#### 7.5.2 Pavement Structural Survey

A total of 80 points were examined at the left hand side of every route in order to conduct physical measurement and visual inspection of the pavement. Cutting was done at an average interval of 1,500 m at 8 routes with the exception of Old Kigogo Road, and all of the streets in area 9. Inspection points are presented in Appendix 7.3.3.

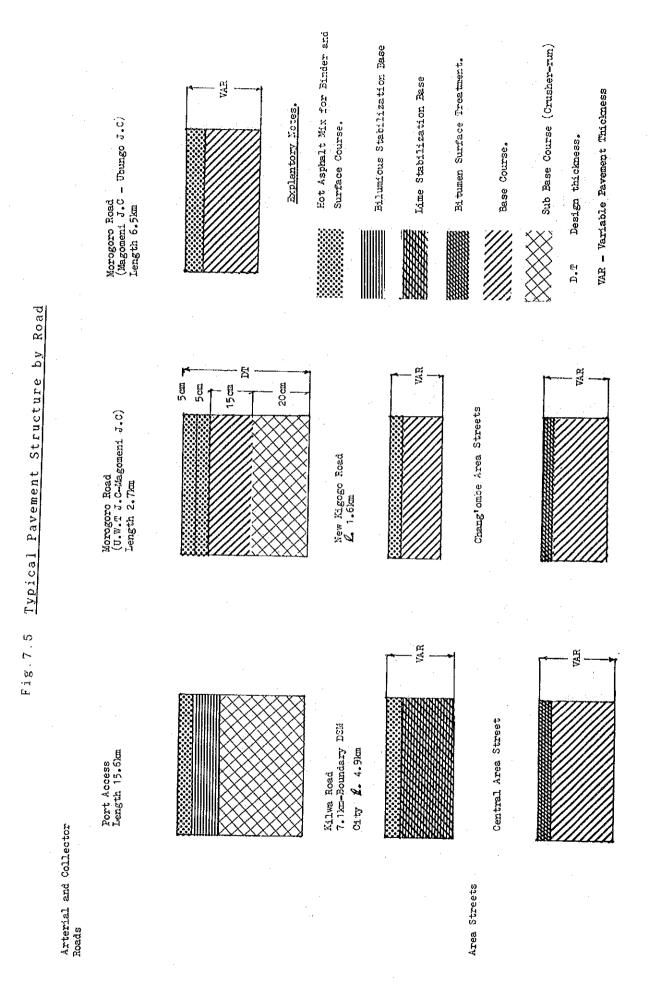

The roads in the city of Dar es Salaam have two types of surface courses, asphaltic concrete layer and mituminous surface treatment layer, both of which are hot mix type pavements.

Hot mix type asphaltic concrete surface, which is a relatively high cost pavement compared to other types, has been observed in arterial roads, such as Morogoro Road and Uhulu Road. Most ofthe roads in the city, however, are constructed with low cost pavement, bitu minous surface treatment surface. They are further classified into two types, namely single bituminous surface (SBST) and double bituminous surface treatment (DBST).

Pavement structure consists of soil or an aggregate subbase on a subgrade of selected materials, crushed stone base course and bituminous surface. Subbase materials, however, were not distingushable from the base materials since they are similar and of the same size.

Typical pavement structures constructed on roads in the city are presented in Fig. 7.5. The type of surface and thickness of each layer depends on the classification of road. In the case of Kilwa Road which is designated as an arterial road/trunk road linking Dar es Salaam with Kibiti, the base course materials are comprised of a lime stabilized soil.

Inspection results on pavement thickness are presented in Appendix 7.3.4. On the basis of the measurments taken at the site, an effective depth of pavement by road is estimated for the purpose of overlay design, as shown in Table 7.7.

Name of Road	Depth of Sub/Base <u>Courses</u> (cm)	Depth of Surface <u>Course</u> (cm)	Effective Depth of <u>Pavement</u> (cm)
Group 1: Arterial/Collector Roads			
1. Old Bagamoyo Road	12	0	12
2. Old Kigogo Road	0	0	8
3. Shekilango Road	10	0	10
4. Morocco/New Kigogo/	12	3	15
5. Kinondoni Street	10	2	12
6 Morogoro Road up to Ubungo	15	7	22
Ubungo – 3km TRM	10	4	14
7. Uhuru Road	12	4	16
8. Gerezani/Bandari Roads	10	4	14
9. Kilwa Road	10	4	14
10. Chang'ombe Road	12	1.5	13

# Table 7.7 Effective Depth of Pavement

## 7.5.3 Quarry Site Survey

A quarry site survey was conducted at the following quarries to observe the general condition of quarry operations and sites.

- Kunduchi Area Quarries

(M/S Stone and Concrete Products Limited, and MECCO Kunduchi)

 Msolwa Quarry near Chalinze (MECCO Msolwa)

- Mikese Quarries near Morogoro
  - (Mikese MOCW quarry, Wade Adam's Maseyu quarry, C.G. Tensen Mikese quarry and Kajima quarry)

The location of each quarry is presented in Appendix 7.3.5 and the following are general observations made by the Study Team:

- Kunduchi Quarry Aggregates;

Most of the aggregates are mixed with a red clay soil during the production process, which may have a negative influence on the construction of pavement during the rainy season. Some aggregates are not suitable for the wearing course materials, so that the adaptability for pavement surface should be checked carefully before use.

The quarry sites are located 20 km north from Dar es Salaam so that transportation cost is likely to be cheaper than that of other quarries.

 Msolwa and Mikese Quarry Aggregates: These materials have a high specific gravity and a low water absorption value compared to Kunduchi aggregates. Materials are suitable for both pavement base and surface courses. The ploblem, however, is the long distance between the quarry sites and Dar es Salaam City (150 km to 175 km approx.) which results in higher transportation cost and lower capacity of daily output of pavement construction.

#### 7.6 Identification of Problems and Issues on the Existing Roads

The following are the main problems and issues which have been identified by the Study Team through study and field investigations on the existing roads in Dar es Salaam City.

#### (1) Pavement Condition of Roads in the City

A PSI survey was conducted on all arterial and collector roads and a section local roads which have been proposed by DCC as priority roads to identify the deterioration level of pavement of each road.

The survey revealed that almost 80 % of roads have deteriorated seriously to the level where overlay or reconstruction measures are required as shown below:

Roads Subject to	Total Road Length Required for					
the Study	Length	Maintenance	Overlay	Reconstruction		
Arterial Roads	148.5	52.5	81.3	14 7		
Collector Roads	65.5	11.6	22.3	31.6		
Local Roads	91.2	0.0	32.3	58.9		
Total	305.2 ki	n 64.1 km	135.9 km	105.2 km		
	(100.0%)	(21.0%)	( 44.5%)	(34.5%)		

The above table shows that the pavement on collector and local roads has deteriorated more seriously than that of arterial roads.

The excessive damaged of these roads has been caused mainly because of the following reasons:

- Increase of overloaded heavy vehicles
- Poor maintenance of roadside and storm drainage structures
- Unsuitable materials used in pavement structures
- Inadequate pavement design and construction
- Small maintenenace capacity due to shortage of funds and equipment which has accelerated yearly damages on pavement

# (2) Situation of Road Congestion

Congestion levels on the existing roads was examined applying the congestion ratio (C.R.) on the basis of road inventory and present traffic volume counted by the Study Team.

The study revealed that the following five (5) roads have very high levels of C.R. over 1.5 which identifies them as beeing heavily congested throughout the day. These roads urgently require improvement measures through widening from 2 to 4 lanes.

C	ongested Roads	<u>C.R.</u>	Length	Section
1.	Uhuru Road	1.91	0.9 km	From Msinbazi to New Kigogo Rd.
2.	Sokoine Road	1.88	0.8 km	Central Area
3.	Morogoro Road	1.68	4.8 km	From Morocco to Port Access
4.	Bagamoyo Road	1.60	3.0 km	From Upanga to Morocco Road
5.	Upanga Road	1.52	1.8 km	Tanganika Mtr. to Selender Br.

# (3) Improvement of Intersections

The intersections controlled by roundabouts have become overloaded in the central area due to an increase of traffic in recent years. The folloing two (2) intersections should be upgraded to signal controlled intersections in order to meet the peak flows:

- Tanganyika Motor Roundabout at Upanga Road

- Junction at Uhulu and Mwinzima Roads

Another three(3) roundabouts in the city center area may also be in need of improvement, however, they must be improved simultaneously along with traffic devices, parking lots and bus bays so as to maximize the effect of investments.

# (4) Provision of Bus Bay

Due to the inappropriate location of bus stops and insufficient numbers of bus bays for passengers, main roads often experience serious traffic congestion in the morning and evening peak hours. In order to improve the situation, bus bays with sufficient space should be provided at appropriate locations, particularly on the following roads where daily traffic volume have exceeded 10,000 per day: (See Fig. 7.6)

- Uhuru Road (Msimbazi Junction 4 lanes Section)
- Morogoro Road (Morocco Junction Port Access Junction)
- Morocco Road (New Bagamoyo Junction Morogoro Junction)
- New Bagamoyo Road (Slender Br. Mpakani Junction)

#### (5) Roadside and Storm Drainage Structures

Lack of proper maintenance of roadside drainage is one of the major causes of pavement deterioration. Since pavement durability is greatly affected by water, maintenance of drainage structures is essential for extending pavement life.

Most of the roads located in the urban areas are properly served by lined channel or underground piped drainage systems, with the exception of the roads which have been constructed without development plans. All the entrances of gullies should be cleared of soil and debris by routine maintenance to ensure the discharge of surface water and to minimize troubles for road users.

Many sections of roads had been blocked and damaged by floodings which frequently occured during this years rainy season. These floodings have been caused mainly by poor drainage maintenance. The programme of renewal and improvement on storm drainage systems is expected to be implemented as soon as possible.

# (6) Other Issues

#### - Road Inventory

The inventories of the city roads are not available in the office of City Council. Since the inventories provide basic information about engineering and traffic characteristics of the city roads, they would be essential reference sources for subsequent engineering and maintenance work.

#### Design Criteria

Design criteria for city roads is also not unavailable in the City Council. The basic design features to be applied for urban roads, such as design speed, axle load limits, width of carriageway and shoulder etc. are essential not only for the design but also for the maintenance of the existing roads.(6)

# 7.7 Roads Selected for Further Study

The Study Team has selected the roads with a total length of 200 km approx. for further improvement in terms of short, middle and long plans. Selection was made taking into consideration the following factors:

Pavement deterioration;

A average PSI value of a road less than 2.5 which equals the level ay which a road requires improvement by either overlay or reconstruction.

Road Congestion;

A congestion Ratio of a road more than 1.5 which equals the level at which a road requires improvement by widening.

Priority Roads Proposed by DCC; Roads are considered to be important from the view point of social and economic activities.

If any of the above factors apply to a road, it will be identified as one which requires further study.

Based on the above criteria, 116.6 km over 35 arterial and collector roads and 88.7 km over 129 local roads in 8 areas are selected for further study as shown in Table 7.8,

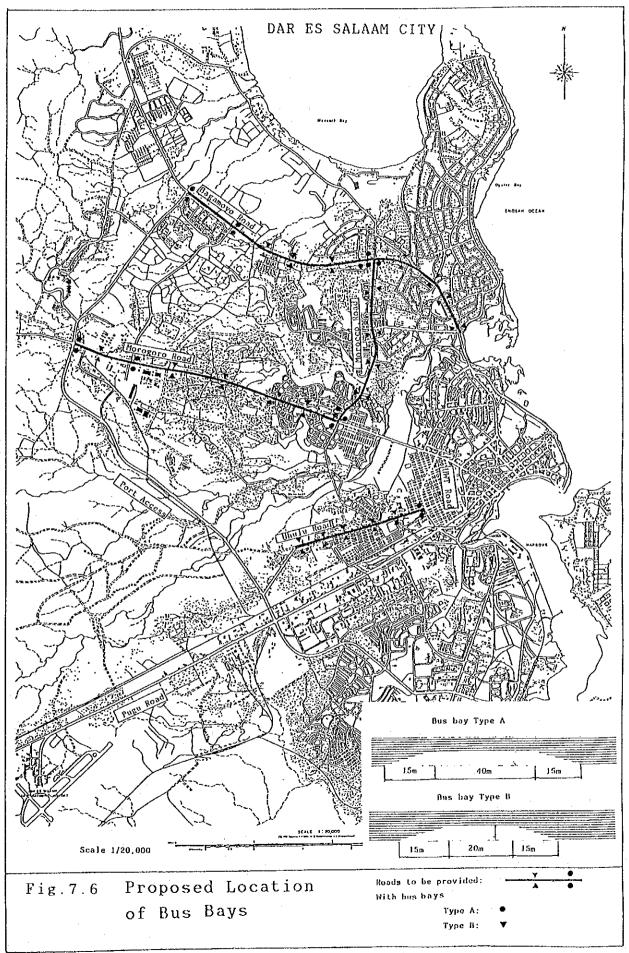

Name of Roads	Subject Roads Total Length	Roads	Pavement Deterio. Ave. PSI less 2.5		Roads Selected for Fur- ther Sdy.

Note:

 (1) The roads with <u>/</u>1 to <u>/</u>5 are located in the areas proposed by DCC as follows: <u>/</u>1; Oyster Bay Area, <u>/</u>2; Mwinjuma Area, <u>/</u>3; Magomeni Area <u>/</u>4; Central Area, <u>/</u>5; Kariakoo Area
 (2) Roads with \* are additionally proposed by DCC.
 (3) Roads with \*\* requires improvement by widening to 4-lane.

(4) Roads with underline are selected by the Study Team for further study with a total length of 200 km approx.

#### CHAPTER 8 EXISTING ROAD MAINTENANCE AND OPERATION SYSTEM

8.1 Present Road Maintenance Conditions

The road network of Dar es Salaam City consists of 1,150km in total, of which 450 km are asphalt roads and 700 km are gravel and earth roads. Presently, most of these roads have deteriorated to the extent that normal routine maintenance is no longer cost effective.

The excessive damage of Dar es Salaam City roads has been caused due to the following principal factors.

- (1) Long time lack of proper and timely maintenance.
- (2) Inadequacy of funds available each year for roads maintenance, rehabilitation and reconstruction.
- (3) Lack of equipment and plants for road maintenance and construction.
- (4) Higher rate of city growth in all aspects as compared to the ability of the City Authority to provide the required infrastructure.

It may be said that trunk roads are generally fair in road maintenance except the city center sites which are rather idle in maintenance. Surface of the asphalt pavement streets are deteriorated to a gravel one and not flat for a long distance, of which pavement crossfalls are mostly worn out lowering carriage way surface than that of the shoulders.

Defects of the asphalt pavement, neglect of the surface drainage, clogging of drain pipes and undredging ditches and unhauling the sand heaped on the streets are seen in many places in the centre area of DSM.

Outside of the city center in urban, called suburban, there are Districts, Divisions and Wards including Temeke, Chang'ombe,Ilala, Magomeni, Kinondoni, Kariakoo and Kusutu, etc. which show good arrangement of the streets and houses,

however, the maintenance of their streets have long been neglected.

On general streets, there are fair conditions in road maintenance with side drains protected by concrete plates or masonry walls but pavement edges are damaged in many places which are due to lack of curb stone or pavement stopper along them. Many potholes are seen on the street surface.

8.2 Present Maintenance System

8.2.1 Road Maintenance Programme

As to the road maintenance in DSM City, the Trunk Road Maintenance Unit (TRM) of the Ministry of Communications and Works is carrying out the maintenance of the trunk road, out of which the city center sections are maintained by Dar es Salaam City Council (DCC).

According to the DCC Integrated Programme, 1988/89-1992 /93, about 89 km of asphalting, 131 km of grvelling, and 80 km of rehabilitation were intended to be done by the City Council, however, the first year programme had not been done, which are due to inadequecy of funds available for road maintenance and rehabilitation.

In accordance with the maintenance results of TRM, routine works of grass cutting, drainage cleaning and repairing of the signal pole have been carried out but the periodical work as improving and repairing were deferred until when equipment and spare parts be procured to be used.

Refering to the actual road maintenance length conducted in the past five years, regarding which New Kigogo road, 2 km long, has been constructed in Magomeni area by DCC and improvement of the Morogoro road and construction of Selender bridge have been done by a financial assistance of the Japanese Government.

Future road maintenance programme, which was worked out in the DSM City Council Integrated Programme (1988-93), however, seems likely difficult to carry out successfully, under existing condition.

Daily production of road maintenance work per meter by unit, which are very small because of the lack of resources of budget, materials, and manpower to be available. According to a recent TRM monthly record, about 90,000  $m^2$  of vegetation control, 22,000  $m^2$  of road cleaning and 4,500  $m^2$ of curb cleaning have been carried out in a month under its routine maintenance works, employing a total of 120 labourers.

#### 8.2.2 Budgetary Allocation and Expenditure

The maintenance expenditure of DCC was not much comparing to the total recurrent expenditure. The ratio is as shown in Table 8.1.

IUDIC 0.1	Rodd Hal	ncenance	Expendicule for o years			
			(Unit	t: Thousand	l Tsh)	
	1983/84	1984/85	1985/86	1986/87	1987/88

Table 8.1 Road Maintenance Expenditure for 5 years

Note: The figures in ( )is for the whole Engineering Dept. Separate data for road is not available in 1983/84. 8.2.3 Organization of Maintenance Office

The road maintenance activity has been carried out by the Road Section of the Engineering Department of the City Council. The Road Section has two divisions which are Road Maintenance Division and the Road Design, Planning and Construction Division which are shown in Fig. 8.1, and has four maintenance depots in the districts of the city, as the field activity offices, on the other hand as a repair shop of the equipments, vehicles and plants.

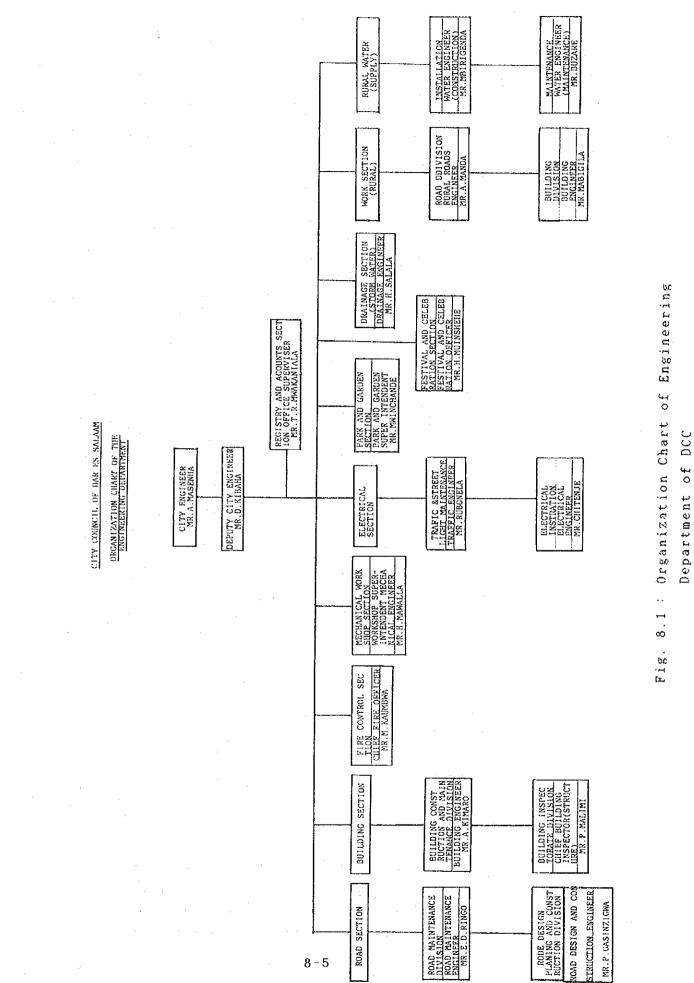

There is the DCC Main Depot which has to practice the maintenance/repairing of all equipment/vehicles from other sections as Building, Fire Control, Electrical and other sections of all Department of DCC, because the Main Depot is belong to the Mechanical Work Shop Section of the Engineering Department of DCC.

#### 8.2.4 Jurisdiction of Each Maintenance Units

The four maintenance depots are located in respective districts in DSM as the field maintenance offices of the Road Section. Each depot, however, is very small in scale and have no adequate equipment/vchicles for the maintenance of the long distance roads of more than 600 km of urban and 500 km of suburbarn road in DSM.

The space of DCC Main Depot along the Pugu road at Chang'ombe has been occupied with a lot of vehicle scraps and irrepairable equipment/plants, so there is no space even to clean the vehicle for inspection and furthermore, the facilities are seen to be uneffective in their arrangement.

At present, the main work of the Depot is to supply fuel to the vehicles from other DCC sections, whereas new idea for the construction of a work-shop shall be worked out for an increasing equipment/vehicles to be maintained.

There are Pugu road, Port access road Maintenance Unit of which organization chart are shown in Fig. 8.2 and TRM Coast Region under the Ministry of Communications and Works for the maintenance of the trunk roads, and they have been well equipped, so the maintenance of the trunk roads are rather good but Kilwa road.

8.3 Present Road Maintenance Operation

#### 8.3.1 Maintenance Activity

There are following categories in the road maintenance works:

<u>Routine maintenance:</u> required continuously on every roads as grass cutting, drain clearing, recutting ditches, culvert maintenance, road sign maintenance.

<u>Periodic maintenance:</u> regravelling, repairing rut dragging, grading, potholes, patching, repairing edges, sealing cracks, surface dressing.

Instead of the works of drainage, sand haulling, filling potholes and restoring scoured surface, routine maintenance works have been carried out on the major roads.

8.3.2 Workmanship of Maintenance Activities

Maintenance activities are carrying out inadequate method, the results of the works seems likely unfair, though the works being carried out by a local contractor are rather good. The local contractors will be fully available for the road maintenance works.

According to the inventory studies over the Main Depot, almost all equipment/vehicles have long been out of work, and there seems no possibility of repairing them because of lack of spare parts, materials and mostly have become scrap.

#### 8.3.3 Availability of Materials

Because materials required for construction are mostly imported from abroad, the Goverment of Tanzania allows to supply fuels/lubrication comparatively fairly in DSM, but other materials as machinery, spare parts for equipment are rather restricted.

Cement; which is being manufactured with 1,250,000 tons of yearly productive capacity, and a production of 356,000 tons (1985), 473,000 tons (1986), are reported respectively (JETRO) and there is Tanzania Portland Cement Factory Co., Ltd at Wazo Hill about 23 km north of DSM.

Asphalt; which is imported from abroad and an oil refinary plant (Italy) is to be opened next year, so local asphalt will be available for the use of road maintenance and asphalt mix is manufactured at the plant of Mwananchi Engineering & Construction Co., Ltd in DSM.

Gravelling material, limestone; which is obtained from Kunduch Beach about 22 km north of DSM.

Aggregate; which is obtained from Morogoro area, about 140km north of DSM.

8.3.4 Capacity of Local Contractors

The construction contractors in Tanzania are requested to be registered to the Ministry as an approved contractor. There are about 36 companies as class one, which is for the projects exceeding Tsh 120,000,000/ for only one project.

These contractors will be fully available for the road maintenance works.

8.4 Present Workshop and Equipment.

This survey was conducted to examine the adequacy of road maintenance equipment and workshop and to identify the existing problems on the equipment and workshop.

8.4.1 Workshop Organization/Facilities

(1) Main Depot.

Main depot is situated along Pugu road within the Dar es Salaam City centre ( See Apppendix 8-1-1 ). The function of this depot is to maintain all the equipment and vehicles belong to the Engineering Department and other Department of DCC.

#### a) Building

The present buildings of the main depot were built 40 years ago by the British Government and its layout is shown in Appendix 8-2-1.

#### b) Organization chart of the main depot

The main depot consists of the following sections as heavy duty vehicle, tractor and earth moving equipment, premix plant, land rover, light duty vehicle, tyre shop, motor-cycle, health Mwananyamala, fire, engine room, machine shop, service, auto-electric, welding, panel beating/spray painting and office machines section as shown in Fig. 8.3, Table 8.2 and Appendix 8-1-3.

Heavy duty vehicle section is intended for repairing lorries above 3 tons. Tractor and earth moving equipment section is intended for repair construction equipment such as bulldozer, wheel loader, road roller and power train. Pre-mix plant section is intended for repairing asphalt mixture, mixabatch.

# Table 8.2 Facilities of the Main Depot

<u>No.</u>	Name of Block	<u>Sq.m</u>	Description
1.	Administ. Block	175	1. Record & switch board room
			2. Depot Surperintendent room
			3. Engineers room
			4. Transport Officer room
			5 Administ. Officers room
2.	Gate house	7	1. Watchman
3.	Elect. Dispensary	825	1
4.	Heavy duty work sho	р	
	and motor cycle	480	1. Tyre gage, Auto Electric,
			Motor cycle shop
			2. Like scrap workshop
5.	Store & greasing.	300	1. Keeping some material and
:			spareparts
6.	Land rover garage	700	1. Keeping scrap land rover.
7.	Heavy plant worksho	p450	1. Crowded with scraps
8.	Petrol, Diesel Tank		
	Stand	75	1. Petrol super 13000 lts
			Regular 4500 lts
9.	Panel beating spray		
	painting weldingsho	p150	1. Ark welding set 1
•			Gas welding set 1

The workshop is headed by the Depot Superintendent, under him there is an assistant executive engineer (mechanical) and the two are overseeing 16 sections.

# c) Present facilities and tools at main depot

There are very few facilities in the main depot and shor -tage of workshop tools as shown in Appendix 8-2-5. For example, the depot does not have enough box sets for each section and special tool such as hydraulic press for final drive system, help puller front hub and rear hub.

(4) Arrangement of Facility

The fuel stands are poorly arranged (see Appendix 8-2-1). The arrangement is causing a queue during fuelling of vehicle and equipment.

	Name of	Tota	1		Not

Table 8.3 List of present facilities in main depot

Note /1: The facilities require repair.

# (2) <u>Road maintenance division and its relationship with the</u> main Depot

The relationship between main depot and site depot is that all the operators and mechanics are dispatched from the main depot to site depots.

#### a) Site depot (see Appendix 8-2-4)

There are four construction site depots namely, Ilala garden, Kisutu, Kigogo road and Temek. These depots are directly under the road maintenance engineer.

-<u>Ilala garden depot</u>: The depot is located along Uhuru road some 4km from main depot. The depot consists of one tool store, two good-win batch mix machine and manual tools such as shovels, forks and hoes. There are three mechanics who are supposed to undertake minor repairs of machines on site. The operators and mechanics are under the main depot.

-<u>Kisutu depot</u>: The depot is located at the junction of Ally Khan annd Olimpia Street some 6 km from main depot. The depot consists of administration block and a few manual tools like shovels fork and hoes.

All the manpower allocated to that depot with an exception of a few clerks and watchman are engaged in road maintenance works. They are supposed to collect the pre-mix asphalt from the Ilala garden depot.

<u>Temeke depot</u>: The depot is located along Temeke road, some 8 km from the main depot. The depot consists of one administration block and a handful of manual tools. All the manpower except a few watchman are engaged in road maintenance work in Temeke district. They are supposed to collect their pre-mix asphalt from Ilala garden depot

<u>Kigogo depot</u>: The depot is situated along Kigogo road, some 10 km from main depot. The depot consists of one administration office and few manual tools. All the staff allocated to this depot with an exception of a few clerks and watchman are engaged in road maintenance works in Kinondoni district. They are supposed to receive their supplies of asphalt from Ilala garden depot.

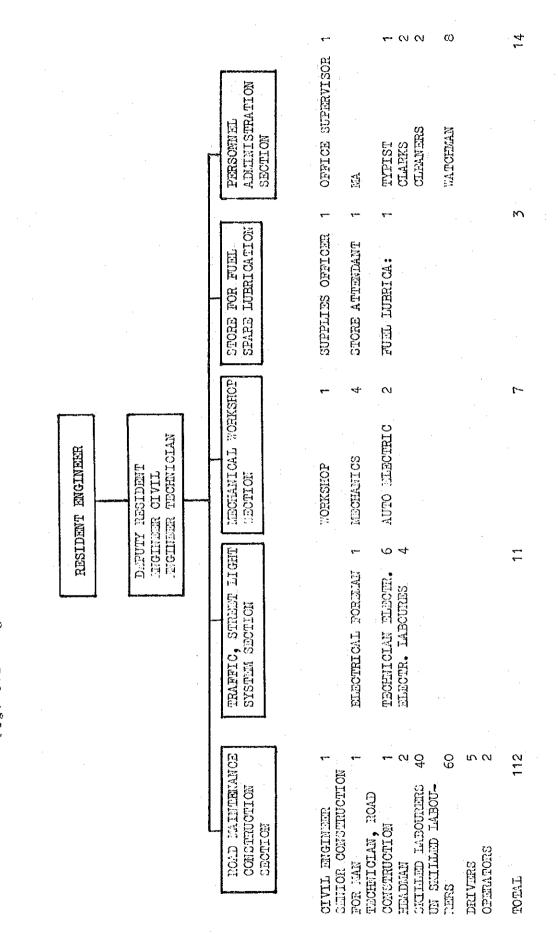

# (3) The Port Access/Pugu road Maintenance Unit

This depot is situated along the Pugu road. The function of this depot is to undertake repair of the maintenance equipment to be used for Pugu and Port Access road, including repair of light system such as bulbs and poles.

They operate a small garage for minor repair on equipment and vehicle for the Ministry of Communications and Works. The unit does not have enough workshop equipment and sufficient manpower.

There is no direct relation between this depot (Maintenance Unit) and the main depot of DCC. Fig. 8.2 shows the organization chart of Port Access/Pugu Road Depot.

Fig. 8.2 Organization Chart of Port Access/Pugu Road Depots

8.4.2 Staff organization.

(1) Number of mechanics and operators in main depot

There are four mechanics who are fully engaged in repairing road maintenance equipment, locating in the pre-mix section.

There are fifteen mechanics in tractor and earth moving equipment section and twenty mechanics in the heavy section. They are repairing road maintenance equipment and other general repair.

Two operators are for batch mixer, two for steel rollers, three for motor graders and two for wheel loader. These makes a total of 9 operators. There are forteen drivers for Isuzu tipper.

(2) Technical level in main depot

a) Mechanic

Level of mechanic is not sufficient, for example, they does not know "How to properly fix propeller shafts" and How to properly fix construction tyre for wheel loader and wheel tyre tractor.

The number of qualified mechanics is very few in the organization. There are no technicians of grade I, II and III. There are only 14 technicians with grade IV. The rests are just assistant technicians and apprentices.

b) <u>Operators</u>

They do not know: -how to carry out inspection before and after work -daily check

-how to loading tipper

For example, <u>KOMATSU</u> wheel loader loading up to 11 ton dump truck, cycle time is 8 min. This is very low level.

#### c) Employment and training

There are two categories of mechanics and operators, category one are those, whose salary scale is below MS.3 (i.e less than Tsh 3,065/ per month, and category two are those who are above MS2 (i.e more than Tsh 3,065/ per month).

For employment of mechanics and operators in category two, permission from the local government service commission should be sought. This commission is responsible for staffing and training of skilled manpower in all the councils in Tanzania.

Most operators and mechanics in main depot are below MS. 3 scale, and the employment of this category staff does not requir any permission from the local goverment service commission.

Training of mechanics and operators whose scales are below MS3 is supposed to be arranged by DCC through the training officer. Presently there is no clear and defined training system for mechanics and operators.

#### 8.4.3 Spare Parts/Storage System

The spare parts supply and storage are under the city store officer in the city finance department. (see Fig. 8.3)

When an equipment is damaged and spare part is needed for replacement, the depot superintendent will write a requisition for spares to the city store officer.

8.4.4 Equipment for Road Maintenance.

# a) Number of equipment

Road maintenance in DCC has 24 construction equipment units, one steel roller is working but other equipment do not work, and only 14 tippers are working. This shows great shortage of equipment.

Shortage of funds have always hindered DCC' desire to replace old equipment, most of which are beyond their econimic lives.

#### b) Type of equipment

Road maintenance division of DCC have kinds of equipment, these are loading, dig and excavator, road maintenance plant and tipper. About 50% of tippers are out of order, and 95% of the four other kinds of construction equipment are out of order.

### c) Suitability of road maintenance equipment

Equipment owned by DCC are generally unsuitable for road maintenance, and some necessary small equipments such as plate compacter, small heater and water tank truck are not there. The list and conditions of these equipment are presented in Appendix 8-2-2 and Appendix 8-2-3.

#### 8.5 Identification of Existing Problems

The following are existing problems and issues identified by the Study Team from the survey on the road maintenance and operation.

## a) Organization of Main Depot

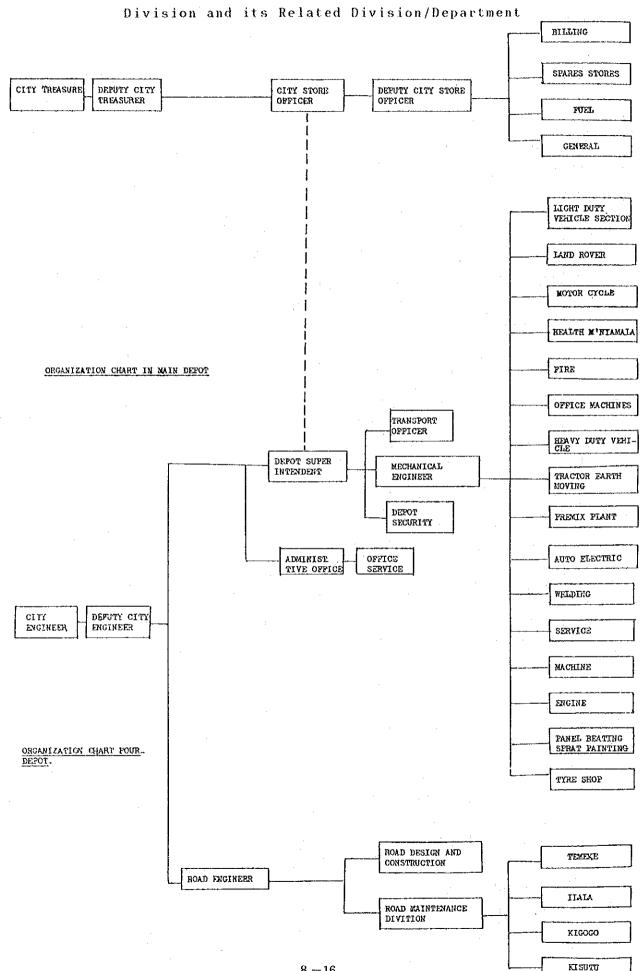

Main depot has two controlling personel, namely Depot Superintendent and Assistant executive engineer. It may be difficult for them to control all the sections (16 sections) of Main Depot.(Refer to Appendix 8-1-3)

Lack of mechanical and electrical inspectors is also problem for maintenance of equipment.

#### b) Relationship between main depot and site depot

No direct relationship between site depots and the main depot is existing.

The only relationship is that so long as all the mechanics and operators are under control of the main depot, they

Organization Chart of Road Maintenance

Fig. 8.3

are time to time dispached to road maintenance division to carry out some jobs whenever required.

#### c) Instruction System

Depot superintendent gives instructions directly to section foreman. In this case it seems that there is no need of having a mechanical engineer, this is wrong.

Generally instruction system at the main depot is very poor and disorganized. For example, presently, equipment coming for maintenance are never inspected before and after maintenance. Job orders and job cards are never technically prepared and therefore very incomprehensive.

#### d) Position of manpower

DCC have many staffs in its mechanical, maintenance section but most of them are unskilled. The section is staffed by very junior mechanics and operators.

#### e) Facilities of working for road maintenance

There is one depot for each district, but they do not have workshop and they only keep manual hand tools. The four depots will have to be re-established, and maintained in close proximity to the main depot to have a minor repair on equipment.

# f) Regular maintenance system

DCC main depot is yet to establish regular maintenance system and also the main depot will have to establish maintenance control system such as:

-Numbering system for new equipment.

-Registration system for new equipment.

-Maintenance schedule for all equipment.

-Emergency system for accident and urgent situation.

#### g) Equipment operation system

Technical level of mechanics in the maintenance section is very poor and there is a great shortage of skilled mechanics and operators.

There are three kinds of manuals, such as operation manual, workshop or repair mannual and maintenance or operation manual. But the Depot should keep these manuals in their respective section and the workshop does not have any manual as well as parts catalog.

#### h) Recommendation

Through this investigation and analysis, a lot of unbalance for the type and numbes of the equipment, vehicles, machines, and facilities including manpower for the present road maintenance works have been observed.

For an exclusive use for the road maintenance, a new main depot should be established urgently. Procurement of machine, equipment and vehicles for the road maintenance works and assignment of manpower will also be planned in relation with the forthcoming maintenance and construction works.

The new main depot will be supported with technical guidances of the contractor who will construct the main depot together with urgent maintenance works such as filling of all potholes and resealing surfaces on the existing roads.

# CHAPTER 9 IMPROVEMENT OF ROAD MAINTENANCE SYSTEM

#### 9.1 General

While the DCC has made every effort to improve/repair the deteriorated roads, restoration to the initial road condition appears difficult. As a result of the study in Dar es Salaam, it is recommended by the Study Team that the road maintenance system should be revised, including the construction of a new main depot to increase the road maintenance capacity.

The construction of a road maintenance depot and the provision of maintenance equipment, technical assistance, training program and preliminary cost estimation were worked out from the short and medium/long-term viewpoints.

Bitumen patching for pot-holes and routine maintenance work were analysed as the most necessary maintenance categories, based on which the necessary equipment, materials and staff were known.

Throughout the analysis, it was assumed that the maintenance efforts provided during the activity period would be the "normal" necessary to preserve the roads in their initial conditions.

9.2 Maintenance Methodology and Procedure

9.2.1 Definition of Maintenance Activities

In consideration of the defective conditions of the DCC's roads, the activities to be covered under routine, periodic and urgent maintenance are as follows.

<u>Routine Maintenance</u>: Required continuously on every road as road furniture installation, bush cleaning, ditch cleaning, gravel patching, dragging, pot-hole patching and grading.

<u>Periodic Maintenance</u>: Regravelling, repairing rut dragging, repairing edges, resealing cracks. surface dressing.

<u>Urgent Maintenance</u>: Needed to deal with emergencies and problems calling for immediate action when a road is blocked.

The first step is to define individual activities that can be measured and related separately to resource requirements on a consistent basis. Several activities were analysed under the designated routine maintenance for the short term plan (1990-1994). This provided the basic framework for the development of the programme.

From the medium (1995-1999), long term (2000 after) plan, periodic maintenance will be undertaken step by step in accordance with the establishment of New Maintenance System in DCC.

9.2.2 Standards (Level of Maintenance)

For each maintenance activity, standards were developed to estimate the amount of each kind of work required during the each stage. Assumptions were made regarding frequency and cycles utilized for the planning and programming of various activities. The standards were expressed in terms of annual number of unit of work.

The following are some examples of standards that were developed on the basis of past experience.

a) Experience shows that average effective life of a bitumen sealed road with ADT of 1000 or more is 4 years.

b) Past experience indicated that 150 liters of bitumen spraying is required every day for patching 30 m<sup>2</sup> of bitumen surface. Consequently a realistic standard would be 5 liters per sq.m of bitumen surface. (details are shown in Appendix 3.1)

#### 9.2.3 Programming

Dar es Salaam City is served by 1,146km of the existing road network system consisting of a hierarchy of arterial, collector and local roads. It consists of 451km of paved roads and 595km of unpaved roads, a total of 1,146km.

The length of road network to be improved/repaired under this project will be estimated about some 100km in short term period, whereas the length of the roads subject to the maintenance system is estimated at about 350km of paved roads.

The amount to be performed under this programming is as follows.

In accordance with the result of maintenance inventory survey, the average PSI value of the arterial roads allow us to develop a required maintenance ratio of 1.0% area for the total road area of 350km long for the short term plan.

<b>Classification</b>	Length	Paved area
Arterial Road	149.5km	1,458.120 sq.m
Collector Road	56.5km	373.978 sq.m
Local Road	145.0km	923.614 sq.m
Total	<u>350.0km</u>	2,775.712 sq.m

The above figures are taken or induced from the results of the inventory surveys.

A total area to be performed maintenance is estimated at 27,550 sq.m (2,755.712 sq.m x 0.01)

Requirement units are based on an average output of 30  $m^2$  /day, 6 hours work /day, 200 days work /year are estimated respectively with the assumption of 3 years term.

27,550 / (@30 x 200 x 3) =1.5 (units)

Therefore, it is proposed that there will be 2 units for carrying out bitumen patching (for pot holes) in short term period.

9.2.4 Proposed Maintenance Activities

As the results of the investigation of the existing road maintenance system and analysis of the problems relating to the roads, it is suggested that following plans are to be carried out under the project .

a) <u>Urgent Pavement Repair</u> of the major roads from a viewpoint of minimum social requirement in Dar es Salaam.

b) To establish a Road Maintenance System including a new <u>road maintenance depot</u> which will be under the jurisdiction of the Road Section of the Engineering Department of DCC.

c) To define the policy for implementation of maintenance programme and monitoring system in a <u>new Road Maintenance</u> <u>Division</u> of the Road Section of the Engineering Department of DCC.

d) To establish a <u>new workshop</u> in a new road maintenance depot.

e) As to urgent pavement repair, the DCC's road maintenance potential seems to be low to carry out it by force account at this moment, accordingly the work will be carried out by a contractor. While the work it will become a responsibility of the contractor <u>to training some DCC' technici-</u> <u>ans</u> so that the works will be performed by the force account with the provision of enough equipment and skill staffs.

Contents of the urgent pavement repair will be given precisely in Chapter 10.

The remaining b),c) and d) are described as follows.

Regarding to define the policy for implementation, generally it will be necessary to define the future course of the organization and it will be reflected to the scope of works and budgetary consideration.

The road maintenance activities through all the DCC roads in DSM will be carried out under this road maintenance system and implementation of maintenance/repair and procurement of materials, staff and both technical, administrative training as well as monitoring will be performed under the system.

In addition the existing workshop in the Main Depot seemed to be inadequate to carry out road maintenance works satisfactorily, whereas a new main depot is expected to be built with workshop function.

9.3 Requirement for Bitumen Patching Maintenance

In order to repaire the pot-holes urgently on the road, an urgent pavement repair will be carried out by a contract work for short period.

After establishing the new maintenance depot with adequate equipment/vehicles for the use of road maintenance, subsequently the bitumen patching on the roads in DSM will be carried out by the maintenance fleet.

Disintegration of bitumenous pavement is the breaking up of a pavement into small, loose fragments. This includes the dislodging of aggregate partials. Pavement repair is made by cutting out to solid material on both sides and bottom and filling it with new base and surface material.

In accordance with the afore-mentioned paragraph 9.2 Methodology and Procedures, there would be required 2 units of maintenance groups. Required maintenance sources as equipment, material and man-power are estimated as follows on the basis of an average output of 30 m2 per day, of which calculations are mentioned in Appendix 9.2.

### Summary of Requirement

	Description	No	•
(a)	Machinery		
	Tipper Truck (7tons)	3	
	LWB Truck (7tons)	1	
	Vib. Roller (2tons)	2	
	Bitumen Sprayer	2	
	Compressor (3.0cu.m)	1	·
	As.cutter	2	
	Supervisory Vehicle	(Pick-up) 2	1
	Motor Cycle	2	
	Walk Talkies	4	
	Two-way Radio	2	
(b)	<u>Material</u>		
	Chippings	600	cu.m
	Bitumen	60,000	litters
	Diesel	64,000	- d o -
	Oil/lubrication	1,000	- do -
	Other miscellaneous	]	ls
(c)	<u>Staffs</u>		
	Inspector	1	
	Foreman	2	
	Drivers/Operators	8	
	Helpers	8	
	Labourers	10	)

9.4 Requirement of Routine Maintenance

Activities to be covered under routine maintenance include:

a) <u>Road Furniture Installation</u> includes installation of direction post, sign and road markers, etc.

b) <u>Bush cleaning</u> is carried out within the road reserve in order to improve visibility and increase the warning time when encountering traffic.

c) <u>Ditch Cleaning</u> is done manually and involves excavation back to original invert level of ditches which have become silted up during rain. This work is usually carried out in conjunction with culvert cleaning.

d) <u>Culvert Cleaning</u> involves the removal of soil deposited inculverts.

e) <u>Gravel Patching</u> involves the replacement of gravel in worn and eroded area of surface and shoulder of gravel and earth roads.

f) <u>Dragging</u> is carried out in dry seasons and involves the periodic dragging of gravel and earth roads with branches of trees between gradings to delay the development of corrugations, ruts and potholes.

g) <u>Grading</u> Grading is the most expensive routine maintenance activity. Light grading is carried out when the road surface is dry and preferably, heavy grading is done after rain. In determining the frequency of grading, taking into account traffic and surface type, grading will be two times a year.

In parallel with the operation of grader, load roller will take part in the compaction work. A roller operation will not be neglected so as to maintain the earth or gravel roads stable flat and to avoid being scoring with track

wheels passing on.

In dry season, water tanker will be used for spraying water on the roads being improving with grader and rollers for the purpose of earth consolidation.

The computational procedures for providing requirement equipment and vehicles are given in Appendix 9-3 respectively and following are the summary of requirement for routine maintenance work.

Summary of Requirement

Ī	Description	No	•
(a)	Machinnery

9.5 Proposed Organization of Road Maintenance System

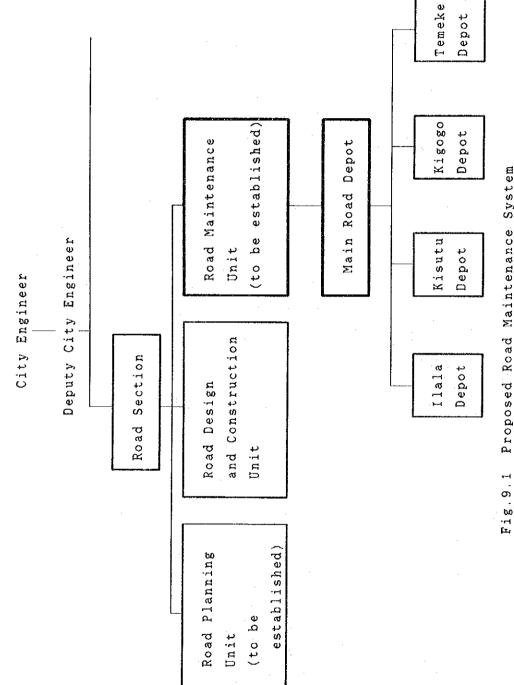

9.5.1 Establishment of Road Maintenance Unit

Proposed new road maintenance system expecting properly maintained city roads shall be established urgently in the Engineering Department of DCC which is shown in Fig.9.1.

This proposed road maintenance system will be consisting of one new Maintenance Unit and two other Unit of Road Planning Unit and Road Design and Construction Unit under the Department of DCC.

The function of each proposed Unit and depot under new road maintenance system is stated as follows;

- a) Road Maintenance Unit
  - to evaluate existing road conditions by using a new road monitoring system intending for a prompt repair of road defects.
  - to prepair road maintenance programme and other technical categories.
- b) Main Road Dept
  - to perform routine and periodic maintenance for DCC roads
  - to perform future improvement works of overlay and reconstruction of pavement, etc.
  - to train mechanics and operators and other technical staff.
  - to train administrative and supervise staff for maintenance works

Proposed Road Maintenance System

c) Sub-Depots

- to perform road monitoring

- to perform maintenance under the Main Depot

- to keep equipment, materials and staff for routine maintenance

 to strengthen its capacity to maintain the roads in accordance with the increase of the traffics on the roads.

# 9.5.2 Proposed Organization and Main Staff of Main Road Depot

In order to implement required road maintenance works, it is necessary to establish Main Road Depot which has functions to store proper equipment for road maintenance, to procure adequate quantity of road maintenance material, to implement maintenance works and to repair all equipment required for road maintenance work.

Therefore, New Main Road Depot should have following four sections with neccessary staff shown in Fig.9.2.

- Road Maintenance Section
- Mechanical Workshop Section
- Material Store Section
- Personnel Administration Section

The responsibility of main staff of the Main Depot is stated as follows.

a) <u>Resident Engineer</u>

The Resident Engineer reports to DCC's City Engineer and has the responsibility and authority to undertake the following:

0 N ω 4 Administration (Construction Expatriates) Administrative Office Sup. Advisory Staffs Personnel Watchman Cleaners Clarks Typist Total Suppliers Officer 1 c **r**-4 Fuel Lubrication Store Attendunt Store Section Material Civil Engineer, Technician Deputy Resident Engineer Temeke Depot Total Resident Engineer Workshop Section Workshop Chief 1 লা **[~** ~| Auto Electric Kigogo Depot Mechanical Mechanics Total Kisutu Depot Road Maintenance 26 က თ 17 φ 64 Maintenance Civil Eng. Section Labourers Operator Foreman Driver Helper Ilala Depot Total

Fig.9.2 Organization Chart of the Proposed Main Depot

- -Direct, through subordinates, all branches ' operation. Develop the Depots' work programs and budget estimates. for DCC approval.
- -Develop with DCC approval, depot policies and operating procedures , including performance standards, design and contruction specifications.
- -Evaluate and award engineering and maintenance proposals relating to DCC operations.
- -Coordinate road-related matters with other ministries that involue DCC participation.
- -Exercise management control on work performance and expenditures consistent with MOCW/DCC policies. The position requires a senior engineer with at least five years of highway experience plus at least five years of government administration in a responsible management position.

#### b) Maintenance Engineer

The Maintenance engineer is directly responsible to City Engineer. In this position, the Maintenance Engineer has the responsibility for the following:

- -Preparing proposed annual work programs and budget estimates for all road maintenance works including contrac--tion works expecting Medium/Long term.
- -Developing for the Resident Engineer's approval standards relating to work performance and maintenance service levels.
- -Maintaining an updated road feature inventory.
- -In cooperation with the training officer, identifying training needs of the road maintenance staff.
- -Maintaining close contact with DCC Road Maintenance Division engineers and provide management support as needed.

This vital depot position requires a graduate civil engineer, ideally, the maintenance engineer should have five years of responsible experience in road and equipment maintenance including two years of on-site field engineering. Given current scarcity of available qualified staff, practical experience and related training will need to run during a technical assistance program.

# c) Supply Officer

The Supply Officer reports directly to the Depot Resident Engineer. In this position the Supply Officer is responsible for the following tasks:

Directing materials supply operations in the main Depot and in outlying facilities on site as required.
Establishing and implementing operating procedures consistent with good workshop practice in such areas as materials sampling, testing and reporting results.
Developing appropriate specifications for road and bridges construction/maintenance materials available in Tanzania.

This position requires a graduate civil or mechanical engineer. Ideally, the Supply Officer should have three to five years of field and storing experience. Given the current scarcity of availabe qualified staff, practical experience and related training will need to begin during a technical assistance program.

#### d) Office Supervisor

The Office Supervisor reports directly to the Resident Engineer. Responsibilities of the Office Supervisor include the following:

- -Directing the on-going administration of all main depot accounting functions.
- -Advising the Resident Engineer in all organizational, administrative, cost accountancy, and budgetary matters.
- -Assisting other Main Depot supervisory and clerical staff in field level implementation and on-going administration of accounting procedures and management systems.

This position requires a person with a minimum of five years experience in government budgeting, accounting and office administration. The ideal candidate should be a qualified cost-accountant.

### e) Workshop Chief

Workshop Chief would be responsible for directing all operations in his respective workshop, including preventive and corrective maintenance and spare parts control.

This position requires senior technicians qualified in the operation and maintenance of both light and heavy equipment. He should have several years of experience in workshop administration, including spare parts management and stock control.

Considering above mentioned responsibilities of the staff, proper arrangement of this staff is difficult in DCC and the operator, foreman and labour who are engaging in existing road maintenance work of DCC will be shift to the new Main Depot.

Therefore, such consideration should be necessary as follows;

- -Invitation of operation and administration expert of road maintenance from MOCW,
- -or to receive the technical assistance from other countries for operation and administration of road maintenance.

-or to send and train trainee to TRM of MOCW.

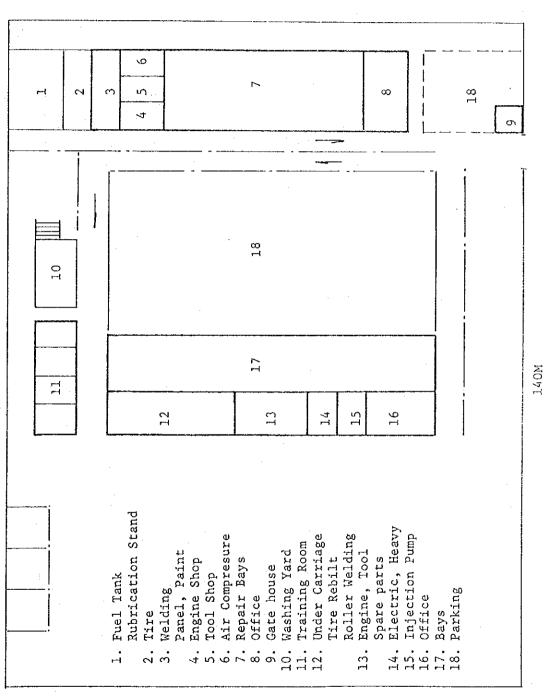

9.5.3. Layout plan of Main Road Depot

Considering the function of the proposed Main Depot, following buildings have been listed up as essential for the operation of the Main Depot. The required floor spaces of these buildings and the layout plan of the Main Depot have been made as shown in Table 9.1 and Fig 9.3 respectively.

In the course of estimation of the required floor space, the future extension of the Main Depot has been also considered that the future required personnel of about 160 persons and the average repair and maintenance ratio of 30% less of the required equipment and vehicle will be the subject to the midium and long-term plan.

### 9.6 Manpower and Training

In accordance with the proposed revamping of the road maintenance system including the establishment of a new Road Main Depot of the DCC' Road Section, and providing for forthcoming the Medium and Long term works, staffskills need to be developed to a level consistent with responsible position.

9.6.1 Manpower

The manpower requirement of the Short, Medium and Long Term period of the Study have been identified in the preceding clause. Appendix 9-4 "Summary of Main Staff and Materials" indicates the number of categorised staff required for those periods.

9.6.2 Training

Training and education to strengthen the technical knowledge of how to maintain/repair roads and machinery and to run the new system including administration of the organization, procurement of the materials, store-keeping and their fiscal budgetary preparation are needed.

The proposed organization are consisting four sections, so the staff assigned to each section shall be train-ed for filling its maintenance potential in the Main Road Depot.

The training programme for each section will be as follows.

(1) Personnel Administration Section

Training/ Production Brigade Operations	Foremen and road crews performing routine road maintenance	Pilot program, joint training and actual productive road mai- ntenance performed under super- vision of foremen trained in on-job teaching, including dis- cussion as to the "why" of ope- rations.
Road and Equipment Maintenance	All Management Staff	Basic principles of road and Equipment maintenance, managem- ent, including techniques for

For the training programme remarked above, some adequate number of specialist, trainers or instructors would be required, for which, DCC will seek for the inland experts including foreign experts in MOCW or other authorities.

9.6.3 Foreign Technical Specialists as Instructors

In consideration of the scarcity of adequate inland trai -nors some foreign technical specialists would be invited to the proposed maintenance depot.

Following two training expartriates consisting of one construction engineer and one mechanical engineer shall be assigned to the proposed system for about two years.

(1) Construction Engineer

The construction engineer shall assist the resident engineer in identifying a general work plan for a strengthen of the road maintenance efficiency of the DCC. The proposed scorpe of work includes:

- a) Work programm, setting out method, management and operation of construction equipment, labour force requirement, arrengement of construction materials, quality control, expenditure control of works and cash flow planning consisting with the most efficient allocation of resources.
- b) Superintendence of the works in progress in accordance with the technical specifications.
- c) Establishment of a training program based on the manpower requirement and implementation of an effective onthe-job training.

The position requires a senior engineer graduated civil engineering course with at least 5 years of responsible experience in road maintenance and/or construction of bituminous, gravel and earth roads.

(2) Mechanical Engineer

The mechanical engineer shall assist the resident engineer in maintaining the construction equipments and workshop facilities. The proposed scope of work includes:

- a) Review on the construction equipments and workshop facilities and planning of the equipment services, maintenan -ce/repair system and arrangement of workshop facilities.
- b) Establishment of maintenance manual of equipment/vehicle for washing or cleaning, inspection, issue repair specifications and completion inspection etc.
- c) Establishment of routine maintenance system in field and depot for daily check of the vehicles/equipments by driver and operator group.
- d) Establishment of a training system for maintenance staff as drivers, operators and mechanics, that is class room training for a proper maintenance and daily, weekly and monthly inspection for each equipments.

The position requires a senior engineer qualified in the operation and maintenance of both light and heavy equipment. He should have several years of experience in workshop administration including spare parts management and stock control.

### 9.7 Recommendation for Proposed Road Maintenance System

Establishment of a road maintenance system, building of a new Main Depot and procurement of the equipment and machinnery for the new Main Depot have been identified and propos -ed in this chapter.

In reviewing with the request of the equipment list prepared by the DCC (see Appendix 9-6), required equipments of road maintenance for the short, medium and long-term plan have been analysed taking into consideration future strengthen of road maintenance potential in order. (see Table 9.2)

However, in addition to these requirements, there will be necessary a series of works and ploblems to be undertaken by DCC or other authorities concerned as follows :

(1) For the building of the new Main Depot, there will require the provision of land area where will be some 15,400. m<sup>2</sup> wide as shown in Fig.9.3 and from a view point of accessibility it shall be located along some arterial road.

(2) In order to run the new road maintenance system effectivly, there will be necessary a provision of budgetary fund of expenditures as mainly itemized follows :

(a)Office expenditures;

-Fuel and light expense -Water and electric supply expenses -Employees' traffic expenses -Office facilities, furniture expenses

-Miscellaneous expenses

(b)Salaries and Wages for staff and employees

(c)Fuel/Oil consumption cost

As to (a) to (c), Summaries of annual budget required are as follows.

Item	<u>Cost/Year (Thousand Tsh)</u>
(a) office Expenditures	= 1,400
(b) Salaries and wages for	
Staff and Employee	= 3,600
(c) Fuel/Oil Consumption cost	= 17,700
(Details are shown in Appendi	ix 9-5.)

(3) In order to assign mechanics, techncians, store staffs and administrative staffs for the new Main Depot, DCC shall take necessary actions regarding the personnel transposition from other organization in DCC and ask MOCW for transference of personnel, if necessary.

(4) It is recommended that Central Government shall subsidize DCC for securing fiscal fund for the new Road main Depot.

(5) In the history of cooporation between Tanzania and Japan,many specialists have been dispatched and engaged in the implovement of technic, socio-economic and mental culture at responsible positions in MOCW or other authorities, therefore, it is recommended that those specialists or successors shall be assigned for the new system in appreciation of these results and experiences.

# CHAPTER 10 IDENTIFICATION OF NECESSARY IMPROVEMENT

### 10.1 General

Taking into consideration the present situation of pavement deterioration and traffic congestions of the existing roads and the political priority given by the government of Tanzania, priority roads with a total length of 205 km approx.were selected by the Study Team in Chapter 7.

The improvement measures required for each section of the roads are identified through study and analysis of the data and information collected through the field surveys.

Preliminary engineering study and cost estimate with an accuracy equivalent to the level of preliminay feasibility study are carried out in this chapter on the basis of the improvement measures identified above.

10.2 Identification of Necessary Improvement

10.2.1 Classification of Necessary Improvement

The necessary improvements dealt with in this study are broadly classified into three categories, namely Category A " Improvement of Road Structures", Category B "Urgent Repair of Pot-holes" and Category C "Improvement of Maintenance System".

Each category consists of the following improvement items:

- (1) Category A: "Improvement of Road Structures"
  - A-1 Overlay

A-2 Reconstruction of Pavement

A-3 Widening from 2 to 4 Lanes

A-4 Rehabilitation/Improvement of Drainage Structures

A-5 Provision of Bus Bays

A-6 Improvement of Intersections

- (2) Category B: "Urgent Repair of Pot-holes" B-1 Urgent Repair of Pot-holes
- (3) Category C: "Improvement of Road Maintenance System"
   C-1 Construction of Road Maintenance Depots
   C-2 Provision of Road Maintenance Equipment
   C-3 Technical Assistant and Training Programme

10.2.2 Category A "Improvement of Road Structures"

Improvement measures necessary for each road have been identified on the basis of information and data collected through road inventory surveys, pavement surveys, drainage surveys and road maintenance surveys.

The following are the results of improvement measures identified for each road:

[A-1] & [A-2]

Overlay and Reconstruction of Pavements:

Sections to be reconstructed and improved with overlay were identified using the Present Serviceability Index (PSI) of the pavement of the existing road. The results of PSI value obtained through the field survey are presented in Appendix 10-1-1 and shown in Fig. 10.1. The criteria for determining overlay and reconstruction are as follows:

Overlay section : PSI value between 2.5 and 1.5
Reconstruction section: PSI value less than 1.5

#### [A-3] Widening from 2 to 4 Lanes:

Roads with more than a 1.5 congestion ratio will be improved by widening from 2 to 4 lanes. Implementation of widening will be determined by taking into consideration the increase of traffic demand as well as road network requirements of Dar es Salaam City. The following five (5) radial roads were determined to be in need of widening as soon as possible.

- Uhule Road from Msinbazi Road Junction up to the end of 2 lanes, L=0.9 km
- Sokoine Road, L=0.8 km
- Morogoro Road from Morocco Road Junction to Port Access Junction, L=4.8 km
- Bagamoyo Road from Selender Bridge to Morocco Road Junction, L=3.0 km

- Upanga Road from Tanganika Motor Junction to Selender Bridge, L=1.8 km

Roads with more than a 1.0 congestion ratio will need to be widened after about 5 to 10 years.

[A-4] <u>Rehabilitation/Improvement of Drainage Structures</u> Box and pipe culverts will be provided where roads are flooded during the rainy season due to inadequate location or low capacity of existing culverts.

### [A-5] Provision of Bus Bays

Bus bays will be furnished on roads where the daily traffic volume has exceeded 10,000 per day to improve traffic congestion. Bus bays will be furnished on the following congested roads as shown in Fig. 7.6.

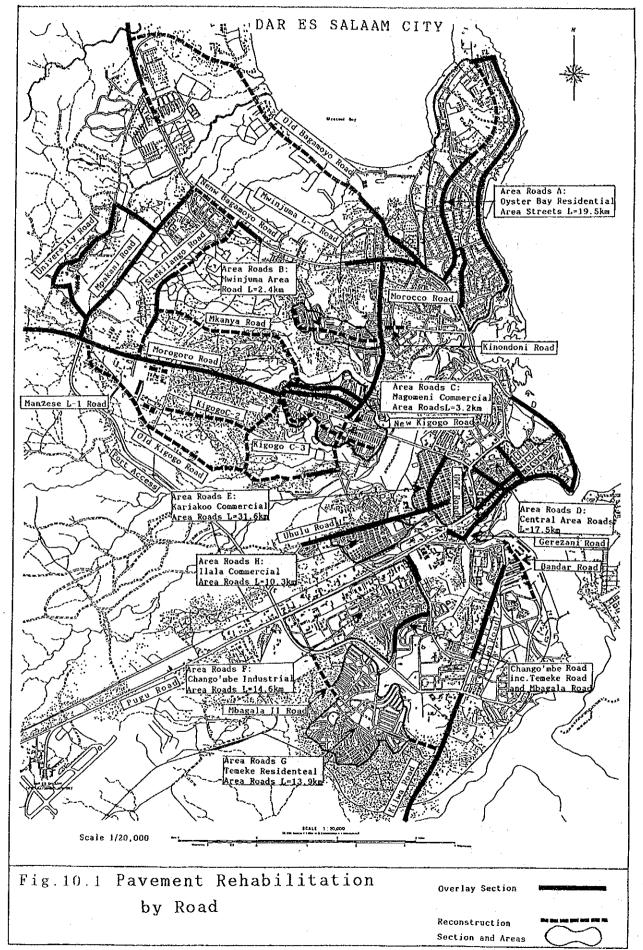

- Uhule Road,

- Morogoro Road,
- Morocco Road,
- New Bagamoyo Road

### [A-6] Improvement of Intersections

The following five(5) intersections controlled by roundabouts must be upgraded to signal-controlled intersections to to meet traffic flows during peak hours:

- Tanganika Motor Roundabout at Upanga Road,
- Roundabout intersection at Uhulu and Msimbazi Roads,
- Other three (3) roundabouts in the Central Area.

### 10.2.3 Category B: Urgent Repair of Pot-holes

# [B-1] Urgent Repair of Pot-holes

In order to minimize the damage on vehicles and to improve traffic flow and safety, urgent repair of pot-holes will be conducted as a temporary measure on all city roads which have deteriorated seriously. The number of pot-holes are tentatively estimated on the basis of PSI value for the purpose of preliminary evaluation.

The determination of actual locations and numbers requiring repair work will be made by DCC or a consulting engineer on behalf of the Government of Tanzania before starting the con -struction work.

# 10.2.4 Category C: Improvement of Road Maintenance System

[C-1] <u>Construction of Road Maintenance Depots</u> Newly constructed road maintenance depots including workshops are proposed so as to strengthen the capacity of road maintenance for city roads as shown below:

1 no. of main road maintenance depot
4 nos. of site road maintenance depots

### [C-2] Provision of Maintenance Equipment

Road maintenance equipment including spare parts and materials will be provided along with the implementation schedule of road improvement under Category A.

### [C-3] Technical Assistance and Training Programme

Training of engineers and improvement of techincal and administrative skills related to road maintenance may necessity the introduction of experts from advanced countries.

A training programme will be prepared emphasizing implementation for the construction of road maintenance depots as well as the provision of maintenance equipment. 10.2.5 Summary of Improvement Measures

Improvement measures identified for each road through the study outlined in the previous paragraph were summarized taking into consideration the following facotors:

(1) [Category A] and [Category B]

Improvement measures identified on each road were reviewed emloying the criteria mentioned below so as to prevent the double investment of improvement measures;

- Improvement measures of overaly or reconstruction of pavement should not be conducted for the road sections where widening of the existing road was proposed in this study.
- Provision of bus bays, renewal and improvement of drainage structures and improvement of roundabout intersections should be implemented in conjunction with the construction of improvement measures of the related roads.
- Urgent repair of pot-holes on the existing roads should be conducted regardless of the implementation of improvement measures under Category A taking into account the seriously deteriorated condition of pavement which may cause heavy traffic accidents and damages to vehicles.

Based on the above analysis, improvement measures were determined for each road, the summary of which is presented in Table 10.1.

(2) [Category C]

Improvement measures of Road Maintenance System under Category C are summarized in Table 10.2.

#### 10.3 Preliminary Engineering Plan

A preliminary engineering plan was studied with an accuracy equivalent to the pre-feasibility study level as shown below:

#### 10.3.1 Design Criteria and Standards

At present, there is no authorized road design standard. However, MOCW plans to finalize the "Road Design Standards" prepared for submission to the 2nd SATCC Meeting of the "Group of Experts on Road Infrastructure" in July 1984 and is expected to be completed soon according to the MOCW officials. Therefore, the Study Team has decided to use the Road Standards for this project.

It is noted that the above Road Design Mannual was prepared for use on rural roads under the jurisdiction of MOCW, but not for urban roads. Therefore, if there are any items which are not applicable to urban roads, either Japan Road Standards or AASHTO's Design Standard will be applied taking local conditions into account with the approval of MOCW.

#### 10.3.2 Improvement Plan of Roadway

Horizontal and vertical alignments of the roads proposed for renewal and improvement are generally suitable for the Road Design Standard. Therefore no major improvement work on alignments were considered for the proposed roads.

Minor adjustments in horizontal and vertical alignments may be necessary, particulary in improving curves and sight distance. However, these improvement measures will be considered in the sebsequent feasibility study stage but not in this preliminary design stage.

Carriageway and road formation widths were checked through field surveys and road inventory data shown in Appendix 7-1-1. Improvement of cross sections of existing pavements should conform to road standards applied for each road classification.

#### 10.3.3 Improvement Plan of Pavement

Overlay and reconstruction of pavements will be done on the existing pavement in principle without major improvement of carriageway.

The following is the design method of improvement measures proposed for each road:

#### (1) Overlay Design

To strengthen the distressed asphalt pavements, various kinds of methods of overlay design have been developed by different organizations. Those methods can be broadly classified into two groups as follows:

- (i) Design method by pavement component analysis
  - Asphalt Institute Method
  - Japan Road Associations Method
- (ii) Design method with the use of pavement deflection
  - Transport and Road Research Laboratory Method
  - AASHTO Guide,
    - California Method, etc.

In this study, the design method by pavement component analysis developed by the Asphalt Institute in 1977 was employed.

For the determination of overlay and reconstruction thickness, traffic data were analyzed on the basis of "Traffic Demand Forecast" presented in Chapter 5. The following is the design method used for the determination of overlay thickness:

# a. Initial Daily Traffic (IDT) and Growth Rate

Using the traffic count made by the Study Team in 1989, the expected average daily number of vehicles was estimated in both directions for the first year after the improvement of the road, sometime in 1994. This is referred roads the Initial Daily Traffic (IDT), the summary of which is presented in Appendix 10-2-1. Future traffic volume by vehicle type was forecasted based on the traffic volume in 1991 using the following growth rates (1989 - 2000):

\* Car & Light goods ..... 3 %
\* Bus ..... 10 %
\* Truck ..... 2 %
Total ..... 4 %

### b. Percentage of Heavy Traffic

Since loads imposed by passenger cars and light vehicles do not contribute significantly to the structural damage of the road pavement, medium and heavy trucks and buses, two-axle six-tire vehicles or larger, were included in the analyses.

c. Average Gross Mass of Heavy Vehicles

Average Gross mass of heavy vehicles was estimated on the basis of weight study data as shown in Appendix 10-2-2 and was developed using the traffic data obtained by the Study Team.

The result of the estimated of average gross mass is presented below:

	Heavy Good Vehicles	18 ton
-	Medium Good Vehicles and Buses	10 ton

#### d. Single-axle Load

Mixed traffic must be converted to the equivalent of a 8,200 kg (18,000 lb) single axle road.

e. Initial Traffic Number

Initial Traffic Number(ITN) was obtained using the analysis chart as shown in Appendix 10-2-3 on the basis of the number of heavy vehicles, average gross mass and single-axle road.

f. Design Period

Design periods employed for determining thickness of overlay and reconstruction are 10 and 20 years respectively. g. Adjustment Factor for the Design Period

Adjustment factors for the design period and estimated annual traffic growth rate will be determined using Appendix 10-2-4.

h. Design Traffic Number (DTN)

The DTN is the average daily number equivalent to a 8,200 kg (18,000 lb) single-axle load applied for the selected design period. The figures of Design Traffic Number(DTN) were calculated as shown in Appendix 10-4-5.

i. Full-depth Asphalt Pavement Thickness

Using the appropriate Thickness Design Chart as shown in Appendix 10-2-6, the full-depth asphalt pavement thickness (T ) was obtained.

j. Effective Thickness of the Existing Pavement

Pavement structural components of the existing roads were evaluated so as to obtain the representative Effective Thickness (Te) on each proposed road. To determine Te, each layer of the exiting pavement must be converted to the equivalent thickness of asphalt concrete using the Conversion Factor as shown in Appendix 10-2-7. The results of the calculation of effective thickness are given in Appendix 10-2-8.

k. Thickness of Overlay

The required thickness of asphalt concrete overlay is equal to T - Te. Using this method, overlay thickness computation was carried out for all proposed roads. The results of thickness computation are shown in Appendix 10-2-9.

(2) Design of Pavement Reconstruction

Pavement design in Tanzania has been carried out employing either AASHTO Standards or TRRL's Road Note 31. In this Study, however, The Asphalt Institute Design Method, USA, has been applied for the design of pavement reconstruction, since overlay design has been conducted using design method by pavement component analisis developed by the Asphalt Institute, USA, as stated above. Design method of pavement reconstruction is the same as overlay design. (3) Overlay and Reconstruction Thickness by Road Calculation of overlay and reconstruction thickness of pavement was conducted for each road using the estimated bearing capacity (CBR) obtained through field survey and data collected. Table 10.3 showes the results of calculation.

#### 10.3.4 Improvement Plan of Drainage

To maintain city roads under all-weather conditions as well as to extend pavement life, perfection of drainage facilities is an indispensable factor.

The field survey revealed that many sections of roads have been blocked and damaged by floodings which frequently occure during the rainy season due to lack of proper maintenance of roadside drainage and insuffucient capacity of storm drainage systems provided along the roads.

Roadside drainage structures and cross drainage located in flooded areas will be reconstructed or provided to improve the capacity of drainage structures.

It is noted however that reconstruction or renewal of storm drainage systems using major rivers and their tributaries have been excluded from the study for the following reasons:

- (a) Improvement of storm drainage systems is considered to be outside the scope of the study,
- (b) Improvement will entail a considerable amount of work and expense,
- (c) The Ministry of Lands, Natural Resources and Tourism is planning to implement renewal and emergency maintenance work for these facilities.

#### - <u>Pipe</u> culvert

Pipe culvert with a minimum of 100 cm in diameter will be provided considering easy maintenance. These culverts will be provided at flooded areas and widening sections where the existing cross drainage will be damaged due to construction of widening work. The average interval of pipe culvert was 100 m approx.

#### 10.3.5 Improvement Plan of Bridges

Bridges on the existing roads are mostly steel girder and concrete bridges, although wooden bridges can be found in some sections. However, most bridges on the roads selected for further study (205 km approx.) satisfy design loading and carriageway width.

Only a few old bridges constructed with one lane and judged from visual inspection to have insufficient bearing capacity will be reconstructed to 2 lanes.

The types of bridges were selected taking the river width and river bed conditions into account as shown below:

	Span Length (m)		Type of Bridge
-	Span length less than	10 m	RC - Slab Bridge
	Span Length 10 m - 20	m	H – beam Steel Bridge
	Span Length more than	20 m	Steel Girder Bridge

A typical cross section is presented in Appendix 10-2-10.

#### 10.4 Preliminary Quantities and Cost Estimation

10.4.1 Preliminary Work Quantities for Each Road

(1) Categories A: Improvement of Road Structures

Unit work quantities of improvement measures were calcultated on the basis of the typical cross sections shown in Fig. 10.2 obtained through the preliminary design performed in the previous paragraph.

Each improvement measure consists of the following major work items and unit quantities estimated for each improvement measures are given in Appendix 10-3-1.

- Embankment including clearing/grubbing, excavation of common materials at borrow pit, hauling with average distance of 10 km and compaction
- Selected materials for improved subgrade
- Crusher run aggregate (subbase course)
- Selected crushed stone (base course)
- Asphalt concrete (plant mix)
- Tuck coat for overlay
- Prime coat for reconstruction
- Soil aggregate shoulder
- Pipe culvert
- RC bridge including super- and sub-structures
- H-Beam bridge including super- and sub-structures
- Girder bridge including super- and sub-structures
- Miscellaneous work including side ditch, slope protection, guide post, guide rails, traffic sign, lighting facilities, etc.

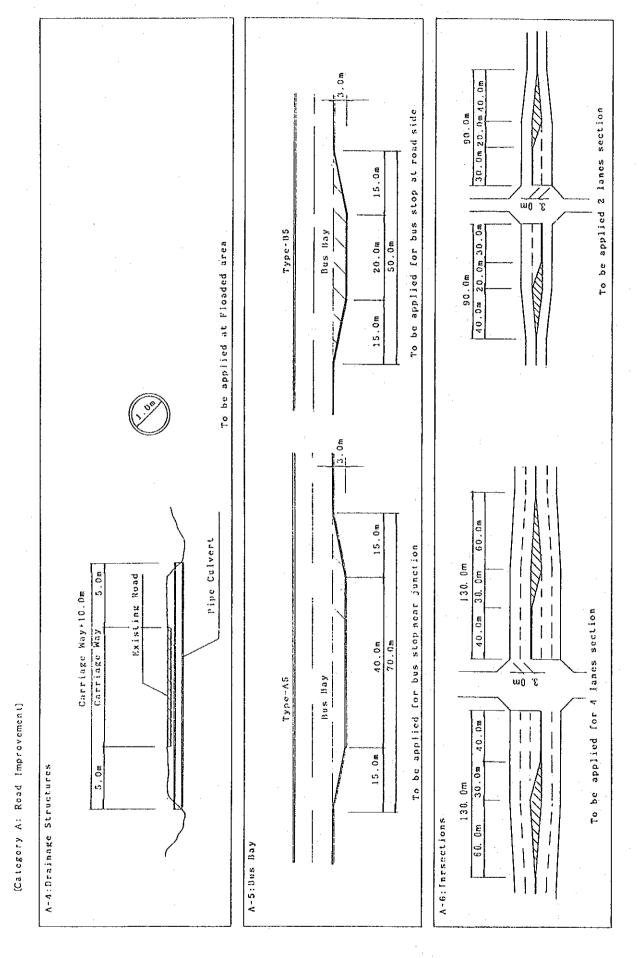

The land aquisition attributable to the improvement measures was not considered in this stage since the right-of-way width resolved by the government is generally sufficient enough for these improvement work.

(2) <u>Category B: Urgent Repair of Pot-Halls</u>

Quantities of pot-holes are estimated assuming the number of and areas of pot-holes per 100 meter of arterial road based

(Asphalt Con.) Subbase t=20cm (Crusher run) Surface t≔3cm Side worke Type C2 Drainsge 4.5m Enbankment V=8.m² ŝ Pavement:Type 82 Existing Road (Uhulu Rd, Upanga Rd, Sokoine Rd.) 7.0m 2.4m 1.0m Drainage (Selecter Materials) 7.0m (Asphalt Con.) Fig 10.2 Type of Improvement Measures

on the data obtained during the PSI survey as shown in Appendix 10-3-2. The work involved in repairing pot-holes is as follows:

- Removal of unnecessary soil and debris
- Selected crushed stone for base course
- Prime coat
- Asphalt concrete

#### (2) Category C

Quantities of road maintenance depot and maintenance equipment to be provided under Category C were estimated taking into consideration the following items:

- a. Type of pavement (earth, gravel and asphalt)
- b. Budget allocated for road maintenance
- c. Amount of maintenance to be done per month or year
- d. Capability of worker and operator
- e. Workable day per month or year

Required quantities of road maintenance depots and equipment are presented in Tables 9.1 and 9.2 respectively in Chapter 9.

10.4.2 Preliminary Cost Estimate for Each Road

## (1) <u>Category A: Improvement of Road Structures" and Category B</u> "Urgent Repair of Pot-holes"

For the purpose of preliminary evaluation, the unit rates used in this study were developed from recent cost data and the bid prices on projects similar to the roads proposed in the study. The unit rates for major work items are shown in Appendix 10-3-3.

Based on the above unit rates, the unit cost of each improvement measure was calculated by applying these unit rates to the estimated unit quantities obtained in the previous paragraph. The results are shown in Appendix 10-3-4. The cost of miscellaneous work was estimated at 10 % of the total cost of major work items.

The preliminary cost of improvement measures was estimated by applying these unit costs to the estimated quantities of improvement measures on each road. The results of the calculation are shown in Appendix 10-3-5 and summaries of the preliminary costs of Categories A and B are presented in Tables 10.4 and 10.5 respectively.

(2) <u>Category C "Improvement of Road Maintenance System"</u> Preliminary cost estimate was made for Improvement of Road Maintenance System to be provided under Category C as shown in Table 10.6.

## CHAPTER 11 FORMULATION OF IMPLEMENTATION PLAN AND SELECTION OF HIGH PRIORITY PROJECTS

11.1 General

As stated in Chapter 10, the improvement measures to be conducted in the study are divided into three main categories with sub-work items as follow:

\* Category A "Improvement of Road Structures"

- Overlay of Pavement
- Reconstruction of Pavement
- Widening from 2 to 4 lanes
- Rehabilitation/Improvement of Drainage Structures
- Provision of Bus Bays
- Improvement of Intersections

\* Category B "Urgent Repair of Pot-holes"

\* Category C "Improvement of Road Maintenance System".

- Construction of Road Maintenance Depot
- Provision of Maintenance Equipment
- Technical Assistance and Training Programme

Implementation of each category is divided into three phases in terms of short, middle and long-term plans taking into consideration the priority and urgency engineering and socio-economy as well as the policy of the Tanzanian Government with in the following target years:

	Short-term Plan	(1990 - 1994)
-	Middle-term Plan	(1995 - 1999)
-	Long-term Plan	(2000 - )

11.2. Evaluation of Proposed Roads under Category A

11.2.1 Criteria for Priority Order

Determination of priority or urgency given to the proposed roads (205 km) selected under Category A has been made primarily according to the degree of pavement deterioration and traffic congestion existing on the roads. However, also taken into account were the socio-economic impact of the proposed roads on their surrounding areas and the priority given by the Tanzanian government.

Items considered for the evaluation consist of three major categories of criteria, namely (1) Engineering Perspectives, (2) Socio-economic Perspectives and (3) Government Priority.

Each category is further divided into sub-categories shown below:

#### (1) Engineering Perspectives

1-a Deterioration of Pavement

The level of deterioration was judged according to the results taken from the PSI (Present Serviceability Index) survey.

#### 1-b Traffic Congestion

The level of congestion was determined using C.R (Congestion Ratio) obtained through analysis of traffic capacity.

#### 1-c Present Traffic Volume

Volume of ADT (Average Daily Traffic) on each road was estimated on the basis of the traffic count survey.

#### (2) Transport Network/Socio-Economic Perspectives

#### 2-a Road Classification

The function or importance of a road is judged in accordance with road classifications, namely Arterial, Collector and Local roads.

#### 2-b Landuse Pattern

The degree of impact on surrounding areas depends on the land-use situation along the proposed roads. The land-use pattern was classified into Commercial/Industrial, Residential and Agricultural/Less developed areas. Criteria of classification is given in Appendix 11-1-1.

#### 2-c Development Potential

The impact of the proposed roads is estimated taking into consideration the existing development plans on the areas influenced along the roads. Degree of impact was estimated in accordance with the criteria shown in Appendix 11-1-2.

#### (3) Priority of Government

Priority given by the Tanzanian government to each road was considered in evaluating of proposed roads.

#### 11.2.2 Ranking and Evaluation of the Proposed Roads

On the basis of the criteria evaluated in paragraph 11.2.1, quantification for each proposed road was conducted.

Primary data used for quantification were collected through field survey on road inventory, pavement condition, traffic count and OD survey, analysis of traffic congestion, road network, land-use pattern, and socio-economy.

In this Study, arbitral weight method was employed in evaluating major criteria and sub-criteria taking into consideration the magnitude of impact as well as the degree of pavement deterioration and congestion level of the existing roads.

The marks assigned to each item are given in Table 11.1.

Scores provided to each road for sub-criterion are summed up according to each category and a total evaluation score is obtained for each road. Table 11.1 Criteria for Selection of High Priority Roads (100km)

	Items of Evaluation	Mark	Remarks
. <u>E</u>	ngineering View Points (60)		
A-1.	Deterioration Level of Pavement	<u>30</u>	
-	Very Bad (PSI Value:0.0 - 1.5)	30	Reconstruction
	Bad (PSI Value:1.5 - 2.5)	15	Overlay
-	Fair/Good(PSI Value:2.5 - 5.0)	0	Maintenance
<b>-</b> 2.	Present Traffic Congestion	<u>20</u>	
_	Heavily Congested (C.R>1.5)	20	Widenning
-	Congested $(1.0 \le C.R \le 1.5)$	10	Imprv. required
	Ordinary(C.R<1.0)	0	No improvement
	(C.R; Congestion Rate)		
A-3.	Present Traffic Volume	10	a
_	ADT more than 10,000	10	
_	1,000 < ADT < 10,000	5	
	ADT less than 1,000	0	
51.	Function of Road	$\frac{10}{10}$	
-	Arterial/Collector Roads	5	·
-	Main/Important Local Roads	0	
-	Other Minor Roads		
B-2.	Existing Landuse Pattern	<u>10</u>	
-	Commercial/Industrial Areas	10	
-	Residential Areas	5	
-	Agriculture/Less Developed Areas	s 0	
B-3.	Future Development Potential	10	
	Commercial/Industrial Areas	10	
-	Residential Areas	5	·
_	Agriculture/Less Developed Areas	s 0	
. Р	olicy of Government (10)		
· .	(10)	10	
-	Priority roads proposed by Gov.	10	
-	Other roads	0	
	Total	<u>100</u>	

The result of scores obtained for each road are presented in Table 11.2.

In ranking the proposed roads according to the criteria established in the previous paragraph, this study employed a group ranking method as follows:

- Rank A: Roads whose scores are higher than the average value
- Rank B: Roads whose scores fall in between the average value and 2/3 of the average

- Rank C: Roads whose scores are lower than 2/3 of the average value

As a result, the roads with a total length of 103 km fell into Rank A as shown in Table 11.3. These are deemed to have priority from the view point of engineering and socio-economy as well as high priority roads among the selected roads of 205 km.

#### 11.2.3 Issue of New Bagamoyo/Upanga Roads

Among the roads classified in Rank A, New Bagamoyo and Upanga Roads were not proposed by DCC as the priority project in this study because of the commitment of Italian Government for its construction.

The government of Tanzania, however, changed their stands recently and decided to exclude a portion of the road from Tanganika Roundabout to Mapakani Road Junction (9,8 km) from the list of proposal sent to Italian government taking into considerarion the result of evaluation made by the Study Team for these roads with the highest priority on the implementation.

Under such a situation, the government of Tanzania requested to include the said sections into this Study as the highest priority projects to be implemented in the short-term plan, for which Japanese side finally agreed.

11-- 5

The proposed roads classified in Rank A were grouped into packages taking into consideration the ease of construction during the implementation stage.

Package of proposed roads was made on the basis of the following criteria:

- Road network requirement to ensure better and efficient connection in the regional road network, including reinforcement of accessiblity from local roads to collector or arterial roads and linkage between rural areas and urban areas.
- Socio-economic requirements needed to improve road systems in the areas in view of the stimulation of economic activities as well as the minimum requirement of infrustructures.

Proposed roads were grouped into 13 nos. of packages.

11.2.5 Evaluation of Proposed Roads Packaged

In determining the ranking of proposed roads packaged in the above, the same group ranking method as the method of ranking for proposed roads in paragraph 11.2.2 was employed as shown below:

Rank A: Packages whose scores are higher than the average value

- Rank B: Packages whose scores are lower than the average value

Table 11.4 showes the result of the score obtained by each package and as the result, the following 6 packages with a total length of 103.4 km were selected to be Rank A.

-				· · ·

## Table 11.4Ranking of Packaged Roads<br/>(Improvement of Road Structures)

Note: Bagamoyo Road from Mpakani Road junction up to Wazo Hill was deleted from the subject of the Study because of the commitment of Italian Government.

Priority	Package	Name of Package		Project
Order	No.			Length
(1)	P - 2	New Bagamoyo Group		9.8 km
(2)	P - 1	Morogoro Road		5.0 km
(3)	P - 9	Chango'mbe Group		19.2 km
(4)	P - 8	Kariakoo Group		31.6 km
(5)	P - 5	Mwinjuma Group		16.9 km
(6)	P-7	Central Group		20.9 km
			Total	103.4 km

Priority Order of Packages Evaluated in Rank A

Detailed of each package with preliminary cost are presented in Table 11.5.

11.3 Evaluation of Urgent Repair of Pot-holes under Category B

Pot-holes have increased to such an extent on the pavement of existing roads which causes serious damages on the vehicles and traffic accidents. The Study Team therefore recommends to repair these pot-holes immediately from the view point of the safety of public.

11.4 Evaluation of Proposed Maintenance Systems under Category C

Improvement measures on road maintenance system under Category C consists of three major work items; (1) Establishement of Road Maintenance Depots, (2) Procurement of Plants and Equipment and (3) Technical Assistance and Training Programme.

Each improvement measures is further divided into the subwork units as shown below:

- (1) Establishment of Road Maintenance Depots
  - 1 no. of Main Depot
  - 4 no. of Site Depots

Rank	Package	Name of Packages	Project	Approx.	Link

Table 11.5 Priority Package of Road under Category A

.

- (2) Procurement of Plants and Equipment
  - Procurement of equipment required for daily and routine maintenance work
  - Procurement of plants and equipment required for major improvement work including overlay and reconstruction of pavements
- (3) Technical Assistance and Training
  - Technical assistance for administration or supervision of maintenance work
  - Training for mechanics and operators

In determining the order of priority for the above work, the Study Team employed the following criteria:

\* Establishment of Road Maintenance Depots

The begin with a main depot should be established for road maintenance in Dar es Salaam taking into consideration the difficulty in allocating the local budget for operating maintenance depots.

Another 4 site depots should be built at the later stage after bringing-up the administrators, engineers and technicians including operators and mechanics through on-the-jobtraining of maintenance which to be undertaken at the main depot.

\* Procurement of Plants and Equipment

Type and numbers of plants and equipment should be determined taking into account the kind of work involved for maintenance as well as the volume of work to be done per month.

The Study Team suggestes to first procure the type of equipment required for dailly and routine maintenance work. Heavy equipment to be used for overlay and reconstruction of pavement, such as crushing plants, aspahlt finishers, vibration rollers, bulldozers, etc. should be procured at a later stage after the road maintenance teams are substantially organized. \* Technical Assistance and Training Programme

In order to operate and administer the maintenance depots smoothly and without ploblems, it is recommended that technical assistance from other countries advanced in road maintenance technology, be recieved immediately after establishing the main depot.

A training programme for engineers and technicians should be implemented in conjunction with the Techincal Assistance Programme.

Summary of evaluation results was presented in Table 11.6.

11.5 Formulation of Implementation Plan

11.5.1 General

The projects proposed in Categories A, B and C were classified into short, middle and long-term plans with the target year as shown below in accordance with the Scope of Works on the basis of the evaluation made for each improvement measures in subclause 11.2 through 11.4

Short-term Plan : 1990 - 1994
Middle-term Plan : 1995 - 1999
Long-term Plan : 2000 - 2005

The implementation plan of projects in each category was formulated taking into consideration the project costs required, ease of construction, construction period, expected impacts to the influenced areas, policy of the government, etc. as follows:

11.5.2 Short-term Plan

(1) <u>Category A: Improvement of Road Structures</u>
 Six (6) packages of road projects obtained the scores in Rank
 A are judged to be urgent works which are to be implemented
 in the short-term plan as follows:

- New Bagamoyo Road/Upanga Road, 9.8 km
- Morogoro Road, 5.0 km
- Chang'ombe Area Roads, 19.2 km
- Kariakoo Area Roads, 31.6 km
- Mwinjimaa Area Roads, 16.9 km
- Central Area Roads, 20.9 km

(2) Category B: Urgent Repair of Pot-holes

This improvement measure was proposed as the urgent measures so that it should be implemented in the short-term plan. (205 km)

(3) <u>Category C: Improvement of Maintenance System</u> DCC will be responsible for the maintenance after completion of the improvement under the Category A. DCC is, therefore,

required to establish proper road maintenance system before taking over the project roads. Thus, construction of new main depot and procurement of maintenance equipment proposed in the Category C should be implemented at the early stage of the short-term plan.

It is noted that the equipment to be provided in this stage shall be the light equipment to be used for daily and routine maintenance.

#### 11.5.3 Middle-term Plan

In the middle-term plan, it is recommended to implement the remainning priority roads classified into Rank B of Category A as shown below. The procurement of heavy equipment to be used for overlay and reconstruction shall also be implemented in the middle-term plan.

- (1) Category A: Improvement of Road Structures
  - Overlay and reconstruction of the following area roads:
    - Ilala Area Group, 13.1 km
    - Oyster Bay Area Roads, 27.7 km
    - Kigogo Area Roads, 15.8 km
    - Temeke Area Roads, 17.2 km

In addition to the above, the following arterial roads whould be improved:

- Kilwa Road (Overlay), 8.6 km
- Morogoro Road from Port Access Junction to TRM 4.5 km (Overlay and Reconstruction), 4.5 km
- Central Ring Road consisting of Ohio, Sokoine, Gerezani and Bandari Roads (Widening from 2 to 4 lanes), 5.2 km
- (2) Category C: Improvement of Maintenance System
  - Procurement of equipment required for overlay and reconstruction of the roads

#### 11.5.4 Long-term Plan

As stated in the Chapter 5, strengthenning of Middle Ring Road as well as the improvement of intersections by grade separation are essential for the future road network system in Dar es Salaam. The Study Team therefore recommends to implement the following measures:

- (1) Category A: Improvement of Road Structures
  - Imrovement of Middle Ring Road (P-14) consisting of; (Total Length: 10.8 km, Total Cost: Tsh. 26,000 million) a. Widening of Morocco, New Kigogo and Chang'ombe Roads from 2 to 4-lane and provision of grade separated interchange at Morogoro and Uhulu Roads, (Length: 10.8 km, Cost: Tsh. 1,500 million)
  - b. Construction of missing link in between New Kigogo and Chang'ombe by elevated structures with grade separated interchange at Pugu Road,

(Length: 1.0 km, Cost: Tsh. 800 million)

- c. Direct connection of Middle Ring Road with Port by Extension of Chang'ombe Road up to Port Access. (Length: 2.5 km, Cost: Tsh. 300 million)
- Improvement of Intersections by grade separation (P-15) at the following: (Total Cost: Tsh. 500 million)
  - a. Intersection at Pugu Road/Port Access
  - b. Intersection at Pugu Road/Msimbazi Road

11.5.5 Summary of Implementation Plan and High Priority Projects

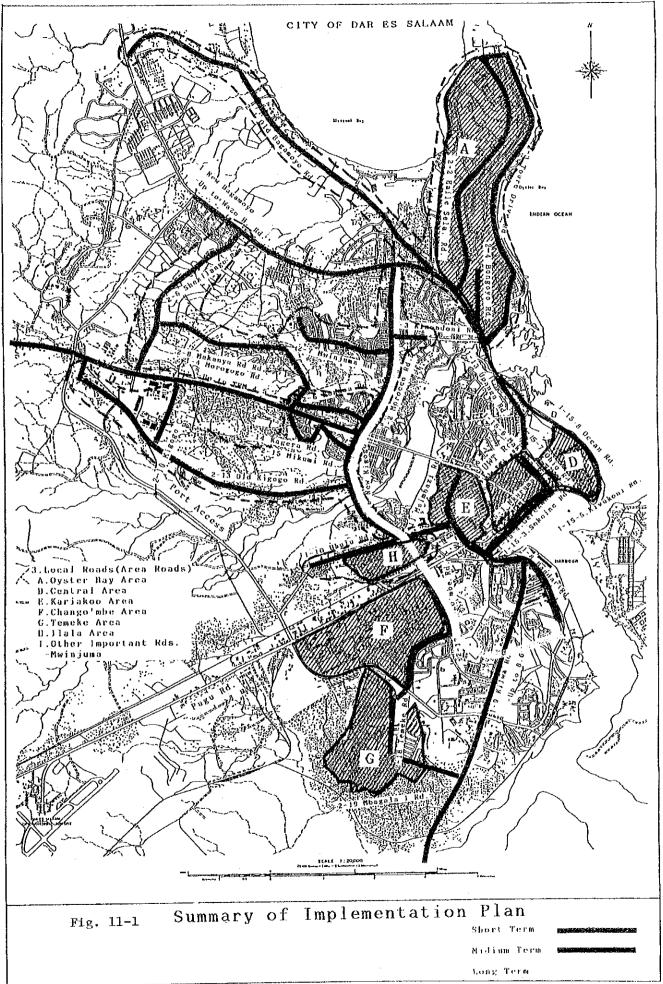

The implementation of short, middle and long-term plans as mentioned above was summarized in Table 11.7 and Fig.11.1.

Fig. 11.2 shows the tentative schedule of each improvement measures with an annual budget required.

The projects selected in the short-term plan were determined to be high priority projects under this study for subsequent preliminary engineering design in Chapter 12.

## Table 11.7 Summary of Implemention Plan

### CHAPTER 12 PRELIMINARY ENGINEERING DESIGN FOR THE HIGH PRIORITY PROJECTS

#### 12.1 General

Supplemetal field surveys was carried out along the high priority project roads selected in the previous chapter.

On the basis of the data and information obtained through the supplemental field surveys, the preliminary engineering design was conducted using the existing topographical maps with a scale of 1/2,500.

#### 12.2 Supplemental Field Surveys

The supplemental surveys conducted by the Study Team are the following items:

- Topographical survey
- Utilities survey
- Traffic survey on area roads
- Intersection traffic movement
- Pavement structural component survey
- Road inventory and drainage survey

#### 12.2.1 Topographical Survey

The existing topographical maps (Photo. dated March, 1982) with a scale of 1/2,500 are available in the Survey Department and covers the whole area of Dar es Salaam City.

In order to obtain the data and information required for subsequent preliminary engineering design, supplemental topographical survey was conducted by the Study Team. The survey was made along the widening sections of the projects, namely Morogoro. Upanga and New Bagamoyo Roads, to identify the major changes in topographical conditions as well as to check the buildings and houses which are irregularly occupied in theright-of-way.

Topographical maps with a scale of 1/500 have been prepared by the Study Team for the design of major intersections of Tanganika Motor Roundabout, Morocco Junction and Port Access Junction which are proposed to be improved to the signal controled intersections.

Cross sectional survey was carried out with an interval of 50m along the widening sections to estimate the required volume of earthwork.

Bench mark (BM) maps with an elevation were collected from the Land Survey Department, however, most of the bench markes shown in the maps were already interfered or demolished by road and building constructions so that no bench marks were confirmed in and near the proposed project sites.

Effective width of existing roadway of Upanga Road was measured carefully by the Study Team so that the proposed widening measure would not interfere with the lands or lots occupied by the embassies of other countries.

#### 12.2.2 Utilities Survey

Utilities survey was conducted along the widening sections of Morogoro, Upanga and New Bagamoyo Roads to identify the existing utilities which might be affected by the construction of the Project and relocated to the suitable place during or before construction.

Utilities maps showing the approximate location with dimention of underground utilities were also collected from the government and agency concerned.

### (1) Water Main (National Urban Water Authority)

There are water mains with a diameter of 18' to 58' laid along Morogoro and Upanga/New Bagamoyo Roads. Pumping station is located near the junction of New Bagamoyo/Mpakani.

Since water mains are laid mostly beneath 2 m in depth, they would not be affected by the road construction with the exception of the hydrants which are located alongside roads and protected with conceret walls. These hydrants migth be nesary to be replaced or protected properly so as not interefere with the road improvement projects.

(2) <u>Telephone Underground Cable and Lines (POSTA)</u> Underground telephone cables exist along Morogoro Road and Upanga/New Bagamoyo Roads.

The improvement of tele-communication system (Phase 1) in Dar es Salaam City is being undertaken by the study team of JICA and the installation of new telephone cable will be started soon accoding to the officials concerend. This phase 1 project will cover the eastern area of Dar es Salaam including Central and Oysterbay areas so that new telephene cables to be laid along Upanga Road might be affected by widening of Upanga Road.

The location of new cable should be determined taking into consideration the proposed widening projects of Upanga Road.

(3) Electric Wire and Pole (TANESCO)

There are existing high tension lines (H.T Line) installed along the project roads which should be replaced to proper location so as not interfere with the construction of the project roads.

(4) Sewarage and Sanitary Pipes (DSSD)

Pipe culverts being used for sewarage and sanitary are located along the roads and joined with the exisiting roadside drainage system. These pipeds should not be disturbed and be maintained as they are, spaecial care should be given during the construction of the project.

12 - 3

#### 12.2.3 Supplementary Traffic Survey on Area Roads

Supplementary traffic survey was conducted on area roads selected as the high priority project, namely Chang'ombe, Kariakoo, Mwinjima and Central Areas, to obtain necessary trafficdata and information required for estimating the projected future traffic volume which will be used for the calculation of project benefits.

Traffic by type of vehicle was counted for 10 hours from 7 a.m. to 5 p.m. at the following representative area roads: (See Fig.12.1)

Central Area :	-	Aggery Street
· · ·	-	Zanaki Street
	-	Libya Street
Kariakoo Area :		Kongo Street
		Mkunguni Street
	-	Shikuku Street
Chang'ombe Area:		Mbozi Road
	_	Changa Street
Mwinjuma Area :	<u> </u>	Makanya Road

The results of survey on each area road are presented in Appendix 12.1.

Since it is impossible to conduct the traffic survey on all the existing roads in the Area during in this short time survey, the representative ADT on each Area have been developed on the basis of 10 hour traffic volume obtained the above, for estimation of projected future traffic in the area using the following formula:

ADT = T12 x K x 1/W where, T12 = T10 + 2(T24-T12)/12 T24/T10 = 6K/(7-K) T10 = 10hrs day-time traffic volume K = Daily/day-time traffic ratio W = Weekly valiation ratio

The results of ADT calculated and existing representative tra

# Table 12-2 Existing Representative Traffic on Arca Road

-ffic in each Area were as shown in Table 12. 1 and Table 12.2 respectively.

#### 12.2.4 Intersection Traffic Movement

Intersection traffic counting was conducted to obtain the volume and carachteristics of traffic flow of each major intersection which will be used for the estimation of traffic capacity and design of proposed intersections.

#### (1) Survey

The survey was conducted at eleven (11) points on the priority roads as shown below:

Bagamoyo Road :-	Morocco Rd. Intersection
-	Old Bagamoyo Rd. Intersection
-	Hail Sellasie Rd. Intersection
-	Kinondoni Rd. Intersection
Upanga/UWT road:-	UN Rd. Intersection
-	Ocean Rd. Intersection
-	Tanganyika Motor Roundabout
-	Maktaba Street Intersection
Morogoro road :-	Port Access Rd. Intersection
. –	Shekilango Rd. Intersection
-	New Kigogo Rd. Intersection

Classified traffic counting was carried out on each selected intersections during the peak hours from 7:00 am to 9:00 am and 3:00 pm to 5:00 pm.

The results of survey and its summary are shown in Appendix 12.2 and Table 12.3.

(2) Traffic Capacity Analysis on Proposed Road Junctions

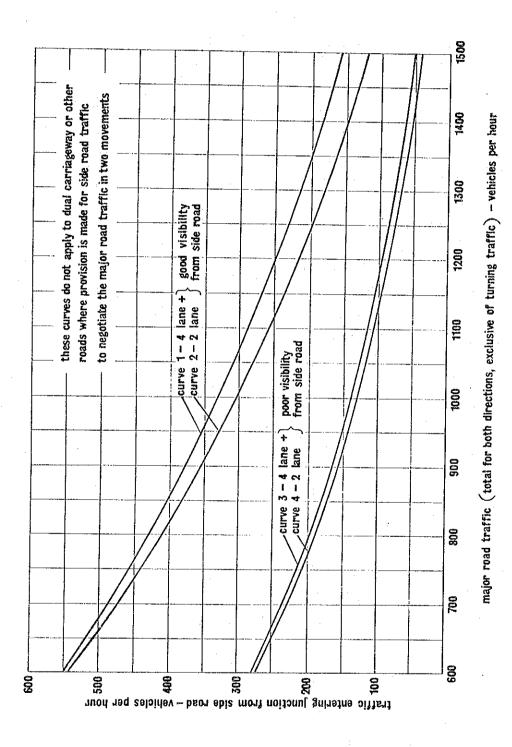

The design mannual, "Roads in Urban/Rural Area" published by the TRRL in UK was applied for the estimation of the traffic capacity on proposed intersections.

Fig. 12.2 showes the chart to be used for analysing the traffic capacity on priority roads.
