$$Q = \frac{\pi K (H^2 - ho^2)}{\log_e (R / ro)}$$

Q : discharge of well (ℓ/sec)

K : coefficient of permeability (2.4×10^{-1} cm/sec)

H and ho: saturated thickness of the aquifer at R and ro, respectively

ro : radius of well (0.75m)

R : radius of influence (300m)

S : drawdown in the well (2m)

$$Q = \frac{\pi K (H^2 - ho^2)}{\log_e (R/ro)} = \frac{3.14 \times 0.0024 (100-64)}{\log_e (300/0.75)} \fallingdotseq 0.045 m^3/sec$$

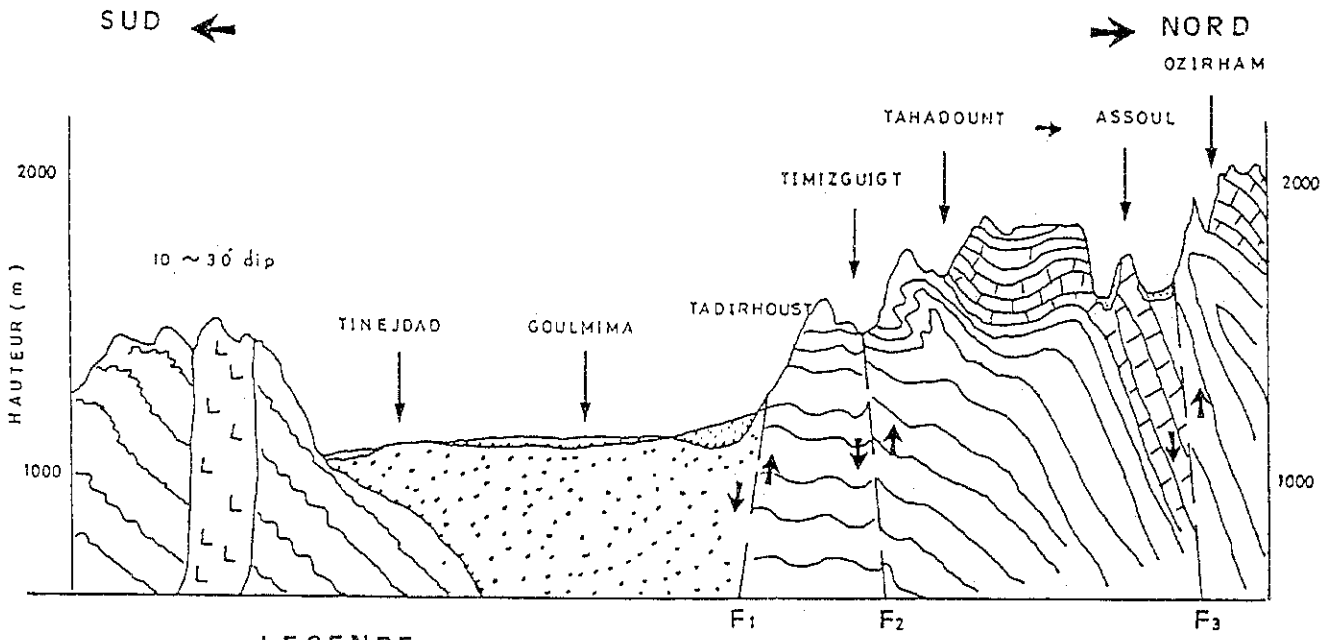
FIG.6.2.2 :PROFIL GEOLOGIQUE SCHEMATIQUE DU BASSIN



NOTE

F1, F2 et F3 sont les principales failles du bassin. Il est présumé que l'existence entre l'oued Tanguarfa et l'oued Rheris (près de Tadirhoust) de nombreuses mines de plomb et de fer est en liaison étroite avec l'existence de la faille F2

LEGENDE

- Roches sédimentaires du Pliocène et Alluviales
- Conglomérats marneux calcaire et argileux du Crétacé
- Grès schisteux schiste argileux du Paléozoïque
- Roches sédimentaires du Jurassique
- Massif calcaire du Jurassique
- Rhyolite du Paléozoique
- Limite de non conformité
- Faille principale (mouvement relatif)
