APPENDIX G. CONSTRUCTION PLAN

G.1 Construction Plan and Method of the Hong Ke System

G.1.1 General

This part presents construction plan on the proposed works for whole Hong Ke system.

The construction plan is worked out to provide a guide for the construction and a basis for the cost estimate as well as adopting conventional and prevailing construction methods in Lao People's Democratic Republic (Lao P.D.R.).

The construction plan are based on the following conditions for the implementation

(1) Executive body

The Government of Lao People's Democratic Republic (Lao P.D.R.) assigned the Municipality of Vientiane (MOV), will be the executing agency for the implementation of the Improvement of Drainage System in Vientiane under the MOV. The Municipality of Vientiane will perform the supervision and administration works with assistance of consulting engineers.

(2) Execution System of Works

The construction will be conducted on the contract basis through the international competitive bidding (ICB) in compliance with Government's regulation.

The work quantities of major works are given in Table G.1.

G.1.2 Construction Plan

(1) Working conditions

The working conditions for the construction planning are as follows:

(a) Workable Day and Hour

The estimation of workable days and hours has a close relation to labor regulation, weather, and handling of materials, etc. As a result of survey and study on such conditions, one (1) shift work for eight (8) hours per day.

The working shift and hour are determined on condition that the earth works and concrete works will be carried out by one (1) shift work for eight (8) hours.

(b) Labor Regulation

There is governmental labor regulation under the Lao Labor Association. According to the regulation, basic daily working hour is eight (8) hours and the work will be stopped on Sunday and national holiday.

(c) Weather Condition

The working days are estimated by deducting the Sundays, national holidays and suspension days caused by rainfall from the yearly calendar days. The suspension day means the time when the work is stopped due to the rainfall, and it varies with the basis of the following criteria.

Suspension days for works

Amount of rainfall (mm)	Work-suspended day	
	Earth works	Concrete works
0 - 5	0	0
6 - 10	0.5	0
11 - 20	1	0
21 - 30	1	0.5
Over 31	2	1

(d) **Swell Factor**

The volume of soil will be changed when it is moved, hulled and compacted. It is classified into three conditions i.e., natural, loose and compacted.

The soil in the natural condition is the soil in its original position. The soil in the compacted condition is the soil after being compacted on backfilled. The swell factor of volumetric change of earth materials is assumed as listed follows.

Swell Factor

Material	Natural	Loose	Compacted
Common	1.0	1.18	0.85
Sand and gravel	1.0	1.15	1.05
Rock	1.0	1.65	1.30

(e) **Hourly Production Rate of Construction Equipment**

The hourly production rates of major equipment were estimated on the basis of a conventional construction methods and formula considering the site conditions. Details of hourly production rates for each type of equipment are given in Table G.2.

(f) Land Acquisition and Compensation

Compensation cost for land and houses in the project area and right-of-way of the land to be required for the execution of the project, which are to be furnished by the Government of Lao People's Democratic Republic (P.D.R.).

(g) Construction Material

Earth materials for embankment, fine and coarse aggregates for concrete, sand and gravel and laterite for road surfacing, boulder for stone masonry, sod for sod facing, and timber products can be obtained locally by the contractors.

The earth materials for embankment and backfill shall be obtained from several kinds of excavation to be carried out under the contract as far as practicable. The earth materials for embankment and backfill will be available from borrow pits shown on the drawings or designated by the Engineer.

The materials of the cement, reinforcement bars and steel materials are imported by the contractors.

G.1.3 Construction Time Schedule

(1) Pre-construction Program

The pre-construction program broadly consists of loan arrangement, selection of consultant, will be started and concluded within a period of twelve (12) months.

In accordance with the procurement guideline of the financial agency for implementing a large scale construction, the prequalification of interested tenderers will be conducted. Tendering and subsequent procedures will follow the prequalifications. Successful tenderers will be selected by the 5th and 6th month for the contract as shown in Fig. G.1.

The land acquisition along the Drainage canal and Nong Chanh Retarding Basin will have to be started as early as possible prior to start of the construction.

(2) Mobilization and Construction Facilities

Mobilization and temporary works consisting of transportation, installation of plants, access road, water and electric supply system and temporary buildings, etc. will be completed or prepared within the 3 months after mobilization of contractor.

(3) Construction Time Schedule

The target data for completion of the project is assumed to be the end 3rd year. Approximately, 3 years would be required for the project work from commencement of Engineering Design to completion of Construction Works as shown in Fig. G.2 and construction work scheduled in each year are described below.

First Year

- (i) Signing of Exchange Notes
- (ii) Selection and Contract of Consultant
- (iii) Detailed design and preparation of tender documents
- (iv) Advertising
- (v) Prequalification
- (vi) Tendering and evaluation of civil works

Second Year

- (i) Award of civil work contract
- (ii) Mobilization
- (iii) Construction of access road and haul road
- (iv) Construction of temporary facilities for contractor use
- (v) Care of water and dewatering
- (vi) Fascine hurdle with sand bags (coffering)
- (vii) Excavation, embankment and slope protection works of the Hong Ke drainage canal

- (viii) Excavation and concrete works of the Morning Market box culvert
- (ix) Excavation and concrete works of lateral canal

Third Year

- (i) Care of water and dewatering
- (ii) Fascine hurdle with sand bags (coffering)
- (iii) Excavation, embankment and slope protection works of the Khoua Khao, Hong Thong drainage canal and Nong Chanh retarding basin
- (iv) Excavation and concrete work of structure for Khoua Khoa, Hong Thong drainage canal and Nong Chanh retarding basin
- (v) Removal of temporary facilities for contractor use
- (vi) Finishing works

G.1.4 Preparatory Works and Construction Facilities

(1) Access Road

Access from Bangkok to Vientiane is available by the combined route of railway and public road to Nong Khai, by Mekong ferry from Nong Khai to the New Vientiane river port, and by road from river port to project area.

An improvement by widening and laterite or gravel metalling of the access to the rock quarry site at Danecy from the National No. 13. Contractors under Improvement of Drainage system area will be allowed to use this access road subject to providing necessary repair and maintenance under cooperation among the contractors. For the borrow areas of sand and gravel and earth deposits for the construction of drainage canal, approach roads to work site will be constructed from the provincial asphalted road by contractors under the contract as the temporary access road.

During the construction, contractors will be required to maintain the national, provincial and village roads to be used for access by using motor grader and macadam roller. Contractors will also have to provide

temporary diversion roads at the construction sites at their own expense where necessary.

(2) Temporary Building and Land Space

It is assumed that the contractors' office, quarter, stores and workshops will be established at the construction sites.

The required areas to be used for these building and yards are estimated as follows:

Description	Building (m ²)	Land (m ²)
Office	300	730
Quarter	150	370
Warehouse	500	1,000
Labor camp	1,500	3,750
Motor pool and repair shop	600	1,200
Miscellaneous	200	400
Total	3,250	7,470

(3) Concrete Production and Aggregate

To produce concrete conforming to the requirements of the Technical Specifications and construction program, suitable concrete materials should be selected and concrete mixing plant having an adequate capacity should also be provided at each site.

The concrete aggregate to be furnished will be available at the borrow area of Mekong river located about 15 km downstream from Vientiane. The material will be hauled by 8 ton dump truck to the stock yard.

Since sources of aggregate are submerged in the river water in the wet season, a sufficient stock of aggregate will have to be stored for enabling the concrete work to be carried out throughout year.

G.1.5 Construction Method

(1) Main Drainage Facilities

The construction of the main drainage facilities will be mainly executed during the dry season when water level of the existing drainage canal is low. Care of water and dewatering will be carried out firstly and this will be immediately followed by a temporary fascine hurdle with sand bags (coffering) construction. Then excavation, embankment, slope trimming and slope protection works will follow thereafter.

Earth works for main drainage canals will be carried out mainly by a back hoe and bulldozers. Excavation of high water canal will be conducted by combination of swamp type bulldozers and amphibious excavators. For the canal reaches, the excavation will be carried out using bulldozer and back hoe for a short hauling distance of material. For a long distance of more than 50 m, backhoe and dump truck will be used for loading and hauling the excavated material. Some of the excavated materials will be used for embankment. The trimming of canal side slopes will be made by back hoes or manual labors. The compaction for canal embankment will be carried out by vibration rollers after conditioning the fill materials to have a moisture content in the required range. The embankment materials will be obtained from suitable excavated materials in drainage canals, and/or the extracted from borrow pits.

Stone or concrete block masonry works will be conducted by manual power mainly.

Revetment and sod facing works are also carried out by manual power mainly.

Bank protection work and structures with wet masonry will be carried out using a portable type concrete mixer as the supporting equipment to the manual construction.

(2) Box Culvert

A combination works by manual power and a back hoe will be applied for this works. A portable type concrete mixer will be used for the concrete. The box culvert construction should be carried out by the stepwise construction taking account of the site conditions.

The demolishing work for the existing structures will be carried out in stepwise providing the partial coffering dike made of wooden piles with bamboo sheets and sand bags.

Removal of concrete and excavation of structures will be carried out by a concrete breaker, pick hammer and 0.6 m³ class back hoe. Those excavated materials will be loaded into 8 ton dump truck for hauling to the spoil bank.

(3) Lateral Canal

The construction of lateral canal improvement will be carried out divided into several stages of the construction section in order to secure the drainage system during construction.

Based on the run-off discharge to the drainage canal and economical point of view, it is planned that the lateral canal improvement works should be carried out by the stepwise construction taking account of the site conditions. The works will be executed by two to three crews in a parallel way.

Excavation will be carried out by a back hoe and dump trucks for hauling works.

Removal of concrete for the existing structures will be carried out by a concrete breaker, pick hammer and 0.6 m³ class back hoe. Those removed materials will be loaded into 8 ton dump truck for hauling to the spoil bank.

A portable type of concrete mixer will be provided for the small quantity of concrete of the lateral canal improvement works.

(4) Nong Chanh Retarding Basin

The retarding basin construction works will be carried out by the stepwise construction in accordance with the site condition providing the partial coffering method using fascine hurdle with sand bags. The works will be executed by two to three crew in a parallel way.

The coffering material will be shifted to the next step construction.

The construction works will be concentrated to the retarding basin in the dry season.

Excavation of high water portion will be conducted by the combination of a swamp type bulldozer, an amphibious excavators and dump trucks under the dry condition to be secured by partial coffering.

Fascine hurdle with sand bags for coffering will be provided mainly by manual power.

Excavated soil will be disposed to the spoil bank by dump trucks.

The trimming of side slopes will be made by back hoe or manual labor. The compaction for embankment will be carried out by a vibration roller after conditioning the fill materials to have a moisture content in the required range. The embankment materials will be obtained from the suitable excavated materials in canals, and/or the extracted from borrow-pits.

Stone or concrete block masonry works will be conducted by manual power mainly.

Revetment and sod facing works are also carried out by manual power mainly.

(5) Metal Works

The installation of gate, screen and its accessories will be conducted in later stage of construction works.

Installation will be conducted mainly by manual power. Truck crane will be utilized as the supporting equipment to manual work for installation of gates, screen and accessories.

(6) Crossing Facilities

There are crossing utilities in the Vientiane City Interceptor such as power lines, water supply pipes and telephone lines.

Those facilities are planned to be replaced following to drainage canal works.

Required works for renewal will be conducted by the nominated contractors of each agencies.

G.1.6 Construction Equipment

The construction equipment are selected based on the time schedule, work quantities, site conditions, design features and suitable combination of equipment.

The hourly production rates and major construction equipment is listed in Table G.2 and Table G.3.

G.2 Construction Plan and Method of the Nam Pasak System and Sub Area I, K

The civil works to be constructed under the Project are broadly divided into two categories; the drainage facilities and the retarding basin. The drainage facilities are further divided into two categories; the main drainages canal and the lateral canals. Main works for each category are listed as follows;

- | | | |
|-----|-------------------------------------|---------|
| (1) | Nam Pasak Main Drainage Canal | 3,300 m |
| (2) | Sub Area "I" | |
| | a) Hong Kai Keo Main Drainage Canal | 1,270 m |
| | b) Nong Bon Retarding Basin | 5 ha |
| (3) | Sub Area "K" | |
| | a) Lateral Canal | 1,800 m |

G.2.1 Construction Schedule of the Nam Pasak System and Sub Area I & K

(1) Project Schedule

The target data for completion of the Nam Pasak System and sub area I, K is assumed to be the 36th month. Approximately, 3 years respectively would be required for the Nam Pasak System and sub area I, K work from the commencement of Engineering detailed design to the completion of construction work as shown in Fig. G.1. The necessary periods are summarized as follows;

- | | | |
|----|--|-------------|
| a) | Engineering design including preparation of tender documents, and prequalification | : 6 months |
| b) | Tendering | : 6 months |
| c) | Main construction works | : 24 months |

(2) Construction Work Schedule

Fig. G.1 shows the construction time schedule of the Nam Pasak System and sub area I, K. Major works scheduled in each year are described below.

Sixth Year (Nam Pasak System)

- a) Signing of Exchange Notes
- b) Selection and contract of consultant
- c) Detailed design and preparation of tender document
- d) Advertising
- e) Prequalification
- f) Tendering and evaluation of civil works

Seventh Year

- a) Award of main construction work contract and mobilization
- b) Construction of temporary facilities for contractor use
- c) Construction of access road and haul road
- d) Care of water and dewatering
- e) Fascine hurdle with sand bags (coffering)
- f) Excavation, embankment and slope protection work of the Nam Pasak main drainage canal

Eighth Year

- a) Care of water and dewatering
- b) Fascine hurdle with sand bags (coffering)
- c) Excavation, embankment and slope protection work of the Nam Pasak main drainage canal
- d) Removal of temporary facilities for contractor use
- e) Finishing works

Eleventh Year (sub area I & K)

- a) Signing of Exchange Notes
- b) Selection and contract of consultant
- c) Detailed design and preparation of tender documents
- d) Advertising
- e) Prequalification
- f) Tendering and evaluation of civil works

Twelfth Year

- a) Award of main construction work contract and mobilization
- b) Construction of temporary facilities for contractor use
- c) Construction of access road and haul road
- d) Care of water and dewatering
- e) Fascine hurdle with sand bags (coffering)
- f) Excavation, embankment and slope protection work of the Hong Kai Koi main drainage canal
- g) Excavation and concrete work of lateral canal for area I
- h) Excavation, embankment and slope protection works of the Nong Bon retarding basin.

Thirteenth Year

- a) Care of water and dewatering
- b) Excavation and concrete work of lateral canal for area K
- c) Removal of temporary facilities for contractor use
- d) Finishing works

G.2.2 Construction Method

(1) Main Drainage Facilities

The construction of the Nam Pasak main drainage canal will be started at after completion of access road. Excavated soil will be conveyed by dump trucks and partly by utilized for embankment. The rest of them will be deposited into the old channel (short cut portion), which has an enough capacity to receive the soil from excavation.

The construction of the main drainage facilities will be mainly executed during the dry season when water level of the existing drainage canal is low. Care of water and dewatering will be carried out firstly and this will be immediately followed by a temporary fascine hurdle with sand bags (coffering) construction, then excavation, embankment, slope trimming and slope protection works will follow thereafter.

Earth works for main drainage canals will be carried out mainly by a back hoe and bulldozers. Excavation of high water canal will be conducted by combination of swamp type bulldozers and/or Amphibious excavators. The trimming of canal side slopes will be made by back hoes or manual labors. The compaction for canal embankment will be carried out by vibration rollers after conditioning the fill materials to have a moisture content in the required range. The embankment materials will be obtained from suitable excavated materials in drainage canals, and/or the extracted from borrow-pits.

Stone or concrete block masonry works will be conducted by manual power mainly.

Revetment and sod facing works are also carried out by manual power mainly.

Bank protection work and structures with wet masonry will be carried out using a portable type concrete mixer as the supporting equipment to the manual construction.

(2) Lateral Canal

The construction of lateral canal improvement will be carried out divided into several stages of the construction section in order to secure the drainage system during construction.

Based on the run-off discharge to the drainage canal and economical point of view, it is planned that the lateral canal improvement works should be carried out by the stepwise construction taking account of the site conditions. The works will be executed by two to three crews in a parallel way.

Excavation will be carried out by a back hoe and dump trucks for hauling works.

The existing structure will be demolished by concrete breaker, pick hammer and back hoe. The fragment will be removed to the spoil bank.

A portable type of concrete mixer will be provided for the small quantity of concrete of the lateral canal improvement works.

(3) Nong Bon Retarding Basin

The regarding basin construction works will be carried out by the stepwise construction in accordance with the site condition providing the partial coffering method using fascine hurdle with sand bags. The works will be executed by two to three crew in a parallel way.

The coffering material will be shifted to the next step construction.

The construction works will be concentrated to the retarding basin in the dry season.

Excavation of high water portion will be conducted by the combination of a swamp type bulldozer, an amphibious excavators and dump trucks under the dry condition to be secured by partial coffering.

Fascine hurdle with sand bags for coffering will be provided mainly by manual power.

Excavated material will be disposed to the spoil bank by dump trucks.

The trimming of side slopes will be made by back hoe or manual labor. The compaction for embankment will be carried out by a vibration roller after conditioning the fill materials to have a moisture content in the required range. The embankment materials will be obtained from the suitable excavated materials in canals, and/or the extracted from borrow-pits.

Stone or concrete block masonry works will be conducted by manual power mainly.

Revetment and sod facing works are also carried out by manual power mainly.

(4) Metal Works

The installation of gate, screen and its accessories will be conducted in later stage of civil construction works.

Installation will be conducted mainly by manual power. Truck crane will be utilized as the supporting equipment to manual work for installation of gates, screens and accessories.

(5) Crossing Facilities

There are crossing utilities in the Vientiane city Interceptor such as power lines, water supply pipes and telephone lines.

Those facilities are planned to be replaced following to drainage canal works.

Required works for renewal will be conducted by the nominated contractors of each agencies.

TABLES

Table G.1 Major Work Items and Quantities (1/2)

Work Items	Unit	Quantity
1. Preparatory Works		
1.1 Access road	m	2,800
1.2 Haul road	m	2,500
2. Main Drainage Canal		
2.1 Khoua Khao	m	1,100

APPENDIX H. COST ESTIMATE

H.1 General

This part presents the project cost for the implementation of the improvement work of the project. The contractors of this project will be selected by international competitive tenderers. The project cost is estimated at the price level of 1989 on the basis of the Feasibility Study completed in February 1990 and the construction plan and schedule as follows:

Foreign Currency	:	J.Yen	1,123,677,000.-
Local Currency	:	US\$	5,268,000.-
<hr/>			
Total (equivalent to J. Yen)			1,866,465,000.-
Total (equivalent to US\$)			13,237,000.-

In order to make cost estimate, a unit price method is mainly applied for each work. Each unit price is estimated and analyzed on the basis of local conditions, the proposed construction method, unit rates of labor wages, material and equipment costs, and reference cost data of the similar projects in Lao P.D.R. and Bangkok. Furthermore, the breakdown is worked out taking into account the financial source, recent international tendering system and cost estimating procedures prevailing in Lao P.D.R. The summary of construction cost is shown in Table H.1.

(1) Basic conditions of Cost Estimates

Prior to estimate of construction cost, the following data collection and pre-study were made:

- (a) Collection of local material and local labor costs published by Ministry of Public Works.
- (b) Collection of CIF costs of imported materials and construction equipment from local dealers and foreign suppliers.

(2) Price Level and Exchange Rate

The construction cost for the project is estimated on the price level of last quarter of 1989.

The following exchange rates are applied considering the prevailing exchange rates at the time of collection of cost data: US\$1.0 = 590 kip = 141 J. Yen.

(3) Currency for Cost Estimate

The construction cost is estimated for the foreign currency component and local currency component in accordance with the source and origin of material and equipment.

The currency for cost estimate is expressed in Japanese Yen (J. Yen) for foreign currency component and in US Dollar (US\$) for local currency component respectively. Total construction cost is expressed in US Dollars (US\$).

The foreign currency component and the local currency component include the following items:

(a) Foreign currency component

- Cost of all imported equipment and spare parts
- Cost of imported materials
- Cost of engineering service for consultant

(b) Local currency component

- Labor cost
- Cost of local materials
- Cost of land acquisition
- Project administration expenses

H.2 Estimate of Project Cost

(1) Cost Component

The costs for the project administration, engineering service and land acquisition are also estimated. The project cost includes physical contingencies.

The project cost consists of the following components:

- I. Direct Construction Cost (Contract Cost)
 - a) Preparatory works
 - b) Main drainage canal
 - i) Khoua Khao drainage canal
 - ii) Hong Thong drainage canal
 - iii) Box culvert (Morning market)
 - iv) Hong Ke drainage canal
 - c) Nong Chanh retarding basin
 - d) Lateral canal
- II. Land Acquisition & Compensation
- III. Government Administration
- IV. Engineering Service
- V. O&M Equipment
- VI. Physical Contingency

(2) Direct Cost

The direct cost consists of three items, that is, material, labor and equipment costs. The costs include allowance and work loss on the net costs. The priced bill of quantity is listed in Table H.2.

(a) Material Cost

The construction materials are divided into local and imported materials.

The unit prices of local materials are estimated based on the price "Price of Construction Materials" assessed by Lao P.D.R.

The local materials are assumed to be procured from the market in the city where the Project site is located and these materials are to be transported to the job site.

The unit prices of imported materials are estimated based on the market prices in Bangkok or Japan together with the inland transportation charge. Basic prices of materials are assumed as listed in Table H.3.

(b) Labor Cost

The laborers required for the construction work are assumed to be local labor. The unit prices of labors are estimated to be local labor.

The labor wages estimated at the rate of 8-hour working per day according to the labor regulation.

The labor wages are shown in Table H.4.

(c) Equipment Cost

The equipment expenses consist of the hourly or daily depreciation cost, repairing cost and management cost which comprise local and foreign currency portions.

The life time ratio of depreciation represented by a straight line method, ratio of repairing represented by an average method and ratio of management for the construction equipment are assumed based on the Japanese Standard criteria. The hourly or daily equipment cost are shown in Table H.5.

(3) Indirect Cost

Contractor's indirect cost which consists of overhead and profit of the contractor is included in this cost estimate. The overhead expenses comprise general administrative expenses and field expenses.

The general administrative expenses include salaries and allowances for contractor's personnel, legal welfare expenses, international traveling and communication expenses, depreciation, insurance, profit and so on. The field expenses consist of cost for contractor's personnel, camp operation, labor control expenses, security insurance and bond, stationary and communication expenses and so on.

The overhead expenses and profit are distributed to the unit price or lump sum of each work item. These expenses are estimated 20 per cost of direct unit cost comprising material costs, labor wages and equipment costs.

(4) Land Acquisition Cost

The costs of right of way and compensation are estimated for the lands, house and other private properties by using the prevailing unit costs obtained at Vientiane.

(5) Administration Cost

The project administration expenses are on man-month basis to cover the costs of supervisions and management of the project.

(6) Engineering Services Costs

The cost of engineering services to be required for the implementation of the project is estimated on man-month basis.

(7) Procurement Cost of O&M Equipment

O&M equipment as the minimum requirement for the project are selected. The cost of equipment is estimated at CIF at the site.

(8) Contingency

The contingency is provided to cope with the unforeseen change of physical conditions. The physical contingency is assumed to be 10% of total construction cost for both currencies.

(9) Taxes and Duties

The taxes and duties to be levied by the Government of Lao P.D.R., consisting of contract tax and income tax, were included in the indirect cost of the unit prices. Other taxes and duties such as personal income tax on the employes of the contractor, and the custom duties on the equipment and materials imported by the contractor were also taken into account in the respective unit prices.

H.3 Disbursement Schedule

Construction funds will be disbursed a period of 36 months to complete the project works. The quarterly fund requirement is estimated as shown in below based on the construction schedule as described in Part G. The detailed disbursement schedule is shown in Table H.6.

Description	Foreign Currency (1,000 J. Yen)	Local Currency (1,000 US\$)	Total Equivalent (1,000 US\$)
<u>First Year</u>			
1st Quarter	37,341	60	325
2nd Quarter	22,404	106	265
3rd Quarter	22,404	118	277
4th Quarter	8,962	66	130
Sub total	91,111	350	997
<u>Second Year</u>			
1st Quarter	296,725	1,472	3,576
2nd Quarter	53,789	274	655
3rd Quarter	41,275	254	547
4th Quarter	119,047	644	1,488
Sub total	510,836	2,644	6,266
<u>Third Year</u>			
1st Quarter	158,286	859	1,982
2nd Quarter	45,871	297	622
3rd Quarter	125,154	297	1,185
4th Quarter	192,420	822	2,185
Sub total	521,731	2,275	5,974
TOTAL	1,123,677	5,268	13,237

I.1 Introduction

The socio-economic study mainly aims at projecting population, gross domestic product (GDP) and gross regional domestic product (GRDP) in the year of 1990, 2000 and 2020, as the basic framework for the preparation of the drainage improvement plan. Present socio-economic framework and other principal indicators are simultaneously mentioned in this sectoral study.

The composition of the socio-economic study is as follows:

Chapter I.2	Present socio-economic condition
Chapter I.3	National economic development plan
Chapter I.4	Socio-economic projection

Chapter I.2 describes to the present socio-economic framework of Lao PDR as well as the Study area and following items are included in the description:

1. Administrative unit
2. Population
3. GDP and GRDP
4. Employment
5. Health condition
6. Price
7. Exchange rate
8. External trade

National economic development plans and Regional development plan of the Vientiane Municipality are presented in Chapter I.3. Population, GDP and GRDP were projected for the year of 1990, 2000 and 2020 in Chapter I.4.

1.2 Present Condition of Socio-economy

1.2.1 Administrative Unit

The Lao PDR is composed of 16 provinces and Vientiane Municipality. The Vientiane Municipality is the capital of the nation and divided into 7 districts, that is, Sisatanak, Chanthabury, Saisetta, Sikhot Tabong, Hat Sai Fong, Hasaithong, Phialad and Saithany district. The Sisatanak, Chanthabury, Saisetta and Sikhot Tabong district are classified as the urban district while the Hat Sai Fong, Hasaithong, Phialad and Saithany district are classified as the rural district.

In each district, there is the district office under the control of the Vientiane Municipality. The district is divided into tassengs that are lower level administrative units composed of villages.

The Study area covers 56.19 km² which is 1.7% of total area of the Vientiane Municipality. Administratively the Study area belongs to four urban districts of Vientiane Municipality, Sykottabong, Chanthaboury, Saysetta and Sysatthanak, and the Study area includes about 100 villages.

1.2.2 Population

The national population census in 1985 is available data source of national population. According to this census there were 3.58 million Laotians, comprising 11.75 million males and 1.82 million female. The average population density was estimated to be 15.1 persons per km² on the basis of the territory of 236,800 km². As for the regional distribution of population in 1985, more than 10% of population concentrated in Vientiane as shown in Table I.1. According to the World Bank estimation in 1986, 85% of population were in rural area

The growth rate of the population during last decade was about 2.6% per annum on an average, however the growth rate at present becomes higher due to baby boom in the post-war periods. Thus the present growth rate was estimated to be 2.9% per annum and 45% of total population were less than 15 years of age.

In 1985 the mortality rate for infants up to one year of age was estimated by the World Bank at 115 per 1,000 live births. The estimated mortality rate for children of one to four years of age 23 per 1,000 due to the poor health condition in rural area. Thus both the birth rate and the death rate were also high and the average expectancy was low as follows:

Birth rate in 1985	42 per 1,000 persons
Death rate in 1985	19 per 1,000 persons
Life expectancy in 1985	44 years of age for male
	46 years of age for female

On the basis of the World Bank estimation in 1989, the population in 1988 was estimated to be about 3.84 million and the population density was about 16 persons per km².

The total population of Vientiane Municipality was estimated to be 337,000 in 1985 based on the national population census. The population in 1988 was estimated to be 474,000 by the Department of Economic Planning and Finance of Vientiane Municipality and the average annual growth rate from 1985 to 1988 was calculated at 4.7%.

The total population of the Study area in 1985 and 1988 were estimated to be 148,985 and 157,653 respectively based on the population survey by Department of Economic Planning and Finance of Vientiane Municipality.

In 1988 the population in the Study area accounted for 35.5% of the total population of Vientiane Municipality. The population density was 2,806 persons/km² and annual growth rate of population was estimated to be 1.9% from 1985 to 1988. The Study area is characterized as a densely populated area.

The Study area is divided into 17 sub-areas on account of the existing drainage system and topographic conditions. The population and population density in each sub-areas is shown in Table I.2.

At present, the population of the Study area is increasing due to inflows from the rural villages.

I 2.3 GDP and GRDP

(1) Estimation of GDP

The national accounts of the Lao P.D.R. were established according to the system of material production methodology which differs from the U.N. system of national accounts. In the material product system only the output of materials sectors (agriculture, industry, construction, transport and commerce) is included in the calculation of Net Material Product (NMP). NMP is defined as output (Gross Material Product) minus the value of material inputs and depreciation. This concept thus differs from Gross Domestic Product (GDP) by excluding value added in the service sectors and depreciation.

In order to convert NMP into GDP, the World Bank add back to the value of NMP depreciation expenditures and the value added of the government sector and nonmaterial services (private sector commerce). To carry out these adjustments, it was assumed that depreciation expenditures amounted to 6% of NMP on the basis of the World Bank estimation.

The revised national accounts are shown in Table I.3.

(2) GDP and GRDP

The gross domestic product (GDP) and per capita GDP in 1986 are estimated to be Kip. 62,891 million and Kip. 17,132 (US\$180 equivalent). The economy has been growing rapidly during 1982 to 1986, recording an increase of 6.4% per annum. However, in 1987 the GDP fell by 3.8% due to the impact of the 1987 drought which drastically reduced agricultural production and electricity generation. Net Material Product and GDP during 1982 to 1987 are shown in Table I.4.

The shares of GDP and employment by industrial origins in 1986 are shown as follows;

Sector	Share of GDP	Share of Employment
Agriculture	65.2%	80.0%
Industry	14.0%	2.2%
Service	20.8%	17.8%

Source: World Bank, 1988

Gross Regional Domestic Product (GRDP) of Vientiane Municipality was estimated by the Department of Economic Planning and Finance of Vientiane Municipality since 1987, as shown in Table I.5. GRDP were estimated based on Net Regional Material Products (NRMP) by adopting above mentioned procedures of the World Bank. The shares of GRDPs of Vientiane Municipality to GDP are estimated to be about 26% and 27% in 1987 and 1988 respectively.

The share of GRDP by industrial sector were estimated to be 76.9% for agriculture, 14.5% for Industry, 4% for Commerce, 1.9% for Construction and 1.8% for Transportation in 1988.

The Study area has been the most important economic center of national and regional economy. The agricultural sector has been the major sector in the Study area. The major products thereof were paddy, vegetables, mungbeans, tobacco and sugarcane. The major industrial products have been those from agro-industry and consumer goods industry. Tobacco, fertilizer, soap, beer, soft drink and fabric are the principal products. Commerce is the other sector which characterize the Study area. There were most important commercial zones in Chanthabury district and 15 major markets in the Study area where both agricultural products and industrial products were collected from whole Vientiane Municipality.

The importance of agricultural sector in the Study area is lower than that in whole Vientiane Municipality. In turn it has produced most of industrial and commercial output in Vientiane Municipality.

(3) World Bank GDP Projection

The World Bank projected the future GDP growth by sector up to 1995 as follows:

Projections of GDP by Sector, 1987 - 95
(Annual Percentage Growth Rates in 1987 Prices)

	1987 - 91	1991 - 95
Gross domestic product	5.3	5.4
of which:		
Agriculture	4.7	4.0
Industry	8.0	9.0
Construction	6.9	8.3
Transport	6.5	8.0
Commerce, Government and private sector services	5.6	7.0

The projected condition of future economic development in each sector is summarized by the World Bank as follows:

- (a) Agricultural production is projected to recover from the impact of the 1987 drought and to rise by 4.7% p.a. in 1987 - 91. Since Laos' per capita consumption of rice is already one of the highest in the world, it is assumed that rice consumption would increase at about the same rate as population growth so that rice output would grow much slower than in the early eighties. It is for this reason that rapid growth of nonrice commodities is essential if agricultural growth is to be high in the future.

- (b) The industrial sector would grow by about 8.0% in 1987 - 91 and 9.0% in later years. Mining output would initially rise rapidly as a consequence of ongoing investments in tin and gypsum, and later on as a result of the exploitation of new mineral deposits. As the effect of the 1987 drought would wear off, electricity production would recover its 1986 level in 1989, and would increase by 24% in 1991 - 95 due to the completion of the Xeset hydropower station. The construction sector would increase by 6.9% in 1987 - 91 and 8.3% in 1991 - 95 as a result of the projected increase in the demand for housing, planned investment in roads, and increased availability of construction materials.
- (c) In 1982 - 86 the transport sector grew at a slower rate than net material product. With the removal of restrictions on shipment of goods across provinces, the relationship between GDP and transport would follow the usual pattern characterized by transport services increasing at a faster rate than GDP. At the same time, the 1987 - 88 removal of restrictions on private sector activities in services and commerce would lead to a rise in commerce and private services. This trend is reflected in the projected rapid growth of the commerce and service sectors.

I.2.4. Employment

The population in working age of Lao PDR in 1986 was estimated to be 1.55 million and 42% of total population according to the World Bank. The figure appears to exclude economically inactive Buddhist monks, secondary school students and military personnels. The World Bank also estimated the sectoral shares of employment in 1986, that is, 80% for agriculture, 2% for industry and 18% for service.

The World Bank projected the future structure of employment up to year of 2000 and the results are shown in following table.

	1986		1995		2000	
	Total (in '000)	%	Total (in '000)	%	Total (in '000)	%
Agriculture	1,364	80.0	1,762	78.0	2,009	77.0
Industry	27	1.6	52	2.3	73	2.7
Construction	10	0.6	23	1.0	31	1.2
Transport, commerce and services	304	17.8	422	18.7	499	19.1
Total	1,706	100.0	2,251	100.0	2,612	100.0

I 2.5 Health Condition

In 1975, a primary health care strategy was adopted to provide health care to the vast majority of the population and a community participation campaign was launched. However much progress has been made in the past 12 years, the health situation and the development of the health system remains unsatisfactory. The absence of well qualified personnel, the lack of drugs, equipment, recurrent cost funding and the poor physical state of health facilities are major cause of this poor health condition.

Life expectancy at birth is 45 years. The crude birth rate of 46 and the crude death rate of 19. Infant mortality is presently estimated at 115 per 1,000 live births and ranges from 50 in Vientiane to 290 in remote rural areas.

The serious problem diseases are malaria, and more recently epidemics of dengue fever at the beginning of the rainy season. These epidemics reclaiming an increasingly high death toll. In addition, typical children diseases, diarrheal diseases and respiratory infections, have high incidence rates. Many of these diseases are preventable through immunization and proper sanitation. However, only 4% of children 12 - 23 months are fully immunized, only 11% are immunized against tuberculosis, 8% have been immunized for DPT and poliomyelitis and 4% for measles. In addition, only 22% of the population has access to safe water.

The health condition in the Vientiane Municipality is same as that of nation described above. The number of patients by kind of disease were obtained from Department of Health, Vientiane Municipality as shown in Table I.6. The typical diseases due to poor sanitary and drainage condition were malaria and dengue and people in the Study area were suffered by these diseases.

According to Department of Health, Vientiane Municipality, there are serious problems in the health sector of Vientiane. The lack of hospitals, equipments, drugs, medicines and personnels are serious constraints to improve health conditions while the low level of sanitary condition of both urban and rural area is major cause of diseases.

The list of hospital in the Vientiane Municipality is summarized in Table I.7.

I 2.6. Price

During 1980's, the economy of Lao PDR has been suffered from the high inflation rate. In 1986 the consumer price index of Vientiane was 65% due to the high price escalation in free market. The major reason of the high price escalation in free market was imbalance between excess money supply and lack of supply of goods and commodities. So the government decreased the money supply and reformed the price system.

There were two kinds of price, official price and free market price before 1985 and the official market price was controlled by the government. Thus the free market price was much higher than the official price. In 1985, the government decided to decrease the price differential between the official price and the free market price which was considered to be the major cause of confusion of price system and thus price differentials were almost eliminated in 1988. As a result the price reflect to the balance of supply and demand of goods and commodities. Besides various policies were carried by the government in order to improve economical structure of Lao economy according to the New Economic Policy for the stabilizing of the inflation. Thus the annual inflation rate in 1987 was decreased to 6.7% and despite the

substantial increase of the official prices in early 1988, the free market prices remained 4.4% by mid-1988.

The price increases during 1982 to 1988 are shown in Table I.8.

I 2.7. Exchange Rate

The multiple price system corresponded a multiple exchange rate system consisting of seven exchange rates which were infrequently adjusted during the 1982 - 86 period. However, starting in 1986 and in parallel with the implementation of a new system of economic management, the Government initiated a unification process of the various exchange rates. The commercial exchange rate was devalued by 171% in 1986 and 320% during the first half of 1988. By mid-July 1988, there were only two official exchange rates, an official (or representative) exchange rate (10 kips per U.S. dollar), which applies to disbursements and repayments of loans and a market rate which is set at the level of the parallel market exchange rate. The exchange rates during 1982 to 1987 are summarized in Table I.9 and the exchange rates in the parallel market in 1989 are shown as follows:

	U.S.\$	J.¥	Kip
Apr, 1989	1.0	133.8	555.0
May, 1989	1.0	144.1	555.0
Jun, 1989	1.0	141.4	565.0
July, 1989	1.0	139.7	589.0
Aug, 1989	1.0	145.7	601.0
Sep, 1989	1.0	140.7	656.0
Average		141.0	590

I 2.8. External Trade

Foreign trade in Lao PDR is characterized by a persistent disequilibrium and a large share of a few commodities for export, namely electricity, logs and wood products and coffee. Most of industrial commodities, such as machinery, vehicles, petroleum, medicine and medical equipment depend on import. The

foreign trade from 1976 to 1988 and the composition of official export and import in 1986 and 1987 are shown in Table I.10 to I.14.

From 1987 the import and export between Lao P.D.R. and foreign countries, mainly Thailand, have expanded rapidly. The major export goods were electricity, logs, wood products, mining products and coffee. Meanwhile major import goods were machinery, petroleum products and other industrial goods. The Study area has been a main transit point of trade with Thailand.

I.3 Socio-economic Development Plan

I.3.1 National Socio-economic Development Plan

I.3.1.1 The Interim Three Year Development Plan

After the foundation of Lao P.D.R., the Government launched the Interim Three Year Development Plan (1978 - 1980) in order to restore deteriorated economy and increase production. The objectives of the plan were to develop the agricultural sector and reach self-sufficient of food by 1980, to expand exports of forestry products, to construct the national road of route 9 as an alternative route to sea through Vietnam and to expand education and training.

Laotian economy achieved a substantial recovery and improvement of food self-sufficiency during this period. The paddy production increased by 15% per annum from 1977 to 1980. GDP was estimated to have grown at a rate of 7% per annum in real terms during the same period. However, the recovery was made only in limited areas and the economic infrastructure was far from satisfactory.

I.3.1.2 The First Five Year Development Plan

In view of the unsatisfactory achievement of the previous Three Year Plan the Government planned to continue the economic development along the same lines laid down by the said Plan, and formulated the First Five Year Plan (1981 - 85). The major objectives of this Plan were:

- (1) To increase agricultural and forestry production so as to provide enough food for consumption and to increase exports of timber, coffee and tobacco,
- (2) To increase industrial production,
- (3) To improve basic infrastructure by expanding internal transport, constructing the national road of route 9 and by developing the distribution network for electricity,
- (4) To improve the internal distribution of goods,

- (5) To increase the number of state enterprise and state controlled cooperatives so as to consolidate the leading role of the socialist sector in the economy,
- (6) To increase the mobilization of resources for investment through taxation, exports and foreign aid,
- (7) To expand the education and training system and improve the health system,
- (8) To improve economic management and organization

So far as agricultural sector is concerned, the Plan focussed on increasing production of rice by expansion of cultivation areas and introduction of irrigation.

During the period from 1981 to 1985, GDP was estimated to have increased at a rate of 5.4% per annum in real term. Agriculture was the major growth sector mainly because of the increase of paddy production, largely as a result of favorable climate condition. On the other hand, despite relatively large investment in the industrial sector, investment returns were much less than initially expected in the period. This is mainly due to inefficient state industrial sector and discouragement of private sector.

I.3.1.3 The Second Five Year Development Plan

In 1986, the Government commenced the Second Five Year Development Plan (1986 - 1990). This plan contains government commitment to a New Economic Policy which involves a comprehensive series of economic reforms covering agricultural price policy, adjustments of wage levels and introduction of profit-oriented principle to public enterprises.

The main development objectives were as follows:

- (1) Stimulation of economic growth through increasing of agricultural production and diversification,

- (2) Maintenance of monetary and fiscal stability through the promotion of the export,
- (3) Control of inflation,
- (4) Strengthening of planning and economic management through reformation of organization of development administration and state enterprises

The target of annual growth rate of GDP by sector were set as following.

Agricultural	9.85%
Industry	13.65%
Transport	11.30%
Construction	12.55%
Internal trade	7.70%
Overall growth	10.35%

The average annual planned growth rate by sector is shown in Table I.15.

I.3.2 New economic policy

The Government have carried out the reformation of economic system in 1987 and 1988 including improvement of price, tax and wage system, reformation of state enterprise management, introduction of competition among the enterprises and liberalization of foreign trade.

I.3.3 Socio-economic Development Plan of Vientiane

The general directions of Five Years Socio-economic Development Plan from 1986 to 2000 of Vientiane Municipality were as the following:

- (1) To improve living standard of the people by supplying foods for daily consumption, consumer goods and houses,
- (2) To increase the agricultural production by introducing the intensive production,
- (3) To improve industrial sector based on new economic policy,
- (4) To improve transportation and communication system,
- (5) To train professionals and technical specialists,
- (6) To guarantee income, budget and fiscal situation

The overall target annual growth rate of output was set to be as high as 10% and major target growth rate by sectors were as follows:

Agriculture	12.2%
Industry	10.0%
Commerce	11.7%

I.4 Socio-Economic Projection

I.4.1 Projection of Population

The 1985 Census provides the most reliable population data in March 1985. In September 1988 the World Bank estimated the population in 1986. Meanwhile Laos Politics, Economics and Society produced a projection for the year of 2000 on the basis of the United Nations Assessment Data. The population growth rates applied in this projections were examined and the projections were availed for the basis of the Study. The figures were simply extrapolated up to the year 2020. The obtained annual growth rates in 1,000 persons are estimated to be as follows;

Year:	1985	1986	1990	2000	2010	2020
Rate (%):	2.90	2.40	2.20	1.92	1.60	1.30
Population:	3,585	3,671	4,016	4,825	5,645	6,426

where the growth rate in 1985 of 2.9% p.a. is the average rate from 1980 through 1984.

The population in the year of 1990 in Vientiane Municipality of 474,000 is estimated through extrapolation of the populations in 1985 and 1988. The shares of the municipality against the national population are assumed by means of the smoothing.

The obtained shares in percent and the consequent populations in 1,000 persons are as follows;

Year:	1985	1988	1990	2000	2010	2020
Share (%):	10.5	11.3	11.8	14.1	16.5	19.0
Population:	377	433	474	680	931	1,221

The population share of the Study area (56.19 km²) against Vientiane Municipality (3,267 km²) was arbitrarily assumed to be 25% in the year 2000. The shares in percent for other years and the consequent populations in 1,000 persons are estimated through extrapolation to be as follows;

Year:	1985	1988	1990	2000	2010	2020
Share:	39.5	35.5	34.5	29.5	27.0	25.0
Population:	149	158	164	201	251	305
Person/km ² :	2,651	2,811	2,918	3,577	4,467	5,427

The future population in each sub-area is estimated on the basis of the present population plus the future population increase in each area. The future population increase in the Study area is supposed to be affected by expansion of urbanized area and a rise in the population density.

The future land use plan in the Study area is proposed by UNDP up to 2000 and after 2000 the land use in the Study area is assumed not to be changed. The landuse projection is shown in Table I.16. Based on this assumption of the future landuse, the future population in each sub-area is estimated as follows;

- (1) The period from 1988 to 2000 the population in each sub-area is assumed to increase by expansion of urbanized area. The share of population increase in each sub-area against the total population increase in the Study area is calculated in proportion to the expansion of assumed urbanized area in each sub-area. The urbanized area is assumed to be composed of central area, public and commercial area, industrial area and residential area according to the projection of land use by the UNDP.
- (2) The population increase in each sub-area after 2000 is assumed to increase by intensification of population density. The share of population increase in each sub-area against total population increase in the Study area is calculated in proportion to the share of assumed urbanized area in each sub-area.

The future population thus projected for each sub-area in 2000, 2010 and 2020 are shown in Table I.17.

I.4.2 Projection of GRDP

(1) Projection of GDP

The government of Lao PDR formulated socio-economic plan under the Second Five Year Development Plan (1986 - 1990).

The plan assumed the annual growth rates of socio-economic figures as follows;

Period	:	1986 - 1990
Population	:	2.9%
GDP (Overall)	:	10.35%
Agriculture	:	9.85%
Industry	:	13.65%
Service	:	7.7%
Transportation	:	11.3%
Construction	:	12.55%

The per capita GDP in the year 2000 is estimated to be Kip. 42,400 applying the same growth rates assumed. The figures were obtained through the accumulation of the future demands and requirements of the detailed items. The plan will be achieved if the global economy, domestic economy and other circumstances such as local climate could maintain the economic environment envisaged. The GDPs projected applying the growth rates presented as above are adopted as the high growth scenario. In this projection, the GDP's after 2000 are estimated through the tangential curve of GDP at the year 2000.

Meanwhile the GDP of Lao PDR were projected by the World Bank from 1987 to 1995 by industrial origin. The figures are available for the study. The World Bank projected GDP up to 1995 in 1988 that the overall annual growth rate of GDP was estimated to be 5.3% from 1987 to 1991 and 5.4% from 1991 to 1995, respectively. The annual growth rate of GDP by industrial origin were estimated as follows:

	<u>1987 - 1991</u>	<u>1991 - 1995</u>
Agriculture	4.7%	4.0%
Industry	8.0%	9.0%
Construction	6.9%	8.3%
Transportation	6.5%	8.0%
Commerce	5.6%	7.0%
GDP	5.3%	5.4%

The GDP in 1990 and 1995 are estimated in 1986 constant price as below:

	<u>1985</u>	<u>1990</u>	<u>1995</u>
GDP (million kip)	58,774	77,300	100,500
Growth rate of GDP (%)	-	5.3%	5.4%
Per capita GDP (kip)	16,394	119,254	22,827
Per capita GDP (US\$) (US\$1 = Kip 95)	173	202	240
Growth rate of per capita GDP (%)	-	3.1%	3.5%

The growth rate of per capita GDP in the period from 1985 to 1990 is estimated to be 3.1% per annum. Meanwhile that in 1990 to 1995 is estimated to be 3.5%. The annual growth rate of per capita GDP after 1995 is assumed applying the tangential curve of the average annual growth rate in 1990 - 1995 as below:

<u>Period</u>	<u>Average annual growth rate</u>
1985-1990	3.1%
1990-1995	3.5%
1995-2000	4.0%
2000-2005	4.5%
2005-2010	5.0%
2010-2015	5.5%
2015-2020	6.0%

The GDPs in 2020 at 1986 constant price is estimated to be 497,000 x 10⁶ Kip.

The per capita GDP in 2020 is projected to be 820US\$ based on above projection. The GDPs projected as above are adopted as the low growth scenario.

In this study figures of the low growth scenario are adopted for the planning to avoid over investment. GDPs projected on the basis of both scenarios are presented in Table 3.3.2.

(2) Projection of GRDP in Municipality

The GRDP of Municipality is estimated in proportion to the share of GRDP against GDP. The future share of GRDP against GDP will increase because the economic importance of Municipality will grow for the year to come. The share of future population in Municipality against national population will increase as well. The shares of GRDP against GDP in 1987 and 1988 were estimated to be 26% and 27% respectively on the basis of the actual data as shown in Tables I.4 and I.5. The future shares are estimated by means of the curve fitting through smoothing and the shares are assumed to increase by constant proportion of 1% per annum. The GRDPs projected up to 2020 at 1986 constant price are shown as follow:

	<u>1990</u>	<u>1995</u>	<u>2000</u>	<u>2010</u>	<u>2020</u>
GDP (million kip)	77,300	100,500	133,900	249,400	497,000
GRDP (million kip)	22,500	34,200	52,200	122,200	293,200
Share (%)	29%	34%	39%	49%	59%
Per capita GRDP (US\$)	500	640	810	1,380	2,530

(3) Projection of GRDP in the Study area

The GRDP in the Study area is estimated applying the following assumptions.

- 1) At present most of commercial and industrial productions are born in the Study area. The economic structure and the productivity of the remaining area in Municipality is assumed to be similar to that of whole nation, characterized as a rural area. Accordingly the per capita GRDP in the remaining area is assumed to be equal to the per capita GDP.

- 2) The estimated per capita GDP are applied to the population in the Municipality less the population in the Study area to obtain the GRDP in the area excluding the Study area. The substantial part of differences in two GRDPs are basically assumed to be born in the Study area.
- 3) Further, in the future the production of commercial and industrial products in the remaining area is assumed to be increasing due to the expansion of urban area in the Municipality, outside of the Study area. The productivity of the remaining area is assumed to increase due to the urbanization. The share of population in the remaining area against the population in the Municipality is assumed to be an index of the increase in the productivity.

The following formula is adopted to estimate the GRDP in the Study area.

$$\text{GRDPSA} = \text{p.c.GDP} \times \text{PSA} + (\text{p.c.GRDPVM} - \text{p.c.GDP}) \times \text{PVM} \times \text{I}$$

where:

GRDPSA	:	GRDP in the Study area
p.c.GDP	:	Per capita GDP
PSA	:	Population in Study area
p.c.GRDPVM	:	Per capita GRDP in the Municipality
PVM	:	Population in the Municipality
I	:	Index of share of population

The GRDPs in the Study area up to 2020 at 1986 constant price are thus estimated as below:

	<u>1990</u>	<u>1995</u>	<u>2000</u>	<u>2010</u>	<u>2020</u>
GRDP (million kip)	15,800	22,800	32,700	71,100	160,000
Share in GRDP (%) of Municipality	35%	32%	30%	27%	25%
Per capita GRDP (US\$)	1,020	1,320	1,710	2,990	5,520

The contributions of industrial sectors for the projected GRDP in the Study area were estimated through applying the rates of land productivity and land use in the Study area.

The land productivity are estimated on the basis of labour productivity by industrial origin in Lao calculated by the World Bank and the density of labour by industrial origin in the Study area. The proportion of land productivity by industrial sector are assumed as below;

Agriculture	1
Commerce	10
Industry	50

The GRDPs by industrial origin in the Study area at 1986 constant price are estimated as below;

	(Unit Million Kip)									
	<u>1988</u>		<u>1990</u>		<u>2000</u>		<u>2010</u>		<u>2020</u>	
	<u>GRDP</u>	<u>Share</u>	<u>GRDP</u>	<u>Share</u>	<u>GRDP</u>	<u>Share</u>	<u>GRDP</u>	<u>Share</u>	<u>GRDP</u>	<u>Share</u>
Agriculture	9,183	68%	10,300	66%	16,300	50%	24,300	34%	34,100	21%
Industry	2,800	21%	3,600	23%	11,400	35%	34,000	48%	95,100	60%
Commerce	1,480	11%	1,900	12%	5,000	15%	12,800	18%	30,800	19%
Total	13,463	100%	15,800	100%	32,700	100%	71,100	100%	160,000	100%

(4) Projection of GRDP in sub-area

The shares of GRDP of sub-areas against the Study area is assumed in proportion to the landuses projected. The land productivity in agricultural area, industrial area and commercial area is adopted weighted value.

The GRDPs in each sub-area are shown in Table I.9.
