C-5 PRELIMINARY DESIGN OF ALTERNATIVE 1

Design Outline of Alternative-1

The Alternative-1 is designed to construct the upper reservoir with 2 stages, the ultimate scale of which is the same as that of the upper reservoir in Case-2, in order to facilitate a prompt procurement of land for the upper reservoir.

At the 1st stage the capacity of the upper reservoir is 500 MW - 8 hours, and at the 2nd stage it is 1,000 MW - 8 hours.

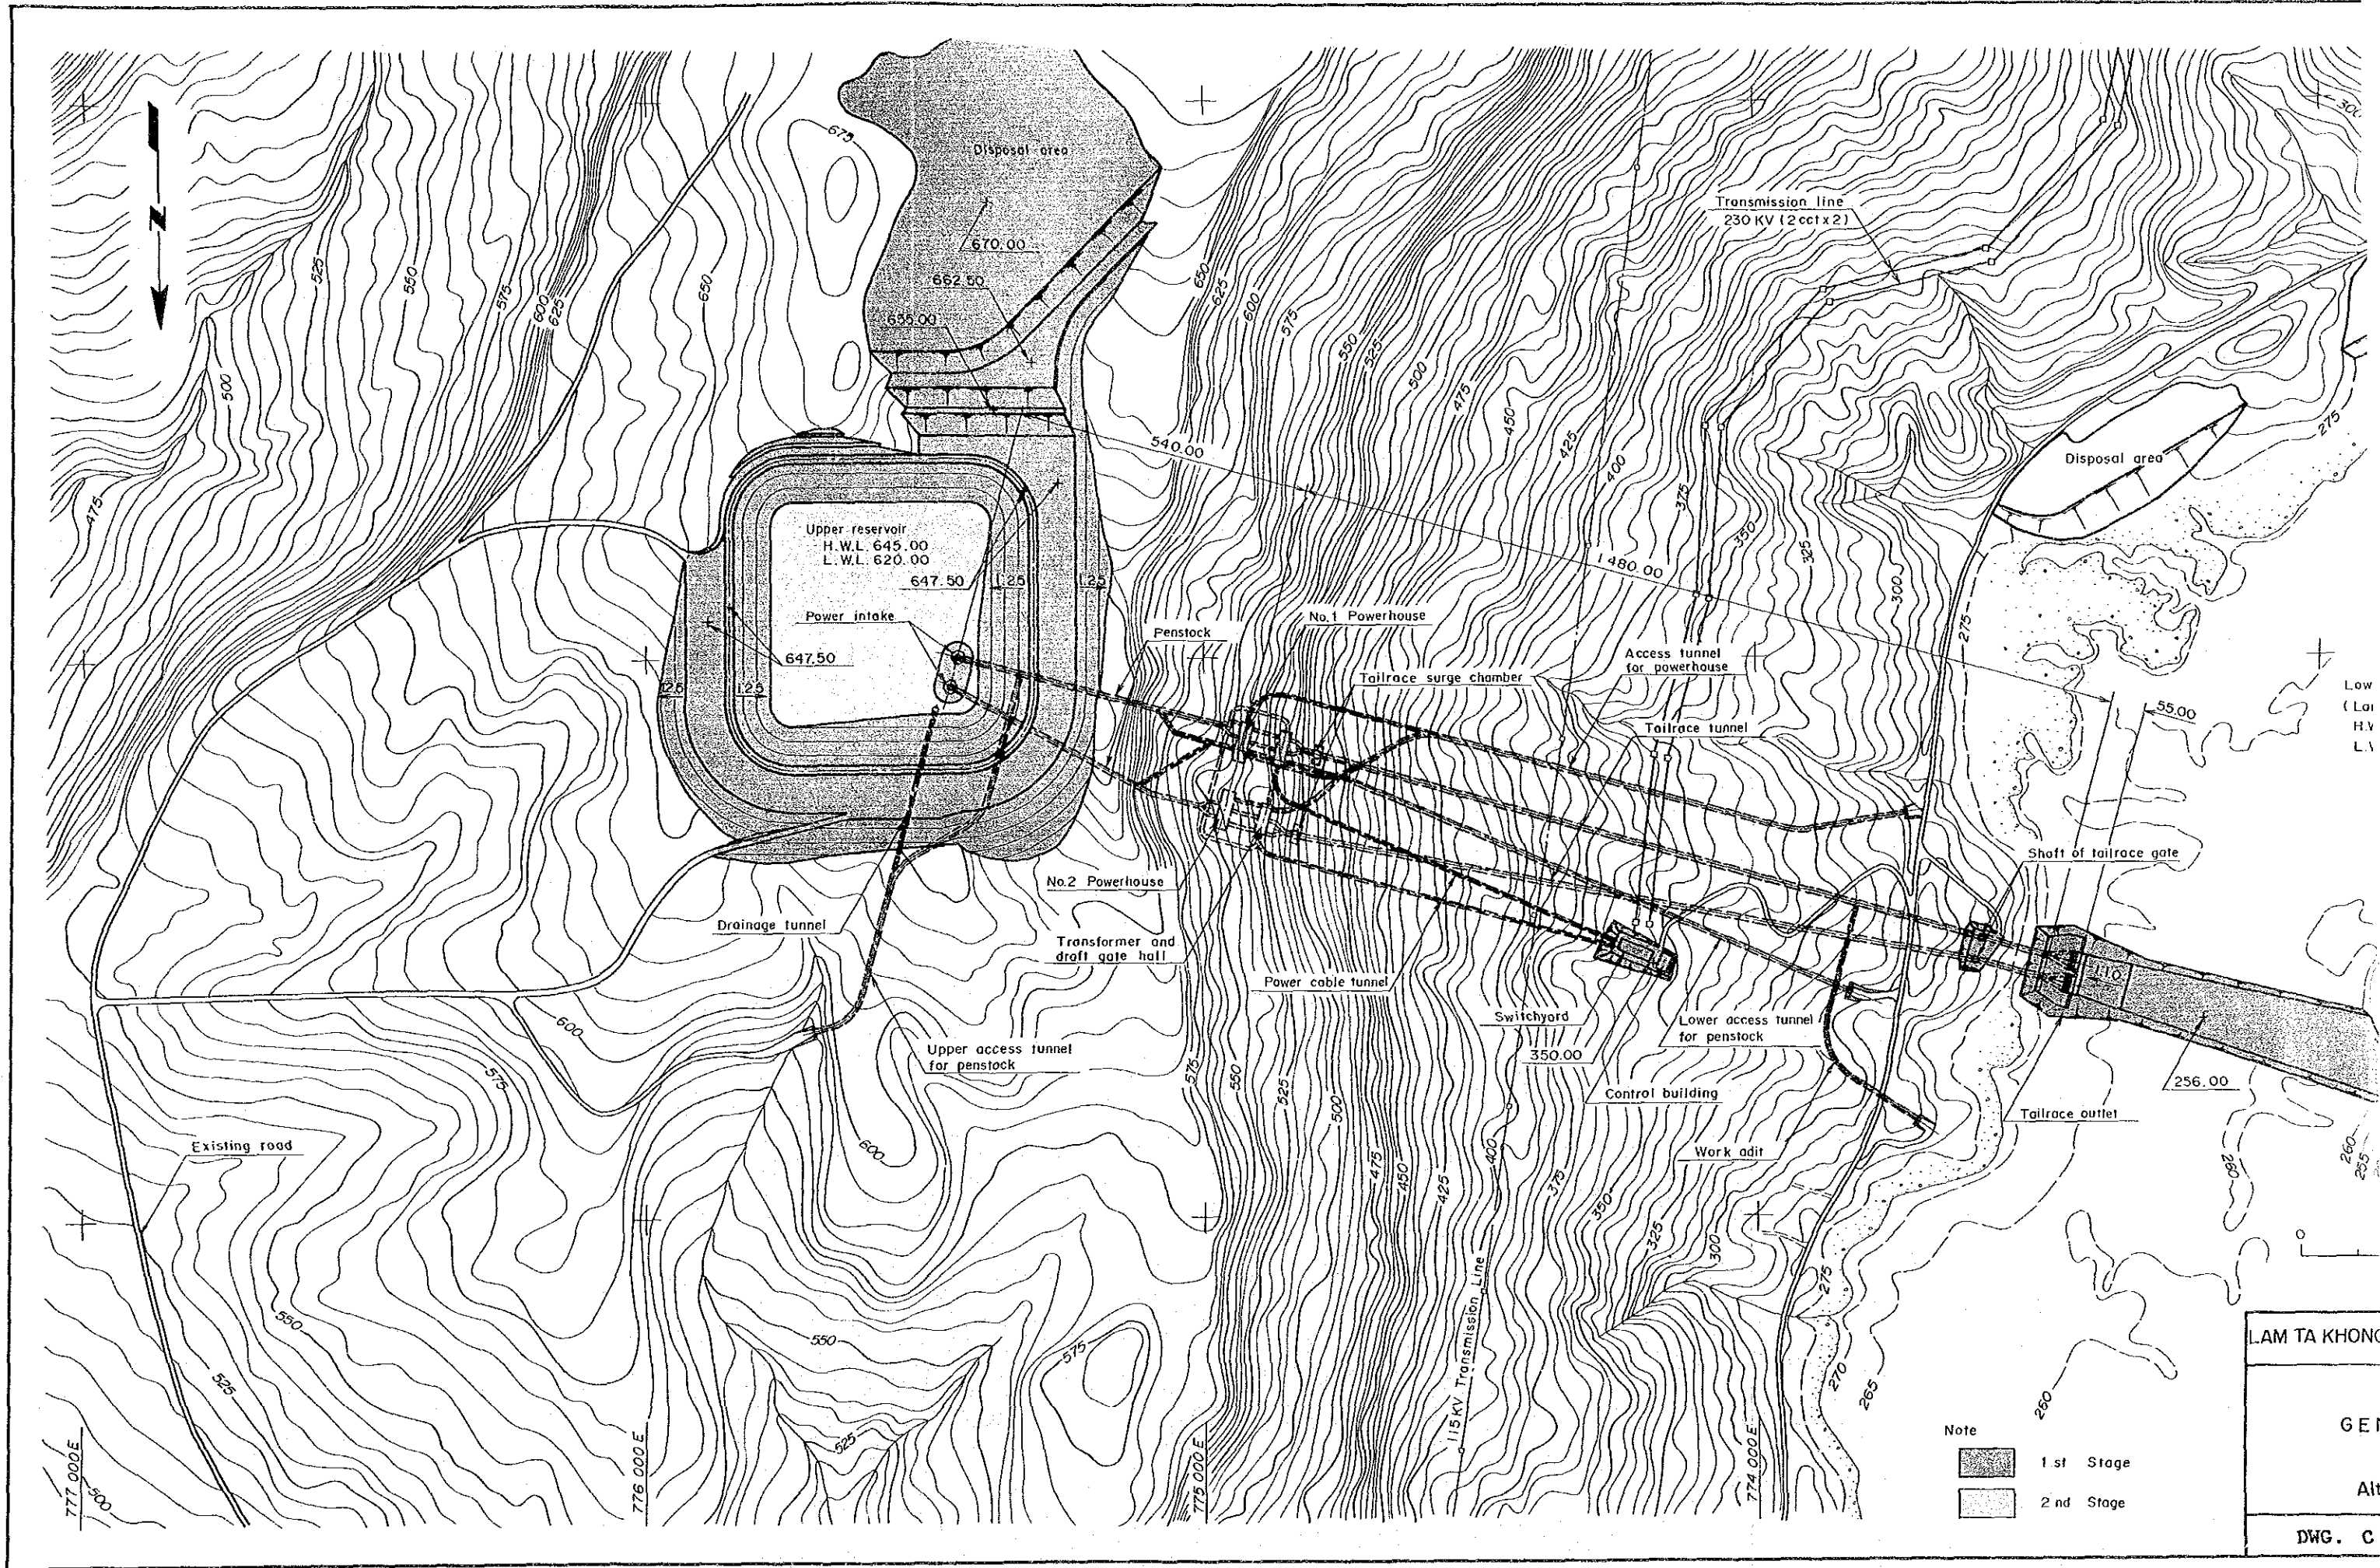

Excavation muck of the dam is diverted to the dam embankment and the remainder is disposed of in the spoil area. At the 2nd stage the embankment material of the dam is taken from the spoil area.

C-6 PRELIMINARY DESIGN OF ALTERNATIVE 2

Design Outline of Alternative-2

(1) General

Alternative 2 has been studied as a power generation plan having maximum output of 500 MW and the peak duration time of 8 hours. In this plan, all civil structures have been laid out to avoid "Watershed Classification 1A" defined by the National Environment Board.

The upper reservoir is located roughly at the same place as in the adopted plan, and the waterway was laid out along the ridge in the direction from north to north - northwest in order to avoid the area classified as "1A". The tailrace outlet has been planned at a location approximately 3 km to the upstream of Lam Ta Khong Dam, so that the total length of the waterway is minimized. The powerhouse is located underground near the dam, and the switchyard is located on the ground near the powerhouse.

Therefore, in the layout of Alternative-2, the total length of waterway is longer than the adopted plan, and the length of the access tunnels are also longer.

(2) Upper Reservoir

The upper reservoir is planned at a location roughly the same as the one in the adopted plan, which is designed to be constructed by excavating the ground at roughly 660 m elevation.

The inner surfaces of pool are covered with the asphalt concrete. The embankment is made by using some of the muck. The upper reservoir is large scale pool type reservoir with an allover asphalt facing fill-type dam.

The upper reservoir is a 500 m - square pool. The maximum output is 500 MW and the power can be generated for 8 hours.

The volume of excavation will be approximately $4,170 \times 10^3 \text{ m}^3$, and the volume of embankment $2,860 \times 10^3 \text{ m}^3$.

(3) Waterway

The waterway is underground type, and it is located along the ridge, thereby avoiding the area classified as "1A".

The power intake is Morning-glory shape, and installed at the bottom of the upper reservoir, which is connected to the penstocks through a vertical shaft.

The penstock consists of the upper, middle and lower horizontal sections and the upper and lower inclined tunnels (51°). There is only one line of penstock, which has inside diameter of 5.80 - 2.60 m, and the total length of approximately 585.00 m.

The tailrace is a circular pressure tunnel with a total length approximately 3,880 m x 2-1 ways, and the inside diameter is 4.90 - 6.60 m. As the tailrace tunnel is fairly long, a surge chamber is required against load built-up and load rejection. The construction of this tunnel form the critical path of the whole construction work.

The lower access tunnel for penstock branches from the access tunnel for powerhouse, and reaches the middle horizontal part of penstock.

(4) Powerhouse

The powerhouse is located at approximately 400 m underground, and equipped with two, 250 MW pump turbines, generators, and auxiliary equipments. This is an underground powerhouse accommodated in a large cavern which is 22 m wide, 45.7 m high, and 72.5 m long.

The access tunnel for powerhouse equipments starts from a point near the tailrace outlet, passes along the tailrace tunnel, and reaches to the erection bay of the powerhouse. This access tunnel for the powerhouse is very long, with the total length being 3,900 m. This tunnel is also

used to water draining passage for the powerhouse, and it is connected to the lower access tunnel for penstock and work adit of surge chamber.

The switchyard has been designed to be located on the ground near the powerhouse, in order to reduce the length of cable tunnel. As the gradient of the cable tunnel is steep, being 45°, there remains some problems with cable installation.

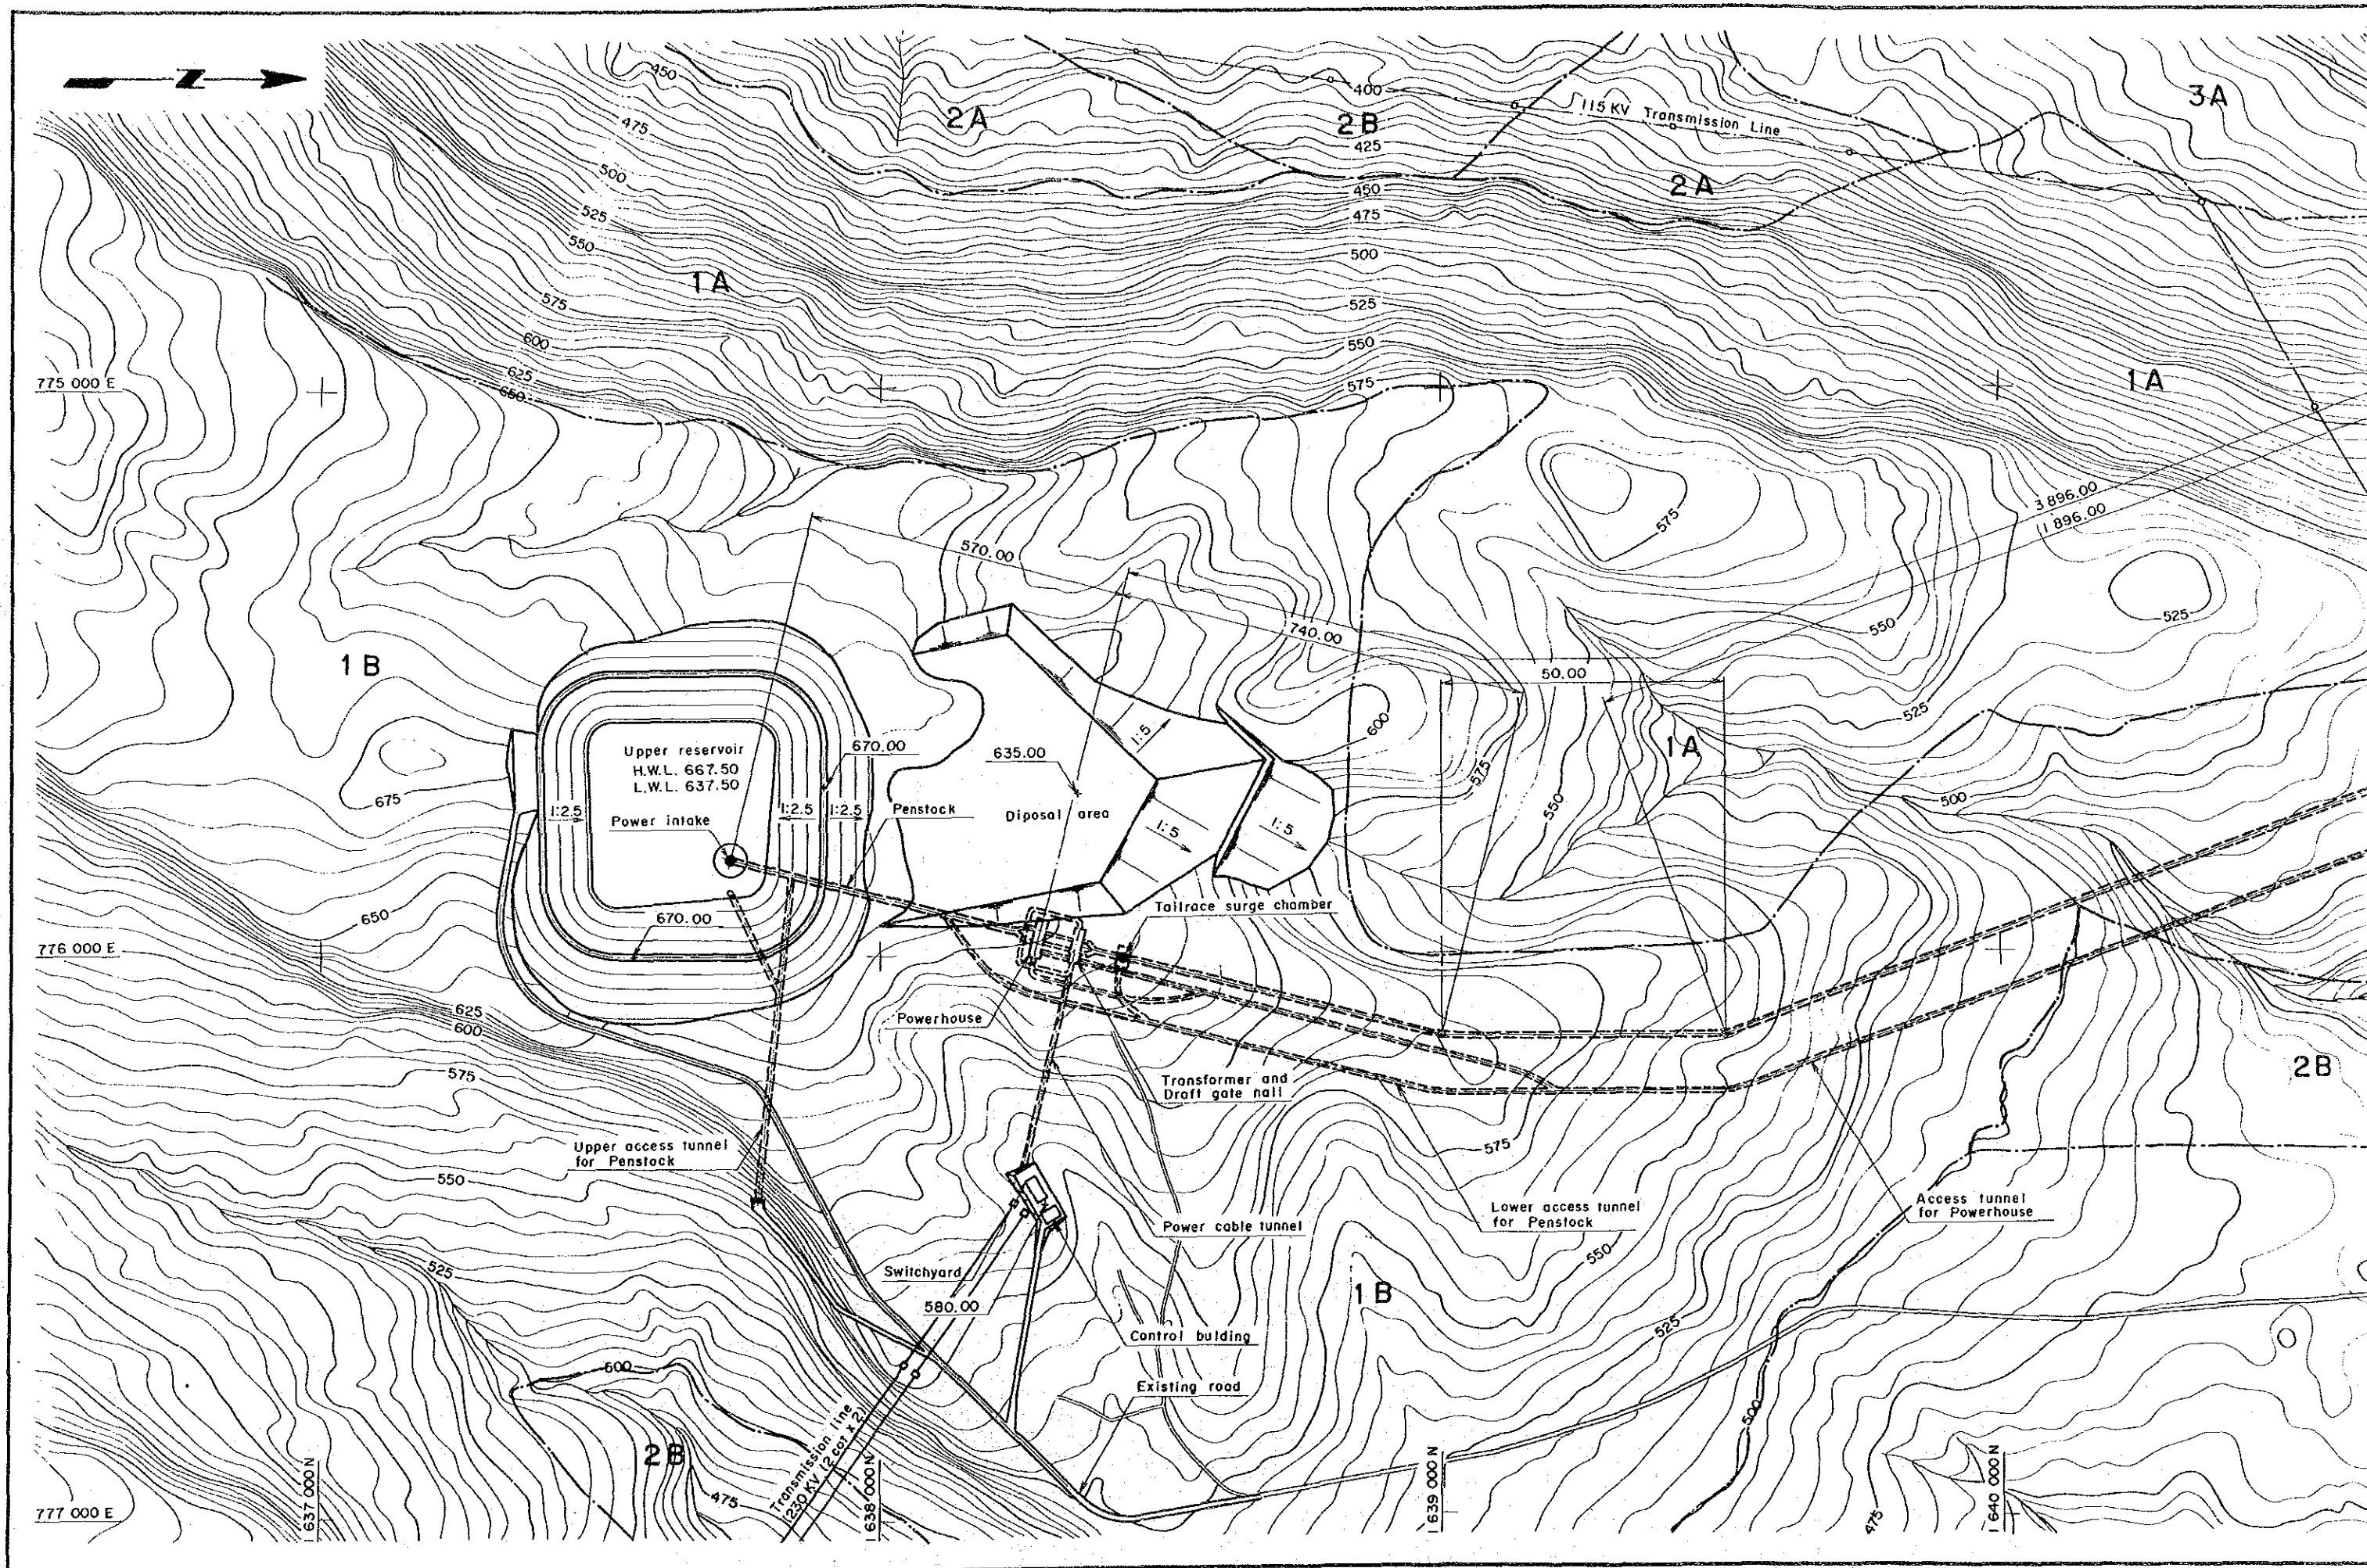

In the construction work of the powerhouse, the access tunnel for powerhouse forms the critical path. This work interferes with the construction works of the lower inclined tunnel of penstock, surge chamber, etc., and construction schedules of these works affect one another. Thus, sufficient study is required to assure construction time, safety, and ventilation inside the tunnels.

| 4. Power Intake | | |
| Type | | Morning-glory Shape |
| Inside Diameter * Length * Number of Set | m*m*- | (18.00~5.80D) * 52.00 * 1 |
| 5. Penstock | | |
| Type | | Inclined Shaft Embedded Steel |
| Inside Diameter * Length * Number of Set | m*m*- | (5.80 ~2.60D) * 585.00 * 1 |
| Gradient | ° | 51 |
| Approximately Weight | t | 3,910 |
| 6. Tailrase Tunnel | | |
| Type | | Concrete Lined Pressure Type |
| Inside Diameter * Length * Number of Set | m*m*- | (4.90 ~6.60D) * 3,880.00 * 1 |
| 7. Tailrace Surge Chamber | | |
| Type | | Chamber Surge Tank |
| -Set | - | 1 |
| -Shaft Chamber | m * m | (D) (H) 8.90 * 107.00 |
| -Upper Chamber | m*m*m | (W) (H) (L) 10.00 * 10.00 * 35.00 |
| 8. Tailrace Outlet | | |
| Type | | 4 Continuous Box Culbert |
| Length | m | 55.00 |
| Width * Height * Number of Set | m * m | (6.70 ~30.00)* (6.70 ~10.00) * 1 |
