

2-2-5 Problems Confronting Broadcasting in Indonesia

Ever since the start of radio and TV broadcasting in Indonesia, the government has devoted a great deal of efforts to the development of broadcasting services in order to ensure that broadcasting actively plays the roles assigned to it. As a result, as mentioned in 2-1-2 (2) and (3), a considerable population coverage has already been reached by both radio and TV. In the case of radio, a population coverage of 68% has been attained through 49 stations across the country. And in the case of TV, too, a national population coverage of 68% has been achieved through the network of ten TV stations and 244 transmitting stations.

However, because of its rapid development, the radio and TV broadcasting in Indonesia has been faced by problems as mentioned below in various aspects including broadcast-network facilities, management and operation, programmes and technical management including maintenance.

(1) Composition and Coverage of Broadcasting Network

1) Number of Programme Series

At present, both in radio and TV, two series each of programmes are broadcast in metropolitan Jakarta. However, in the provinces, there is only one series of programmes broadcast, both in radio and TV. This means that the diversified wishes of the audience concerning programmes, especially those of the residents in regions outside Jakarta, are not being met sufficiently.

2) Coverage

Indonesia is a vast archipelago nation consisting of a large number of islands and occupying a wide area. As a result, despite the great efforts made to improve and expand broadcasting networks, the population coverage still remains at about 68% for both radio and TV. The current condition of coverage, therefore, is still quite far from the nationwide service which is the target set by the Indonesian government.

The broadcasts on the radio network are currently conducted through the combined use of medium waves and shortwaves. The

medium wave is used for broadcasting in and around the area in which the station is located, while shortwaves are used for broadcasts to farther inland regions and remote islands. However, because of the unstable reception condition, the range of the area in which broadcasts can be received in good condition is limited. In the case of the 12 regional stations in eastern Indonesia, such as Irian Jaya, they have no medium-wave facilities and therefore are still broadcasting in shortwave only.

On the TV broadcasting network, transmission of programmes of TVRI is conducted via the PALAPA satellite operated by PERUMTEL. TVRI has been promoting the construction of TVRO relay transmitting stations in areas unserved by TV broadcast, but the pace of construction is only an average of five stations a year and so there is still a long way to go before the target of nationwide service is attained.

While it is technically feasible for general TV viewers to receive broadcasts via the PALAPA satellite (See 2-1-2(3) 3), the transmission power of the PALAPA, owing to its originally having been designed as a communication satellite, is so small that the viewers are required to set up an antenna with a large diameter. So, there is a problem in the reception of PALAPA broadcasts because of the cost and other installation conditions. Consequently, numerically, little improvement can be expected in TVRI's coverage by direct reception of broadcasts via the PALAPA satellite.

(2) Programme Production & Programme Compilation, Programme Transmission Network and Business Communication Circuit Network

The radio programmes are produced at 49 stations across the country. As to the programme compilation at the regional stations, 20% of the broadcasting hours are devoted to the relaying of news and information programmes from Jakarta and the remainder to the broadcast of programmes produced by the stations themselves, partly owing to the inadequacies of the programme transmission network as mentioned later on.

As to the transmission circuits for radio programmes, a downward link originating from Jakarta has been established by leasing telephone lines of the PALAPA satellite circuits from PERUMTEL, but owing to poor sound quality and noise interference, good quality transmission of programmes is impossible. For that reason, none of the regional stations is relaying various kinds of cultural and other high-quality programmes produced by the Jakarta station except for news and information programmes.

Meanwhile, since no link-up has been set up yet, instantaneous-exchange broadcasting of programmes, which is one of the excellent functions of broadcasting, is not yet conducted in Indonesia.

The Nusantara stations, which play central roles in their respective regions, have the function of managing the regional stations under their respective jurisdictions. However, none of them has programme transmission circuits linking it with the regional stations. In the past, periodical relays of programmes were conducted on the off-air waves in shortwave but such relaying has seldom been conducted in recent years for such reasons as that there is noise interference from the shortwave bands. Hence, the Nusantara stations are not playing the role of regional key stations as far as broadcasting programmes are concerned.

As to TV, the Jakarta central station broadcasts a National Programme and a Metropolitan Programme. The broadcast hours are about 7 hours a day on weekdays for the former and only about 2.5 hours for the latter. As a result, requests have been made by the TV audience to increase the broadcast hours.

Meanwhile, with regard to the local TV broadcasts, 10 stations across the country are currently conducting 2-3 hours (about 30% of the daily broadcast hours) of local broadcasts. The remainder of the daily broadcast hours is devoted to the relaying of programmes from Jakarta.

As to the transmission of TV programmes, it used to be done through TVRI's own circuits and the standby circuits leased from PERUMTEL in Java and Sumatra. But since the launching of the PALAPA satellite, nationwide relays of programmes have been conducted via the satellite as well, by leasing a transponder. So, at present, combined use is made of the above-

mentioned two ways of programme transmission. Transmission of programmes to the stations outside Java or Sumatra depends primarily on the PALAPA satellite. Under these circumstances, the local TV broadcasts are confined to the service areas of the transmitting stations of the ten programme-producing stations and those relaying stations, to which the programmes of the parent stations are relayed either via TVRI's own circuits or via the off-air waves.

While the downward transmission of TV programmes (from Jakarta) has somehow been established, the upward (to Jakarta) circuits have not yet been set up. So, the simultaneous relaying of regional programmes and programme exchanges, both of which are excellent functions of TV, have not yet been conducted in Indonesia.

As an important circuit network other than the programme transmission circuits, the business communication network is necessary for communications between broadcasting stations. At present, both RRI and TVRI make exclusive use of shortwave SSB equipment for business communications purposes such as the sending of news scripts and the making of technical contacts. There is no other method of inter-station communication that can be relied on, except for the subscription telephone, telegram and mail. As a result, efficient operation of broadcasting services has been seriously obstructed.

As to such inadequacies in transmission circuits and business communications circuits, the Indonesian government, too, has been expending a great effort to improve the situation. However, the improvement and expansion of circuit networks require a large amount of funds and, moreover, there is the need of maintaining close cooperation with the government offices and agencies concerned, such as the Ministry of Tourism, Posts and Telecommunications and PERUMTEL. As yet, none of the improvement plans has been brought to reality.

In any case, as to the projects that extend over various government offices and agencies, what is indispensable is to establish an overall plan extending over all the offices and agencies concerned and a system to promote the implementation of the plan.

(3) Deterioration of Functions of Broadcasting Facilities and Inappropriate Maintenance System

The maintenance of broadcasting facilities, the work that becomes increasingly essential as the broadcasting facilities are expanded, has not been conducted sufficiently. Even though some of the stations have been found to be making substantial efforts in their maintenance work, it has been noticed that, at almost all of the stations, the deterioration of equipment and their functions is quite advanced. Especially at RRI stations, spare parts are in short supply, with the result that a number of cases have been seen where broken-down installations and equipment have been left unrepaired for a long period. The problem apparently lies in aspects such as the inability of the personnel to cope with equipment failures, allocation of maintenance equipment and spare parts and the nationwide maintenance and management system for equipment and installations.

(4) Control of Quality of Broadcasts

In order for the broadcasting service to fulfill its mission, there is the need of establishing a system whereby the quality of its products, viz., the programmes, is constantly controlled. In other words, through this system, it must be ensured that programmes of high quality are transmitted on high-quality radiowaves and are delivered to the broadcast audience in good condition, and that the quality is constantly maintained and improved.

Among the regional stations, some cases are seen where broadcasting is continued without rectifying the deteriorated sound or picture quality. Problems are considered to lie in the skills of personnel and the operational management system, including the problems relating to the technical facilities.

Furthermore, such work as confirmation and improvement of reception conditions are not conducted systematically.

(5) Improvement of Quality of Broadcast Programmes

In Indonesia, besides the nationwide broadcasts of RRI and TVRI, broadcasts by stations that are neither RRI nor TVRI can also be received. In the case of radio, there are non-RRI commercial stations, etc., which are winning popularity among the regional residents with interesting programmes that are closely linked with the respective local communities. In the case of TV, Indonesia's first commercial TV station started broadcasting in Jakarta in March 1989. In addition to such domestic broadcasts as mentioned above, people in Indonesia can enjoy TV programmes from Thailand and Malaysia by installing a parabolic antenna which can receive TV signals in their home through the PALAPA satellite.

Under these circumstances, RRI and TVRI are now placed in a position where they are strongly requested by the listeners and viewers to make their programmes more diversified and more interesting and to further improve the programmes both in quality and quantity.

Although broadcasting is extremely effective as a means of educating the people, it must be pointed out that systematic production of educational programmes is not yet being conducted either in RRI or TVRI.

(6) Management and Operation

In order to operate a broadcasting organization soundly, three factors are necessary. They are the so-called "3Ms," viz., Men, Material and Money.

As for "Men," RRI and TVRI together have a total of about 13,700 employees, but the problem is that there are only a few that possess the high level of specialized ability which is required in carrying out broadcasting work. (Refer to 2-2-6.)

"Material" means facilities and equipment. At both RRI and TVRI, the superannuation of facilities is quite advanced but adequate maintenance is not being done, with the result that lowering of the level of broadcasting service is taking place. On the other hand, the need has been expressed for the expansion of facilities in order for RRI and TVRI to fulfill the mission assigned to them as broadcasting organizations.

As for "Money," the greater part of the construction budget is dependent on foreign aid. As regards the operational budget, the main financial sources are the national treasury in the case of RRI and TV license fees and a government subsidy in the case of TVRI. As the facilities are increased and the programme services expanded from now on, a substantial increase in the amount of the budget will become necessary.

In the case of radio, the license-fee system is not adopted. Although some of the regional governments are collecting an annual charge of 500-600 Rp as tax, such a revenue does not directly become income of RRI. While expectations are placed on the TV license fee as a financial source for broadcasting services from now on, the rate of collection of the license fee, because of the collection being left to POS and GIRO, is low at about 55% on the national average.

Ever since their start, Indonesia's radio and TV broadcasting services have been operated as two separate organizations. But the Indonesian government has been examining, at its in-house study committee, the plan to integrate both organizations of RRI and TVRI into a state-run broadcasting corporation, an efficient and sound enterprise that unifies Men, Material and Money. However, there still being a number of problems to be solved, the Indonesian government has not yet formed a definite plan.

2-2-6 Present Status of Personnel Assignment and Necessity of Training

(1) Past Transition in Number of Personnel

The transition in number of personnel of RRI and TVRI during the past decade is as shown in Fig. 2-2-1. During the past ten years, the increases were 1,635 at RRI and 2,536 at TVRI. Particularly at TVRI, the number of personnel increased sharply along with the expansion of the TV broadcasting network.

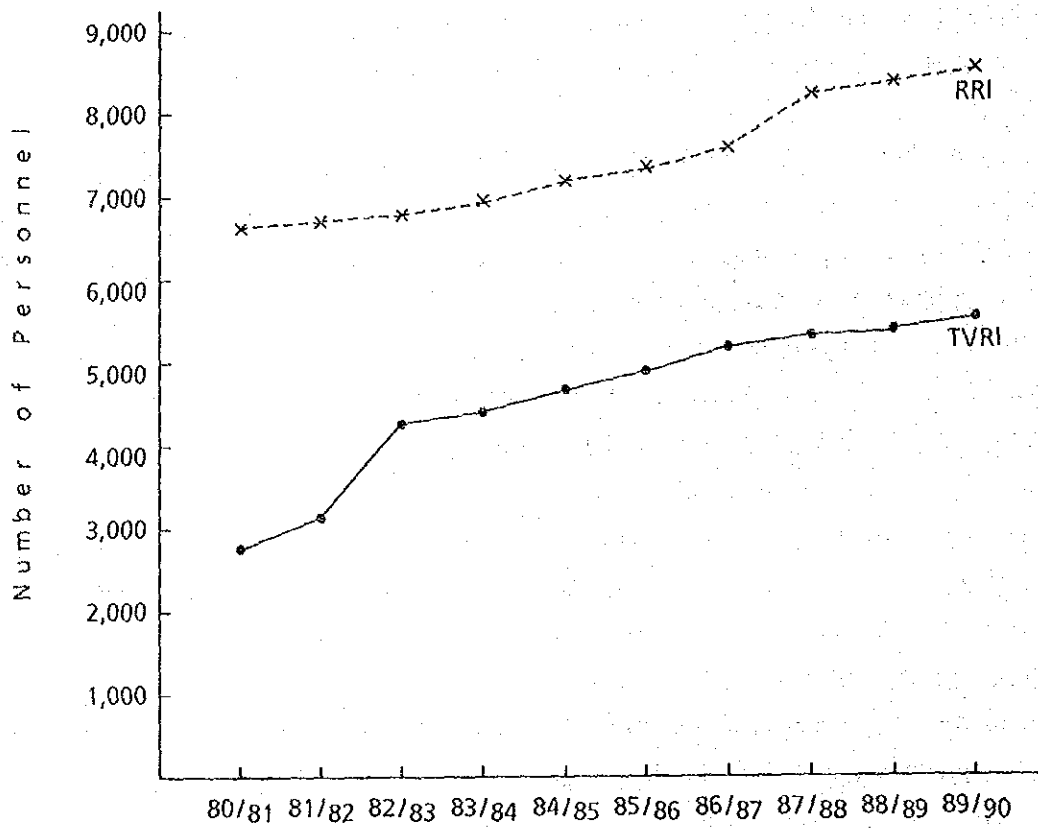

Fig. 2-2-1 Number of Personnel of RRI & TVRI

(2) Outlook for Future Number of Personnel

With regard to the various projects currently in progress as mentioned earlier in 2-2-1, the RTF Directorate General estimates that, with the completion of the projects, the required increase in the number of personnel would be about 800 and considers it necessary to employ additional personnel.

Regarding not only the projects that consist mainly of work to rehabilitate the existing facilities but also the other types of projects, the RTF Directorate General is considering the possibility of reassigning personnel as much as possible from among the existing staff; however, as for the broadcasting stations and transmitting stations to be newly

constructed, the Directorate General admits the necessity of new employment of personnel. The main stations requiring such new employment of personnel are the four TV stations (Banda Aceh, Samarinda, Ambon and Bandung) at each of which a TV studio is to be newly constructed. At each of these stations, the same as in the case of other TVRI stations, there is the need of establishing a work force of about 200. As for the 50 TV relay stations to be newly constructed, it is estimated that assignment of about five persons each would be required, as Indonesia adopts a manned-system for all such TV relay stations.

As for the projects with both software and hardware aspects which are judged as being necessary to be implemented during the ten years of Repelita V and VI, it is also considered essential to establish a maintenance system, to furthermore construct TV relay stations in the poor TV reception areas and to increase the number of personnel needed to improve the quality of programmes. Hence, the RTF Directorate General considers it necessary to newly employ about 330 personnel.

(3) Present Status of Personnel Composition

Table 2-2-3 shows a comparison between RRI and TVRI in the quality of personnel in terms of compositional ratios of the personnel's educational backgrounds. The numbers of staff members who are graduates of either a college or a university, the type of persons most needed in the broadcasting services, are only 9.9% in the case of RRI and 14.0% in the case of TVRI in ratio against their respective total work forces. The graduates of a high school or its equivalent account for about two-thirds. And the majority of them are graduates of a general course; the number of those completing a specialized course, such as a technical course, is small.

Table 2-2-3 Comparison in Number of Personnel between RRI and TVRI in Terms of Educational Background

(Unit: person)

Education	RRI		TVRI	
	Number of Persons	Ratio (%)	Number of Persons	Ratio (%)
University graduate	356	4.3	341	6.4
Academy graduate	468	5.6	415	7.7
Senior high school graduate	5,702	68.4	3,350	62.2
Junior high school graduate	855	10.3	488	9.1
Primary school graduate or below	954	11.4	787	14.6
Total	8,335	100.0%	5,381	100.0%

Total number: 13,716 persons

(As of the end of March, 1989)

(4) Present Status of Personnel Employment and Necessity of Personnel Training

In Indonesia, where the rate of unemployment is rather high, the government adopts the policy of giving as many employment chances to the people as possible. Hence, the Ministry of Manpower allocates new recruits to all the public organizations. With regard to the new recruits thus allocated by the Ministry of Manpower, DEPPEN assigns them to various work-sites in consultation with such broadcasting organizations as RRI and TVRI. As a result, such broadcasting organizations as RRI and TVRI are placed in a position where they are obliged to accept any new recruit allocated to them, even if the persons allocated to them by the Ministry of Manpower may be found to have inadequate personal qualities or educational background for broadcasting work.

For the development of broadcasting services, what is indispensable is to enhance the operational ability of the broadcasting personnel who require a high-level of intellectual capacity and expertise. However, in the educational environment of Indonesia today, it is extremely difficult to find a large number of excellent personnel outside DEPPEN. Hence, it

becomes increasingly necessary to give training to the maximum number of personnel within the organization, from the basics of broadcasting work to the sophisticated ability to execute the work.

In order to cope with the training needs as mentioned above, Radio and TV Operational Training Centres have been set up, but the training actually given at these Centres has not necessarily been responding effectively enough to the needs of the work-sites.

The Radio Operational Training Centre was established in 1976 with financial and technical assistance from West Germany. At this Centre, during the period of 14 years from 1976 to 1989, a total of 104 training courses were conducted for 2,850 trainees (annual average of 204 trainees).

The Television Operational Training Centre was established in 1980, also with financial and technical assistance from West Germany. During the period of ten years from 1980 to 1989, a total of 2,884 persons underwent training at this Centre (annual average of 288 trainees).

The training given at the above-mentioned two training centres is vocational training on three levels, viz., basic, intermediate and advanced. The period of training varies from course to course, from 2-3 weeks to six months. The period when the training given at these Centres was at its peak was from around 1981 to 1984, when about 300 trainees completed a total of 14 courses in radio and about 450 completed 25 courses in TV each year. However, in 1987 and thereafter, the numbers of courses decreased to less than a half of the above-mentioned figures and the annual number of graduates also fell to about 100 persons at each Centre.

The total annual average of graduates of the above-mentioned two training centres at present is 492 including both radio and TV. This corresponds to 3.6% of the total number of staff members at RRI and TVRI. And this means that each staff member is given only one chance to receive training in 28 years!

In order to further improve and develop broadcasting in Indonesia, it is considered essential to ensure that each and every one of the staff members engaged in broadcasting services gains highly advanced knowledge and ability concerning the programmes and enhances his or her technological capabilities to cope with the steadily advancing broadcasting technologies. Hence, it is considered to be absolutely necessary to set up training courses seizing every possible opportunity so as to enable each staff member to undergo training at least an average of once every 5-6 years during the period of his or her career.

In view of the actual status of training given to the broadcasting personnel at the training centres in Indonesia, what has now become increasingly important as the method of enhancing the quality and ability of personnel in carrying out their duties is the so-called on-the-job training (OJT) in which the employees are trained and educated under appropriate guidance given by their seniors in the course of their day-to-day activities on the work-site. However, because of the fact that adequate chances to gain experience and training are not given to the middle-class employees who are expected to promote the broadcasting work as leaders, there is a shortage of human resources with appropriate experience, ability, insight and leadership. As a result, problems as mentioned earlier in 2-2-5 remain to be solved in such aspects as day-to-day management and operation, programme production and operation, maintenance and management of facilities.

2-3 Present Status of the Multi-Media Training Centre (MMTC)

As mentioned earlier in 2-1-2 (1), as broadcast-related training centres of DEPPEN of the Indonesian government, there are the following three Centres; the Radio Operational Training Centre (RTC), the Television Operational Training Centre (TVTC) and the Multi-Media Training Centre (MMTC). As shown in Fig. 2-1-1, on the organizational chart, the first two belong to the Employees' Educational and Training Centre, and the MMTC to the Secretariat of the Vice Minister.

As to the contents of training given, whereas the first two Centres conduct necessary vocational training for the employees of radio and TV broadcasting organizations, the MMTC, which has been designated as an academy to offer diploma-conferring educational training courses, has been conducting education and training of personnel in accordance with the established regulations.

Here, in this section, the present status of MMTC will be explained, leaving the details of RTC and TVTC to be given later in 3-2-3.

2-3-1 Outline

(1) Process Leading to Establishment of MMTC

Based on its judgment that in Indonesia, a multi-racial nation possessing a vast territory, broadcasting is the most effective means of information to achieve national unity and modernization, the Indonesian government since the beginning of the 1970s has carried out large-scale expansion and improvement of radio and TV broadcasting networks, with foreign economic assistance such as Japan's yen credit loans and buyer's credits from European countries and the United States. As a result, by the beginning of the 1980s, broadcasting networks that are roughly of today's scale had been established. In addition, following the rapid expansion of broadcasting services, a large number of broadcasting personnel were employed.

As mentioned earlier in 2-2-6, with regard to the employment of personnel for the Indonesian government and public organizations, the

government adopts the national policy of giving as many employment opportunities as possible to the people and has the established system of having the Ministry of Manpower allocate the new employees to the public organizations. As a result, the organization in charge of broadcasting services are often placed in a position where they are obliged to employ any allocated personnel even if their qualities or educational background were found to be insufficient for broadcasting work. This has brought about the situation where the personnel who are lacking in specialized knowledge about broadcasting or who are inexperienced persons possessing only a low level of technical skills are assigned in large number to the work-sites of broadcasting services, obstructing the smooth running of broadcasting work, such as programme production, operation, maintenance and management of facilities. Hence, over the years, the importance of education and training of personnel within the organization had been strongly recognized. After the start of the 1970s, the Radio Training Centre (RTC) and the Television Training Centre (TVTC), as the training facilities for broadcasting personnel, were established one after the other with assistance from West Germany. However, they were both too small in scale to satisfy the training needs of the broadcasting services.

In view of this situation, DEPPEN drew up a plan to establish in the academic city of Yogyakarta a comprehensive education and training centre (the Multi Media Training Centre) for the training and education of the personnel working for all of the information media under its control; film, video, printing, publication and general information, as well as broadcasting. And accordingly, the Indonesian government requested Japan to provide technical cooperation and grant aid. In response to this request, Japan in 1984 provided Indonesia with facilities and training equipment through grant aid to assist the latter in radio and TV personnel training and to provide technical cooperation concerning the training of broadcasting personnel.

The process leading to the completion of this grant aid technical cooperation was as follows:

1972

Proposal made by the Advisory Team (JICA-based long-term experts from Japan) on the necessity

of establishing a training centre for broadcasting personnel

1977-78 Establishment, within DEPPEN, of the Study Committee on the Construction of MMTC. Preparation, after a series of studies, of a plan to establish MMTC.

September 1979 Submission of a formal request by the Indonesian government to the Japanese government.

September 1980 Dispatch, by the Japanese government, of a contact survey team to consult with the Indonesian government about matters relating to this subject.

January 1981 Dispatch of a preliminary survey team concerning grant aid.

September 1981 Dispatch of the Basic Design Study Team on grant aid; signing of the Minutes on Sept. 25.

February 7, 1982 Dispatch of a team to explain the draft final report on the Basic Design Survey under grant aid.

June 10, 1982 Dispatch of the preliminary study team on project-based technical cooperation (training plans).

August 20, 1982 Signing of Exchange of Notes

October 14, 1982 Verification of the consultancy contract by the Japanese government.

February 28, 1983 Verification by the Japanese government of the contract with the contractor.

October 12, 1983 Dispatch of a study team to sign an agreement on the execution of project-based technical cooperation (R/D). (R/D was signed and became effective on October 21).

April 2, 1984 Delivery of the building.

May 16, 1984 Dispatching of long-term experts to Indonesia from Japan.

June 21, 1984 Delivery of broadcasting equipment.

November 25, 1984 Dispatch of a team to discuss the Project.

July 31, 1985 Opening ceremony for the MMTC held in the presence of the President of Indonesia.

(2) Objectives and Contents of Training

Originally, the MMTC was established with the objective of providing the broadcasting personnel with basic knowledge required for carrying out their duties and to give them practical training. However, in Indonesia, unless the employees of the government or public organizations obtain qualifications based on the official school system authorized by the state, it is difficult for them to become eligible for application of the official promotion system. Besides, at the broadcasting organizations, urgent need has also been felt for the training of prospective middle-class senior staff members. For the above-mentioned two reasons, the DEPPEN authorities changed the contents of the training given at the MMTC and examined the possibility of changing the MMTC into an educational training organization (academy) authorized to confer diplomas (qualifications) to its graduates. As a result, the MMTC was changed into an academy under the presidential order dated July 30, 1985.

Thus, the trainees at the MMTC, by completing the Diploma I (DI) Course, Diploma II (DII) Course and Diploma III (DIII) Course, are now awarded the qualifications as a graduate of an academy and the way has now been opened for them to be eligible for promotion within the organization.

The MMTC has a further plan of eventually opening three more courses viz., the Diploma IV (DIV) Course, the Specialist I (SPI) Course and the Specialist II (SPII) Course.

These courses aim at conferring such vocation qualifications as outlined below.

As shown in Fig. 2-3-1, Indonesia's educational system adopts the 6-3-3 system comprising 6 years in primary school, 3 years in junior high school and 3 years in senior high school. Higher education is conducted at universities (4-5 year system) and colleges (2-3 year system) called "academies." The MMTC corresponds to the above-mentioned "academy."

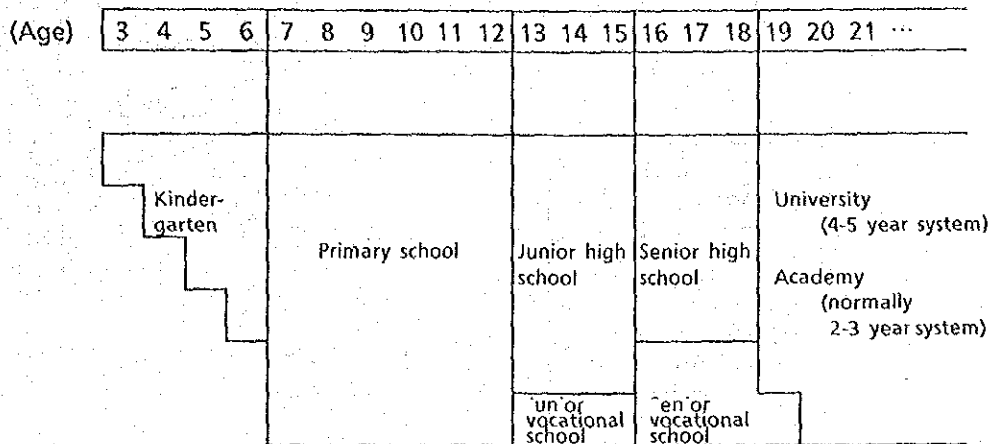

Fig. 2-3-1 Educational System of Indonesia

Fig. 2-3-2 shows a comparison of MMTC's Diploma Courses with the educational system of general universities that confer degrees.

Whereas general universities educate the students continuously for a set number of years in principle, the diploma training courses at the MMTC complete the training at the end of the period set for each course. So, in the case of MMTC's diploma courses, the employees after completion of a course generally return to their work-sites in the broadcasting services to engage in practical work and those desiring further training may proceed to more advanced courses on recommendation by the director of the broadcasting station to which they belong and after being selected by the MMTC. The qualifications of the personnel for whom each diploma course is intended and the targets and contents of each course are as shown in Table 2-3-1.

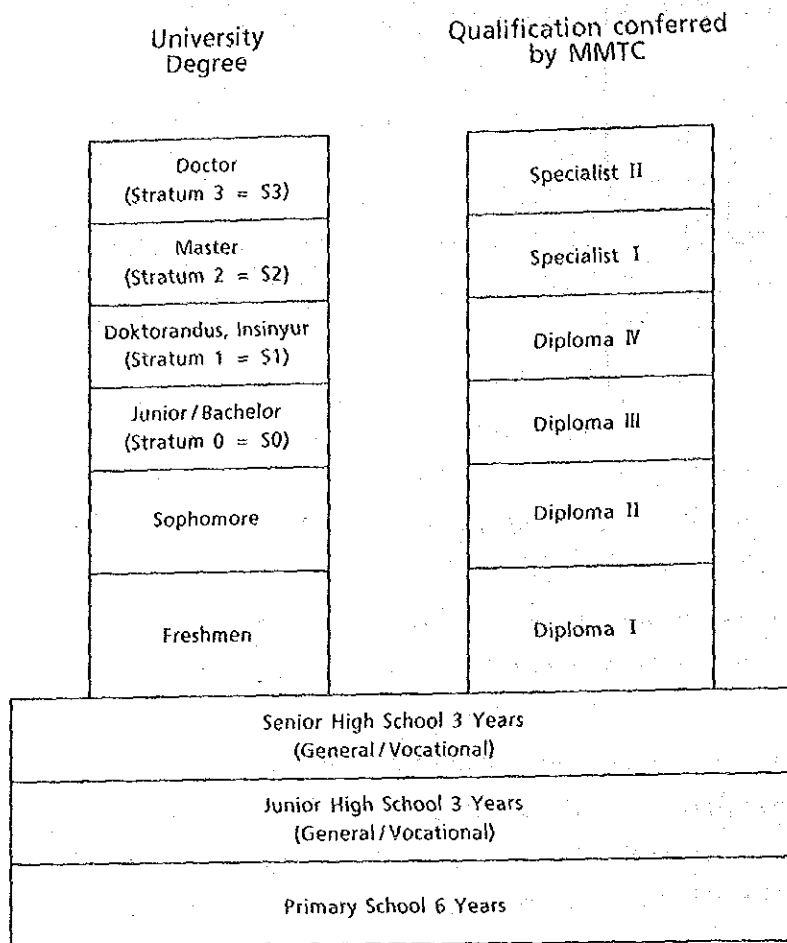

Fig. 2-3-2 Comparison of Educational Systems between General Universities and MMTC

(4) Organization and Personnel

The MMTC is a training institution that conducts human resources development of the staff members of RRI and TVRI, both of which are under the jurisdiction of the RTF Directorate General. However, because of the fact that educational training and staff administration of the employees of the Ministry of Information are in the charge of the Vice Minister's secretariat, the MMTC is under the supervision of the Vice Minister's secretariat as stated in 2-1-2.

The current organizational system of the MMTC, whose system has gradually been streamlined since its establishment, is as shown in Fig. 2-3-3. The number of staff members is 107 in all, plus 33 instructors from outside the organization. The breakdown of the staff of the MMTC is as shown in Table 2-3-2.

Table 2-3-1 Outline of the Diploma Courses

Name of Course	Intended for:	Targets to be Attained	Contents of the Courses
Programme Compilation Planning	Those who are in charge of programme compilation and/or planning at RRI/TVRI and who have been recommended by the heads of their departments.	To learn characteristics of the media, methods of arranging programmes in the right order and correct programme transmission.	Programme management, programme composition, programme production, audience survey, broadcasting rights, broadcast scripts.
Programme Lines Production	Those who are in charge of programme production at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire practical and specialized knowledge concerning programme production.	Production management, programmes, programme production, programme aesthetics, programmes and broadcast management.
News and Current Affairs Reporting	Those who are in charge of news at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire wide-ranging knowledge and functions concerning news coverage and news-programme production	Composition of news, news-programme management, news-programme production, news-programme planning, ethical code, news-scriptwriting.
Studio and Master Control Technical Operation	Production and operation engineers at RRI/TVRI who have been recommended by the heads of their departments.	To acquire knowledge about radio and TV equipment and production techniques concerning programme production.	Measuring techniques and measuring instruments, studio equipment operation techniques, technical and lighting systems in programme production and measuring techniques.
Transmission Operation	Those who are in charge of transmission operation at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire practical knowledge concerning programme transmission.	High-frequency circuits, transmission techniques, antenna, radiowave propagation, transmitter techniques, measuring techniques and measuring instruments.

D-I

Table 2-3-1 Outline of the Diploma Courses

Name of Course	Intended for:	Targets to be Attained	Contents of the Courses
Broadcasting Programme Planning	Those who are in charge of programme planning at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire the ability to assemble all kinds of programme materials in accordance with programming plans.	Evaluation and production of programmes, methods of preparing production materials, personnel assignment, planning, script-writing, budget planning.
Programme Package Production	Those who are in charge of programme production at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire the ability to give due consideration to methods, techniques and artistic sense when producing each programme.	Programme aesthetics, direction, audio-visual techniques in programme production, and theory on programme formats.
Script/Story Writing	Those who are in charge of scriptwriting at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire the ability for idea development, writing techniques and scriptwriting in programme production.	Programmes, literature, scriptwriting, techniques for gathering of programme materials, theory on programme formats.
Broadcast Journalism	those who are in charge of news at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire the ability for scriptwriting, reporting, editing, commentating and analyzing news materials.	Broadcast Journalism, presentation and reporting techniques, news programmes and current-affairs commentating, news editing and news-programme production.
Studio Production Techniques	Production engineers at RRI/TVRI who have been recommended by the heads of their departments.	To acquire ability not only in programme production engineering but also in understanding various programme materials.	Shooting techniques, audio techniques, video techniques, measuring techniques and editing techniques.
Transmission Technics	Transmission engineers at RRI/TVRI who have been recommended by the heads of their departments.	To acquire complete knowledge concerning transmitters, radiowave propagation, audio and video transmission qualities.	Multiplex transmission system, antenna, radiowave propagation, measuring techniques and measuring instruments, transmitter techniques.

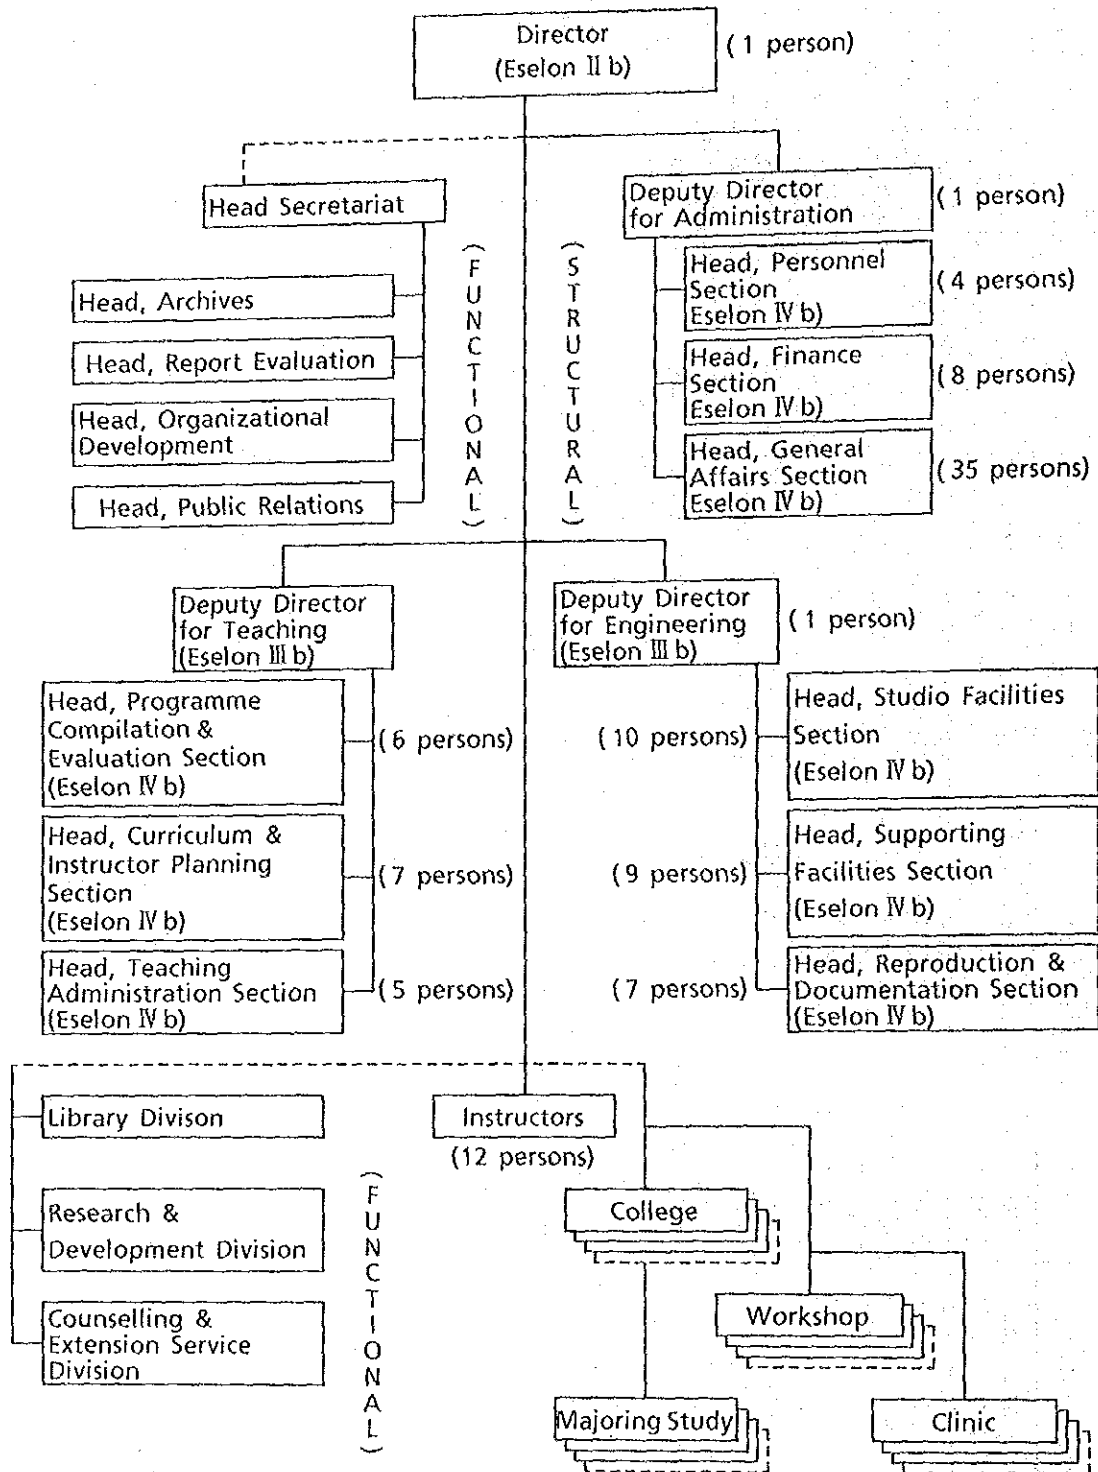

D-II

Table 2-3-1 Outline of the Diploma Courses

Name of Course	Intended for:	Targets to be Attained	Contents of the Courses
Educational and Religious Programme Production	Those who are in charge of production of educational/religious programmes at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire the ability to produce educational/religious programmes in conformity with social order from a comprehensive point of view.	Educational psychology, cultural anthropology, cross-cultural exchanges, script-writing, musical descriptions.
Scenario and Storyboard Writing	Those who are in charge of scriptwriting at RRI/TVRI and who have been recommended by the heads of their departments.	To acquire the ability to write radio and TV programmes, to dramatize literal works and comedies, to write presentation scripts and shoot scripts.	Scriptwriting, animation, script analysis, broadcast performances, filming methods.
Apparatus Engineering	Apparatus engineers at RRI/TVRI, who have been recommended by the heads of their departments.	To acquire the knowledge concerning designing, planning and construction of studio and master control facilities.	Facility planning for broadcasting stations, acoustic engineering, programme-production equipment planning, optimum equipment layout, animation techniques.

2-3-2 How Japan's Grant Aid Programme and Technical Cooperation are Being Implemented

As mentioned in 2-3-1 (1) explaining the process leading to the establishment of MMTC, the plan to establish the Radio/Television Broadcasting Training Centre was submitted in September 1979 by the Indonesian government to the Japanese government, requesting Japan's cooperation. In response to this request, the Japanese government, following the sending of various survey teams and discussions with the Indonesian government since 1980, decided to provide facilities and equipment through grant aid assistance and to offer assistance in personnel training in the form of project-based technical cooperation.

(1) Grant Aid Cooperation

Based on the results of the preliminary study in January 1981 and the Basic Design Study in September 1981, the Japanese government decided to cooperate in the establishment of a Radio/Television Broadcast Training Centre with grant aid totalling 1.8 billion yen and concluded an Exchange of Notes (E/N) on August 20, 1982. In June 1984, the facilities were completed and were delivered to the Indonesian side. On July 31, 1985, the opening ceremony was held, honoured by the presence of President Suharto.

The main facilities and equipment provided are:

- a) Buildings 900 million yen
 - Ferro-concrete structure 4 buildings
 - Total floor area 5,495m²
 - containing classrooms, TV studios, radio studios, training rooms and other training facilities
- b) Training equipment 900 million yen
 - Equipment for use in training personnel in TV and radio broadcasting

Meanwhile, the Indonesian side, in parallel with the above-mentioned cooperation from Japan, constructed such facilities as the auditorium, library, dining room and lodging facilities (totalling 5,723m² in area) with funds totalling 1.3 billion yen (5.73 billion rupiahs, 1983). Details of facilities and equipment are described in 2-3-5.

(2) Project-based Technical Cooperation

With regard to the technical cooperation in personnel training at the projected Radio/TV Broadcasting Training Centre, discussions concerning the implementation of technical cooperation were held in October 1983 based on the results of the preliminary study conducted in June 1982 and the survey conducted in August 1983 by the long-term study experts. As a result, an R/D was concluded on October 21, 1983 concerning provision of project-based technical cooperation. Based on this R/D, the sending of long and short term experts, acceptance of trainees to study in Japan and provision of training equipment have been carried out.

The technical cooperation at the outset had been planned to be implemented for five years from the signing of the R/D, but this plan was extended by two years in October 1988. Further, in order to expand D-II and D-III, the present R/D is scheduled to be concluded this coming summer (1990) to extend the period of the technical cooperation for two more years from October 1990.

1) Sending of Long-term Experts

Since May 1984 up to March 1990, a total of 19 JICA-based long-term experts have been sent to Indonesia to cooperate in the

development of MMTC.

The composition of each expert team from 1984 to October 1988 when the first extension was made was seven persons consisting of six experts and one coordinator. The fields of work the seven persons took charge of were as follows:

- (1) Programme compilation (up to October 1989, this was also in the charge of the team leader)
- (2) Programme production
- (3) News reporting
- (4) Production engineering
- (5) Master control and post-production
- (6) Transmitter engineering
- (7) Coordination

As from October 1988 when the first 2-year extension became effective, the number of experts was reduced by two persons and, at present, each expert team consists of five persons, viz., 4 experts and 1 coordinator, as follows:

- (1) Programme compilation and news reporting (up to October 1989, this was also in the charge of the team leader)
- (2) Programme production
- (3) Production engineering, master control and post-production
- (4) Transmitter engineering (since October 1989, this was also in the charge of the team leader)
- (5) Coordination

2) Sending of Short-term Experts

In addition to the cooperation through the sending of long-term experts as mentioned above, the guidance to be given, as needs arise, through the sending of short-term experts had been promised in the R/D and has since been implemented over the years. Table 2-3-3 shows the records of cooperation conducted through the sending of short-term experts from Japan to Indonesia between the period from the opening of the MMTC until the end of fiscal 1989.

Table 2-3-3 Technical Cooperation by Short-term Experts

Year	Item	Category	Duration	Participant	Expert
1984/85	Administration Art	General	1984.11. 18 ~1985. 1. 18	1	1 JICA/NHK

Acoustics	General Technics	Ditto	22	1 JICA/NHK	
Total				453	26

3) Training of Counterpart Personnel Accepted for Study in Japan

The objectives of the training of counterpart personnel accepted for study in Japan include i) securing of personnel to whom future technical transfers may be directed and ii) fostering of personnel who will play the leading role in the running of the MMTC. Fully realizing the importance of such training of the counterpart personnel in Japan, the Japanese government expressed agreement at the time of the R/D discussions to the plan of accepting the trainees into Japan on a continual basis; about ten during the first two years and several persons each year during the subsequent years. In actual practice, however, as shown in Table 2-3-4, Japan has already accepted more trainees than originally agreed.

Table 2-3-4 Counterpart Training in Japan

Year	Name of Training	Number of Persons	Course
1983	MMTC Instructor	4	Special
1984	Administration	2	Group + Individual
	Educational Programmes	1	Group + Individual
	TV Engineering	1	Group + Individual
	Radio Engineering	1	Group + Individual
	Graphic Design	1	Individual
	Administration	1	Individual
1985	Editing	1	Group + Individual
	Photo Processing	1	Group + Individual
	Transmitter	1	Group + Individual

	TV Engineering	2	Group + Individual
	General Affairs	1	Individual
1989	TV Administration	2	Group
	TV News Programmes	1	Individual
	TV Engineering	1	Group
	Measuring Technics	1	Individual
Total		38	

The results of training in Japan of the above-listed counterpart trainees were satisfactory. After their return to Indonesia, all except five of the members listed became involved in the running of the educational training projects at the MMTC and have been contributing substantially to the development of the MMTC. Table 2-3-5 shows the numbers of such personnel taking charge of different training courses at the MMTC as of April 1990.

Table 2-3-5 Course and Counterpart

Name of Course	Programme Compilation	Production	News	Operation Technics	Transmitter	Total
Number of Counterparts	9	5	4	8	6	29
Name of Experts	Shigeki Ueno	Yuji Tokimatsu	Shigeki Ueno	Osamu Kobayashi	Noboru Shimoji	

4) Provision of Equipment

Table 2-3-6 shows how equipment have been provided during each fiscal year. Table 2-3-7, on the other hand, shows how additional equipment have been provided by going carried in by the experts.

Table 2-3-6 Equipment Provided by Technical Cooperation

Year	Price (1000 Yen)	Main Equipment
1984	23,156	Photocopy machine, typewriter, personal computer, word processor, measuring instrument, handy camera, VTR, monitor
1985	159,960	Training kits, TV OB van, transmission equipment, measuring instrument, radio OB van, radio car, microbus
1986	96,641	TV OB van, production equipment, measuring instrument, TV transmitting antenna
1987	25,445	Portable power generator, close-up photography equipment, transformer, slidac, signal generator, grand piano
1988	20,232	Colour corrector, location tools, news gathering tools, electronics training kits, VTR, spare parts
1989	62,032	Outdoor news gathering tools, video editing tools, location sound equipment, electronics practice equipment, maintenance spare parts, training material making tools
Total	387,466	

Table 2-3-7 Supplementary Equipment for Experts' Jobs

Year	Price (Unit: 1000Yen)	Main Equipment
1984	1,903	Camera, monitor, video tape, stationary, books
1985	1,362	Books, VTR, monitor
1986	1,781	Betacam power supply unit, word processor, disc records, books
1987	2,969	Typewriter, high speed dubbing machine, stationary, word processor
1988	7,901	Personal computer, TV camera, tape recorder, books, VTR controller
1989	10,580	Word processor, personal computer, measuring instrument, TV camera, VTR
Total	26,496	

2-3-3 How the Diploma Course Training is Conducted

(1) Outline of How the Diploma Course Training has been Conducted since the Opening of the MMTC

The MMTC was originally established with the objective of giving basic knowledge required by broadcasting personnel in carrying out their duties and also of conducting practical training for them.

From May 1984 the JICA-based experts, keeping the opening of the MMTC in view, conducted the training of instructors and, at the same time, tackled the work of offering guidance in the development of the training courses. As a result, through the cooperation of the experts and the Indonesian side, the training curriculums for a total of 11 months, viz., Basic-I (4 months), Basic-II (3 months) and Basic-III (4 months), were developed.

Immediately before the opening of the MMTC, President Suharto suggested the necessity of guaranteeing the status of trainees by conferment of qualifications, and the DEPPEN authorities accordingly examined the possibility of changing the training courses into a system under which diplomas are conferred, and decided to change the MMTC into a diploma-conferring training organization (academy). This change into an academy took effect on July 30, 1985 following the issuance of Presidential Orders Nos. 59 and 60. On the following day, July 31, the MMTC was officially opened in the presence of President Suharto.

Consequently, it became necessary for the MMTC to change its training curriculums, but this problem was dealt with by using the already-developed 11-month curriculums — Basic-I (4 months), Basic-II (3 months) and Basic-III (4 months) — as the curriculums for the Diploma-I (DI) Course.

Originally, the MMTC had planned to open five Diploma-I (DI) courses (totalling 120 persons) simultaneously with the opening of the MMTC in 1985. However, owing to budgetary restrictions, only four courses (79 trainees) were conducted. As these courses were started in the middle of a fiscal year, the training for that fiscal year was conducted for only

one semester and the second-semester training was conducted in 1989 together with the 1989 trainees.

During 1986/87, 1987/88 and 1988/89, overall cuts were made in the national budgets owing to the deterioration in finance caused by the drop in oil prices. Consequently, the MMTC's training courses were obliged to be reduced to 2 courses, 3 courses and 4 courses in the respective years. In 1989/90, all of the five D-I courses were conducted, thanks to government finances taking a favorable turn and also to the recognition by the Indonesian government of the importance of human-resources development and training. Also in 1989/90, three D-II courses (out of the eight courses planned), which had been under preparation, were carried out. In 1990/91, too, the same as in the preceding year, five D-I courses and three D-II courses are in progress.

Table 2-3-8 shows the records of training courses conducted at the MMTC since its opening, and Tables 2-3-9 (a) and (b) each show how the D-I and D-II courses have been conducted.

Table 2-3-8 Record of Training Courses

Diploma Course	Course	Year

(2) Annual Schedule of Training Courses

A brief explanation will be given here of the annual pattern of training given at the MMTC, using the case of the courses conducted in 1989/90 as an example.

In both the D-I and D-II courses, the first semester started on April 6, 1989 and continued for a net period of 16 weeks, followed by four weeks consisting of a semester exam, preparations, a makeup exam and a short trip. The second semester began on September 11 and similarly continued for a net period of 16 weeks excluding the holiday periods, followed by 10 weeks consisting of preparation for exams, the semester exam, a makeup exam, a state exam (paper tests), a makeup exam for the state exam, a state exam in practical skills, a state exam (oral tests) and a short trip. Table 2-3-10 shows the schedule of training at the MMTC for 1989/90.

Table 2-3-10 Training Schedule (as of 1989/1990)

Month Day	April				May				June				July				August				September				October				November				December				January				February				March

(3) Curriculums

In both D-I and D-II, the curriculum is divided into general subjects, basic-skill subjects and specialized subjects. Through lectures and practical training, the trainees are required to take each year a total of 44 credits in the case of D-I and 40-42 in the case of D-II. Besides the above, the trainees are supposed to attend such non-credit classes as lectures on "Sports and Health" and "Organization and Operational System of DEPPEN."

As for the credits, in the case of lectures, a trainee earns one credit (or one SKS-SISTEM KREDIT SEMESTER in Indonesian) by continuously attending the classes — 50 minutes per subject a week — for 16 weeks. In the case of practical training, a trainee earns two credits by taking part in practical training one day (8:00-16:20 being the standard hours) a week for 16 consecutive weeks.

As for the practical training, each trainee is required to earn 8 SKS a year (one day a week during the 1st semester: 2 SKS, and three days a week during the 2nd semester: 6 SKS) in the case of D-I courses, and 10 SKS a year (three days a week during the 1st semester: 6 SKS, and two days a week during the 2nd semester: 4 SKS) in the case of D-II courses. So, in terms of ratios in the number of hours, the lectures-practical training ratios are roughly 6:4 in the case of D-I and 5:5 in the case of D-II. The curriculum composition is such that the higher the level of the course, the more importance is attached to practical training.

As for the curriculums of the training courses which are conducted at present (five D-I courses and three D-II courses), they are shown in 3-3-2 (2), Operational Plans, together with the courses being planned.

(4) Timetables

Weekly timetables are prepared in accordance with the curriculums of the D-I and D-II courses.

The daily allocation of lecture hours is done by taking 50 minutes as the unit and each subject is normally allotted 100 minutes (2 SKS), as follows:

1st period: 08:00 - 08:50
(Recess: 5 minutes)
2nd period: 08:55 - 09:45
(Recess: 10 minutes)
3rd period: 09:55 - 10:45
(Recess: 5 minutes)
4th period: 10:50 - 11:40
(Lunch: 60 minutes from 11:40 to 12:40)
5th period: 12:40 - 13:30
(Recess: 5 minutes)
6th period: 13:35 - 14:25
(Recess: 5 minutes)
7th period: 14:30 - 16:20

The timetables in the 1st and the 2nd semesters for the five D-I courses and three D-II courses conducted in 1989/90 are shown in Tables 2-3-11, 12 and 13. Of the lectures given in the respective courses, joint classes were conducted for such general subjects as the Indonesian Language, Religion, State Ideology, Introduction to Research Methodology and Citizenship. In the tables are also shown which rooms were used for such joint classes. As for other lectures, general classrooms were used. How the practical training has been conducted will be explained in the next item (5).

(5) How Practical Training is conducted

The objectives of practical training lie in having the trainees confirm, through practical training given them in a form as close as possible to what they would experience on the actual work-site in broadcasting services, the knowledge and theories they will have gained through their lectures and in thereby having them enhance their technical skills related to broadcasting work.

The training given in the D-I courses aims at enabling the trainees to perform their broadcasting duties under the instruction of their seniors. It is, therefore, so designed that the trainees may be able to gain basic knowledge and skills in broadcasting services through their participation in practical training. The training given in the D-II courses, on the other hand, aims at enabling the trainees to execute their own routine duties through the cooperation and assistance of their supervisors. It is also designed so that, through practical training, the trainees may be able to gain specialized knowledge and skills.

The outline of the aims, place, method, etc., of practical training given in each course is shown in Table 2-3-14.

Table 2-3-14

Course	Aim of Practical Training	Remarks (Outline of Place, Method and so on)	
D I	Programme compilation planning	<ul style="list-style-type: none"> • Basic knowledge and skill on <ul style="list-style-type: none"> - Management and facilities of broadcasting station - Programme planning and compilation - Relation between programme and audience • Practice on programme production 	<ul style="list-style-type: none"> • Practical training at RRI and TVRI stations in Yogyakarta • Data survey and audience research at POS & GIRO and Statistics Bureau • Production training in MMTC
	Programme lines production	<ul style="list-style-type: none"> • Basic knowledge and skill on programme production • Practice on programme production 	<ul style="list-style-type: none"> • Production training in MMTC
	News and current affairs reporting	<ul style="list-style-type: none"> • Basic knowledge and skill on news gathering and news programmes • Practice news programme production 	<ul style="list-style-type: none"> • Production training in MMTC
	Studio and master control technical operation	<ul style="list-style-type: none"> • Basic knowledge and skill of production and master control technics • Practice of programme production technics 	<ul style="list-style-type: none"> • Production technic training in MMTC

	Script/story writing	<ul style="list-style-type: none"> • Professional knowledge and skill on gathering materials and script/story writing 	<ul style="list-style-type: none"> • Gathering materials outside of MMTC • Writing practice in MMTC
	Studio production technics	<ul style="list-style-type: none"> • Professional knowledge and skill on production and master control technics • Practice on programme production technics 	<ul style="list-style-type: none"> • Practical training in MMTC

The assignment of practical-training days during each week, as mentioned in (3) and (4), is done in such a way as to avoid overlapping and to ensure effective use of the facilities. Thus, during the 1st semester, one day for the DI courses and three days for the DII courses are assigned and, during the 2nd semester, three days for the DI courses and two days for the DII courses are assigned, respectively.

As for the contents of the practical training given in each course, a summary of how the courses were conducted in 1989/90 is given in Table 2-3-15.

Among the training courses, such as those in programme production, that actually use such production facilities as studios or OB vans, the trainees of related courses are brought together to be given joint training, because joint work by both the programme and engineering personnel is required and also because the availability of practical-training facilities is restricted. Thus, in conducting the three DI courses, viz., "Programme Lines Production," "News and Current Affairs Reporting" and "Studio and Master Control Technical Operation," all the trainees are divided into a number of teams by theme and by the facilities to be used (radio & TV studios and OB vans), so as to have each team produce, by joint work, a programme under a given theme. In this way, the trainees are given the chances of gaining skills in their specialized fields of work through their participation in the joint activities as mentioned above.

There are a number of different patterns of practical training in programme production according to the training course concerned or the theme of each programme. But conceptually, each programme production team is expected to complete the production of one programme in three weeks, as follows:

- 1st week: Preparation for the production, getting the equipment ready and conducting rehearsals.
- 2nd week: Production of the programme in a studio or by on-the-spot coverage; recording of the programme
- 3rd week: Editing and evaluation of the programme

The courses "Programme Compilation Planning" and "Transmission Operation" in DI and "Script Story Writing" in DII are each carried out under a special practical-training procedure of a set pattern.

For example, in the case of the "Programme Compilation Planning" in DI, the trainees, in addition to participating as staff in charge of programme compilation in the practical training in programme production at the MMTC as mentioned above, take part in practical training outside the MMTC, such as the practical training in programme compilation at the Yogyakarta station of RRI or TVRI, as the case may be, and a data survey and an audience survey conducted by such offices as the post office or the statistics bureau. In the case of the "Transmission Operation" course in DI, practical training is conducted independently in such subjects as the basics of electricity, electronic circuit technology and measurements in transmitter operation. Also, as for the "Script/story Writing" course in DII, the training given is not so arranged as to directly relate to the training in programme production, and the participants are, instead, given practical training in scriptwriting for all stages of programme production, from news or material gathering and preparations to the actual writing of scripts for broadcast.

Table 2-3-15 How Practical Training is Conducted at the MMTC (fiscal 1989/90)

Course	Semesters I (D I) and III (D II)	Semesters II (D I) and IV (D I)
D I Programme Compilation Planning	<ul style="list-style-type: none"> All the 24 trainees (once a week on Friday) Introduction of radio and TV facilities at MMTC, and practical training in the study of broadcasting concepts relating to RRI and TVRI. 	<ul style="list-style-type: none"> Three groups: (further split up into two sub-groups) (3 days a week, on Monday, Tuesday and Wednesday) Outside : Practical training at RRI and TVRI; data survey and audience opinion survey at POS & GIRO and Statistics Bureau MMTC : Production training by taking part in "Programme Lines Production" and "News and Current Affairs Reporting" groups
D I Programme Lines Production D I News and Current Affairs Reporting D I Studio and Master Control Technical Operation	<p>[Places: Classrooms, studios, RRI and TVRI]</p> <ul style="list-style-type: none"> First 5 weeks (once a week on Thursday); Participants in each course will be divided into 3 groups. Trainees will be taken around to have a look at 9 different types of equipment including Radio and TV audio, lighting, TV studio camera and VTR and to receive briefings on each (no operation). During the next 9 weeks; Four groups will be formed; TV-1, TV-2, R-1 and R-2. Practical training in the production of a simple type of programme, taking 2-4 weeks to go through various stages from preparation to evaluation. (During this period, each group will produce 3 programmes in Radio or TV, totaling 12 radio and TV programmes.) the programme-production groups and news-reporting groups will produce different programmes, while the trainees in engineering will participate in any one of these groups. Each group will go through separate preparation stages and, when they come to the production stage, the engineers will join and together conduct rehearsal and recording. The evaluation of the programmes produced will also be done jointly. <p>[Places: Classrooms, studios and outdoors]</p>	<p>[Places: RRI and TVRI, government offices, classrooms and studios]</p> <ul style="list-style-type: none"> Three days a week, Monday, Tuesday and Wednesday Trainees will be divided into 4 groups for "News and Current Affairs Reporting" and also 4 for "Programme Lines Production". (Six groups each in 1989) During three weeks as a unit period, preparation, rehearsals, recording, post-production and evaluation will be conducted. Each group will produce five different types of somewhat complex programs. Equipment to be used: TV : Studio, OB van and ENGS Radio : ATAs Trainees in "Studio and Master Control Technical Operation" will join at the recording and post-production stages.
D I Transmission Operation	<ul style="list-style-type: none"> Once a week on Thursday. Trainees will be divided into six groups of 4 members. Introduction of studio equipment, and basic training in such work as soldering, handling of electronic parts, measuring of voltage, handling of ammeters and oscilloscopes. <p>[Places: Classrooms, studios and outdoors]</p>	<p>[Places: Classrooms, studios and outdoors]</p> <ul style="list-style-type: none"> Three days a week, on Monday, Tuesday and Wednesday. Trainees will be divided into three groups viz., TV transmitter, radio transmitter and electronic engineering experiments. Each group will be given training in different subjects in turn during the three-day period each week. Radio and TV transmitters: Handling of equipment, various measuring methods, outdoors measurements. Electronic engineering experiments: Experiments on electronic circuits, amplifier, experimental assembly of logic circuits in transistors, outdoor measurement. <p>[Places: Studio and electric-power training room]</p>
D II Script/story Writing	<p>[Places: Studio and electric-power training room]</p> <ul style="list-style-type: none"> Three days a week, on Monday, Tuesday and Wednesday. Trainees will write scripts for six different types of Radio and TV programmes, such as information of cultural programmes Training will be giving for a period of 9 weeks as a unit. 1st 3 weeks : Preparation & Hunting 2nd 3 weeks : Theme, Synopsis 3rd 3 weeks : Writing of the scripts Three scripts will be written by each trainee who will continue the scriptwriting work further in the next semester. At the present stage, the trainees in this course will have no direct relations with the groups in other courses, such as Programme Production. 	<ul style="list-style-type: none"> Two days a week, on Wednesday and Friday. continuation of Semester III.
D II Programme Package Production D II Studio Production Technics	<p>[Places: Classrooms, outside MMTC]</p> <ul style="list-style-type: none"> Three days a week, on Monday, Tuesday and Wednesday. Trainees will be divided into groups producing six different types of Radio and TV programmes, such as news, educational and cultural, and during a period of 1 to 3 weeks as a unit period, they will engage in preparation, rehearsal, recording, post-production and evaluation. During the period of Semester III, the trainees will be given practical training in the production of six of. Radio and TV programmes each. <p>[Places: Classrooms, studios, outdoors]</p>	<p>[Places: Classrooms and outside MMTC]</p> <ul style="list-style-type: none"> Two days a week, on Wednesday and Friday. Continuation of Semester III. Through Semester III and IV, the trainees will be given practical training in the production of about 11 Radio and TV programmes.

2-3-4 How Training Other than the Diploma Courses (Enrichment Courses) is Conducted

At the MMTC, various training courses other than the Diploma Courses, which are also related to broadcasting, are conducted. They are called, at the MMTC, the Enrichment Courses. The Enrichment Courses are conducted by making use of the hours when the MMTC's facilities are not being used. The past records of Enrichment Courses conducted at the MMTC are given in Table 2-3-16. The Enrichment Courses may roughly be classified into three types. One of the three is the training given by JICA's short-term experts.

Table 2-3-16 Enrichment Courses

Year	Duration	Number of Days	Course	Number of Participants
1985/86	10/1 ~ 11/5	31	Music and dance	24
		31	1 Courses	24
1986/87	7/16 ~ 10/11	74	TV transmitter No. 8	24
	10/11 ~ '87.1/10	76	TV transmitter No. 9	24
	8/27 ~ 10/4	33	Radio transmitter	25
	Total	183	3 Courses	73
1987/88	6/8 ~ 6/26	17	TV set design	16
	6/15 ~ 7/23	34	Radio production	20
	7/20 ~ 12/26	155	Radio and TV agriculture programme	13
	8/10 ~ 9/16	33	TV drama producing	12
	8/10 ~ '88.1/23	154	TV studio maintenance	12
	9/16 ~ 10/26	35	Radio maintenance	20
	10/5 ~ 10/30	23	Microwave technics	12
	12/2 ~ 1/10	33	Radio production	20
	12/8 ~ 12/10	3	TV documentary production	75
	'88.1/4 ~ 1/8	5	News report and editing	23
	'88/1/4 ~ 2/14	36	Radio programme planning	20
	Total	528	11 Courses	243
1988/89	3/25 ~ 8/16	124	TV transmitter	18
	3/30 ~ 4/6	7	Radio administration	21
	7/1 ~ 8/12	37	Rural programme practice	18
	7/18 ~ '89.1/19	161	Higher special knowledge	15
	7/26 ~ 9/2	34	Radio transmitter maintenance	20
	9/27 ~ 10/6	9	Radio news basics	20
	10/19 ~ 10/21	3	Cine film processing	15
	11/14 ~ 11/16	3	Radio media and effects	40
	11/17 ~ 12/12	23	TV measurement	12
	'89.1/2 ~ 3/4	36	Radio announcer	21
	Total	437	13 Courses	200
1989/90	7/24 ~ 8/4	10	Colour TV lighting	33
	8/28 ~ 9/1	5	Agriculture broadcasting in West Germany and Indonesia	30
	9/19 ~ 9/28	8	Radio production	14
	9/20 ~ 9/23	4	Workshop "Historical remedy"	10
	Total	27	4 Courses	87
	Grand Total	1,206	29 Courses	627

2-3-5 Current Condition of Training Facilities and Training Equipment

(1) Outline of the Existing Facilities

The MMTC is located in the Sleman district in the northeast of Yogyakarta city. This site is located along the Magelang road, which is a main highway linking Yogyakarta Semarang in the north of Java, and is in the suburbs of Yogyakarta about 6km to the north of the palace. The site is divided into three blocks. Table 2-3-17 below shows the area of each block and the main buildings standing on the site of each block.

The layout of the existing buildings is shown in Fig. 2-3-4, their ground floor plan in Fig. 2-3-5 and their first floor plan in Fig. 2-3-6.

Table 2-3-17 Main Facilities of MMTC

<u>Block A</u>	Site Area	37,515m ²	(Total floor area)
	Existing training facilities	Reinforced concrete, 2-storied	5,495m ²
	Auditorium	Reinforced concrete (partly steel-frame), 2-storied	929m ²
	Library	Reinforced concrete, 2-storied	619m ²
	Canteen	Reinforced concrete, single-storied	570m ²
	Others (Guard house, transformer building, etc.)		100m ²
		Sub-total	7,713m ²
<u>Block B</u>	Site Area	About 6,300m ²	
	There is no facility on the site which is currently used as farmland.		
<u>Block C</u>	Site Area	31,947m ²	
	Trainees' dormitory "A"	Reinforced concrete, 4-storied	2,050m ²
	Trainees' dormitory "B"	Reinforced concrete, 4-storied	1,750m ²
	Staff's dormitory	Reinforced concrete, 2-storied	700m ²
	Staff's housing	Wooden, single-storied	420m ²
		Sub-total	4,920m ²
Grand total:	Site area	75,762m ²	
	Total floor area of the buildings	12,633m ²

(2) Composition and Contents of the Buildings

1) Existing Training Facilities

These facilities were constructed with grant aid offered by Japan and were delivered to the Indonesian side in June 1984. The facilities consist of an administration building, a studio building, a classroom building and a workshop building, as follows:

a) Administration building:

Administration office	311 m ²
Clinic	26
Printing room	26
Instructor room	311
Deputy director office	26
Text room	29
Secretary	45
Director office	52
Expert office	104
Meeting room	91
Entrance hall	311
(incl. temporary classroom of 104m ²)	

Total 1,379 m²

b) Classroom building:

Classrooms (52m ² × 12 rooms)	624 m ²
Store	35

c) Workshop building:

Transmitter training room	104 m ²
Preparation room	52
Basic electric training room	104
Power receiving room	52

d) Studio building:

TV studio	259 m ²
TV subcontrol room	104
TV master control room	116
TV announcer's booth	26
Radio studio	156
Radio subcontrol room	78
Radio master control room	65

Radio announcer's booth	39
Store	104
Telecine training room	58
VTR training room	58
Tape-editing training room	39
Film-developing training room	26
Film-editing training room	19
Makeup room (15m ² × 2 rooms)	30
Workshop	39
Training equipment maintenance room	78
Observation corridor	93
Air conditioning machine room	181
Total floor area (net)	3,918 m ²

The auditorium, library, canteen and the dormitories were constructed by the Indonesian side, as follows:

2) Auditorium:

Audience seating area	477 m ²	(ground floor: 325m ² 1st floor: 152m ²)
Stage	184	(incl. dressing room and makeup room)
Entrance hall	91	
Foyer	32	
Toilets	59	
Machine room, etc.	68	

The audience seats are of a system in which movable chairs are arranged according to required capacity. The maximum capacity is 450 seats.

3) Library:

Open-shelf reading room	288 m ²
Administration office	38
Stack room	103
Research room	23
AV teaching material storeroom	17
Entrance hall and exhibition room	81

Toilets	50
Machine room	14

On the ground floor are such rooms as the administration office and stack room, while the entire 1st floor is used as an open-shelf reading room.

4) Canteen:

Dining room	311 m ²
Instructors' dining room	15
Kitchen	104
Pantry	56
Store	30
Office	32
Toilets	12

Meals can be served to a maximum of 200 persons at a time.

5) Trainees' dormitory

Each room, about 16m², is to be shared by two persons and a toilet and shower set is to be shared by the residents of two rooms. Table 2-3-18 shows an outline of trainees' dormitories.

Table 2-3-18 Main Facilities of MMTC

Building	Number of rooms	Capacity	Remarks
Trainees' dormitory "A"	66	132	For female trainees and instructors
Trainees' dormitory "B"	65	130	For male trainees

Twenty-two rooms in trainees' dormitory "A" are currently used as a family dormitory for the instructors, so the actual maximum capacity of the trainees' dormitory is 218 instead of 262.

6) Staff's Dormitory

A 2-storied apartment building consists of ten 70m² housing units.

7) Staff's houses

There are three terrace houses accommodating six households, each household occupying living quarters of about 70m².

(3) How the Existing Training Facilities are Used

The existing training facilities are maintained well. The routine sweeping and cleaning are done adequately and repainting of exterior walls and checking and repairing of air conditioners are also conducted regularly. The actual conditions of use of main rooms are as follows:

1) Classroom building

One room is allocated to each class. The classrooms are used under the so-called "homeroom" system. Each classroom is 52m² and can accommodate 24 persons. During 1989/90, five D-I courses and three D-II courses, totaling eight courses, were conducted. The D-I courses used five rooms on the ground floor and D-II courses used three rooms on the 1st floor. The remaining four classrooms are normally used for short-term training courses other than the Diploma Courses. The eight classrooms used for the Diploma Courses are provided with an air-conditioning system by the Indonesian side. When a joint lecture class is conducted on such subjects as language or religion, such classes are normally given in a temporary classroom (104m², 70 seats) which is provided by partitioning a part of the entrance hall. Besides this, the auditorium (capacity: 450 seats) is occasionally used for joint classes with a large audience.

The weekly time schedules for the Diploma Courses are as shown in Tables 2-3-11 ... 2-3-13. For these courses, the classrooms are used as follows:

a) Allocation of Classrooms

At present, eight classrooms are reserved for regular use by five classes of D-I and three classes of D-II, so that most of the lectures for these two courses may be given in these rooms.

b) Conducting of Joint Lectures

The general subjects, such as Indonesian, English, religion, national ideals and introduction to survey methods, are generally taught in the form of joint lectures, using, at present, the auditorium and the temporary classroom.

The number of times used by D-I and D-II courses combined

are: three times a week in the auditorium and once a week in the temporary classroom during the 1st semester, and once a week for both the auditorium and the temporary classroom during the 2nd semester.

c) Usage of Classrooms for Practical Training

As will be explained later in item 5), the classrooms are used not only as a studio or a practical training room but also for preparations for practical training, and for preparations, discussions and evaluations by different training groups.

As far as the Diploma Courses as mentioned above are concerned, the usage rate of the classrooms hitherto has been confined to 67%. However, from another point of view, it may be said that, because of the lack of a joint classroom, the training courses at present inevitably have to be conducted occasionally in the auditorium or the provisional classroom in the lobby, both of which are not quite suited for such use from the point of view of the structure and environmental conditions.

At MMTC, in addition to the Diploma Courses mentioned above, the Enrichment Courses have been conducted in recent years and the number of such courses now reaches 13 to 15 each year. At peak times, about five Enrichment Courses are conducted in parallel in addition to the Diploma Courses. At such times, the usage rate of classrooms rises close to 100%, which means that the training facilities are being used effectively enough.

2) Administration building

The administration office is located on the ground floor by the entrance hall. Its floor area is 311m². At present, the office is used by 25 staff members. By partitioning a part of this room, a space is provided to install a PABX and an automatic fire alarm receiver. The instructors' office on the 1st floor is also 311m² in area and is currently used by 14 regular instructors. According to the standards set by the Ministry of Education and Culture of Indonesia for office areas, a floor space of 6-7m²

should be made available to each person for general staff. This means that both the administration office and the instructors' office can accommodate about 50 persons each.

(4) Current Condition of Training Equipment

Table 2-3-19 shows the current condition of grant aid equipment, technical cooperation equipment and expert's equipment. As the tables show, administration and utilisation of equipment are generally good.

Incidentally, in this table, the utilization and management conditions have been evaluated in three stages, from A to C. In making this evaluation, the opinion of the technical-cooperation expert has also been solicited for reference purposes. The reasons for evaluation "C" are specifically stated on page 129 and thereafter.

Note S: SET A: excellent B: good C: fair

Regarding Table 2-3-19, a number of items of equipment have had their current conditions evaluated as "C" in the 'Utilization' column. Such items and the respective reasons of their having been evaluated as "C" (fair) are as follows:

Grant Aid Assistance

1-I Film Processing Equipment

1. 16mm color film developing machine
2. Analysis equipment
3. Water boiler
4. Chemicals
5. Others

[Reason]

In recent years, the development of ENG equipment has been most remarkable, both in quality and quantity. In the industrialized countries, image pickup by film, which is the method hitherto used in image pickup for animation, has been replaced almost entirely with image pickup by ENG. In Indonesia, owing to the delay in the introduction of ENG equipment, image pickup by film is still used at some of the stations. However, in Indonesia, too, image pickup by film is certain to decline in the future and, consequently, the need for training personnel in film-shooting will also tend to decrease.

IV-35 Operating Impedance Bridge (MZ-810)

[Reason]

This measuring instrument is a device for the measuring of a medium-wave antenna constant. However, since a medium wave antenna had not been installed at the MMTC, the frequency of use of this instrument was low, as it was used only on such occasions as for simulated measurements.

- IV-45 Temperature meter
- IV-49 Test film SMPTE
- IV-50 Test film
- IV-51 Test slide

[Reason]

The same reasons as those mentioned for 1-I.

1985 Technical Cooperation

- 9(5) SSB transmitter (NSD-515)
- 9(7) Linear amplifier (TL-922)

[Reason]

The SSB transmitter and the linear amplifier, which is used for the SSB transmitter, are not the main items of equipment required in conducting broadcasting; they are both devices used in secondary work, such as communications. Hence, the frequency of training in the handling of these equipment is low.

1987 Technical Cooperation

- 3(11) Vacuum tube tester (VG-4G-N)

[Reason]

Almost all of the broadcasting equipment today use semiconductors; the vacuum tubes, which have been used hitherto, are almost completely out of use at present. Consequently, the frequency of use of the vacuum tube tester has also decreased.

- 3(14) UHF receiver

[Reason]

UHF receivers are a quite special type of broadcasting equipment; they are not a type of equipment that is used in large numbers. Consequently, the frequency of training in the handling of this equipment is also low.

1988 Technical Cooperation

4(1) Logic analyzer

[Reason]

the logic analyzer is an item of equipment that has been allocated mainly for the purpose of repairing digital equipment. Since, for the present, breakdowns of digital equipment are infrequent, the frequency of use of this equipment is also low. However, it is expected to be fully utilized in the future, because the curriculum to be taught in the future includes logical operation circuits.

5(1) Spare board for 1" VTR

5(2) Spare board for Betacam

[Reason]

Both of the two being spare boards, the frequency of their use is low.

2-4 Process Leading to the Request and the Contents of the Request

2-4-1 Process Leading to the Request

As has been mentioned in the Introduction, MMTC was originally established as an institution to offer basic training and education. However, in view of the urgent need in Indonesia to foster candidates for senior staff positions, the MMTC was designated in 1985 as a school authorized to confer degrees by a presidential order, so that the graduates of MMTC may be eligible for the national promotion and appointment system. As a result, the need arose for MMTC to introduce a substantial change in the academic contents of its curriculum befitting its status as a school authorized to confer degrees. In response to this need, the contents of the technical cooperation offered by Japan to Indonesia under grant aid have also been changed and implemented accordingly.

At present, at MMTC, the DI courses (5 fields - "D" means "Diploma") and a part (3 out of 8 fields) of the DII courses are being conducted.

However, following the changes made in the curriculum as mentioned above, there occurred a shortage of the required facilities and equipment and, moreover, it has now become difficult for MMTC to implement the remainder (5 fields) of the DII courses and any of the projected DIII courses (11 fields). Thus, it is now practically impossible to adequately train the middle-class engineers who are most needed by Indonesia today. It was against such a background that the Government of Indonesia requested of Japan the provision of grant aid cooperation to enable the supply of the necessary and adequate facilities and equipment required in running the above-mentioned training courses at MMTC.

In response to this request from the Indonesian government, Japan ascertained such questions as the background of the request, its contents and the system of implementation of the Project and examined the appropriateness of the Project. And in order to determine the policy for the basic design study, Japan sent to Indonesia a preliminary study team from April 10 to 22, 1989. This study team conducted the necessary survey and returned to Japan after signing the Minutes of Discussion confirmed between the Vice Minister of Information and the study team. Then, in

July 1989, the team submitted a report on the preliminary study to the Japan International Cooperation Agency (JICA).

As a result of the preliminary study, the following findings were made.

In the past, there were problems in the running of the MMTC because of the inadequate budget. However, the conditions were subsequently improved and the operational setup of the MMTC was streamlined. The facilities and equipment provided by Japan have been utilized effectively but are quantitatively insufficient, with the result that complete execution of DII and DIII is impossible. Of the eight DII courses, three have already been opened. As for the remaining five courses, the training of the instructors has been completed and the budget allocation has been realized, and so these five courses are scheduled to open as soon as the necessary equipment are provided. As for the DIII, a detailed curriculum is now being prepared. The scale of the expansion plan is generally appropriate. Those who have finished their training in the DI courses have already returned to their respective workplaces and are actively engaged in their work. The Government of Indonesia has been pushing ahead its plans for expansion and improvement of the broadcasting services. For that purpose, the Ministry of Information considers it essential to foster human resources for middle-class staff and hence the Ministry places high expectations on the execution of this project.

2-4-2 Contents of the Request

(1) Targets of the Diploma Courses

1) Targets of the DII Courses

Each of the DII Courses has the following targets:

Names of the Courses	Targets
Broadcasting Programme Planning	Acquisition of specialized ability for programme compilation work, including the drawing up of programme compilation plans, the execution of broadcasting work based on these plans, planning and editing of programmes, and the establishing of a programme-production system.
Programme Package Production	Acquisition of knowledge and skills concerning the direction and production methods of editing and processing primary materials in the course of the production of programmes.
Script/Story Writing	Having the participants undergo training in the methods of planning and composition of programmes, which are required for programme production, and acquire various techniques and specialized knowledge, both of which are essential in the writing of broadcasting stories and scripts.
Broadcasting Performances	Acquisition of performance techniques including reporting, narrating, skillful delivery, body movements and gesturing.
Broadcast Journalism	Acquisition of specialized knowledge and culture required as a broadcast journalist as well as the ability required as the staff in charge of news and current-affairs programmes, such as manuscript writing, reporting, editing and commentating.

<p>Studio Production Techniques</p>	<p>Acquisition of specialized technical knowledge concerning such broadcast-engineering techniques as video, audio, image pickup, lighting and transmission techniques relating to radio and TV programme production technologies and programme continuity techniques.</p>
<p>Transmission Techniques</p>	<p>Acquisition of specialized technical knowledge concerning such technical matters as electronic technologies, wireless techniques, transmission equipment and measuring instruments in relation to radio and TV broadcast transmission techniques.</p>
<p>Technical Repairs</p>	<p>Acquisition of specialized technical knowledge concerning such technical matters as video, audio, image pickup, video/audio recording equipment and measuring techniques in relation to repairing techniques for broadcasting equipment.</p>

2) Targets of the DIII Courses

Each of the DIII Courses has the following targets:

Names of the Courses	Targets
Broadcasting Management	Acquisition of ability required by broadcasting managers, that is, the managerial ability needed in operating a broadcasting station and conducting broadcasts accurately and effectively; more specifically, the ability to handle various aspects of a broadcasting service including planning and compilation of programmes, budgeting, management of broadcasting facilities and equipment, organization, personnel assignments, programme evaluation and audience servicing.
News and Information Programme Production	Acquisition of skills needed in developing programmes based on news and information programme materials, and development of ability as a journalist with expertise to direct and manage a reporting team on the sites of news events.
Educational and Religious Programme Production	Acquisition of skills concerning the production of wide-ranging socio-educational programmes intended for general adults, women and children and educational programmes including sports.
Cultural and Entertainment Programme Production	Acquisition of skills concerning the production of cultural, artistic or entertainment programmes including music, traditions, classics and shows.
Technical and Artistic Production Design	Acquisition of ability as an art designer to handle such work as the production of studio settings and sceneries needed for programme production.
Scenario and Storyboard Writing	Acquisition of skills concerning shooting scripts and presentation scenarios for general programmes including entertainment, as well as dramaturgy and scenarios and scripts for stage performances and broadcasts.

Public Speech and Drama Casting	Acquisition of skills concerning direction, public speaking, drama casting and performances in relation to programme production.
Apparatus Engineering	Acquisition of expertise and knowledge concerning broadcasting-equipment planning, such as designing techniques for studio equipment, continuity-studio engineering, and general installations.
Open Studio and Mobile Production Engineering	Acquisition of knowledge and expertise concerning audience-participation programme production in radio and TV and production engineering for outside broadcasts, including techniques for video, audio, image pickup, lighting and outside broadcasting engineering.
Satellite and Terrestrial Transmission Engineering	Acquisition of knowledge and expertise concerning satellite and terrestrial transmission engineering, including microwave engineering, satellite engineering, meteorology, transmission techniques, antenna engineering, radiowave propagation theories and broadcast-reception techniques.
Maintenance	Acquisition of knowledge and expertise concerning techniques for maintenance of broadcasting equipment, including studio facilities, continuity-studio equipment, transmission equipment, measuring of general equipment and maintenance techniques.

(2) Plans for Diploma Courses beyond 1990/91

The plans for the Diploma Courses beyond 1990/91 have been explained by MMTC as described in Table 2-4-1.

(Table 2-4-1)

(3) Outline of the Facilities and Equipment Requested

The facilities and training equipment requested by the MMTC are as outlined below in Table 2-4-2.

Table 2-4-2 Outline of Facilities and Equipment Requested

Facilities Requested	Equipment Requested
TV Studio	Three TV cameras, 1 set of video/audio/lighting equipment, DVE and monitor.
Radio Studio	24-channel stereophonic audio control equipment, a tape-recorder and a disc player.
Voice-dubbing Studio	A tape-locking system and a multi-track tape-recorder.
Performance-training Room	A TV camera, a cassette VCR and a monitor.
Physics-programme Preparation Room	Physics experiment equipment and measuring instruments.
Chemistry-programme Preparation Room	Chemistry experiment equipment and microscopes.
Designing Room	Drawing instruments and a photocomposer.
Scriptwriting Room	A VCR, a monitor and a 16mm projector
Electronics and Digital Training Room	Training equipment and measuring instruments.
Electric-power Engineering Training Room	A transformer, a power generator, a power distribution board and measuring instruments.
Radiowave Engineering Training Room	Training equipment and measuring instruments.
Audio Training Room	Training equipment and measuring instruments.
Video Training Room	Training equipment and measuring instruments.
Transmitter Training Room	A TV transmitter, a radio transmitter, an antenna and measuring instruments.

Two Classrooms	Overhead projectors, VCRs and monitors.
Three Joint Classrooms	Overhead projectors, VCRs, monitors and PA systems.
Audio-visual Classroom	A cassette VCR, a video projector, a monitor and a PA system.
Seminar Room	An overhead projector, a VCR and a monitor.
ENG-equipment Maintenance Room	Maintenance equipment and measuring instruments, and a battery-charger.
LL Classroom	LL installations.
Post-production Room	Post-production system
	<p>The following are equipment only, without facilities:</p> <p>Two 1-inch VTRs; an editing controller; 5 sets of Betacam editing systems; 5 Betacam cameras with lighting equipment; a TV OB van equipped with a microwave relay device, a VTR, and a video/audio device; a radio OB van equipped with a wide bandwidth transmitter, an antenna and an audio device; a microwave relay transmitter/receiver; a shortwave antenna; a satellite broadcast reception antenna.</p>
