Days spent	171	122	59	196	548
Private/Foreign					
Docked vessels	0	4	4	6	14
Days spent	0	36	45	47	128
Total					
Docked vessels	9	10	9	17	45
Days spent	171	158	104	243	676

Source: CDD, Docking-Undocking Record

Using the above record, the average number of docking vessels per year can be estimated as follows:

$$\begin{aligned} \text{Average docking days per vessel} &= 676/45 \\ &= 15.0 \text{ days} \end{aligned}$$

When the annual working days of CDD are 303 days, with the exception of national holidays and weekly holidays, the average number of vessels per year = $303/15.0$
= 20 vessels

Accordingly, the ship repair capacity in the dry dock in 1987 is set at 20 vessels per year.

2) Small vessels

The past docking record of small vessels during 1984/85 - 87/88 is shown in Table 5-1-2.

Table 5-1-2 Past Docking Record of Small Vessel

Item	Year				Total
	1984/85	1985/86	1986/87	1987/88	
Docked vessels					
Trawlers	3	11	19	20	53
Coasters	3	10	22	6	41
Total	6	21	41	26	94
Days spent *1	66	117	225	91	499
No. of dockings	4	13	20	11	48

Source: CDD, Docking Undocking Record

*1 This figure does not show the total days spent by each vessel, but the total days of dock used.

Since the plural vessels were docked at the same time, current docking capacity is estimated as follows:

Average days spent per one docking = $499/48$
= 10.4 days

Average number of dockings per year = $303/10.4$
= 29 times

Meanwhile, the average number of vessels per one docking at the same time can be calculated as follows:

Number of vessels = total No. of vessels/No. of dockings
= $94/48$
= 2 vessels

Accordingly, the ship repair capacity in the dry dock in 1987 is set at 29 times per year and 2 vessels at a time.

3) Current repair price per vessel

Current average repair price per vessel is estimated as shown in Table 5-1-3, based on the past performances showing as follows:

(Lac. taka)

Year Customer	1985/86	1986/87	1987/88	1988/89	Average
	BSC	22.8	18.0	21.5	19.7
Private	15.0	15.7	11.8	16.9	14.8
Foreign flag	10.7		7.5		9.1
Small vessel	10.5	5.7	5.3	8.6	7.5

Source: CDD

The unit price for seagoing vessels is calculated using the unit price by customers and the ratio of the number of docked vessel.

As for small vessels, the past average repair price in the same table, 7.5 lac. taka per vessel is adopted.

Table 5-1-3 Current Repair Price per Vessel

(Lac. taka)

Seagoing vessels	BSC	Private	Foreign
Repair price per vessel by customer	20.5	14.8	9.1
Docked vessel (%) (1985/86 - 1988/89)	62	28	10
Current unit price, Seagoing vessel	17.8 $(20.5 \times 62 + 14.8 \times 28 + 9.1 \times 10)/100$		
Current unit price, Small vessel	7.5		

Above prices are set as the repair price per vessel in 1987.

(2) Estimated Future Docking Capacity and Repair Price (Without Project - this means a case in which any improvement projects are not considered.)

1) Estimated future growth rate (Without Project)

The docking capacity and the repair work items of CDD are expected to increase gradually in proportion to the productivity and technology increased by self improvement.

The future growth rate of productivity and work volume is set as given in Table 5-1-4.

Table 5-1-4 Estimated Growth Rate (Without Project)

Year	Productivity	Work Volume
1987/88	1.00	1.00
1989/90	1.06	1.04
1992/93	1.16	1.10
1993/94	1.19	1.13
1997/98	1.29	1.22
2002/03	1.37	1.35
2007/08	1.41	1.44
2012/13	1.41	1.44

The growth rate of the productivity by self-improvement is estimated as 3% per year from 1987 to 1993, 2% from 1994 to 1998 and 1% after 1999 based on the current capability, future growth rate of industrial production.

The growth rate of work volume is set at 2% annually considering an increase of repair work items as shown in Table 5-1-19.

2) Estimated docking capacity (Without Project)

Based on the current capacity and future growth prediction of productivity as shown in Table 5-1-4, future docking capacity (Without Project) can be estimated as shown in Table 5-1-5.

The average docking days per vessel in the year 2007 - 2012 is assumed at about 11 days which is 60% of an advanced country's docking days(5 - 6 days).

Table 5-1-5 Estimated Docking Capacity (Without Project)

Year	Seagoing Vessels		Small Vessels	
	Number	Days/docking	Number	Days/docking
1987/88	20	15.2	29	10.4
1989/90	21	14.4	30	10.1
1992/93	23	13.2	33	9.2
1997/98	25	11.7	37	8.2
2002/03	27	11.2	39	7.8
2007/08	28	10.8	40	7.6
2012/13	28	10.8	40	7.6

3) Estimated repair price in the future (Without Project)

Estimated average repair price per vessel can be estimated as shown in Table 5-1-6, based on the current average repair price as given in Table 5-1-3 and the prospective growth of work volume as given in Table 5-1-4.

Table 5-1-6 Estimated Repair Price per Vessel
(Lac. taka)

Year	Seagoing Vessels	Small Vessels
1987	17.8	7.5
1989	18.5	7.8
1992	19.7	8.3
1997	21.7	9.4
2002	24.0	10.1
2007	25.7	10.8
2012	25.7	10.8

5-1-2 Expected Future Work

(1) Seagoing Vessels

Future docking demand of seagoing vessels is estimated as shown in Table 5-1-7, based on the required number of vessels forecast in Chapter 4, Table 4-2-15 and 4-2-16.

The expected future work of ship repair is estimated for two cases, the lifting share of Bangladesh flag vessels is 30% and 40%.

The detailed docking demand of BSC, private, and foreign flag vessels is given in Table 5-1-8 to 5-1-10.

Table 5-1-7 Expected Docking Demand of Seagoing Vessels

1. Lifting Share 30%				
Year	BSC Own	Private	Foreign	Total
1989/90	8	2	3	13
1992/93	12	3	4	19
1993/94	13	3	4	20
1997/98	15	6	7	28
2002/03	17	9	10	36
2007/08	17	10	11	38
2012/13	17	10	11	38
2. Lifting Share 40%				
Year	BSC Own	Private	Foreign	Total
1989/90	8	2	3	13
1992/93	13	3	4	20
1993/94	13	4	4	21
1997/98	17	7	7	31
2002/03	20	12	9	41
2007/08	20	14	9	43
2012/13	20	14	9	43

Table 5-1-8 Expected Docking Demand of BSC Owned Vessels

1. Lifting Share 30%				
Year	Number of Vessels	Share of CDD	Docking Frequency	Docking Demand
1989/90	22	1	0.4	8
1992/93	25	1	0.5	12
1997/98	30	1	0.5	15
2002/03	35	1	0.5	17
2007/08	35	1	0.5	17
2012/13	35	1	0.5	17
2. Lifting Share 40%				
Year	Number of Vessels	Share of CDD	Docking Frequency	Docking Demand
1989/90	22	1	0.4	8
1992/93	26	1	0.5	13
1997/98	34	1	0.5	17
2002/03	40	1	0.5	20
2007/08	40	1	0.5	20
2012/13	40	1	0.5	20
<p>- Docking frequency of BSC vessels is estimated based on the past docking record as stated in Chapter 3, Table 3-4-5, with the expectation of increasing up to 0.5 in 1992, every two years, in accordance with the regulations.</p> <p>- Docking share of CDD to BSC owned vessels is estimated as 100%, considering the governmental policy.</p>				

Table 5-1-9 Expected Docking Demand of Private Vessels

1. Lifting Share 30%				
Year	Number of Vessels	Share of CDD	Docking Frequency	Docking Demand
1989/90	25	0.4	0.24	2
1992/93	28	0.4	0.3	3
1997/98	33	0.5	0.4	6
2002/03	39	0.5	0.5	9
2007/08	41	0.5	0.5	10
2012/13	41	0.5	0.5	10
2. Lifting Share 40%				
Year	Number of Vessels	Share of CDD	Docking Frequency	Docking Demand
1989/90	25	0.4	0.24	2
1992/93	31	0.4	0.3	3
1997/98	36	0.5	0.4	7
2002/03	49	0.5	0.5	12
2007/08	59	0.5	0.5	14
2012/13	59	0.5	0.5	14
<p>- Future docking shares of CDD is estimated at 0.5 from 1997/98, considering the future improvement of CDD and the past performance stated in Chapter 3, Table 3-4-7.</p> <p>- Docking frequency is also estimated to be 0.5 (every two years) in 2002/03, in accordance with the regulations.</p>				

Table 5-1-10 Expected Docking Demand of Foreign Vessels

1. Lifting Share 30%			
Year	Number of Vessels	Share of CDD	Docking Demand
1989/90	195	0.02	3
1992/93	217	0.02	4
1997/98	261	0.03	7
2002/03	343	0.03	10
2007/08	366	0.03	11
2012/13	366	0.03	11
2. Lifting Share 40%			
Year	Number of Vessels	Share of CDD	Docking Demand
1989/90	195	0.02	3
1992/93	212	0.02	4
1997/98	248	0.03	7
2002/03	303	0.03	9
2007/08	313	0.03	9
2012/13	313	0.03	9
<p>- The future docking demand of foreign flag vessels is forecast on the assumption that 2% of the vessels calling at the port of Chittagong and Mongla from 1989 to 1992 and 3% of them after 1993 are expected to dock at CDD.</p>			

(2) Small Vessels

1) Trawlers

As regards the docking demand of fish trawlers, the estimation is made based on the required number of fishing trawlers being forecast in Chapter 4, Table 4-2-15.

The past docking record mentioned in Chapter 3, table 3-4-7, shows that the share of CDD is 0.41 and the docking frequency is 0.41. Since the data is obtained under the condition that docking priority is given to seagoing vessels, future docking frequency and shares of CDD is considered to be higher than the past.

Therefore, the shares of CDD and the docking frequency of trawlers is set at 0.6 and 1.0 respectively.

The expected docking demand of trawlers is shown in Table 5-1-11.

Table 5-1-11 Expected Docking Demand of Trawlers

Year	Number of Vessels	Share of CDD	Docking Frequency	Docking Demand
1989/90	39	0.6	1.0	23
1992/93	44	0.6	1.0	26
1997/98	51	0.6	1.0	30
2002/03	58	0.6	1.0	34
2007/08	60	0.6	1.0	36
2012/13	60	0.6	1.0	36

2) Coasters

The docking demand of coasters and other small vessels is set at 1.05 times that of trawlers according to the understanding of shipowners and CDD, and the past performances.

3) Total docking demand of small vessels

The total docking demand of small vessels is summarized in Table 5-1-12.

The number of vessels to be docked at the same time is set at 3 vessels after 1989. The number of dockings is calculated for the purpose of corresponding to the number of dockings of seagoing vessels.

Table 5-1-12 Total Docking Demand of Small Vessels

Year	Trawlers	Coasters and Others	Total	Number of Dockings
1989/90	23	24	47	15
1992/93	26	27	53	17
1993/94			54	18
1997/98	30	31	61	20
2002/03	34	35	69	23
2007/08	36	37	73	24
2012/13	36	37	73	24

5-1-3 Future Plan for Improvement

The future docking demand to the docking capacity of CDD without Project is shown in Table 5-1-13 and Fig. 5-1-1, where docking demand of small vessels is shown in the figure of the number of dockings.

Table 5-1-13 Supply and Demand Forecast of Docking

1. Lifting Share 30%				
Year	Docking Capacity (C)	Docking Demand (D)		(D)/(C)
		Seagoing	Small	
1989/90	21	13	15	1.33
1992/93	23	19	17	1.56
1997/98	25	28	20	1.92
2002/03	27	36	23	2.18
2007/08	28	38	24	2.21
2012/13	28	38	24	2.21
2. Lifting Share 40%				
Year	Docking Capacity (C)	Docking Demand (D)		(D)/(C)
		Seagoing	Small	
1989/90	21	13	15	1.33
1992/93	23	20	17	1.60
1997/98	25	31	20	2.04
2002/03	27	41	23	2.37
2007/08	28	43	24	2.39
2012/13	28	43	24	2.39

Table 5-1-3 shows that the number of vessels in demand exceeds the docking capacity of CDD in this case.

Then the following improvement plans (Plan "A" and Plan "B") are considered to meet the docking demand and increase work volume of CDD. In planning, the reduction of the docking period per repair vessels and diversification of repair work is considered. To achieve this objective, the improvement of engineering technic, worker's skill and provision of proper additional facility is indispensable.

(1) Plan "A"

1) Basic concept

Ship repair business both for seagoing vessels and for other small vessels shall be carried out at the existing dry dock with technical assistance from technically advanced country and provision of additional facility.

2) Training programme

a) Training at overseas shipyard

Engineers, economist and/or staff of CDD shall be dispatched to technically advanced country. (48 man-months)

b) Technical assistance from technically advanced country

Engineers/experts shall be dispatched to CDD. (54 man-months)

3) Additional facility

In addition to the existing facility, such machinery, equipment and attachments as given in Table 5-1-14 are planned.

4) Estimated future growth rate

At present, due to the insufficiency of overall ship repair technology, know-how and proper machinery, shipowners have a tendency to hesitate placing repairing orders with CDD for complicated work. This situation makes it difficult for CDD to obtain enough work volume resulting in less sales compared with the scale of its facility.

With the execution of Plan "A", it is expected that CDD can get more repair work such as overhauling of main engine, auxiliary machinery, various steel work, etc. The prospective repair work is shown in Table 5-1-19.

Table 5-1-14 List of Additional Facility and Its Necessity

Item	Unit	Purpose/Necessity	Expected Effect
<u>Dry dock and workshop</u>			
Air compressor and piping around dock and workshop	1	Increase use of air tools for ship repair and other steel work	Shortening work period & improvement in quality
Oxygen and accetylene manifold and piping	1	Easy preparation for work & reduction of bottle handling job	Shortening work period & easy bottle control
Drinking water piping	1	Supply of satisfying quality & quantity to docked vessels	Increase service item to customers
<u>Workshop</u>			
Static balancing machine for propeller max. 4.5m dia.	1	Adjustment after repair of propeller for seagoing vessels	Increase job opportunity Improvement in quality
Electrical equipment maintenance equipment	1	General overhaul & repair jobs for docked vessels and workshop facility	Increase job opportunity Shortening work period & improvement in quality
Testing equipment for heavy cargo gear	1	Testing after repair for inspection	Increase job opportunity
Lathe machine Center distance 9m Supporting capacity 15 ton	1	Repair of heavy work such as tail shaft, rollers etc.	Increase job opportunity both for repair of vessels and allied work
Lathe machine Center distance 2.5m	2	To fill gap of existing machining	Equalizing of work load Increase job opportunity
Planer stroke 4m, 1.4m W	1	Repair/machining of repair parts such as machine bed, liner, etc.	Increase job opportunity both for ship repair & allied work
Surface grinder stroke 1m, 0.6m W	1	Repair/machining of repair parts such as machine bed, liner, etc.	Increase job opportunity both for ship repair & allied work
Attachment for boring & milling machine	1	Increase capability for various work	Increase job opportunity both for ship repair & allied work

Item	Unit	Purpose/Necessity	Expected Effect
Dynamic balancing machine		Testing of rotor of turbo-charger and basket for centrifugal machine	Increase job opportunity both for repair vessel & allied work
Wood turning lathe	1	Various wood work such as pattern of casting, etc.	Shortening work period & improvement in quality
Wood planer	1	Various wood work such as pattern of casting, etc.	Shortening work period & improvement in quality
Steam cleaner	2	Cleaning of over-hauled engine parts	Shortening work period & improvement in quality
<u>Paint shop</u>			
Sand blasting equipment	6	Surface preparation of ship's hull and allied work	Shortening work period & improvement in quality
High pressure water pump	2	Cleaning of ship's hull	Shortening work period & improvement in quality
<u>Foundry</u>			
Casting equipment for ferrous and non-ferrous metals	1	Casting of various parts such as cooler cover, bush, etc.	Increase job opportunity both for repair vessel & allied work
Remetaling equipment	1	Repair of bearings for vessels, etc.	Increase job opportunity
<u>Tools</u>			
Hand tools Mechanic Electrician Fitter Carpenter Plumber	1	To apply proper tools and safety protectors for various work	Shortening work period & improvement in quality To keep safety work
Cutting tool Measuring tools Lifting tools Pneumatic tools Electrical tools Gas cutting tools Welding tools Protectors Scaffoldings			

It is also expected that the technical assistance and additional facility improve CDD's docking capacity year by year till average docking days becomes about one week which is 80% of a advanced country's docking days (5 - 6 days) and considered to be maximum in Bangladesh.

The estimated future growth rate of productivity and work volume are shown in Table 5-1-15. The rate of productivity is estimated at 3% per year from 1987 to 1992, 6% in 1993 and 12% in 1994, and afterwards, the rate is estimated to decrease gradually. Likewise, the rate of increase rate of work volume is estimated at 2% per year from 1987 to 1992, 3% in 1993, 4% in 1994, 5% in 1995 and 6% up to 2002, and afterwards, the rate is estimated to decrease by 1% year by year.

Table 5-1-15 Future Growth Rate of Plan "A"

Year	Productivity	Work Volume
1987/88	1.00	1.00
1989/90	1.06	1.04
1992/93	1.16	1.10
1993/94	1.23	1.14
1997/98	1.67	1.40
2002/03	1.95	1.87
2007/08	2.05	2.16
2012/13	2.05	2.16

5) Estimated docking capacity

Based on the current capacity and future growth prediction of productivity, the future docking capacity can be estimated as shown in Table 5-1-16

Table 5-1-16 Estimated Docking Capacity of Plan "A"

Year	Seagoing Vessels		Small Vessels	
	Number	Days/docking	Number	Days/docking
1987/88	20	15.2	29	10.4
1989/90	21	14.4	30	10.1
1992/93	23	13.2	33	9.2
1993/94	24	12.6	35	8.7
1997/98	33	9.2	48	6.3
2002/03	39	7.8	56	5.4
2007/08	41	7.4	59	5.1
2012/13	41	7.4	59	5.1

Consequently, the future docking capacity of CDD to docking demand is summarized in Table 5-1-17, and Fig 5-1-1.

Table 5-1-17 Supply and Demand Forecast of Docking

1. Lifting Share 30%						
Year	Docking Demand			Docking Capacity (C)	D/C	
	Seagoing	Small	Total (D)			
1989/90	13	15 (47)	28	21	1.33	
1992/93	19	17 (53)	36	23	1.56	
1993/94	20	18 (54)	38	24	1.58	
1997/98	28	20 (61)	48	33	1.45	
2002/03	36	23 (69)	59	39	1.51	
2007/08	38	24 (73)	62	41	1.51	
2012/13	38	24 (73)	62	41	1.51	
2. Lifting Share 40%						
Year	Docking Demand			Docking Capacity (C)	D/C	
	Seagoing	Small	Total (D)			
1989/90	13	15 (47)	28	21	1.33	
1992/93	20	17 (53)	37	23	1.60	
1993/94	21	18 (54)	39	24	1.62	
1997/98	31	20 (61)	51	33	1.54	
2002/03	41	23 (69)	64	39	1.64	
2007/08	43	24 (73)	67	41	1.63	
2012/13	43	24 (73)	67	41	1.63	

In the above table, docking demand of small vessels is given in the figure of number of dockings.

Figures in bracket show the number of vessels.

1. Without Project

2. Plan "A"

- Docking capacity of CDD
- Docking demand (Seagoing vessels, L.S. 30%)
- Docking demand (Seagoing vessels, L.S. 40%)
- . - . - Docking demand (Seagoing & small vessels, L.S. 30%)
- Docking demand (Seagoing & small vessels, L.S. 40%)

Fig. 5-1-1 Docking Demand and Supply Capacity

6) Prospective number of docked vessels

According to the aforementioned docking capacity to docking demand, the expected number of docked vessels is summarized as shown in Table 5-1-18.

Table 5-1-18 Prospective Number of Docked Vessels

1. Lifting Share 30%				
Year	Docking Capacity	Vessels Seagoing	Docked Small	Demand Surplus (Small)
1989/90	21	13	24	23
1992/93	23	19	12	41
1993/94	24	20	12	42
1997/98	33	28	15	46
2002/03	39	36	9	60
2007/08	41	38	9	64
2012/13	41	38	9	64
2. Lifting Share 40%				
Year	Docking Capacity	Vessels Seagoing	Docked Small	Demand Surplus (Small)
1989/90	21	13	24	23
1992/93	23	20	9	44
1993/94	24	21	9	45
1997/98	33	31	6	55
2002/03	39	39	0	69
2007/08	41	41	0	73
2012/13	41	41	0	73

In the above table, small vessels are given in the figure of number of vessels.

Table 5-1-19 Prospective Repair Work Items

1) Current Situation
Hull cleaning and painting Tank cleaning Plate renewal Tail shaft survey and minor repair Valve work Rudder survey and repair Anchor cable survey Lignum-vitae renewal Propeller survey and minor repair Other minor repair
2) Increase by self-improvement
In addition to the current work capability, - Steel repair work such as; Pipings and valves Deck fittings Hatch covers Superstructures - Overhaul and minor repair of; Pumps Deck machinery Cargo gears Electric motors Electric fittings - Other minor repair job
3) Plan "A"
Plan "A" In addition to the increase by self-improvement, - Overhaul and repair of; Main engines Turbochargers Generator engines Aux. machinery Coolers and heaters Aux. boilers Generators - Electrical equipment - Anchoring & mooring apparatus - Steering gears - Navigation equipment - Complicated repairing of shafting, rudders and propellers - Heavy plate renewal - Other repair and inspection work

7) Estimated repair price in future

Prospective average repair price per vessel is estimated as shown in Table 5-1-20, based on the current average repair price as given in Table 5-1-3 and the prospective growth rate of work volume as given in Table 5-1-15.

Table 5-1-20 Estimated Repair Price per Vessel

(Lac. taka)

Year	Seagoing Vessel	Small Vessel
1987	17.8	7.5
1989	18.5	7.8
1992	19.6	8.3
1997	24.9	10.5
2002	33.3	14.0
2007	38.4	16.2
2012	38.4	16.2

(2) Plan "B"

1) Basic concept

This plan is to construct a new docking facility for small sized ship repair, in addition to the implementation of Plan "A".

2) Training programme

a) Training at overseas shipyard

Same as Plan "A".

b) Technical assistance from technically advanced country

Same as Plan "A".

3) Additional facilities

In addition to the machinery and equipment stated in Plan "A", a docking facility for small vessels of maximum ship length 50m is provided.

In order to determine the optimum size and type of the docking facility, the following study is conducted.

Capacity of docking facility

The necessary docking capacity is studied with comparison between a docking demand and a docking capacity in two cases.

Case A : Provision of a docking facility of one vessel.
 Case B : Provision of a docking facility of two vessels at the same time
 In this case, the docking capacity is set at 70% of double capacity of Case A, considering waiting loss time, etc.

The comparison between supply and demand is shown in Table 5-1-21.

Table 5-1-21 Supply and Demand Forecast of Docking

Year	Docking Capacity		Docking Demand *1	
	Case A	Case B	L.S. 30%	L.S. 40%
1989/90	-	-	23	23
1992/93	-	-	41	44
1993/94	17 *2	23	42	45
1997/98	48	65	46	55
2002/03	56	77	60	69
2007/08	59	81	64	73
2012/13	59	81	64	73

*1 Surplus demand of the dry dock in Table 5-1-18

*2 The new facility is assumed to be constructed in the middle of 1993/94.

Besides the docking demand, a tendency for docking of small vessels has to be taken into consideration in planning the docking capacity.

Since the fishing trawlers operated in the Bay of Bengal are usually in pairs with their sister ships during fishing, shipowners often dock their trawlers at a time.

Under these circumstances, it is recommendable that a new docking facility for small sized vessels should have the capacity of two vessels docking at the same time.

4) Prospective number of docked vessels on a new facility

When a new docking facility is provided, the expected number of docked vessels on it is estimated as shown in Table 5-1-22, and correlation between docking demand and supply capacity is shown in Fig. 5-1-2.

The expected number of docked vessels in the dry dock and the docking capacity are the same as Plan "A", given in Table 5-1-18.

Table 5-1-22 Prospective Docking Vessels in Future on a New Docking Facility

Year	Lifting Share 30%	Lifting Share 40%
1989/90	-	-
1992/93	-	-
1993/94	23	23
1997/98	46	55
2002/03	60	69
2007/08	64	73
2012/13	64	73

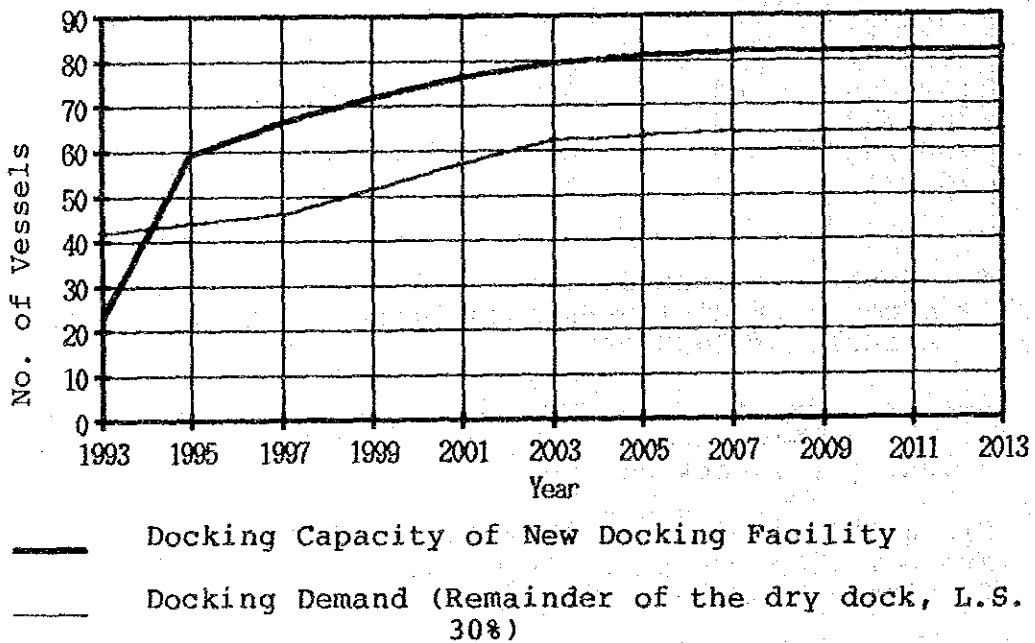

Fig. 5-1-2 Docking Demand and Supply, Plan "B" (On a New Docking Facility)

5) Estimated repair price in future

Estimated average repair price per vessel is the same as Plan "A", given in Table 5-1-20.

5-2 STEEL STRUCTURAL ENGINEERING

5-2-1 Planning Condition

The present condition of Steel Structural Engineering at CDD is as follows:

(1) Outline of Existing Facilities

1) Area of shop

Fabrication shop	: 60 m x 18 m x 2 shops	2,160 m ²
Fabrication area (outdoor)	: 35 m x 40 m	1,400 m ²
Steel stockyard	: 40 m x 40 m	1,600 m ²
Total	:	5,160 m ²

2) Main facilities

Access door : 3 m B x 3.5 m H 4 doors

Electric power box : 7 boxes

Distribution unit and pipes for compressed air, acetylene gas and oxygen gas are not installed.

3) Operational equipment

O.T.C. : 3.2 tons 2 sets

O.T.C. : 3.2 tons 1 set

O.T.C. : 12.5 tons 1 set

Plate bending roller : t= 20 mm, w = 3,050 mm 1 set

Hydraulic press : 500 tons 1 set

Hydraulic press : 400 tons 1 set

Horizontal band saw : Max. dia. 250 mm 1 set

Frame bender : 250tons(Horizontal press) 1 set

Shearing machine : t=10 mm, w= 2,600 mm 1 set

Pipe bending machine : Max. 50 A 1 set

Small scale auto gas cutting machines, arc welders, etc.

4) Number of staff & workers and Working hours

Supervisor (Staff) : 5 persons

Workers(Plater, Welder) : 52 persons

Total : 57 persons

Estimated working hours per capita (Based on actual results of 1987 & 1988): about 2,480 hours/year

(Attendance ratio: 90%, Working day: 303 days/year, overtime: about 2 hours/day)

Estimated total working hours per year: 129,000 hours
(52 x 2,480)

(2) Record of Production

Ship repair has been the main sale of this yard and steel structures such as bridges, cranes, heat exchangers, chassis, etc. have also been fabricated since the yard started operating in May, 1981.

The production record of main steel structures on a commercial basis from July, 1985 to April, 1989 is shown in Table 5-2-1.

Table 5-2-1 Production Record of Main Steel Structures
(From July, 1985 to April, 1989)

Description	Q'ty	Weight (ton)	Sales amount (Tk)	Price (Tk/ton)	Labour (Hr/ton)
Fabrication of portable bridge	9	195.12	92,12,519	47,215	453
Fabrication of pontoon, platform & tank	5	205.71	102,93,208	50,037	312
Fabrication of lighting & rappel tower	3	55.04	42,47,018	77,162	494
Fabrication of rack & ladder	3	193.08	48,24,239	34,687	243
Fabrication of pipe	2	104.00	18,16,282	17,464	185
Fabrication of zinc pot, casing, roller, etc.	10	24.79	40,64,369	163,952	1,073
Total/Average	32	777.74	343,34,824	44,174	351

Source: CDD

(3) Trend of Sales Record

The sales amount of steel structures has been moderately increasing since the start of the operation. Especially in 1986 and 1987, the sales of steel structures remarkably increased.

It became 80% of Allied product sales and about 20% of the total sales of CDD.

The past 5 year sales of steel structures and its proportion to total sales of CDD is shown in Table 5-2-2.

Table 5-2-2 Sales Record for 5 Years (80 % of Allied Product Sales)

(Unit: Lac. taka)

Year	1983/84	1984/85	1985/86	1986/87	1987/88
Sales(A)	1.4	25.3	43.1	127.9	127.8
(A)/ Total Sales	4 %	6 %	9 %	22 %	18 %

Source: CDD

(4) Analysis of Present Condition

1) Production and sales

- Average annual sales for latest 2 years;

$$(127.9 + 127.8) / 2 = 127.85 \text{ Lac. taka}$$

- Average annual production for latest 2 years;

$$127,85,000 \text{ Tk}/44,174 \text{ Tk/ton} = 290 \text{ tons}$$

2) Rough estimation of production capacity

Average annual production for latest 2 years is about 290 tons.

Accordingly, fabrication capacity per square meter in present fabrication shop (2,160 m²) can be estimated as follows:

$$290 \text{ tons}/2,160 \text{ m}^2 = 0.13 \text{ tons/m}^2$$

(5) Estimation of Working Hours for Manufacturing

The total annual working hours for 52 workers of the steel structure fabrication shop is estimated to be 129,000 hours as mentioned above.

Assuming that the average share of working hours for ship repair work is 25%, the total working hours for steel structure is estimated to be 96,750 hours (129,000 x 0.75).

Accordingly, the average working hours per ton for steel structure is estimated as follows:

$$96,750 \text{ hours}/290 \text{ tons} = 333 \text{ hours/ton}$$

5-2-2 Expected Future Work

In planning for improvement of CDD's steel structural engineering, the kind and the volume of CDD's expected work are considered as follows:

(1) Increase of Present Products

The present products are diverse products such as pontoons, tanks, towers, racks & ladders, etc. They are ordered as peripheral equipment or parts of their facilities for maintenance or repairing by municipal corporations and private companies located in the Chittagong area.

And so, the order used to be inconstant and small in number.

However, as these demand will be stable and augmented, every effort has to be made to meet these demands.

(2) Products for Various Project of National Development

Based on the study results as mentioned in Chapter 4, Section 3 "Steel Structure", the following are expected for CDD as future demands of steel structural projects.

1) Electricity transmission tower and telescopic pole

During the period of Fourth Five Year Plan(1990-1995), the following scale of products are planned by BPDB.

Total procurement volume:	44,000 tons
Average annual demand foecast:	8,800 tons

Large sized towers have been manufactured by overseas makers, on the other hand, rather small sized towers and poles have been manufactured by several domestic makers. As mentioned above, there will be a strong demand for these products which CDD can participate in manufacturing as a main contractor or as a subcontractor, whichever it may be.

2) Bridge

According to the national development plan of Bangladesh, bridges of a total length of 2,000 m for national roads and of 3,000 m for regional roads are to be constructed.

The total weight of these bridges is estimated to be about 4,400 tons.

National roads	2,000 m x 1.0 ton/m =	2,000 tons
Regional roads	3,000 m x 0.8 ton/m =	2,400 tons
	<u>Total</u>	<u>4,400 tons</u>

The steps for CDD to participate in the bridge market as a promising maker are considered as follows:

- i) As bridges for national roads are large and heavy, overseas makers shall get an order as a main contractor.

CDD should make efforts to upgrade technical potential and to receive orders of steel structures from overseas contractors as a local leading subcontractor to increase production volume.

- ii) On the other hand, the size of bridges for regional roads are rather small, even domestic makers can manufacture most of them.

In this case, CDD shall become one of the strong makers as a main contractor.

CDD can get top shares in the market of manufacturing bridges, because CDD has no strong competitor in Bangladesh.

3) Chemical plant

The demand of steel structures for chemical plants is estimated to be 1,200 tons per year.

These component parts of chemical plants consist of such heavy steel structures as steel buildings, crane girders, etc.

CDD is the best equipped manufacturer of steel structures in Bangladesh.

CDD stands in a promising position to become a local leading subcontractor of manufacturing steel structures for overseas contractor.

(3) Other Products

Other products which CDD can manufacture are expected to be as follows:

1) Baskets for centrifugal machines

As CDD has no balancing machine, they can not manufacture the basket of a sugar mill plant.

Upon CDD's investigation, future demand of the product is estimated as follows:

4-5 baskets/year for 1 mill x 15-16 mills = 60 pcs/year

Price per basket is estimated at about 1.5-2.0 Lac. taka.

2) Well pipes for irrigation

CDD can manufacture pipes for pumping up irrigation water by using small bending roller machine.

3) Chassis for automobile

CDD has been manufacturing them, and they shall receive an order together with DEW of BSEC as before.

(4) Suggestion to Manufacture Railway Wagons and Marine Cargo Containers

According to the information got in the Study, the suggestion for production of railway wagons and marine cargo containers is made as follows:

1) Manufacture of railway wagons

The feasibility study, called "Establishment of Railway Carriage and Wagon Manufacturing Plant", was carried out by JICA in 1985, in accordance with the request of the Government of Bangladesh.

According to the report, the project is planned as follows:

- Project site : Near Parbatipur
- Project : Construction of railway carriage and wagon manufacturing plant complex
- Production capacity: 120 Nos. of passenger wagons per year
900 Nos. of good wagons per year

Considering the project is under planning by the Bangladesh Railway, manufacturing of railway wagon in CDD should be planned carefully, watching the progress of the said project.

2) Manufacturing of marine cargo containers

The growth of Bangladesh container traffic is remarkable as seen in Chapter 4, Table 4-1-11.

Accordingly, the demand of marine cargo containers is expected. At present, there is no manufacturer of marine cargo containers in Bangladesh.

In considering these circumstances, it appears that there is a chance of manufacturing marine cargo containers for CDD.

When the introduction of the manufacturing of this product is planned, however, it should be done very carefully.

Because, in the process of production, dimensional accuracy, structural strength, durability, etc. of the product, very severe conformity with international standards, for example International Organization for Standardization(ISO), are required.

Therefore, those manufacturers who are engaging in this field are required to be equipped with suitable facilities for manufacturing, such as prevention jigs using compressed air cylinders against distortion, welding machines for thin plates, surface treatment and painting, as well as production technique and skill.

As for raw materials, some kinds of steel materials for roof sheets, side sheets, corner posts, etc. are available locally, while door fittings and wooden floor plates have to be imported.

Manufacturers of containers in Japan usually have their specialized production line in their workshops, and a mass production system is introduced for their economical production.

Considering the above, when CDD would try to embark in this field, it should be noted that:

- it costs a considerable investment amount to establish container production lines which enable CDD to keep required product accuracy and to realize competitive production, and
- it is necessary for CDD to establish a material procurement system, so as to obtain parts and fittings of good quality, for a cheaper price and on time.

5-2-3 Future Plan for Improvement

The purpose of this improvement plan is to review the existing facilities and equipment of CDD, and then, to expand the production volume of steel structure based on Chapter 5, Section 5-2-2 "Expected Future Work".

To optimize capacity utilization and to improve the performance of CDD, it is important to recognize future targets and goals.

The future plan shall enable CDD to upgrade productivity and to expand production capacity.

To materialize these purposes, the investigation of CDD's present condition i.e. existing facilities and equipment of steel structural shops was carried out, and the result of the investigation was analyzed. Then the alternative improvement plans i.e. plan "a", plan "b" and plan "c" regarding facilities, equipment, production and management are proposed as shown in Fig 5-2-1.

Considering the basic concept and facility plans, the improvement of productivity and its final goal of each plan are estimated to be as shown in Fig. 5-2-2. Productivity(tons/m²) of plan "b" and "c" is aiming at 0.4 tons/m² in 2012/13 which is about a half of a highly advanced country's productivity.

Fig. 5-2-2 Expected Improvement of Productivity

(1) Plan "a"

1) Basic concept

Plan "a" is the proposition that increase of production volume and productivity shall be performed by effective utilization of the existing fabrication shop and facilities with minimum investment and by receiving engineers despatched from a technically advanced country.

2) Production volume

- Improvement of productivity

Year	Target	Production volume
1989:	0.15 ton/m ²	0.15 t/m ² x 2,160 m ² = 324.0 tons
1992:	0.17 ton/m ²	0.17 t/m ² x 2,160 m ² = 367.2 tons
1993:	0.20 ton/m ²	0.20 t/m ² x 2,160 m ² = 432.0 tons
1997:	0.23 ton/m ²	0.23 t/m ² x 2,160 m ² = 496.8 tons
2002:	0.25 ton/m ²	0.25 t/m ² x 2,160 m ² = 540.0 tons
2007:	0.30 ton/m ²	0.30 t/m ² x 2,160 m ² = 648.0 tons
2012:	0.32 ton/m ²	0.32 t/m ² x 2,160 m ² = 691.2 tons

Table 5-2-3 Production Volume of Steel Products, Plan "a"

Year Products	(Ton)						
	1989/ 90	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
Electricity trans- mission towers	0	0	0	0	0	0	0
Portable bridges	60	50	110	150	170	220	250
Chemical plants	0	0	0	0	20	40	50
Steel Racks and Ladders	80	100	100	110	120	140	150
Pontoons, Platforms and Tanks	100	120	120	140	140	150	150
Other	80	100	100	100	100	100	100
Total	320	370	430	500	550	650	700

3) Sales

Table 5-2-4 Sales of Steel Products, Plan "a"

Products & Price	(Lac. taka)						
	Year 1989/ 90	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
Portable Bridges(@47,000 Tk)	28.2	23.5	51.7	70.5	79.9	103.4	117.5
Chemical plants(@40,000 Tk)	0	0	0	0	8.0	16.0	20.0
Steel Racks and Ladders(@35,000 Tk)	28.0	35.0	35.0	38.5	42.0	49.0	52.5
Pontoons & platforms (@50,000 Tk)	50.0	60.0	65.0	70.0	75.0	75.0	75.0
Other (@43,000 Tk)	34.4	43.0	43.0	43.0	43.0	43.0	43.0
Total	140.6	161.5	189.7	222.0	242.9	286.4	308.0

(The price of each product is based on the price shown in Table 5-2-1.)

4) Facility plan "a"

Above all, products such as pipe piles for marine civil engineering, pen stocks for power plants, tanks, crane girders, etc. shall be manufactured by effective utilization of press machines and bending rollers.

Additional new machines and tools necessary for manufacturing the products mentioned above are as follows:

- Punching, shearing & angle cutting machine..... 1 set
for fabrication of parts of bridge, tower, etc.
- Bending roller(6 t x 200 φ x 1.8 m) 1 set
for bending thin plates into pipes
- Semiautomatic gas cutting machines 2 sets
for rationalization of gas cutting
- Automatic welding machines 2 sets
for rationalization of welding
- Air tools, journal jacks, etc.

5) Technical training programme "a"

An engineer despatched from a technically advanced country shall carry out on the job training for upgrading the fabrication technique of steel structures for one year.

(2) Plan "b"

1) Basic concept

The future demand of steel structures shall be much greater than the present production capacity of CDD. Increase of their production capacity by expansion of the fabrication shop enables CDD to extend their share in the market.

Plan "b" is the proposition that as a result of the study of CDD's layout and effective utilization of the facilities, the conversion of one engine shop and one machine shop to two fabrication shops (total: 1,620 m²) enables CDD to expand the existing fabrication area of steel structures into 3,780 m² without disturbance of ship repair work.

The main target of Plan "b" is to receive the order of new products such as electricity transmission towers and portable bridges in addition to present products, in other words, which shall bring stable operation of fabrication shops and effective utilization of the existing facilities.

Supplement of necessary facilities for effective production of new products, measures for zinc plating jobs, technical training programmes for fostering of design technology are considered in Plan "b", in addition to the implementation of Plan "a".

2) Production volume

- Improvement of productivity

Year	Target	Production volume
1989:	0.15 ton/m ²	0.15 t/m ² x 2,160 m ² = 324.0 tons
1992:	0.17 ton/m ²	0.17 t/m ² x 2,160 m ² = 367.2 tons
1993:	0.15 ton/m ²	0.15 t/m ² x 3,780 m ² = 567.0 tons
1997:	0.25 ton/m ²	0.25 t/m ² x 3,780 m ² = 945.0 tons
2002:	0.34 ton/m ²	0.34 t/m ² x 3,780 m ² = 1,300.0 tons
2007:	0.38 ton/m ²	0.38 t/m ² x 3,780 m ² = 1,436.0 tons
2012:	0.40 ton/m ²	0.40 t/m ² x 3,780 m ² = 1,520.0 tons

Table 5-2-5 Production Volume of Steel Products, Plan "b"

Year Products	(Ton)						
	1989/ 90	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
Electricity trans- mission towers	0	0	80	250	400	470	500

Total	320	370	560	930	1,300	1,460	1,520

3) Sales

Table 5-2-6 Sales of Steel Products, Plan "b"

Year Products & Price	(Lac. taka)						
	1989/ 90	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
Electricity Towers(@80,000 Tk)	0	0	64.0	200.0	320.0	376.0	400.0
Portable Bridges(@47,000 Tk)	28.2	23.5	47.0	94.0	164.5	188.0	197.4
Chemical plants(@40,000 Tk)	0	0	12.0	32.0	40.0	56.0	60.0
Steel Racks and Ladders(@35,000 Tk)	28.0	35.0	38.5	45.5	52.5	52.5	52.5
Pontoons & platforms (@50,000 Tk)	50.0	60.0	65.0	70.0	75.0	75.0	75.0
Other(@43,000 Tk)	34.4	43.0	47.3	55.9	64.5	64.5	64.5
Total	140.6	161.5	273.8	497.4	716.5	812.0	849.4

(The unit price of electricity tower is estimated on the basis of the production cost.)

4) Facility plan "b"

To minimize additional investment for the conversion, only minimum modification shall be carried out. Facility for increase of production volume and for manufacturing electricity transmission towers and bridges shall be introduced.

- Partition wall (4m H x 50 m L)
for separating the converted shop and machine shop
- Electric distribution boxes and pipings
- Bending roller ... 1 set
- Punching, shearing & angle cutting machine ... 1 set
for fabricating parts of electricity
transmission towers and bridges
- Turning rollers ... 2 sets
for automatic longitudinal and circular
welding of pipe piles, penstocks, etc.
- Semiautomatic welding machines ... 2 sets
- Semiautomatic gas cutting machines ... 5 sets
- Semiautomatic parallel gas cutting machine ... 1 set
- Traversers ... 2 sets
- Radial hoist cranes ... 3 sets
- Air tools, journal jacks, measuring tools, etc.
- Mold lofting floor (about 300 m²) in the main store

5) Technical training programme "b"

Training at overseas yard	Year 1992	1993
	Trainee (Man-Month)	
Designing bridges, etc.	12	-
Designing steel towers, etc.	12	-
Drawing	12	-
Mold lofting	12	-
Marking, cutting, drilling, etc.	12	-
Assembling, welding	12	-
Quality Control	12	-
Technical assistance to CDD from overseas yards	1992	1993
	Trainer (Man-Month)	
Galvanizing engineer	-	6
Designing engineer	-	12
Total	84	18

(3) Plan "c"

1) Basic concept

Considering the future great domestic demand for steel structures, the fabrication area in Plan "c" is not enough.

Plan "c" is the proposition that new fabrication shops shall be constructed next to and as large as the existing fabrication shop, in addition to the implementation of Plan "b". (Fabrication area becomes 5,940 m² in total.)

2) Production volume of plan "c"

- Improvement of productivity

Year	Target	Production volume
1989:	0.15 ton/m ²	0.15 t/m ² x 2,160 m ² = 324.0 tons
1992:	0.17 ton/m ²	0.17 t/m ² x 2,160 m ² = 370.0 tons
1993:	0.15 ton/m ²	0.15 t/m ² x 5,940 m ² = 891.0 tons
1997:	0.25 ton/m ²	0.25 t/m ² x 5,940 m ² = 1,485.0 tons
2002:	0.34 ton/m ²	0.34 t/m ² x 5,940 m ² = 2,019.6 tons
2007:	0.38 ton/m ²	0.38 t/m ² x 5,940 m ² = 2,257.2 tons
2012:	0.40 ton/m ²	0.40 t/m ² x 5,940 m ² = 2,376.0 tons

Table 5-2-7 Production Volume of Steel Structure, Plan "c"

Year	(Ton)

Total	140.6	161.5	451.1	822.5	1,118	1,242	1,345

4) Facility plan "c"

New facilities for new shops mainly consisting of material handling equipment, and present fabricating machines in addition to the facility mentioned in facility plan "b" are used in production.

- Construction of new shops (18 m x 60 m) ... 2 buildings
- O.T.C. (10 tons) ... 2 sets
- Piping for distribution of compressed air, acetylene gas and oxygen
- Electric power distribution box ... 10 boxes
for welding machines

5) Technical training programme "c"

Technical training shall be carried out according to the same schedule as Plan "b".

(4) Without Project

"Without Project" means that any modifications and reinforcements are not carried out in CDD's facility and under their management.

The following data was prepared as basic data for comparison of feasibility to the above three plans.

1) Production volume

- Improvement of productivity

Year	Target	Production volume
1989:	0.15 ton/m ²	0.15 t/m ² x 2,160 m ² = 324.0 tons
1992:	0.17 ton/m ²	0.17 t/m ² x 2,160 m ² = 367.2 tons
1993:	0.19 ton/m ²	0.19 t/m ² x 2,160 m ² = 410.4 tons
1997:	0.20 ton/m ²	0.20 t/m ² x 2,160 m ² = 432.0 tons
2002:	0.20 ton/m ²	0.20 t/m ² x 2,160 m ² = 432.0 tons
2007:	0.20 ton/m ²	0.20 t/m ² x 2,160 m ² = 432.0 tons
2012:	0.20 ton/m ²	0.20 t/m ² x 2,160 m ² = 432.0 tons

6 SELECTION OF OPTIMUM PLAN

6 SELECTION OF OPTIMUM PLAN

6-1 OUTLINE OF OPTIMUM PLAN

6-1-1 Combination of Each Plan

The outline of the future plan proposed in Chapter 5 is summarized as follows: The estimated investment amount necessary for the implementation of each plan is shown on the following conditions: (1 Taka = 4.35 Yen, at 1989 price)

Plan	Outline	Investment Amount (Lac. taka)
Ship repair Plan "A"	Effective utilization of existing dry dock by way of technical training and additional machinery and equipment	T/A 391.2 Facility 925.2 <hr/> Total 1,316.4
Ship repair Plan "B"	Construction of new docking facility for small sized vessel repair (50 m class x 2 berths), in addition to the implementation of Plan "A"	T/A 391.2 Facility 1,670.6 <hr/> Total 2,061.8
Steel Structure Plan "a"	Upgrading of productivity using existing fabrication shop by way of technical training and additional facility (Fab. shop area: 2,160 m ²)	T/A 64.4 Facility 68.8 <hr/> Total 133.2
Steel Structure Plan "b"	Conversion of one engine shop and one machine shop into a fabrication shop, in addition to the implementation of Plan "a" (Fab. shop area: 3,780 m ²)	T/A 235.4 Facility 159.1 <hr/> Total 394.5
Steel Structure Plan "c"	Construction of a new fabrication shop, in addition to the implementation of Plan "b" (Fab. shop area: 5,940 m ²)	T/A 235.4 Facility 594.1 <hr/> Total 829.5

In order to sound preliminary feasibility of each plan and to find an optimum plan for improving CDD, the following four cases are selected by combining each plan.

Steel Ship Struct. Repair	Plan "a"	Plan "b"	Plan "c"
Plan "A"	Case "1"	Case "2"	
Plan "B"		Case "3"	Case "4"

6-1-2 Selection of an Optimum Plan

(1) Pre-checking of Feasibility

Several improvement plans should be examined as to their worthiness for implementation by financial analysis, so called pre-checking of feasibility.

The pre-checking of feasibility should be examined in accordance with the process as shown in Fig. 6-1-1.

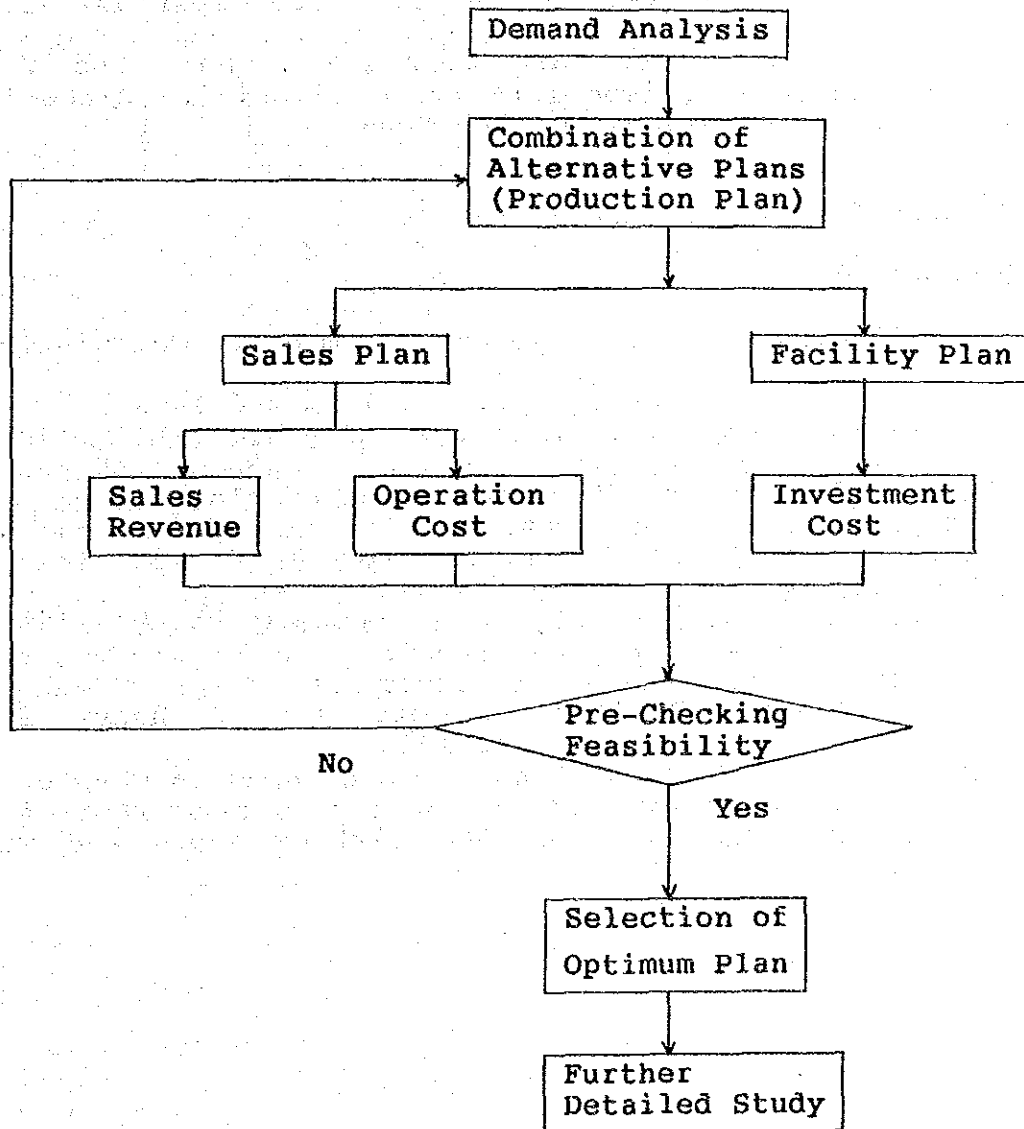

Fig. 6-1-1 Pre-Checking of Feasibility

Since the purpose of pre-checking is to select an optimum plan for further study in detail, the data applied for calculation is estimated at the preliminary level. This section will present the following indexes as the evaluation criteria.

- Financial internal rate of return (FIRR).

FIRR is compared with the interest rate of lending fund from banks and the government. Bangladesh industries procured their fund from banks by around 14% of nominal interest rate per year as on 1985 (BBS, Yearbook 1987). The 4% of real interest rate can be obtained by drawing 10% of the inflation rate from 14%. Thus, the 4% is considered as a minimum rate of profitability since this is the procurement cost of the fund.

(2) Financial Internal Rate of Return

1) Preconditions

The following preconditions are assumed for calculation.

- Period of construction 1992 and 1993
- Operation period 20 years (1993 - 2012)
- Currency exchange rate One taka = 4.35 yen
- No residual value after completion of plan.
- Project revenue and cost to be considered are only expanded portions increased from Base Case (without Project) by implementing the plans.
- Gross operating profit are assumed to be 15% of operation cost for ship repairing and 10% for steel structure, following the study report of "BSEC, Revised Project Proforma on Dry Dock & Heavy Steel Structural Works, September 1982"
- Production and sales plans are presented in Chapter 5.
- Sales and cost by plan are presented from Table 6-1-2 to 6 for demand case of 30% lifting share and Table 6-1-7 to 11 for 40%.

2) Results

Financial profitability of each plan is calculated as follows in terms of FIRR.

Table 6-1-1 FIRR of Each Plan

		(%)			
		Lifting Share	Repairing	Steel	Total
Case	"1"	30	1.4	0.02	1.3
		40	0.9	0.02	0.8
	"2"	30	1.4	6.8	2.8
		40	0.9	6.8	2.4
	"3"	30	4.4	6.8	4.8
		40	5.1	6.8	5.4
	"4"	30	4.4	5.5	4.7
		40	4.1	5.5	5.2

Source: Study Plan

FIRR for both case "3" and "4" exceed the currently prevailing market interest rate of 4%, and case "3" is found to be obtained the highest FIRR.

Case "3" with 30% case of lifting share shall be selected to study further since it obtained the highest FIRR and the difference in FIRR between 30% and 40% could not appreciate much. Cash flow statements for each case are presented from Table 6-1-2 to 11.

Table 6-1-2 Base Case (Without Project, 30%)

6-2 Management and Operation of Optimum Plan

6-2-1 Production Plan

(1) Ship Repair

The quantity of production in ship repair is estimated in Chapter 5, Table 5-1-18 and 22. In order to carry out detail study on the Optimum Plan, dead weight tonnage is considered as the basic value of the quantity of production instead of number of vessels.

The annual production plan of ship repair is shown in Table 6-2-1. This calculation was made under the following conditions:

1) Average dead weight tonnage per vessel

The future vessel size mentioned in Chapter 4, Table 4-2-5 is adopted for the average dead weight tonnage of seagoing vessels to be docked in the future as shown in Table 6-2-1.

The average dead weight tonnage of small vessels in the future is set at 760 DWT per vessel on the basis of the past docking performance.

2) Prospective number of docked vessels

The prospective number of docked vessels estimated in Chapter 5 is adopted. The number of vessels by customers is shown in Table 6-2-1

Table 6-2-1 Average Dead Weight Tonnage and Prospective Number of Docked Vessels

	BSC	Private	Foreign	Total	Small Vessels
Average DWT by customers	12,935	8,403	7,442	-	760

2012/13	17	10	11	38	73

Table 6-2-2 Annual Production Plan of Ship Repair

(1,000 DWT)

Year	BSC	Private	Foreign	Total	Small Vessel
1989/90	103.48	16.81	22.33	142.61	18.24
1992/93	155.22	25.21	29.77	210.20	9.12
1993/94	168.15	25.21	29.77	223.13	26.60
1997/98	194.03	50.42	52.09	296.54	46.36
2002/03	219.90	75.63	74.42	369.94	52.44
2007/08	219.90	84.03	81.86	385.79	55.48
2012/13	219.90	84.03	81.86	385.79	55.48

(2) Steel Structure

Upgrading productivity in planned fabrication shops is a key factor for CDD to keep competitiveness in the market and to meet the demand stated in Chapter 5, Section 5-2-1 "Planning Condition" and the improvement of productivity as shown in Fig. 5-2-2.

Year	Target	Production volume
1989:	0.15 ton/m ²	0.15 t/m ² x 2,160 m ² = 324.0 tons
1992:	0.17 ton/m ²	0.17 t/m ² x 2,160 m ² = 367.2 tons
1993:	0.15 ton/m ²	0.15 t/m ² x 3,780 m ² = 567.0 tons
1997:	0.25 ton/m ²	0.25 t/m ² x 3,780 m ² = 945.0 tons
2002:	0.34 ton/m ²	0.34 t/m ² x 3,780 m ² = 1,300.0 tons
2007:	0.38 ton/m ²	0.38 t/m ² x 3,780 m ² = 1,436.0 tons
2012:	0.40 ton/m ²	0.40 t/m ² x 3,780 m ² = 1,520.0 tons

Increase of production volume is shown in Table 6-2-3.

Table 6-2-3 Production Volume of Steel Products

Year Products	(Ton)						
	1989/ 90	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
Electricity trans- mission towers	0	0	80	250	400	470	500
Portable bridges	60	50	100	200	350	400	420
Chemical plants	0	0	30	80	100	140	150
Steel racks and ladders	80	100	110	130	150	150	150
Pontoons, platforms and tanks	100	120	130	140	150	150	150
Other	80	100	110	130	150	150	150
Total	320	370	560	930	1,300	1,460	1,520

(3) Production Plan of Galvanizing Shop

Such products as steel structural products, pipes for ship repair and shipbuilding, and some products ordered from other outside companies are galvanized.

As to the products ordered from other companies, considerable amounts of electric products and water supply equipment concerned with development projects are expected.

Accordingly, in addition to the planned steel structural products, galvanizing volume is estimated as shown in Table 6-2-4.

Table 6-2-4 Galvanizing Volume Forecast

Year Products	(Ton)						
	1989/ 90	1992/ 93	1993/ 94	1997/ 98	2003/ 04	2007/ 08	2012/ 13
Towers and bridges	0	0	180	450	750	870	920
Pipes for ship repair & shipbuilding	0	0	50	50	50	50	50
Other products	-	-	30	80	130	180	230
Total	-	-	260	580	930	1,100	1,200

Note: i) Galvanizing capacity :

1 ton/hr x 8 hrs x 303 days x 0.5 (Operation rate)
= 1,200 tons/year,

1 ton/hr x 10 hrs x 303 days x 0.5 = 1,500 tons/year

ii) Galvanizing volume is shown in weight tons of steel products.

6-2-2 Manpower and Training Plan

(1) Ship Repair

1) Manpower plan

The necessary manpower is estimated as shown in Table 6-2-6, based on the annual working hour as shown in Table 6-2-5, calculated with the aforementioned production plan on the following conditions:

a) Annual working hours per capita

Annual working days	:	303 days
Average working hours per day	:	7.1 hours
Average overtime per day	:	2 hours
Attendance ratio	:	90 %
Estimated annual working hours per capita	:	2,480 hours

b) Working hours per dead weight tonnage

Based on the past performance of CDD, current working hours per dead weight tonnage of seagoing vessels is calculated at 1.7 hours/DWT. For small vessels, current working hours per dead weight tonnage is set at 5.1, three times that of seagoing vessels.

These average working hours are low due to the insufficient work volume per vessel. Taking into account the future work volume, the average working hour per DWT is assumed to be increased in proportion to the increase of repair items.

c) Improvement of productivity

As a result of technical assistance, it is expected that the productivity of ship repair in CDD is improved as mentioned in Chapter 5, Plan A and B.

d) Subcontracted work

In this study, a subcontracted work system is applied. The percentage of subcontracted work is assumed as follows:

1989/90	0%
1992/93	0%
1993/94	10%
1997/98	20%
2002/03	30%
2007/08	30%
2012/13	30%

Table 6-2-5 Estimated Annual Working Hours

Year	Productivity	Growth rate	Seagoing vessels Hr/DWT	Working hours	Small Vessel Hr/DWT	Working hours
1987/88	1.00	1.00	1.7	-	5.1	-
1989/90	1.06	1.04	1.8	237,866	5.3	91,269
1992/93	1.16	1.10	1.9	338,852	5.6	36,755
1993/94	1.23	1.14	1.9	351,569	5.8	125,734
1997/98	1.67	1.40	2.4	422,610	7.1	198,210
2002/03	1.95	1.87	3.2	603,100	9.5	256,472
2007/08	2.05	2.16	3.7	691,029	11.0	298,131
2012/13	2.05	2.16	3.7	691,029	11.0	298,131

Remark: Working hours = DWT x Hr/DWT / Productivity

Table 6-2-6 Manpower Plan of Direct Workers

Year	Total Working Hours	Skilled Workers	Unskilled Workers	Total
1989/90	329,135	53 (0)	80 (0)	133 (0)
1992/93	375,607	61 (0)	91 (0)	152 (0)
1993/94	477,303	70 (8)	104 (11)	174 (19)
1997/98	620,819	80 (20)	120 (30)	200 (50)
2002/03	859,572	97 (42)	146 (62)	243 (104)
2007/08	989,160	112 (48)	167 (72)	279 (120)
2012/13	989,160	112 (48)	167 (72)	279 (120)

Figures in brackets show the number of subcontracted workers.

2) Training plan

Although techniques and experience have accumulated at CDD for docking repairs in the 8 years since its inauguration, adequate education and training programmes for other ship repair work has to be implemented for engineers and workers in order to increase their proficiency and improve CDD's productivity.

These activities consist of:

- dispatch of CDD's engineers to an advanced shipbuilding country
- engagement of experts from an advanced shipbuilding country

The training plan is shown in Table 6-2-7.

Table 6-2-7 Training Plan for Ship Repair

1. Training in Overseas Shipyards			
Technical Fields	Number of Trainees	Period (Month)	Man-Months
Engineers Management (Costing, Scheduling, Financing)	1	6	6
Hull	1	6	6
Machinery	2	6	12
Electric	1	6	6
Casting	1	6	6
Quality Control	1	6	6
Total	7		48
2. Technical Assistance from Overseas Shipyard			
Technical Fields	Number of Experts	Period (Month)	Man-Months
Engineers			
Hull	1	12	12
Machinery	1	12	12
Electric	1	12	12
Mechanical	1	12	12
Welding	1	6	6
Total	5		54

(2) Steel Structure

1) Estimation of working hours

Production efficiency is shown in average working hours per ton.

CDD's production efficiency(Hr/ton)is shown in Table 5-2-1.

After execution of this project, improved production efficiency and annual working hours per year is estimated as shown in Table 6-2-8.

Table 6-2-8 Estimation of Annual Working Hours

Year		(1,000 hours)						
		1987/ 88	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
Efficiency factor		1.00	1.21	1.30	1.80	2.21	2.42	2.52
Products	Hr/ton							
Electricity towers	450	0	0	27.7	62.5	81.5	87.4	88.6
Portable bridges	400	16.0	16.5	30.8	44.5	63.3	66.1	66.1
Chemical plants	400	0	0	9.2	17.8	18.1	23.1	23.6
Steel racks and ladders	220	15.4	18.2	18.6	15.9	14.9	13.6	13.0
Pontoons & platforms	270	27.0	27.0	27.0	21.0	18.3	16.7	15.9
Other steel structures	500	40.0	41.3	42.3	36.1	33.9	31.0	29.5
Other	-	30.6	34.3	51.9	65.9	76.7	79.3	78.9
Total	-	129.0	137.3	207.5	263.7	306.7	317.2	315.6

Note: Annual working hours = (Production weight tons x Hr/ton) / Efficiency factor

2) Manpower plan

a) Manpower of steel structure shop

The number of workers is calculated using the following formula:

Annual total working hours/2,480 hours per man = Number of workers

Table 6-2-9 shows the manpower plan for steel structure work.

Table 6-2-9 Manpower Programme

Year	1987/ 88	1992/ 93	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
<u>Employee increase</u>							
Skilled workers	-	0	7	5	4	0	0
Unskilled workers	-	0	3	2	2	0	0
Subtotal	-	0	10	7	6	0	0
<u>Subcon. increase</u>							
Skilled workers	-	2	13	10	8	3	0
Unskilled workers	-	1	6	5	4	1	0
Subtotal	-	3	19	15	12	4	0
<u>No. of workers by skill</u>							
Skilled workers	37	39	59	74	86	89	89
Unskilled workers	15	16	25	32	38	39	39
Grand total	52	55	84	106	124	128	128

b) Manpower of galvanizing shop

In the estimation of manpower, the efficiency factor is assumed to be a half of the Japanese standard galvanizing shop. Number of workers is shown in Table 6-2-10.

Table 6-2-10 Manpower Plan of Galvanizing Shop

Year	1993/ 94	1997/ 98	2002/ 03	2007/ 08	2012/ 13
<u>Stage & Manpower</u>					
<u>Pretreatment stage</u>					
Skilled workers	2	3	4	4	5
Unskilled workers	3	4	4	5	5
<u>Galvanizing stage</u>					
Skilled workers	2	3	4	5	5
Unskilled workers	3	4	5	5	5
Engineers	1	1	1	1	1
Total	11	15	18	20	21

3) Training plan

To increase the capacity of production, such measures as reinforcement of sales promotion, development of new clients and expansion of product items, is necessary for CDD to get more orders.

As a short-term goal, CDD is expected to play its part in various construction projects as a subcontractor and conduct stable operation of fabrication shops in order to accumulate technical expertise, and then, CDD aims at obtaining a good reputation and position as a main contractor in the future.

Fostering design technology is imperative for CDD to achieve this goal.

To begin with, the training of assigned designers for the purpose of the design of electricity transmission towers and bridges shall be carried out in the overseas steel fabrication yard according to the schedule as shown in Table 6-2-11.

Table 6-2-11 Technical Training Programme

Training at overseas yard	Year 1992 Trainee (Man-Month)	1993
Designing bridges, etc.	12	-
Designing steel towers, etc.	12	-
Drawing	12	-
Mold lofting	12	-
Marking, cutting, drilling, etc.	12	-
Assembling, welding	12	-
Quality Control	12	-
Technical assistance to CDD from overseas yard	1992 Trainer (Man-Month)	1993
Galvanizing engineer	-	6
Designing engineer	-	12
Total	84	18

(3) Overall Yearly Manpower Plan

The overall yearly manpower plan is made as shown in Table 6-2-12.

Table 6-2-12 Manpower Planning

Year	Officers & Staff	Indirect Workers			Direct Workers			Total
		Ship Repair	Machine Shop	Steel Structure	Galv. Shop	Galv. Shop		
1989	301	55	133 (0)	17	52 (0)	0 (0)	558 (0)	
1992	306	55	152 (0)	18	52 (3)	0 (0)	583 (3)	
1993	313	57	174 (19)	20	62 (22)	5 (5)	631 (46)	
1997	320	58	200 (50)	21	69 (37)	7 (7)	675 (94)	
2002	330	60	243 (104)	23	75 (49)	9 (8)	739 (161)	
2007	335	61	279 (120)	25	75 (53)	10 (9)	785 (183)	
2012	335	61	279 (120)	25	75 (53)	10 (10)	785 (183)	

Figures in brackets show the subcontracted workers.

6-2-3 Material Procurement

Regarding material procurement, it is considered that, in principle, all materials available locally are used. The procurement of materials necessary for the implementation of production plan is planned as follows:

- (1) Ship Repair Work
 - 1) Imported materials
 - Steel materials of special quality
 - Marine paint
 - Mechanical and electric parts
 - 2) Local materials
 - Steel materials necessary for general repair work
 - Zinc anode
 - Consumables (Sand for blasting, welding rod etc.)
 - Other

- (2) Steel Structure Work
 - 1) Imported materials
 - Zinc plated bolts and nuts for electricity transmission towers
 - Checkered plates for portable bridges
 - Raw zinc material for galvanizing
 - 2) Local materials
 - Steel materials from Chittagong Steel Mills Ltd. and National Tubes Ltd.
 - Welding consumables
 - Paint
 - Chemicals for galvanizing
 - Other

It is one of the most important factor for shipyard management to procure these materials on time, for a cheaper price and of good quality.

CDD has established their own material procurement system. With the implementation of the plan, the procurement of materials increase both in quality and variety. Therefore, the following countermeasures should be considered:

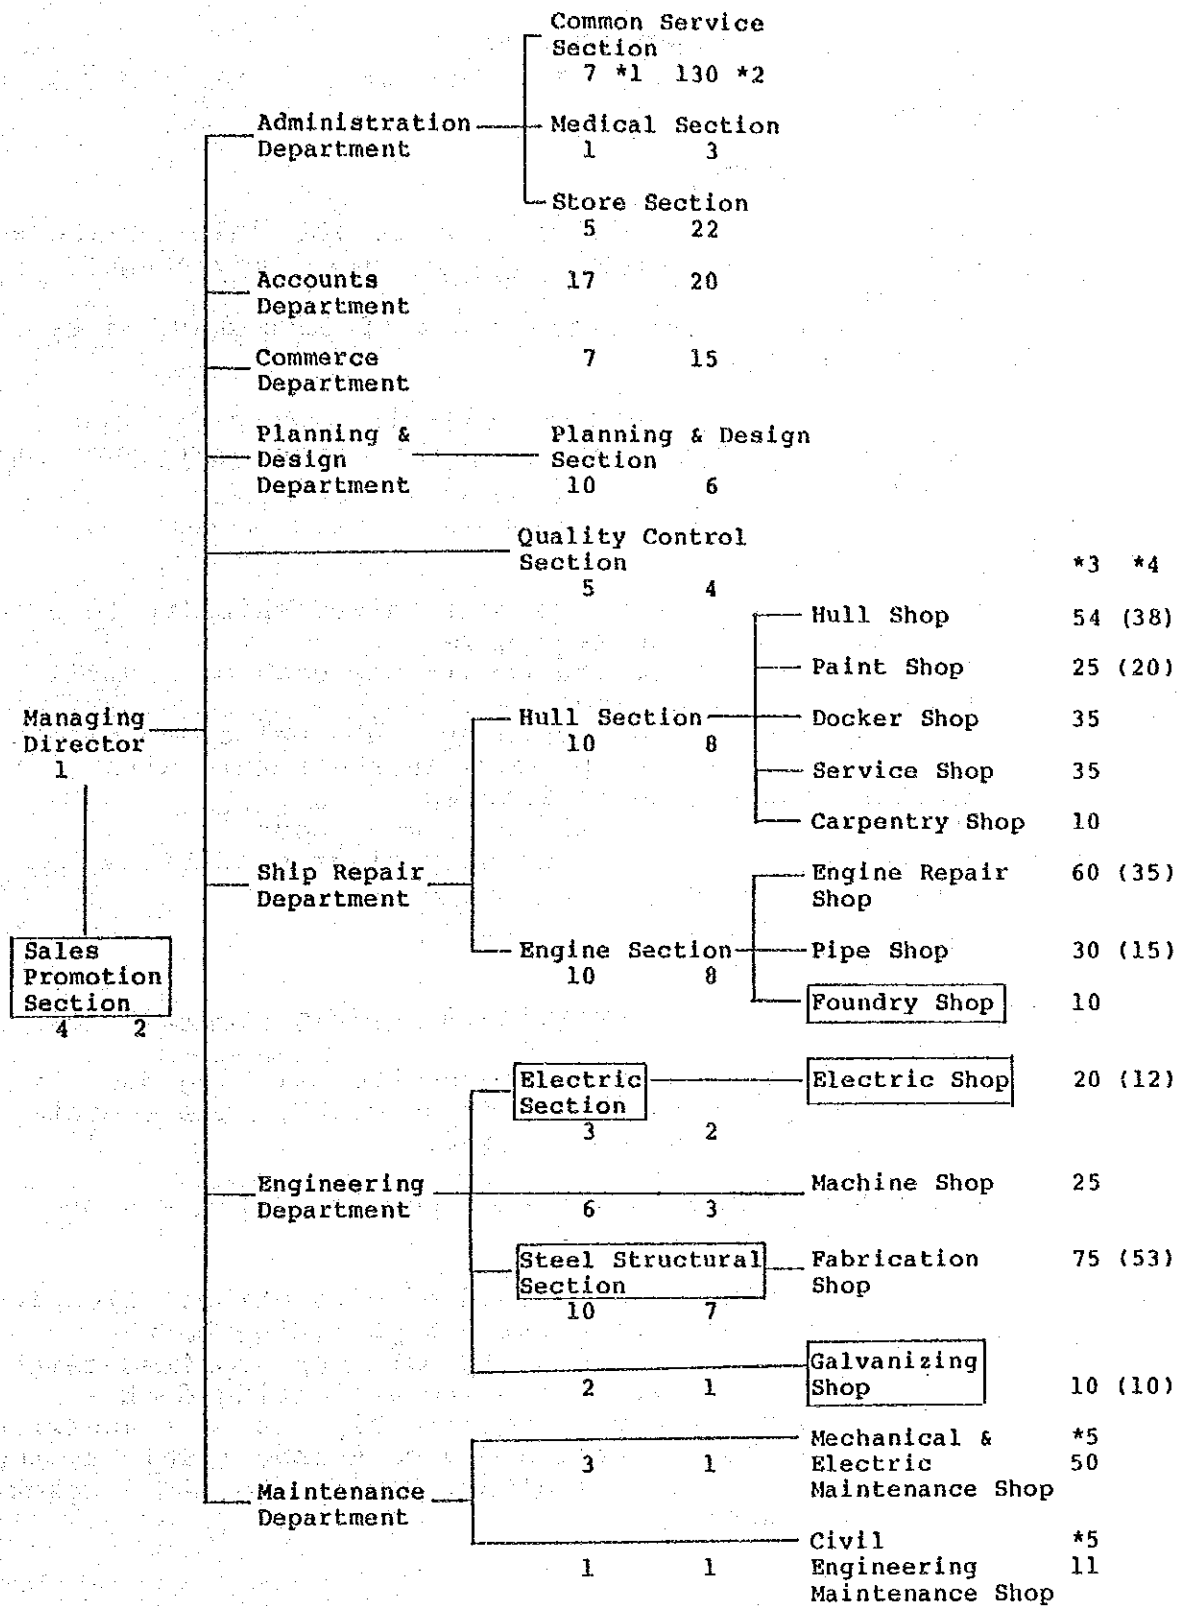

- Review of proper kinds and quality of fast moving materials
- Review of present material procurement procedures and prompt action of it
- Planning of suitable procurement and stock in accordance with production plan
- Preparation, in advance, of such imported materials that will take a long time for delivery (for example, it is useful to prepare materials for ship repair prior to their docking by getting information in advance)

6-2-4 Organization

The current organization of CDD seems to be relatively reasonable. But it still is necessary for CDD to reorganize so that every departments can display their function more efficiently, in accordance with the future production plan.

The organization chart shown in Fig. 6-2-1 is recommended. This organization is drafted in consideration of the following points:

- 1) This organization shall cover the present facilities and the newly planned facilities.
- 2) The Administration Department shall have a minimum number of members and the Common Service Section covers all office work relating to the production department.
- 3) The Sales Promotion section shall be newly organized and operated under the control of the Managing Director.
- 4) A newly planned Foundry Shop shall be put under the control of the Engine Section.
- 5) The Electric Section shall be newly organized.
- 6) The Steel Structure Section shall be newly established. The existing fabrication shop shall be operated under this section.
- 7) A newly built galvanizing shop shall be organized in the Engineering Department.
- 8) The technical officers group consists of engineers, assistant engineers, sub assistant engineers and foremen.

Remark: *1 Officer
 *2 Staff
 *3 Direct Worker
 *4 Subcontracted Worker
 *5 Indirect Worker

* The figures show the number of personnels in 2012/13.
 * The newly established sections and shops are shown in rectangulars.

Fig. 6-2-1 Recommended Organization Chart

6-3 NEW FACILITIES OF OPTIMUM PLAN

6-3-1 Ship Repair

(1) Drydocking System

There are several kinds of systems for ship repair and shipbuilding in which there are advantages and disadvantages.

Table 6-3-1 is a comparison table of each docking system in a general way.

In this study, taking the following preconditions into consideration, four plans have been proposed and analyzed.

1) Preconditions

- a) To be able to repair two small sized ships (up to 50 m in length) , at the same time
- b) To be able to build and repair one each of a small sized ship at the same time
- c) To be able to build a ship of 3,000 DWT class coastal cargo vessel (Max. 4,000 DWT) in the future with little modification of the facilities
- d) To minimize the initial investment cost
- e) Natural conditions, especially river conditions
- f) Future expansion or conversion

2) Proposed plans

Plan A : Expansion of existing dock (Fig. 6-3-1)

This is a plan to expand the existing dock by 100 m towards the dock head. The intermediate gate is also considered.

Plan B : A floating dock system combined with a shore berth (Fig. 6-3-2)

This plan is comprised of conventional floating docks and ship repair/shipbuilding berths. The launching of newly built or repaired ships in a berth is done using a floating dock. When necessary, a repair ship can be transferred to a shore berth, and vice versa. (This system was adopted in ItalThai Marine Ltd. in Bangkok, Thailand)

Table 6-3-1 Comparison of Drydocking System (General)

Item	Slipway System	Graving Dock	Floating Dock	Shiplift
1. Operational possibilities	In general for shiprepair and shipbuilding. In principle, for small and medium-sized vessel.	Depending on design used for shiprepair and shipbuilding.	Normally, for repair only.	For shipbuilding and repair.
2. Productivity and flexibility	The number of vessels to be repaired or built at the same time depends on the number of berths. Accessibility is good.	Depending on the size of dock, one or two vessels can be docked. Accessibility is not good, because of the difference in height between dock bottom and ground level.	Only one ship can be repaired. Accessibility is restricted due to the high side walls.	In principle, same as slipway system.
3. Future extension	Can be extended in longitudinal and transverse direction, within a limit of bearing force.	Normally, no extension possible.	In principle, possible to extend in longitudinal.	Can be extended in longitudinal without problems by adding hoists and platform sections.
4. Docking time	Approx. 1 hour.	Time spent depends on pump capacity. Standard: 5-6 hours.	Medium docking time usually required, depending on pump capacity	Approx. 1 hour.
5. Operation	Experienced and skilled dockers required.	Simple operation	Required skill of personnel.	Required skill of personnel.
6. Maintenance	Cradle-Periodically sand-blasted and painted. Groundway-Required periodic replacement.	Gate-Periodic drydocking required.	Dock structure-Protection of steel structure against corrosion required.	Platform-Occasionally blasted and painted. Machinery-Occasional overhaul required. Wire rope-Sample testing and replacement on a recommended schedule.
7. Maintenance cost per year	2 - 3 % of initial cost	1 % of initial cost	4-5 % of initial cost	2 - 3 % of initial cost
8. Siltation	Care be taken to underwater of slipway.	Problems be occurred at dock entrance.	Care be paid to clearance between dock bottom and sea bed.	Care be paid to clearance between platform and sea bed.
9. Service life	15 - 20 years	30 years	15 - 20 years	20 - 25 years
10. Initial cost	Low	High	Relatively high	Relatively high

Plan C : Shiplift system (Fig. 6-3-3)

A typical mechanical shiplift system is considered. The major components of this system are:

- Liftdock (Docking recess, platform, lifting hoist, etc.)
- Ship transfer (Side transfer pit, transfer carriages, etc.)
- Shipbuilding and/or repair berth

Plan D : Slipway (Fig. 6-3-4)

This system is almost the same as the one normally used in the Bangladeshi shipyards.

Table 6-3-2 shows a comparison of the features of each proposed plan. From this table, it can be found that there are advantages and disadvantages in each plan. In the case when numerous repair vessels are expected, Plan "B" and Plan "C" are effective. However, the demand for CDD is not greatly expected, consequently, Plan "D" (Slipway system) is recommendable from the view of minimum investment, simple operation, easy expansion, etc. as shown in Table 6-3-2.

3) Slipway system

a) Scale of slipway

The scale of the slipway is decided so that whichever bigger of the two ships up to 50 m in length for ship repair or 3,000DWT class coastal cargo vessel (Max. 4,000DWT) for shipbuilding in the future can be accommodated.

The dimension of these types of vessels is as follows:

<u>350GT Fishing trawler</u>	<u>3,000DWT Cargo boat(4,000DWT)</u>
Loa = 50.0 m	Loa = 82.5 m (100.0 m)
Lpp = 45.0 m	Lpp = 75.0 m (90.0 m)
B = 8.0 m	B = 13.2 m (14.3 m)
D = 5.9 m	D = 6.6 m (7.7 m)

In light weight condition

Displacement = 600 T
 df = 1.2 m
 da = 4.2 m
 dm = 2.7 m
 (Incl. keel depth)

In launching condition

Displacement = 1,000-1,250 T
 df = 0.5-0.6 m
 da = 2.5-2.6 m
 dm = 1.5-1.6 m

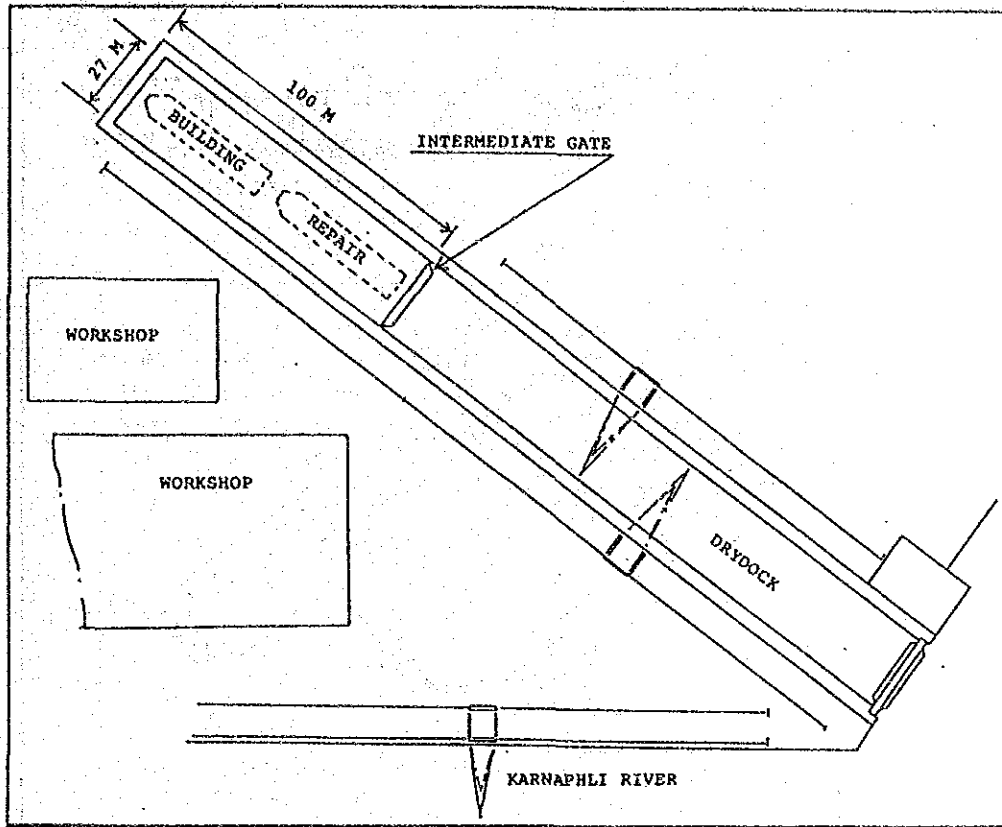

Fig. 6-3-1 Expansion of Existing Dock (PLAN "A")

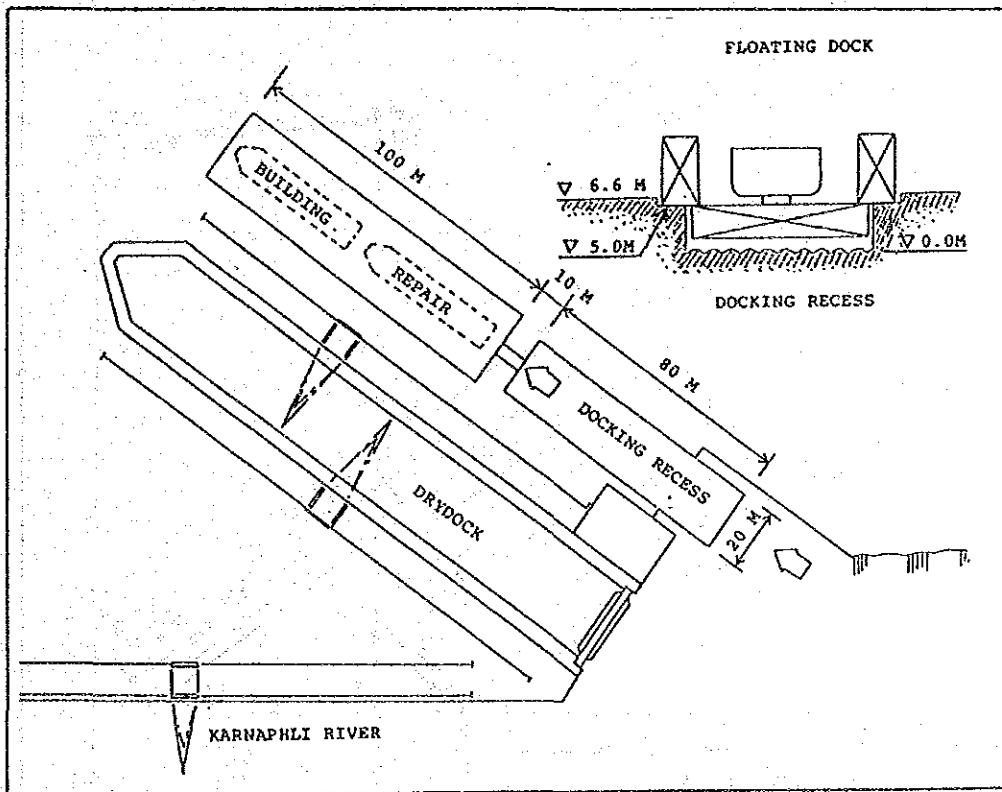

Fig. 6-3-2 Floating Dock System (PLAN "B")

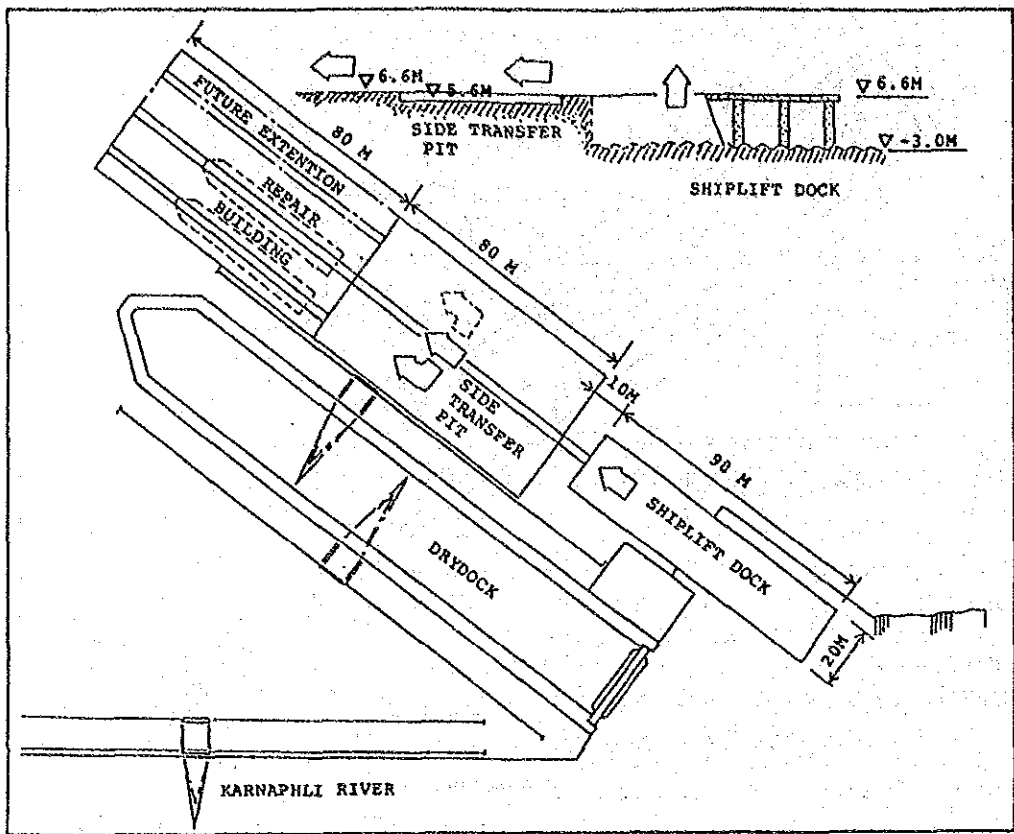

Fig. 6-3-3 Shiplift System (PLAN "C")

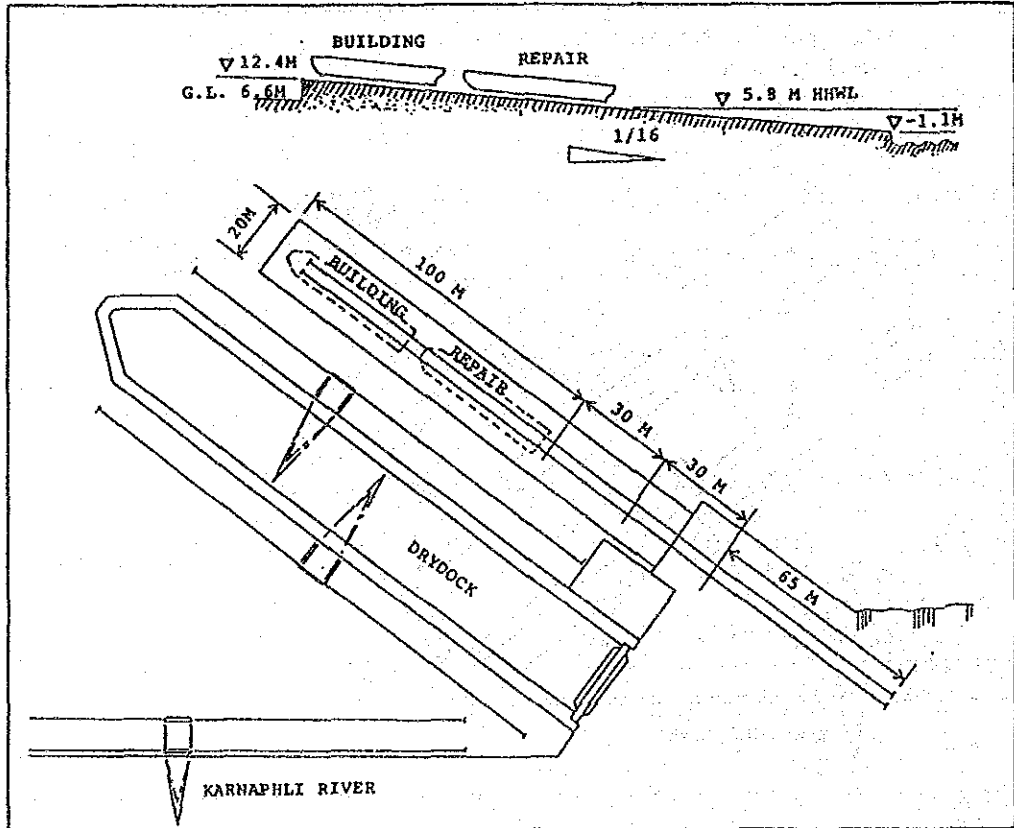

Fig. 6-3-4 Slipway System (PLAN "D")

Table 6-3-2 Comparison of Proposed Docking System

ITEM	PLAN "A" (Expansion of Drydock)	PLAN "B" (Floating Dock)	PLAN "C" (Shiplift)	PLAN "D" (Slipway)
1. Layout	No specific obstruction. Can be kept space for No. 2 Drydock in future. Portside dock crane (40T) available by extending crane rails. ○	Space for No.2 Drydock is allotted. Difficult to find mooring space for Floating dock. Starboard dockside crane (15T) available. △	Space for No.2 Drydock is utilized. Starboard dockside crane available by some extension of crane rails. ○	Space for No.2 Drydock is allotted. Starboard crane available. ○
2. Future Expansion	Difficult △	Difficult X	Difficult X	Not so Difficult ○
3. Flexibility	Both build and repair of small sized vessels can be done at the same time. In case of building up to 4,000 DWT class vessel, repair for small sized vessels can not be done. △	Both build and repair up to class "2" vessels can be done at the same time. ○	Same as PLAN "B" ○	Same as PLAN "A" △
4. Operation	Simple ○	Difficult X	Rather difficult △	Simple ○
5. Maintenance	Minor maintenance ○	Maintenance of dock structure done using existing drydock. △	Required proper maintenance of mechanical/ electrical parts. △	Minor maintenance ○
6. Siltation	Little influence. ○	A little influence for docking recess. △	Much influence, because enough clearance needed between platform and river bed. X	Little influence ○
7. Initial Investment	Large X	Medium △	Relatively large X	Small ○
General Judgement	△	X	X	○

Based on the above figures, the necessary dimension of the slipway becomes as follows:

Railway length = 100m (50m x 2)

Width of ship repair berth = 13m (9m + 2m x 2)

Width of shipbuilding berth = 18.3m (14.3m + 2m x 2)

As for the width of the berth, 13 m is enough for the two 50 m long class ships to be repaired. However, considering the difficulty of widening the berth in the future, 18.3 m in width should be taken so as to afford the docking of shallow draft-wide breadth type of ships and coastal cargo vessels.

b) Type of slipway

There are two types of slipways : ordinary type and semi-dock type as shown below.

Ordinary type

Semi-dock type

Considering the present site conditions, there exists the following problems in adopting the ordinary type. (See Fig. 6-3-4)

- Longer slipways will be required due to big tide differences.
- Working floor level will be considerably higher than ground level.
- Existing underwater concrete floor makes it difficult to stretch slipway into river.
- Maintenance of underwater slipway is difficult, especially the siltation problem is unavoidable.
- Wide range of cofferdam is required while under construction, and this may disturb the current docking operation.
- In case of launching, complicated launching preparation will be required.

On the other hand, by adopting the semi-dock type, these problems can be avoided.

c) Location of slipway

Fig. 6-3-5 shows the location of the semi-dock type of slipway. The slipway is being placed within the reach of existing starboard dockside crane(15 tons of lifting capacity).

d) Docking and undocking plan

Fig.6-3-6 shows the arrangement of docking on slipway for 350GT fishing trawlers.

After the keel is touching the top of the hauling cradles, the water inside the slipway is pumped out by using the existing dry dock dewatering pumps. When undocking, filling the water into the slipway is done through the valves installed on the dock gate.

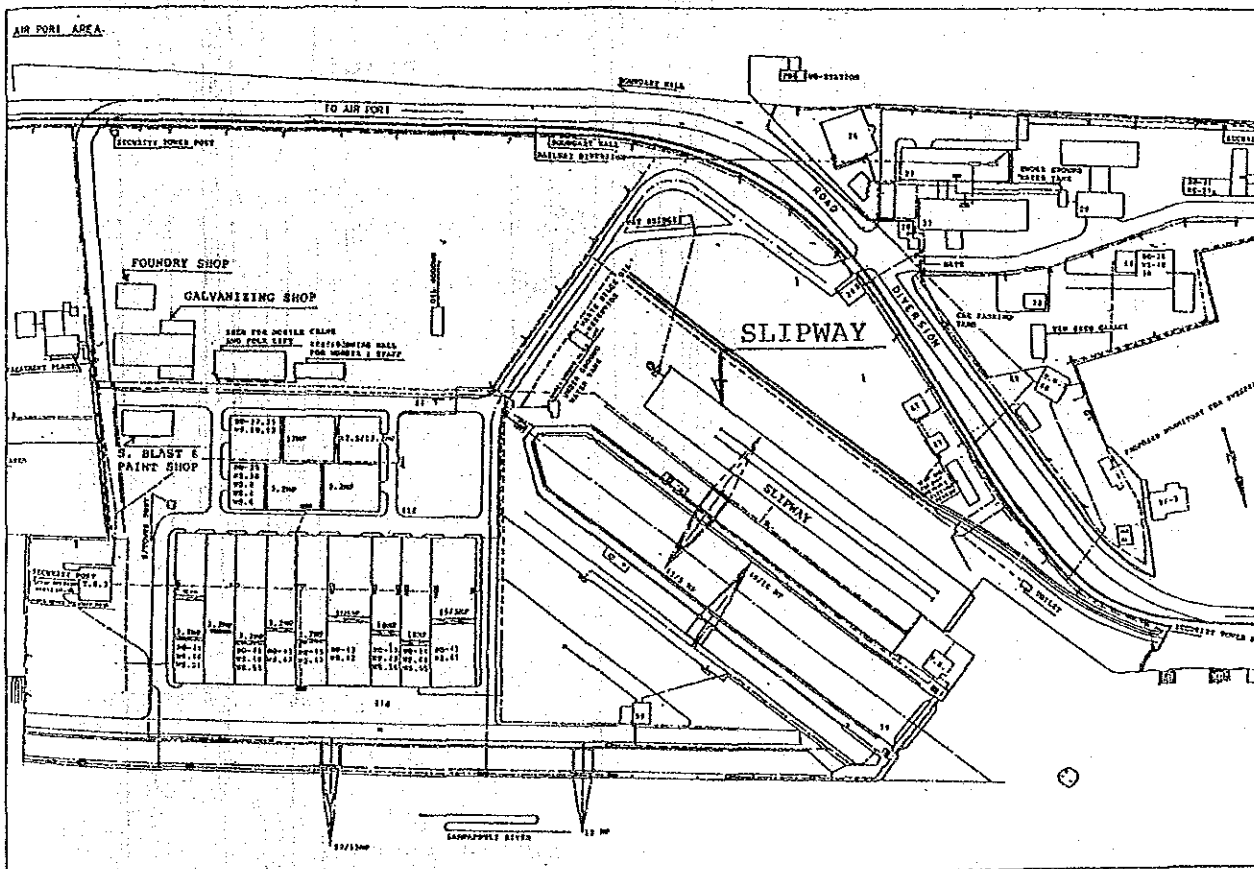

Fig. 6-3-5 Location of Slipway

Fig. 6-3-6 Arrangement of Docking on Slipway

(2) Machinery and Equipment

Taking into account the future work volume and prospective ship repair work, additional machinery and equipment is indispensable.

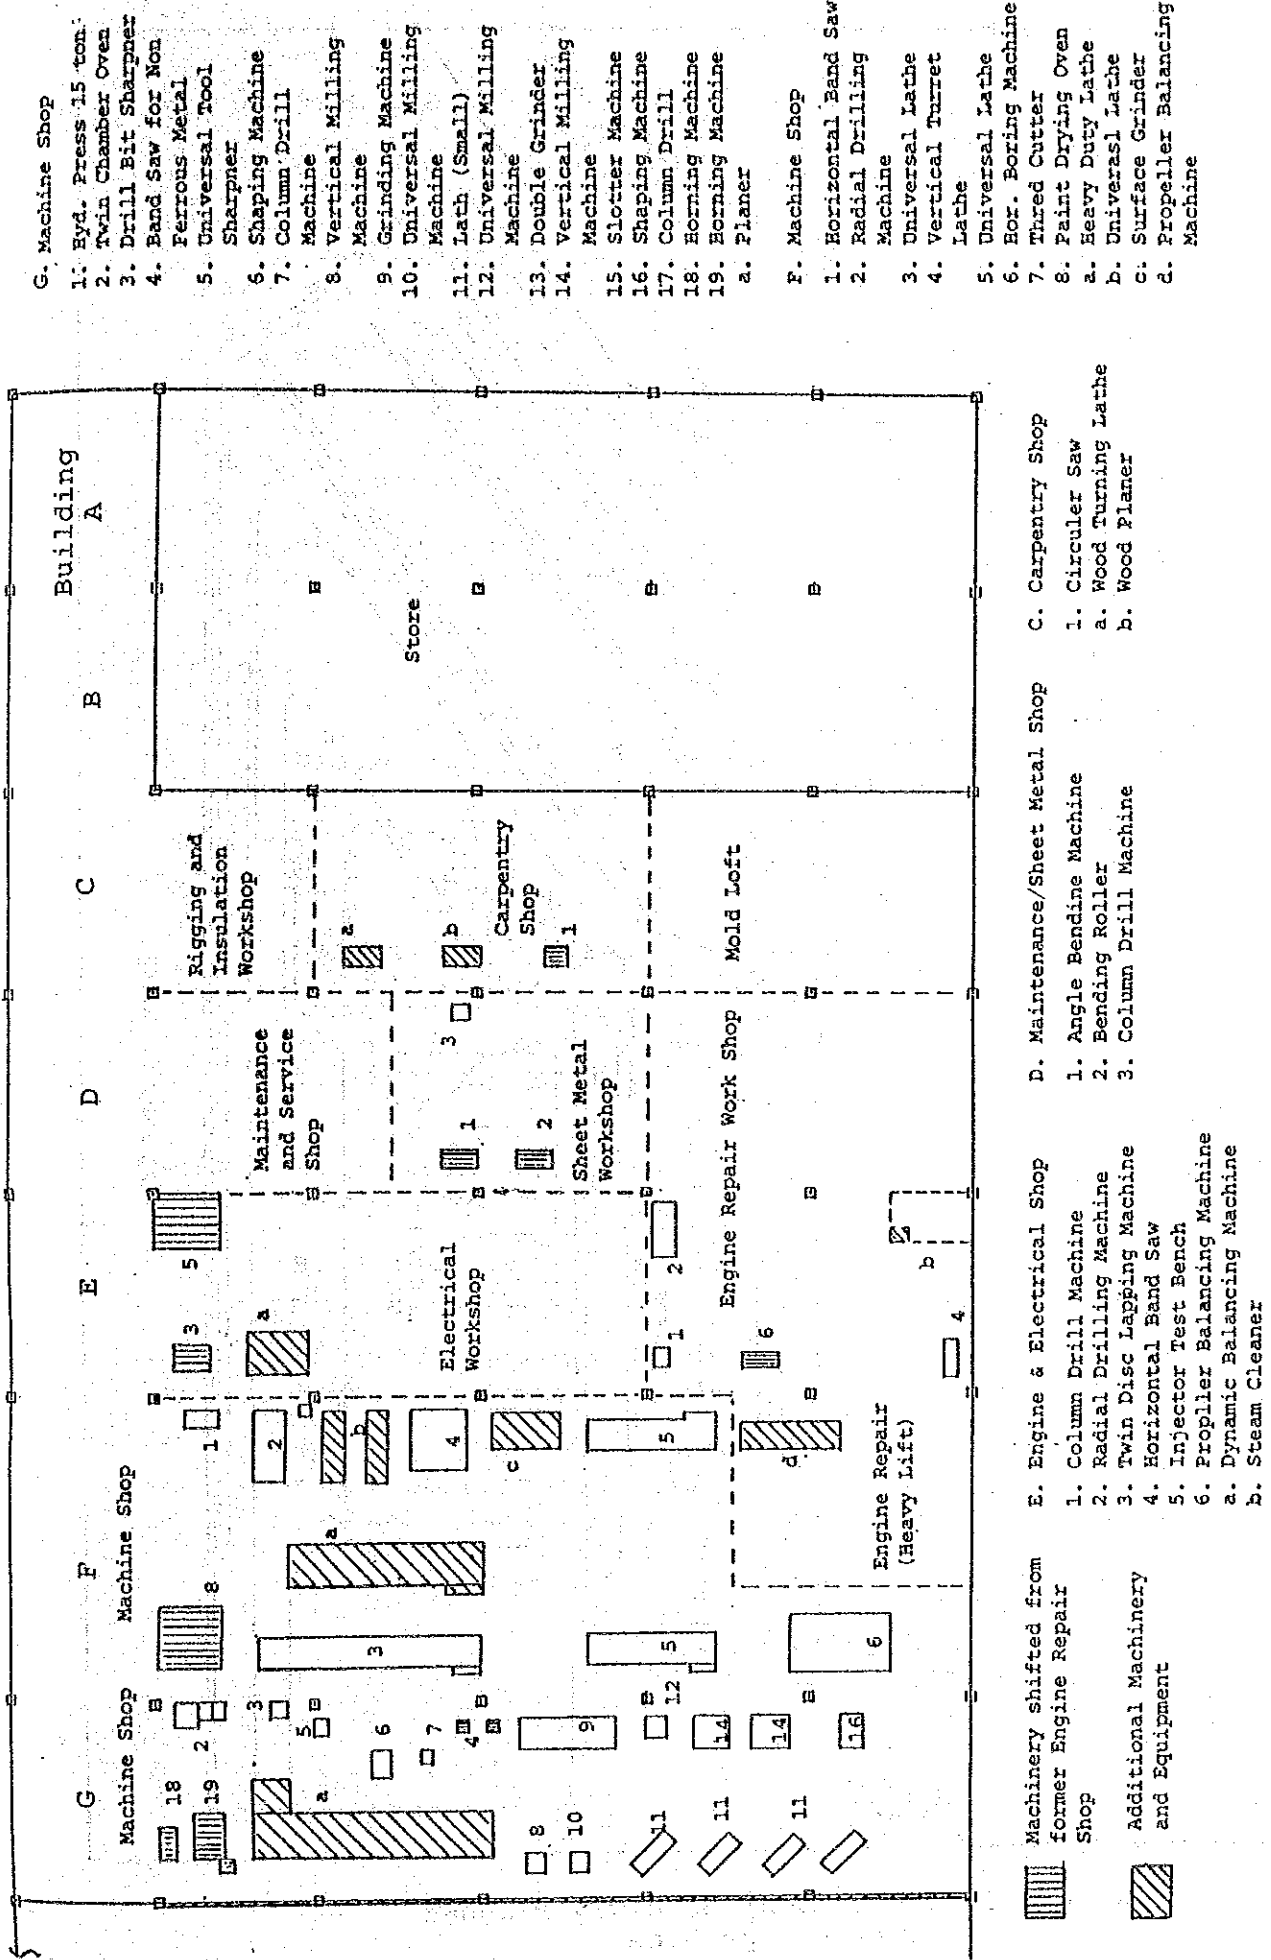

The outline of additional facilities is shown in Table 6-3-3.

The layout of workshop machinery and the arrangement of newly planned utility pipe line is shown in Fig. 6-3-7 and 6-3-8.

Table 6-3-3 Outline of Additional Facilities

No.	Item	Unit	Main Particulars
1	Utility		
	(1) Air compressor and piping	1	30 m ³ x 7 kg/cm ² 2 sets
	(2) Compressor house	1	
	(3) Oxygen and acetylene manifold	1	Fixed x 2 sets Portable x 10 sets
	(4) Drinking water piping	1	From WASA line
2.	Workshop		
	(1) Static balancing for propeller	1	Max. dia 5.5 m
	(2) Lathe machine	1	Center distance 9 m Supporting capacity 15 tons
	(3) Lathe machine	2	Center distance 2.5m Swing over bed 1.4 m
	(4) Planer	1	Cutting length 4 m Cutting width 1.4 m
	(5) Surface grinder	1	Table length 1.2 m Table width 0.6 m
	(6) Attachment for boring & milling	1	Boring bar, milling head, etc.
	(7) Dynamic balancing machine	1	Max. diameter 1.6 m Center distance 3 m

No.	Item	Unit	Main Particulars
3.	Ship repair workshop		
	(1) Electrical apparatus testing equipment	1	Testing and measuring equipment
	(2) Testing equipment for heavy cargo gear	1	Weighing scale and weight
	(3) Steam cleaner	2	Capacity 300 L/min.
4.	Paint shop		
	(1) Sand blasting equipment	6	Capacity sand 400kg
	(2) High pressure water pump	2	300 kg/cm ² 100 L/min.
5.	Carpenter's workshop		
	(1) Wood turning lathe	1	Center distance 1 m Swing over bed 0.7 m
	(2) Wood planer	1	Cutting width 0.3 m
6.	Foundry		
	(1) Building	1	16 m x 10 m
	(2) Casting equipment	1	Tilt crucible with furnace
	(3) Remetaling equipment	1	Ladle, soldering bath, crucible, etc.
4.	Tools		
	(1) Hand tools	1	Mechanic Electrician Fitter Carpenter Plumber
	(2) Cutting tool		
	(3) Measuring tool		
	(4) Lifting tool		
	(5) Pneumatic tool		
	(6) Electrical tool		
	(7) Gas cutting tool		
	(8) Welding tool		
	(9) Protectors		
	(10) Scaffoldings		

G. Machine Shop

1. Hyd. Press 15 ton
2. Twin Chamber Oven
3. Drill Bit Sharpener
4. Band Saw for Non Ferrous Metal
5. Universal Tool Sharpener
6. Shaping Machine
7. Column Drill Machine
8. Vertical Milling Machine
9. Grinding Machine
10. Universal Milling Machine
11. Lath (Small)
12. Universal Milling Machine
13. Double Grinder
14. Vertical Milling Machine
15. Slotter Machine
16. Shaping Machine
17. Column Drill
18. Horning Machine
19. Horning Machine
- a. Planer

F. Machine Shop

1. Horizontal Band Saw
2. Radial Drilling Machine
3. Universal Lathe
4. Vertical Turret Lathe
5. Universal Lathe
6. Hor. Boring Machine
7. Thred Cutter
8. Paint Drying Oven
- a. Heavy Duty Lathe
- b. Univerasl Lathe
- c. Surface Grinder
- d. Propeller Balancing Machine

E. Engine & Electrical Shop

1. Column Drill Machine
2. Radial Drilling Machine
3. Twin Disc Lapping Machine
4. Horizontal Band Saw
5. Injector Test Bench
6. Propeller Balancing Machine
- a. Dynamic Balancing Machine
- b. Steam Cleaner

D. Maintenance/Sheet Metal Shop

1. Angle Bendine Machine
2. Bending Roller
3. Column Drill Machine

C. Carpentry Shop

1. Circuler Saw
- a. Wood Turning Lathe
- b. Wood Planer

Machinery shifted from former Engine Repair Shop
