6. GENERAL DESCRIPTION FOR BUILDING WORKS

I. GENERAL DESCRIPTION

I.1 GENERAL

The major design criteria applied in this calculations are standard requirements conforming to "Architectural Institute of Japan Standard for Structural Calculation of Reinforced Concrete Structures and Commentary" and "Architectural Institute of Japan Standard for Structural Calculation of Steel Structures".

I.2 DESIGN CRITERIA

Loading Conditions

In this structural calculations, the loads and external forces that act on the structure are the following.

(A) Dead load
(B) Live load

Table 1 Combination of Loads

Conditions of Stresses		Combination of Stresses
Permanent stresses	Normal time	G + P

where ;

G ; stress due to dead load
P ; stress due to live load

The dead and live loads of each part of building are applied in accordance with the Japanese Building Standard Law Enforcement Order.

I.3 Structural analysis

(1) Structural analysis

Stress analyses of reinforced concrete frames are carried out through a computer , NEC PC-9801 RA.

Structural analysis for the vertical load is obtained through the stiffness matrix method considering the axial, flexural and shering deformations based on the elastic theory.

(2) Modulus of Elasticity

Module of elasticity are as follows :

Concrete : Ec = 215.2 t/cm²

Sher modulus of elasticity are as follows :

Concrete : Gc = 92.2 t/cm²

I.4 Design of Members

The design of reinforced concrete structure shall be based on "AIJ Standard for Structural Calculation of Reinforced Concrete Structure".

Compressive strength of concrete at 28 days shall be 210 kg/cm² and more.

Reinforcement bar materials shall comply with deformed bar, "SD35 ". (JIS G 3112)

Weight of reinforced concrete shall be calculated as 2.4 t/m³ and the "Young Ratio" of reinforcement bar to concrete shall be "n = 15".

I.5 Allowable Design Stress of Materials

(c) Concrete and Reinforcing Bar

Allowable design stress of concrete and reinforcing bar will be summarized as follws :

Type of Str- / Materials — ess	For permanent load		
	Tension	Compression	Shear
Concrete (c=210kg/cm²)	——	Fc/3=70	4.25
Rein.-bar (JIS G3112)	1,800	1,800	1,000

Allowable bond stress per unit surfaces of reinforcing bar shall be shown as follws :

Type of Str- / Materials — ess	For permanent load	
	*Top bars	Other bars
Deformed bar	Fc/15 14.0	Fc/10 21.0

* Top bar, in reference to load, shall be holizontal bar so placed that more than 30cm of concrete is casted in the member below the bar.

(d) Allowable Bearing Capacity of Soil

The bearing capacity of soil is 30 t/m² for permanent load.
