		Unit: Million Pesos		
Item	First Stage	Second Stage	Total	
Financial Cost	1,977.3	1,918.4	3,895.7	
Economic Cost	1,628.3	1,678.6	3,306.9	

Tables 4.4.5 - 4.4.8 show the breakdown of the financial project cost according to construction stretch and stage.

#### 4.4.3 Construction Schedule

The Proposed Priority Projects are each split into two stages. The construction time schedules of the Upper Agno River Project and the Pantal-Sinocalan River are shown in Figure 4.4.1 and Figure 4.4.2 respectively. These schedules are prepared in accordance with the two stage implementation schedule described in Section 4.6, and will be subject to change for further elaboration.

### 4.5 Project Evaluation

## 4.5.1 Project Benefit

#### (1) Framework of Benefit Analysis

There are two types of flood control benefits: (a) direct benefits stemming from reduction or prevention of flood damages (deterrent effects); and (b) other benefits arising from positive effects of flood control.

Direct benefits refer to prevention or reduction of direct and indirect damages due to flood. Direct damage consists of: (a) agricultural damage to crops, livestock and aquaculture; and (b) non-agricultural damage to houses, buildings and infrastructures. Indirect damage arises from suspension of economic activity; (c) additional transport expenditures owing to traffic blockades; and (d) costs of rescue and relief activities. The flood damage analysis provides a quantification of these benefits.

Other benefits also arise as a result of flood control. In the short run, these include: (a) land enhancement; (b) greater agricultural production; and (c) improved agricultural productivity. The long run

effects include: (d) development of agro-industries and aqua-based industries; (e) changes in economic and employment structures; (f) increase in per capita income and consumption; and (g) improvement in the quality of life. These effects can be attributed to flood protection in the sense that it makes possible, enhances, or accelerates their occurrence or development.

#### (2) Direct Benefits

The annual average flood control direct benefit in the 1991 price level is estimated to be \$283.4 million and \$207.0 million for the Upper Agno and Pantal-Sinocalan projects, respectively, or some \$490.4 million for the two projects.

#### (3) Estimation of Other Benefits

The results of the I/O analysis and the "what-if" cases indicate that such growth is significant as seen in the linkage effects and in the measured monetary impact. Potential values that can be created are conservatively estimated at P1.1 billion annually, exceeding the direct benefits derived in the flood damage analysis. Hence, it is deemed conservative to use a growth factor for the benefit flow to reflect future development in an area that would benefit from flood control. This growth factor is assumed at 4.9% in real terms, the same rate as the projected real growth of GRDP (refer to Section 2.3.5).

## 4.5.2 Economic Benefit Cost Analysis

## (1) Methodology

Economic evaluation reviews the economic justification of the flood control projects by use of the cost-benefit analysis. A project is considered acceptable (a) if the Economic Internal Rate of Return (EIRR) equals or exceeds the social discount rate; or (b) if the Net Present Value (NPV) is greater than zero. The social discount rate is defined as the opportunity cost of capital or the rate of return. This is obtained from NEDA who currently sets it at 15%.

#### (2) Project Economic Costs

Summarized below are the economic cost estimates of the proposed Priority Projects:

	Summary		(Unit: Million Pesos) Pantal-Sinocalan
Main Construction Costs	<del></del>	2,324	2,246
Other Costs			
Compensation		246	195
Administration		129	122
Physical Contingency		405	384
Engineering Services		372	359
Total Project Costs		3,476	3,307

## (3) Conditions of Cost-Benefit Analysis

## Case of Analysis and Benefit Flows

Four cost-benefit runs are made on:

- (i) Case A: Upper Agno project alone;
- (ii) Case B: Pantal-Sinocalan project alone;
- (iii) Case C: Upper Agno and Pantal-Sinocalan projects together (Simultaneous Implementation); and
- (iv) Case D: Upper Agno and Pantal-Sinocalan combination but with the former project implemented ahead of the latter project by 5 years as is recommended in Section 4.6.

The most likely project implementation scenario is Case D: Combination/ Stepwise Implementation.

The study assumes the benefit flow in the future development condition increases annually at 4.9%, the same rate as the likely GRDP growth rate.

# Conditions of Cost-Benefit Analysis

The cost-benefit analysis are made under the following conditions:

(i)	Base Year	Beginning of 1990.
(ii)	Project Life	50 years (from 1995-2044).
(iii)	Economic Life	50 years (from 1995-2044).
(iv)	Construction Period	10 years (starting 1995).
(v)	Annual Operation and	0.5% of main construction cost and
	Maintenance Costs	physical contingency of completed works.
(vi)	Price Levels	Projections of costs and benefits based
		on 1991 price levels.
(vii)	Growth Factor (GF) of	
	Benefit Flow	GRDP Growth (GF = 1.049).
(viii)	Social Discount Rate	15%.
(ix)	Foreign Currency	
	Conversion Rates	US\$1.00 = $\Re$ 27.80 = $\Re$ 137.

# (4) Results of the Cost-Benefit Analysis

Case of Analysis	Costs and Benefits	
Case A: Upper Agno		
Costs (Million Pesos)	3,476	
Benefits (Million Pesos/year)	283	
EIRR (%)	20.58	
NPV (Million Pesos)	976	
Case B: Pantal-Sinocalan		
Costs (Million Pesos)	3,307	
Benefits (Million Pesos/year)	207	
EIRR (2)	16.96	
NPV (Million Pesos)	318	
Case C: Combination/ Simultaneous Implem	entation	
Costs (Million Pesos)	6,783	
Benefits (Million Pesos/year)	490	
EIRR (Z)	18.83	
NPV (Million Pesos)	1,295	
Case D: Combination/ Stepwise Implementa	tion	
Costs (Million Pesos)	6,783	
Ronofito (Million Donne (man)	490	
Benefits (Million Pesos/year)		
EIRR (%)	20.47	

Case A has the highest EIRR at 20.58%. Case B has a lower EIRR at 16.96%. Flood conditions warrant implementing the Upper Agno project before Pantal-Sinocalan project.

Case D: Stepwise Implementation shows an EIRR of 20.47%, higher than the 18.83% EIRR of Case C: Simultaneous Implementation. The cost-benefit analysis appears to validate the stepwise implementation, considering that it has the second highest EIRR but the highest NPV. Case D is also the most appropriate from the viewpoint of GOP's budget considerations. Therefore, it will be the best choice for GOP.

## (5) Sensitivity Analysis

The sensitivity of Case D to possible changes in future economic conditions is summarized below:

	Sensitivity Analysis	EIRR (1)		
Base	Case	20.47		
Case	1: 10% Increase in Costs	19.07		
Case	2: Reduction in Growth Factor to			
	3.9%	18.10		
		4	1 +	

## 4.5.3 Evaluation of the Socio-Economic Impacts of The Project

## (1) Impacts on Socio-Economic Conditions

## a) Social Costs

The social costs involved in implementing the Priority Projects include encroachment of land, inundation of land, social conflicts arising from land acquisition and resettlement, damage to infrastructures, incident of diseases, water rights conflicts, and seawater intrusion, and are described in Section 5.2.

## b) Social Benefits

The social benefits are assessed to outweigh these social costs.

#### Effect on Human Settlements

With the flood control works, river basin communities will be less troubled by the onset of the typhoon season. Flood damage analysis reveals that estimates of persons affected by floods range from 61,000 to 1,589,000 depending on the flood return period. Flood protection will reduce casualty, mortality, and morbidity rates significantly. Economic activity will also greatly stabilize.

## Effect on Labor and Employment

Flood protection will have several effects on labor and employment. The first run effect is on construction work opportunities arising from the flood control projects. During project implementation, a large number of skilled and unskilled workers will be needed. After construction, authorities need to hire additional staff to operate and maintain the facilities.

The second run effect is on work opportunities stemming from increased farm production, although this should be weighed against the loss of jobs arising from encroachment of certain farmlands and fishponds. But the third run and perhaps the most significant effect is on jobs arising from changes in the economic and job structures.

- (2) Spread Effects: Impact on the Regional and Macro Economies
- a) Impact on the Regional Economy

If flood control succeeds in containing damages, the Pangasinan basin economy will become more productive. With the province generating agricultural surpluses, the economic base for processing and trading of farm produce will become stronger. The spread effects of flood protection will come in terms of stronger intra-regional links for the production, processing, and distribution of goods.

In short, flood protection allows Pangasinan's river basin economy to achieve its potentials and this, in turn, makes it possible for the province

to set a faster growth for the Ilocos Region. The regional economy will then be able to meet, and perhaps even exceed, the projected GRDP growth.

## b) Impact on the National Economy

Stronger Pangasinan-led regional economic growth will contribute to attainment of national development goals, as Ilocos will then be able to cast off its lagging performance. This will allow Ilocos to bridge the development gap with the more advanced regions of the country. Interregional commerce and trade should increase. The expanded consumer markets will redound to the benefit of the national economy.

The river basins, in addition, straddle the vital North-South trunkline roads passing through Urdaneta and Dagupan City and link points of Northern Luzon with points in the southern part of the island. Given this spatial dimension, the impact of flood control is likely to be felt beyond the confines of the region and to the other regions of Luzon.

#### 4.6 Project Implementation Schedule

## 4.6.1 Two Stage Implementation Schedule

The financial project cost is estimated to be 3,913 million pesos for the Upper Agno River Project and 3,896 million pesos for the Pantal-Sinocalan River Project. If the two projects are implemented simultaneously from 1995 in a 5 year period, required annual average project fund is 1,560 million Pesos, corresponding to 3.8% of the projected GRDP 40.8 billion pesos (at 1990 price) in 1995 in the Study Area. In Ilocos Region, the public investment to the infrastructures was recorded at about 1.9% of the GRDP in 1990.

Given the first priority on the Upper Agno River, and the second priority on the Pantal-Sinocalan River, each project is planned to be implemented in two stages in each 10 year period. All the projects are planned to be completed in 15 years. In this case the annual investment fund would stay at the level of 1% of the region's GRDP. The project implementation schedule, shown in Figure 4.6.1, is prepared with the target construction commencement of the Upper Agno River in 1995 and that of the Pantal-Sinocalan River in 2000. This schedule assumes:

- 1) Detailed design of the first stage of Upper Agno Project will begin following submission of the Final Report (the Feasibility Study).
- 2) The project will be financed by international financing organizations which will require time for negotiation and agreement.
- 3) Loan agreement between the Government of the Republic of the Philippines and the financing agencies will be made by the time of completing the detail design.
- 4) Land acquisition and compensation payment will be completed before commencement of construction works.

The first stage of the Upper Agno River Project aims primarily to restore and reinforce the existing diking system against a 10-year design flood discharge, together with construction of the new Poponto floodway and natural retarding basin. The second stage consists of excavating low water channels, installing reverments and other remaining works. Location of the two stage works is illustrated in Figure 4.6.2.

The financial costs of the first and the second stages are 2,923 million pesos and 890 million pesos respectively. The breakdowns of these project costs and work quantities are shown in Table 4.4.5 and Table 4.4.6.

The first stage of the Pantal-Sinocalan River Project aims to protect the three municipalities, Dagupan city, Calasiao, and Santa Barbara, from a 10-year design flood discharge with provision of the proposed by-pass channel, the diking system from the river mouth to the upstream of Santa Barbara on the right bank of the Sinocalan River, the diking system for the Santa Barbara stretch on the left bank of the Sinocalan River, and bank protection on both banks of the Pantal River. The second stage consists of the remaining diking systems for the Sinocalan, Dagupan, and Ingarela Rivers, low water channel improvement, revetments, and other remaining works. Location of the two stage works is illustrated in Figure 4.6.3.

The financial costs of the first and the second stages are 1,977 million pesos and 1,918 million pesos respectively. The breakdown of these

project costs and work quantities are shown in Table 4.4.7 and Table 4.4.8.

As discussed in Section 4.1, construction of a new diking system in the upstream stretch confines flood runoff inside the new river area and induces a significant increase of flood discharge in the downstream reaches. Special care needs to be paid to implementing the first stage works of these projects, in particular to the Upper Agno River, to avoid adverse flood incidence due to such increase in flood discharge. In short, the stretches of the Bayambang-Alcala including the Poponto floodway and retarding basin, Alcala-Asingan, and Asingan-San Manuel shall be implemented simultaneously.

## 4.6.2 Project Fund Required

The project cost is estimated at the price level as of May, 1991 and the preliminary annual disbursement schedule is prepared for the Upper Agno River Project (see Table 4.6.1) and the Pantal-Sinocalan River Project (see Table 4.6.2) based on the foregoing two stage implementation schedule.

#### 5. ENVIRONMENTAL ASSESSMENT

## 5.1 IEE on Master Plan Study Area

## 5.1.1 Objectives of the Environmental Study

The objectives of the Environmental Study on the Agno River Basin Flood Control in the Master Plan stage are as follows;

- To identify items of impacts on the environment concerned by the Project,
- 2) To evaluate the magnitude/significance of the impacts,
- 3) To judge whether the proposed projects need further environmental study, and if so, to point out the effects to be studied in the Feasibility Study Stage.

## 5.1.2 Initial Environmental Impact Assessment in the Master Plan Stage

## (1) Methodology of EIA

To attain the objectives of this environmental study in the Master Plan stage, an Initial Environmental Examination (IEE) was conducted. The IEE is a first approach of EIA by screening and scooping, needing to be carried out at a depth only so as to determine whether an EIA will be required in the next Feasibility Study stage through the IEE.

A checklist method was applied as a basic tool of IEE in this environmental study. The expected effects were evaluated by significance ranging from A to C for each project component and classified as either positive or negative. The checklist items were selected by the Study Team taking into consideration the feature of the Project and the guidelines prepared by the Government of the Philippines (GOP) and the Asian Development Bank (ADB).

## (2) Results of IEE for the Project

The results of the Initial Environmental Examination of the Framework Plan and the Long Term Plan are presented in Table 5.1.1.

#### Agno River

The major project components of flood control in the Agno River are the San Roque dam, the Moriones-O'Donnell dam, the river improvement works along the Agno River, and the Poponto retarding basin. All of these components could be expected to cause relatively significant effects on the environment, in particular, social impact due to land acquisition and resettlement.

First of all, resettlement issues on the local people are expected especially in the inundation areas of the San Roque dam and the Moriones-O'Donnel dam. Agricultural lands in the prospective reservoir areas are also affected by inundation. Secondly, Erosion problems in the upstream and downstream areas are expected because the San Roque and Moriones-O'Donnel dams are located in an erosion susceptible area with slopes of 8° - 15°. Water quality deterioration may not be caused by these dams, but eutrophication and saline water intrusion might be expected.

As for the river improvement works in the Agno River and the Poponto retarding basin, there might give significant social impacts due to the right-of-way required for the new dike construction and inundation by the retarding basin.

#### Pantal-Sinocalan River

The major schemes of the Pantal-Sinocalan River flood control are the river improvement works and Binalonan floodway.

The river improvement works might have significant social impacts due to the right-of-way required for the new dike construction.

Although no crucial natural environmental issues are expected by the project, water quality deterioration in the downstream area of the Sinocalan

River might be caused by the diversion of flood water from the Tuboy River to the Angalacan River through the Binalonan floodway.

#### Cayanga-Patalan River

The major schemes of the Cayanga-Patalan River flood control are the river improvement works and the Bued closing dike. The river improvement works might have significant social impact due to the right-of-way required for the new dike construction. The Bued closing dike is not planned to be constructed inside the river channel. It can be, therefore, considered that the natural and social environmental impacts caused by the closing dike are similar to those of the river improvement works except flood flow increase downstream of the dike.

Several environmental impacts are identified in those three project areas. The degree of social impacts due to the location might be significant. The natural environmental impacts could be reduced by taking proper countermeasures.

#### 5.1.3 Principal Conclusions of IEE

- . According to the EIA guideline of DPWH, the project shall be requested to prepare an EIA report because it includes two large scale dams in the Framework Plan and the project area is considered prime agricultural land.
- . Among the proposed schemes of the Framework Plan, the San Roque dam, the Moriones-O'Donnell dam, the provision of new dikes, and the extension of Poponto retarding basin may have environmentally significant impacts, such as resettlement problems and the encroachment of agricultural lands. Thus, the most careful attention shall be paid to those prospective social impacts.
- As for the other schemes, no significant environmental effects may be expected for both the Framework Plan and Long Term Plan. However, some natural environmental impacts having low or medium level of significance may be expected. Further environmental study shall, therefore, be required to visualize the expected impacts, and to find proper and possible countermeasures.

## 5.2 Preliminary EIA on Priority Project

## 5.2.1 Methodology of EIA for the Projects

To attain the objectives of this environmental study in the Feasibility Study stage, an Initial Environmental Examination (IEE) was conducted for the parameters identified in the Master Plan Study at first. A preliminary Environmental Impact Assessment (EIA) is conducted only for the parameter items which were scooped by the IEE.

## 5.2.2 Results of the Preliminary EIA

The results of the preliminary Environmental Impact Assessment (EIA) are presented in Table 5.2.1. The parameter items for which impact is assessed to be significant are:

Parameter Item	Upper Agno River	Pantal- Sinocalan River
A) Problems due to the location		
. Resettlement	-/A	-/A to -/C
. Land value changes	= to $+/A$	+/A
. Encroachment of agricultural and aquacultural lands	-/A to -/B	-/A to -/C
. Effects on groundwater hydrology	0	-/C to 0
. Impairment of Navigation	0	-/C to 0
. Loss of community and recreation areas	-/B to -/C	-/c
B) Problems in Construction Stage		·
. Hazards to workers and nearby residents	-/C	~/C
. Deterioration of water quality	-/C to 0	-/C to 0
C) Problems in Operation Stage		
. Deterioration of water quality	0	-/C to 0
. Intrusion of saline water	0	-/C to 0
. Vector disease hazards	-/C to +/C	0 to +/C
. Public health hazards	-/C to +/C	0 to +/C

Note: (1) + : Positive effect, - : Negative effect, 0 : No effect.

<sup>= :</sup> Neutral effect

<sup>(2)</sup> A : High level of significance, B : Medium level of significance,

C : Low level of significance

Among the environmental parameter items identified as significant, social environments are weighted higher negative impact than natural environments in both the upper Agno River and Pantal-Sinocalan River projects.

	Upper Agno River	Pantal- Sinocalan Rive
Natural Environment		<del></del>
. Effects on groundwater	no effect	low '
. Deterioration of water quality	1ow	1ow
. Intrusion of saline water	no effect	low
Social Environment		
. Resettlement	high	high
. Encroachment of lands	high to medium	high to low
. Impair of navigation	no effect	1ow
. Loss of community	medium to low	low
. Hazards to workers and nearby residents	low	1.ow
. Vector disease hazards	low	no effect
. Public health hazards	1ow	no effect

Expected positive impacts are land value change (high), vector disease hazards (low) and public health hazards (low).

## 5.2.3 Principal Conclusions of the Preliminary EIA

## Upper Agno River Project

The project components of flood control in the upper Agno River are river improvement works along the main stream; mainly construction of diking systems, excavation of low water channels, construction of Poponto floodway, and expansion of the Poponto retarding basin. Among them, construction of new dikes and the Poponto floodway, and expansion of the Poponto retarding basin are expected to impose significant impact on the social environment in terms of resettlement and encroachment of agricultural and residential lands. Loss of community is also an adverse effect due to the resettlement.

The identified municipalities to be affected are:

- a) Poponto floodway and retarding basin; Bayambang, Bautista, Alcala, San Manuel, Moncada, Paniqui and Ramos
- b) Carmen stretch; Vilasis and Rosales
- c) Asingan-San Manuel stretch; Santa Maria, Asingan, San Manuel and Tayug.

The impacts due to problems during construction and the impacts on vector disease and public health are all at a low level of significance and are expected to be mitigated to a satisfactory level.

#### Pantal-Sinocalan River

The project components of flood control in the Pantal-Sinocalan River are construction of the Dagupan bypass and river improvement works along the main stream and its tributaries, the Dagupan and the Ingalera; namely, the construction of diking systems, and excavation of low water channels. Among them, construction of the bypass and new dikes in the areas of Dagupan city and towns of Calasiao and Santa Barbara are expected to impose significant impact on the social environment in terms of resettlement and encroachment of agricultural and residential lands. Loss of community is also an adverse effect due to the resettlement.

The identified cities and municipalities to be affected are:

- a) Pantal-Sinocalan River stretches; Dagupan, Binmaley, Calasiao, Santa Barbara, Urdaneta, San Carlos, and Malasiqui
- b) Dagupan bypass; Dagupan and Calasiao

The impact due to problems during construction and intrusion of saline water, and the impact on navigation, vector disease and public health are all at a low level of significance. Although the expected impact on water quality in the urban stretch of the Sinocalan River and fishponds along the Dagupan River is assessed to be low level, further detailed study will be required in order to clarify some unknowns involved due to insufficient records.

For the identified parameter items listed under problems due to the location whose impact level of significance is high, particular conditions are described in the next section.

## 5.2.4 Problems Due to the Location

#### (1) Resettlement

Planned new setback levees of the upper Agno River and Poponto floodway, new diking systems of the Pantal-Sinocalan River and the Dagupan bypass confine land, buildings and houses inside the new river areas. The Poponto retarding basin extends inundation area around the existing Poponto swamp.

The number of affected buildings and houses, and riparians and residents who are to be evacuated and resettled is estimated as follows:

River	No. of Building /Houses	Population
Upper Agno River		
- Upper Agno River	920	5,520
- Poponto retarding basin	3,960	23,760
Total	4,880	29,280
Pantal-Sinocalan River		
- Main Pantal-Sinocalan River	1,790	10,740
- Ingarela River	504	3,024
- Dagupan River	481	2,886
- Bypass channel	103	618
Total	2,878	17,268

Negative impact on these assets and people is assessed at a high level of significance in the upper Agno River and the Pantal-Sinocalan River, while it is assessed at low level in the Dagupan bypass. These impacts differs from other right-of-way issues because the subject land, assets, and people are located mostly in flood prone areas. Namely, the riparians and residents to be resettled are also beneficiaries on account of flood protection.

## (2) Land Value Change

Positive impact on land value change is assessed at a high level in

both the upper Agno River and the Pantal-Sinocalan River except in the area around the Poponto retarding basin. Impact on the Poponto area is assessed to be neutral because negative impact due to an increase in inundation area might be involved.

## (3) Encroachment of Agriculture and Aquacultural Lands

In the upper Agno River project, realignment of dikes, and construction of new levees and a floodway will encroach on some agricultural and residential lands in the municipalities of San Manuel, Asingan, Villasis and Alcala. In the Pantal-Sinocalan River project, the proposed bypass channel in Dagupan city will occupy cropland as well as residential areas. Likewise, construction of new dikes along the river course will encroach on agriculture, fish pond and residential land in and around Dagupan city and the towns of San Carlos, Calasiao, and Santa Barbara. A total of 2,006 ha is required to be acquired for the right-of-ways as estimated below:

River	Acquisition Area (ha
Upper Agno River	
- Upper Agno River	1,041
- Poponto retarding basin	166
Total	1,207
Pantal-Sinocalan River	
- Main Pantal-Sinocalan Rive	r 467
- Ingarela River	121
- Dagupan River	146
- Bypass channel	65
Total	799

Negative impact on these land encroachment is assessed at a high to medium level in the upper Agno River, while it is assessed at a high to low level in the Pantal-Sinocalan River.

#### 6. RECOMMENDATIONS

## 6.1 Recommended Projects

Both the Long Term Plan and the Priority Projects are highly justifiable economically with EIRRs of:

Long	Term Plan	EIRR (2)
a)	Agno River with Tarlac	16.6
b)	Agno River Tributaries	15.3
c)	Allied Rivers	33.8
d)	All the Study Area	20.5
Prior	ity Project	
a)	Upper Agno River	20.6
b)	Pantal-Sinocalan River	17.0
c)	Combination/stepwise	
	Implementation	20.5

If the Study Area's flood control succeeds in containing damages with implementation of the proposed Long Term Plan, the basin economy of Pangasinan and Tarlac will become more productive. With the province generating agricultural surpluses and spread effects, flood protection will come in terms of stronger inter-regional links for the production, processing and distribution of goods. In short, flood protection allows the basin economy of Pangasinan and Tarlac to achieve its potentials and this, in turn, makes it possible for the provinces to set a faster growth pace for the Ilocos Region. The regional economy will then be able to meet, and perhaps even exceed, the projected GRDP growth.

On the other hand the river basins straddle the vital North-South trunkline roads passing through Urdaneta and Dagupan City and link points of Northern Luzon with points in the southern part of the island. Given this special dimension, the positive impact of flood control is likely to be felt beyond the confines of the region and to the other points of Luzon.

Given the first priority on the Upper Agno River and, the second priority on the Pantal-Sinocalan River, the first stage of the Priority

Projects is recommended to be implemented as urgent flood protection measures.

The financial project costs of the first and second stages of the Priority Projects are:

	Upper Agno River	Unit: Million Pesos Pantal-Sinocalan River
First stage	2,923.4	1,977.3
Second stage	989.8	1,918.4
Total	3,913.2	3,895.7

Following the Priority Projects, the Long Term Plan is recommended to be implemented with the target commission year 2020. The total project cost is estimated to be 15,974 million pesos at 1989 constant price level.

## 6.2 Recommendation for Further Study

## (1) Environmental Impact Statement

The Government of the Philippines is recommended to conduct a detailed environmental impact assessment study to prepare the Environmental Impact Statement. The major items to be studied and assessed are:

- 1) Social impact with respect to land acquisition and resettlement issues especially in the following stretches:
  - a) Upper Agno River
    - . Poponto floodway and retarding basin
    - . Carmen stretch
    - . Asingan San Manuel stretches
  - b) Pantal-Sinocalan River
    - . Pantal-Sinocalan River main stream and its tributaries
    - . By-pass route
- 2) Water use, water quality and related issues in the dry and wet seasons especially in the following stretches:

- a) Upper Agno River
  - . Bayambang stretch
- b) Pantal-Sinocalan River
  - . Urban stretch of the Sinocalan River (Marasay River)
- c) Fish ponds along the Dagupan River

#### (2) Laboratory Hydraulic Model Tests

The following laboratory hydraulic model tests are recommended to determine the alignment and detailed dimensions of the structures concerned and to confirm the stability of river channels and beds before the detailed design:

## a) Upper Agno River

- . Alignment and dimension of the diversion dike and the channels leading to the Poponto Floodway and the Bayambang stretch and those of the floodway dikes.
- . Alignment and dimension of the setback levees in the Carmen and the San Manuel stretches.

#### b) Pantal-Sinocalan River

. Alignment and dimension of the by-pass channel, and the intake channel and the watergate at the junction of the existing Sinocalan River.

#### (3) Seismic Resistance Design

The seismic resistance survey and design done in this Study is preliminary, and thus further detailed survey and design on this subject are recommended to be conducted in the detailed design stage.

## (4) Monitoring of Sedimentation

In order to get reliable quantitative sediment records, monitoring of sedimentation in the Poponto swamp and the Tarlac River is recommended.

#### APPENDIX - A

#### CONTENTS OF MAIN REPORTS

#### Part 1: Master Plan

#### 1. INTRODUCTION

- 1.1 Objective of the Study
- 1.2 Background of the Study
- 1.3 Contents of the Report

## 2. THE STUDY AREA

- 2.1 River Basins in the Study Area
- 2.2 Socio-Economic Conditions in the Study Area

## 3. PROFILE OF AGNO RIVER AND ALLIED RIVERS

- 3.1 Present River Conditions
- 3.2 Existing River Facilities and Structures
- 3.3 Previous River Control Works

## 6. SEDIMENT ANALYSES

- 6.1 Estimation of Sediment Yield
- 6.2 Sediment Balance Analysis

#### 7. GEOLOGY

- 7.1 Physiography of the Study Area
- 7.2 Geology of the Agno River Basin
- 7.3 Geology of the Planned Dam Sites
- 7.4 Geotechnical Assessment of Dike Foundation and Materials

#### 8 MASTER PLAN FORMULATION CRITERIA

- 8.1 Basic Concept
- 8.2 Definition of Framework Plan and Long Term Plan
- 8.3 Alternative Study Criteria
- 8.4 Design Criteria
- 9. SCREENING OF FLOOD CONTROL ALTERNATIVES
  - 9.1 River Improvement and Floodway
  - 9.2 Flood Control Dams and Retarding Basins

#### 10. MASTER PLAN

- 10.1 Plan Formulation Process
- 10.2 Framework Plan
- 10.3 Long Term Plan
- 10.4 Flood Forecasting and Warning System
- 10.5 Sabo Works

## 11. COST ESTIMATES

- 11.1 Cost Estimation Criteria
- 11.2 Unit Cost
- 11.3 Cost Estimates

#### 12. ECONOMIC EVALUATION

- 12.1 Benefit
- 12.2 Economic Benefit Cost Analysis
- 12.3 Project Evaluation

## 13. IMPLEMENTATION PROGRAM

- 13.1 Priority Project Areas Subject to Feasibility Study
- 13.2 Implementation Schedule

## 14. ENVIRONMENTAL ASSESSMENT

- 14.1 Objectives of the Environmental Study
- 14.2 Environmental Impact Assessment in the Master Plan Stage

## 15. REVIEW OF MASTER PLAN AFTER RESUMPTION OF STUDY

- 15.1 Suspension and Reumption of the Study
- 15.2 Review of Framework Plan for Agno River

## Part 2: Feasibility Study

#### 1. INTRODUCTION

- 1.1 The Feasibility Study
- 1.2 Suspension and Resumption of the Study
- 1.3 Contents of Report

#### 2. THE PROJECT AREA

- 2.1 Location and Socio-Economic Conditions
- 2.2 Economic Profile and Role of Pangasinan in Ilocos Region
- 2.3 Climate
- 2.4 Hydrology
- 2.5 Geotechnical Conditions
- 2.6 Sediment Analysis
- 2.7 Seismic Resistance Survey
- 2.8 Profile of Agno River and Existing River Facilities
- 2.9 Profile of Pantal-Sinocalan River and Existing River Facilities

#### 3. FLOOD CONTROL PLAN FOR UPPER AGNO RIVER

- 3.1 River Improvement Plan
- 3.2 Poponto Retarding Basin Plan

## 4. FLOOD CONTROL PLAN FOR PANTAL-SINOCALAN RIVER

- 4.1 River Improvement Plan
- 4.2 Alternative Study for Dagupan Urban Stretch

#### 5. NON-STRUCTURAL MEASURES

- 5.1 Basic Concept of Plan
- 5.2 Flood Control Operation and Maintenance System
- 5.3 Monitoring of Sedimentation

## 6. ENVIRONMENTAL IMPACT ASSESSMENT

- 6.1 Objective and Methodology of the Environmental Study
- 6.2 Existing Environment
- 6.3 Results of Preliminary EIA

## 7. COST ESTIMATES

- 7.1 Cost Estimation Criteria
- 7.2 Unit Cost
- 7.3 Project Costs
- 7.4 Construction Plan

#### 8. PROJECT EVALUATION

- 8.1 Project Benefit
- 8.2 Economic Benefit Cost Analysis
- 8.3 Evaluation of Socio-Economic Impact of The Project

## 9. PROJECT IMPLEMENTATION SCHEDULE

- 9.1 Project Implementation Schedule
- 9.2 Recommendation for Further Study

## Remarks :

<sup>(1)</sup> The project cost is the financial cost at 1989 constant price level.

The project cost in the parentheses is the economic cost.

<sup>(2)</sup> Annual benefit is the economic price at 1989 constant level.

<sup>(3)</sup> EIRR is the economic internal rate of return for the case of future increase of benefit under lower economic growth.
