

## CONTENTS PART I

CHAPTER 1 SOCIO-ECONOMIC CONDITIONS.....	1
1.1 Population .....	1
1.2 Economic Activities.....	4
1.3 General View of Industry.....	7
1.3.1 Hydrocarbon Industry .....	7
1.3.2 Industry .....	9
1.3.3 Agriculture .....	10
1.4 Trade and Balance of Payments.....	11
1.5 Transportation.....	15
1.5.1 Roads .....	15
1.5.2 Railways .....	17
1.5.3 Aviation.....	17
1.5.4 Ports and Shipping .....	17
CHAPTER 2 NATURAL CONDITIONS .....	21
2.1 Topography.....	21
2.2 Meteorology.....	21
2.2.1 Climate .....	21
2.2.2 Wind .....	24
2.2.3 Rainfall .....	34
2.3 Marine Conditions .....	36
2.3.1 Tide .....	36
2.3.2 Current .....	37
2.3.3 Wave.....	40
2.3.4 Littoral Drift.....	53

2.4	Geological investigation .....	55
2.4.1	General .....	55
2.4.2	The Port of Algiers .....	56
2.4.3	The Port of Oran .....	79
2.4.4	The Port of Annaba .....	95
2.5	Bathymetric Survey .....	117
2.6	Seismic activity .....	129

### CHAPTER 3 PRESENT SITUATION OF ALGERIAN MARITIME

	TRANSPORTATION .....	131
3.1	Algerian Flag Merchant Fleet .....	131
3.2	Maritime Enterprise .....	132
3.3	Liner Service .....	134
3.4	Tramper Service .....	134

### CHAPTER 4 OUTLINE OF THE ALGERIAN PRINCIPAL PORTS .....

4.1	Typical Cargo Flow through the Algerian Principal Ports .....	135
4.2	Port Administration System in Algeria .....	139
4.2.1	Outline .....	139
4.2.2	Port Enterprise .....	139
4.3	Environment Aspects .....	141
4.3.1	General .....	141
4.3.2	Water quality in the major ports .....	141
4.3.3	MARPOL Convention .....	142
4.3.4	Solid waste .....	143
4.3.5	Pollution of harbor sea bed .....	143

**CHAPTER 5 THE PORT OF ALGIERS.....144**

5.1 Port Facilities.....144

5.1.1 Infrastructures and Superstructures.....144

5.1.2 Cargo Handling Facilities .....162

5.1.3 Port Service and Utilities.....170

5.1.4 Superannuation of Port Facilities .....171

5.2 Port Related Industries.....173

5.2.1 Concessionaires Within the Port Limits.....173

5.3 Cargo Traffic through the Port .....174

5.3.1 Handling Volume and Commodities.....174

5.3.2 Trading Counterparts by region.....179

5.3.3 Passenger Traffic .....179

5.4 Port Activities .....182

5.4.1 Vessels Calling at the Ports.....182

5.4.2 Cargo Handling System .....185

5.4.3 Storage Conditions .....194

5.4.4 Utilization of Berths .....197

5.5 Port Management and Operation .....199

5.5.1 Organization Structure and Function .....199

5.5.2 Employee Breakdown .....203

5.5.3 Port Service Performance.....204

5.5.4 Financial Condition.....206

5.6 Review of the Existing Plan.....211

**CHAPTER 6 THE PORT OF ORAN .....212**

6.1 Port Facilities.....212

6.1.1 Infrastructures and Superstructures.....212

6.1.2 Cargo Handling Facilities .....218

6.1.3 Port Service and Utilities.....222

6.1.4 Superannuation of Port Facilities.....222

6.2	Port-Related Industries.....	223
6.2.1	Factories Located in the Port.....	223
6.3	Cargo Traffic through the Port.....	224
6.3.1	Handling Volume and Commodities.....	224
6.3.2	Trading Counterparts by region.....	229
6.3.3	Passenger Traffic .....	229
6.4	Port Activities .....	232
6.4.1	Calling Vessels at the Ports.....	232
6.4.2	Cargo Handling System .....	234
6.4.3	Storage Conditions .....	247
6.4.4	Access to the Hinterland .....	248
6.5	Port Management and Operations .....	249
6.5.1	Organization Structure and Function .....	249
6.5.2	Employee Breakdown .....	249
6.5.3	Port Service Performance.....	252
6.5.4	Financial Condition.....	254
6.6	Dredging Records.....	259
6.7	Review of the Existing Plans.....	259
<b>CHAPTER 7 THE PORT OF ANNABA.....</b>		<b>262</b>
7.1	Port Facilities.....	262
7.1.1	Infrastructures and Superstructures.....	262
7.1.2	Cargo Handling Facilities .....	269
7.1.3	Port Service and Utilities.....	273
7.1.4	Superannuation of Port Facilities .....	273
7.2	Port Related Industries.....	274
7.2.1	Factories Located in the Port.....	274
7.2.2	Major Industries related to the Port Traffic in the Hinterland.....	274

7.3	Cargo Traffic through the Port .....	276
7.3.1	Handling Volume and Commodities .....	276
7.3.2	Trading Counterparts by Region .....	281
7.3.3	Passenger Traffic .....	281
7.4	Port Activities .....	284
7.4.1	Calling Vessels at the Ports .....	284
7.4.2	Cargo Handling System .....	286
7.4.3	Storage Conditions .....	299
7.4.4	Access to the Hinterland .....	299
7.5	Port Management and Operations .....	301
7.5.1	Organization Structure and Function .....	301
7.5.2	Employee Breakdown .....	301
7.5.3	Port Service Performance .....	305
7.5.4	Financial Condition .....	308
7.6	Dredging Records .....	313
7.7	Review of the Existing Plans .....	313
<b>CHAPTER 8 DEMAND FORECAST .....</b>		<b>314</b>
8.1	Hinterland of the Ports .....	314
8.2	Socioeconomic Frame for the Target Years .....	319
8.2.1	Populations .....	319
8.2.2	Economy .....	319
8.3	Methodology for Demand Forecast .....	320
8.4	The Port of Algiers .....	321
8.4.1	Macro Forecast .....	321
8.4.2	Micro Forecast .....	327
8.4.3	Passenger .....	350
8.5	The Port of Oran .....	351

8.5.1	Marco Forecast .....	351
8.5.2	Micro Forecast.....	357
8.5.3	Passenger.....	363
8.6	The Port of Annaba .....	364
8.6.1	Macro Forecast .....	364
8.6.2	Micro Forecast.....	370
8.6.3	Passenger.....	379
8.7	Forecast of Volume of Container Cargoes .....	380

**CHAPTER 9 FUNCTIONAL ALLOTMENT OF PORT ACTIVITIES AMONG THE THREE STUDY PORTS.....384**

**CHAPTER 10 MASTER PLAN FOR THE PORT OF ALGIERS.....386**

10.1	The Basic Concept of the Port Development.....	386
10.2	Usage Plan for the Existing Port Facilities .....	388
10.3	Modernization Plan of the Existing Facilities.....	403
10.3.1	Modernization of the Cereal Terminal.....	403
10.3.2	Preparation of the Open Yards for Steel Products and Wood..	403
10.3.3	Preparation of a Berth for Bitumen and Bunker Fuel.....	403
10.4	Establishment of an Additional Container Terminal .....	405
10.4.1	General .....	405
10.4.2	Number of Containers Handled at the Container Terminal ....	405
10.4.3	Major Shipping Routes.....	405
10.4.4	Required Scale of the Main Facilities of the Terminal-2.....	406
10.4.5	Layout of the Main Facilities of Terminal-2.....	412
10.4.6	Alternative Development Plans of Terminal-2.....	414
10.5	Examination of Cargo Handling System .....	426
10.5.1	General Cargo Vessel.....	426
10.5.2	Ro-Ro Vessels .....	434

10.5.3	Cereals in Bulk .....	436
10.5.4	Tanker .....	438
10.5.5	Car Ferry .....	439
10.5.6	Container Vessel .....	439
10.6	Access Channel and Basins .....	440
10.7	Breakwaters.....	440
10.8	Access Roads and Railways.....	440
10.9	Use plan for space East of Terminal-2 .....	442
10.10	Environmental Consideration in the port Activities .....	442
10.10.1	<i>Environmental Impacts Induced by the Development of Terminal-2.....</i>	442
10.10.2	Improvement of Environment Within the Existing Port District.....	443
10.10.3	Provision of Facilities for Reception of Waste Water from Vessels .....	443
10.11	Contents of the Master Plan .....	444
10.12	Cost Estimation .....	446
<b>CHAPTER 11 MASTER PLAN FOR THE PORT OF ORAN .....</b>		<b>448</b>
11.1	Strategy of the Master Plan.....	448
11.2	Present Capacity of Port of Oran.....	449
11.3	Proposed Scale in Master Plan.....	455
11.3.1	Methods to Determine Number of Berths.....	455
11.3.2	General Cargo Wharf .....	456
11.3.3	Cereals Wharf .....	459
11.3.4	Vegetable Oil Wharf.....	460
11.3.5	Animal Feed Wharf.....	461

11.3.6	Petroleum Products Wharf .....	461
11.3.7	Cement Wharf .....	462
11.3.8	Alumina Wharf .....	463
11.3.9	Car Ferry Wharf .....	464
11.3.10	Container Wharf .....	465
11.3.11	Harbor Facilities .....	468
11.3.12	Port Traffic Facilities .....	469
11.4	Master Plan and Evaluation .....	472
11.4.1	Preparation of Alternative Plans .....	472
11.4.2	Evaluation of Alternative Plans .....	472
11.5	Construction Scale Under the Master Plan .....	479
11.5.1	Required Port Facilities .....	479
11.5.2	Construction Plan of the Master Plan .....	481
11.6	Examination of Cargo Handling System .....	483
11.6.1	General Cargo Vessel .....	483
11.6.2	Ro-Ro Vessels .....	485
11.6.3	Bulk Carrier .....	485
11.6.4	Tanker .....	489
11.6.5	Car Ferry .....	489
11.6.6	Container Vessel .....	489
11.7	Consideration of Environmental Aspects .....	491
11.7.1	Environment Impacts by the Port Development .....	491
11.7.2	Measures in the Future .....	491
11.8	Cost Estimation .....	493
<b>CHAPTER 12 MASTER PLAN FOR THE PORT OF ANNABA .....</b>		<b>495</b>
12.1	Strategy of the Master Plan .....	495
12.2	Present Capacity of Port of Annaba .....	497
12.3	Proposed Scale in Master Plan .....	502

12.3.1	Methods to Determine Number of Berths.....	502
12.3.2	General Cargo Wharf.....	503
12.3.3	Cereals Wharf.....	506
12.3.4	Raw Sugar Wharf.....	507
12.3.5	Vegetable Oil Wharf.....	508
12.3.6	Coal and Coke Wharf.....	508
12.3.7	Metallic Products Wharf.....	510
12.3.8	Ammonia, Tar and Petroleum Products Wharf.....	511
12.3.9	Fertilizer and Carbonic Chemical Wharf.....	512
12.3.10	Petroleum Products Wharf.....	513
12.3.11	Sulphur and Potash Wharf.....	515
12.3.12	Phosphate Wharf.....	516
12.3.13	Iron Ore Wharf.....	517
12.3.14	Car Ferry Wharf.....	518
12.3.15	Container Wharf.....	519
12.3.16	Harbor Facilities.....	522
12.3.17	Port Traffic Facilities.....	522
12.4	Master Plan and Evaluation.....	525
12.4.1	Preparation of Alternative Plans.....	525
12.4.2	Evaluation of Alternative Plans.....	532
12.5	Required Scale Under the Master Plan.....	535
12.5.1	Required Port Facilities.....	535
12.5.2	Construction Plan of the Master Plan.....	537
12.6	Examination of Cargo Handling System.....	539
12.6.1	Handling by EPAN.....	540
12.6.2	Handling of Concessionaires.....	551
12.7	Consideration of Environmental Aspects.....	554
12.7.1	Environment Impacts by the Port Development.....	554
12.7.2	Measures for the Polluted Sediment Inside the Port Area.....	554
12.7.3	Measures in the Future.....	555
12.8	Cost Estimation.....	556

**CHAPTER 13 PORT MANAGEMENT AND OPERATIONS.....558**

13.1 General Condition .....558

13.2 Analysis of Operational Performance and Cost .....559

13.2.1 Tugs .....559

13.2.2 Pilot .....561

13.2.3 Mooring .....562

13.2.4 Cargo Handling .....564

13.2.5 Cargo Storage .....566

13.2.6 Comparison of Operational Performance.....568

13.3 General Idea of the Port Management and Operations .....570

13.3.1 General Principles.....570

13.3.2 Terminal Operations .....574

13.4 Future Management System of the EPs.....576

13.4.1 Organization and its Authority .....576

13.4.2 Port Related Businesses.....578

13.4.3 Terminal Operations .....578

**CHAPTER 14 MAINTENANCE FOR CARGO HANDLING EQUIPMENT.....580**

14.1 Present Condition of Equipment.....580

14.2 Equipment Regeneration Plan.....581

14.3 Equipment Management System .....582

14.4 Measures in Future .....583

## APPENDIX

A.1	Principal Ports in Algeria .....	585
A.2	Record of Vessels that Called at the Port of Algiers.....	591
A.3	Port Tariff.....	597
A.4	Hinterland of the Study Ports .....	606
A.5	General Idea of Cargo Handling Systems.....	610
A.6	Setting of Logistic Curves Representing Trend of Progress of Containerization .....	624
A.7	Analysis of Calmness in Basins Protected by Breakwaters .....	629

## LIST OF TABLES

### PART I

Table 1.1.1	Demographic Index .....	2
Table 1.1.2	Population by Wilaya in 1987.....	2
Table 1.1.3	Breakdown of the Algeria Population by Age (1984-1989) ...	4
Table 1.2.1	GDP by Industrial Origin.....	6
Table 1.2.2	Trade Balance and GDP (at constant 1987 price).....	6
Table 1.2.3	Movement of Volume, Price and Value in the Foreign Trade .....	6
Table 1.2.4	Movement of Principal Economic Indicators.....	7
Table 1.3.1	Sectoral Breakdown of GDP (at current price).....	8
Table 1.3.2	Value of Export Hydrocarbon Products (1985-1989) .....	8
Table 1.3.3	Index of Industrial Production .....	9
Table 1.3.4	Principal Products of Manufacturing Industry.....	9
Table 1.3.5	Principal Agricultural Products .....	10
Table 1.4.1	Evolution of Imports per Economic Groups of Commodities .....	12
Table 1.4.2	Evolution of Exports per Economic Groups of Commodities .....	12
Table 1.4.3	Trading Distribution per Geographic Areas and Principal Countries .....	13
Table 1.4.4	Balance of Payments .....	15
Table 1.5.1	Consistence of National Road Framework in 1988.....	16
Table 1.5.2	Principal Statistics of Transport .....	16
Table 1.5.3	Freight Traffic Broken Down by Port (1990).....	18
Table 1.5.4	Number of Ships by Ports (entrance and departure).....	18
Table 1.5.5	Total Port Traffic by Main Commodity Categories .....	20
Table 1.5.6	Container Cargo Traffic .....	20
Table 2.2.1	Climate of the Project Area .....	23
Table 2.2.2	Frequency of Strong Wind (10m/sec or more) .....	28
Table 2.2.3	Incidence of Exeptional Weather .....	30
Table 2.2.4	Monthly Occurrence of Maximum Wind Speed.....	31
Table 2.2.5	Situations Meteorologiques Exceptionnelles en Algerie.....	32
Table 2.2.6	Annual Maximum Rainfall per Hour .....	35
Table 2.2.7	Probable Hourly Rainfall .....	35
Table 2.3.1	Wave Characteristics in Algiers Area .....	42
Table 2.3.2	Wave Characteristics in Oran Area .....	44

Table 2.3.3	Wave Characteristics in Annaba Port.....	46
Table 2.3.4	Wave Estimation Results (Max. Wave Height) .....	51
Table 2.3.5	Calculation of Probable Deepwater Wave Parameters .....	52
Table 2.4.1	Drilling Data.....	55
Table 2.4.2	Laboratory Physical Test Data of Algiers.....	71
Table 2.4.3	Laboratory Mechanical Test Data of Algiers .....	75
Table 2.4.4	Results of the Standard Penetration Test in Algiers .....	75
Table 2.4.5	Laboratory Physical Test Data of Oran.....	93
Table 2.4.6	Laboratory Mechanical Test Data of Oran .....	93
Table 2.4.7	Results of the Standard Penetration Test in Oran.....	93
Table 2.4.8	Laboratory Physical Test Data of Annaba .....	115
Table 2.4.9	Laboratory Mechanical Test Data of Annaba.....	115
Table 2.4.10	Results of the Standard Penetration Test in Annaba.....	115
Table 3.1	Average DWT and Age of Algerian Flag Fleet .....	131
Table 3.2	No.of Vessel per Age .....	131
Table 4.1	Cargo Volume Handled at the Algerian Principal Ports in 1990.....	138
Table 5.1.1	Dimensions and Utilization of the Quays .....	146
Table 5.1.2-a	Location and Area of Transit Sheds and Open Yards Northern Zone .....	159
Table 5.1.2-b	Location and Area of Transit Sheds and Open Yards Central and Southern Zone .....	160
Table 5.1.2-c	Location and Area of Transit Sheds and Open Yards Central and Southern Zone .....	161
Table 5.1.3	Working Condition of Quay Cranes st E.P.AL .....	162
Table 5.1.4	Detail of Working Conditions of Quay at E.P.AL.....	163
Table 5.1.5	Working Condition of Mobile Cranes at E.P.AL .....	164
Table 5.1.6	Working Condition of Grain Unloaders at E.P.AL.....	165
Table 5.1.7	Working Condition of Fork-Lifts at E.P.AL .....	165
Table 5.1.8	Classification of Fork-Lifts by Purchase Year at E.P.AL....	166
Table 5.1.9	Particulars of tug Boat .....	170
Table 5.3.1	The Movement of Cargo Traffic (Port of Algiers).....	175
Table 5.3.2	Cargo Traffic by Category of Commodity 1985-1990 (Port of Algiers) .....	177
Table 5.3.3.1	Container Traffic (Port of Algiers).....	178
Table 5.3.3.2	Movement of Containerization (Port of Algiers).....	178
Table 5.3.4	Trading Counterparts by Regions 1985-1990 (Port of Algiers) .....	180
Table 5.3.5	Passenger Traffic (Port of Algiers).....	181

Table 5.4.1	Record of Mooring and Cargo-handling by Vessel Type at the Port of Algiers in 1990 .....	184
Table 5.4.2	Share of Imported Cargoes Transported by General Cargo Vessels by Kind of Package .....	190
Table 5.4.3	Share of Imported Cargoes Transported by Ro-Ro by kind of Packages.....	191
Table 5.4.4	Utilization of Berths at the Port of Algiers in 1990.....	198
Table 5.5.1	Number of Employees of EPAL 1985 - 1990.....	203
Table 5.5.2	Employee Breakdown of EPAL.....	204
Table 5.5.3	Port Enterprise of Algiers - Income Statement 1987-1990.....	207
Table 5.5.4	EPAL Operation Revenue in 1990.....	209
Table 6.1.1.1	Berthing Facilities at the Port of Oran.....	215
Table 6.1.1.(3).1	Transit Sheds and Open Storage Yards .....	217
Table 6.1.2.1	Detail of Working Condition of Quay Cranes at E.P.O.....	218
Table 6.1.2.2	Comparison for Utilization of Quay Cranes and Ship Cranes at E.P.O.....	219
Table 6.1.2.3	Working Conditions of Mobil Crans at E.P.O.....	220
Table 6.1.2.4	Condition of Grain Unloaders at E.P.O.....	220
Table 6.1.2.5	Classification of Fork-Lift by Purchase Year at E.P.O.....	221
Table 6.3.1	The Movement of Cargo Traffic (Port of Oran).....	225
Table 6.3.2	Cargo Traffic by Category of Commodity 1985-1990 (Port of Oran) .....	227
Table 6.3.3.1	Container Traffic (Port of Oran).....	228
Table 6.3.3.2	Movement of Containerization (Port of Oran).....	228
Table 6.3.4	Trading Counterparts by Regions 1985-1990 (Port of Oran) .....	230
Table 6.3.5	Passenger Traffic (Port of Oran) .....	231
Table 6.4.2.(2).1	Conditions of Utilization at Each Berth.....	242
Table 6.4.3.(2).1	Average Dwelling Time at the Storage Facilities.....	248
Table 6.5.1	Employee Breakdown of EPO .....	251
Table 6.5.2	Number of Employee of EPO 1985-1990 .....	249
Table 6.5.3	Age Structure of EPO's Employee .....	251
Table 6.5.4	Port Enterprise of Oran - Income Statement 1987-1990.....	255
Table 6.5.5	EPO Operation Revenue in 1990 .....	257

## CHAPTER I SOCIO-ECONOMIC CONDITIONS

### 1.1 Population

As shown in Table 1.1.1, the population of Algeria increased at an annual rate of about 3% from 1979 to 1988 and reached 24,697 thousand in 1990. This is primarily due to a decline in the death rate, from 2.4% in the early 1950s to less than 1% in the 1980s. The decline was brought about by social development and economic progress.

Because of the topographic and climatic conditions of Algeria, population is concentrated in the north coastal districts, as shown in Table 1.1.2. In particular, the concentration is most dense in the districts that have the big cities such as Algiers, Oran and Annaba.

Such an rapid increase and uneven distribution of population led to serious social and economic problems such as overcrowding, insufficient housing and inadequate food supply-demand adjustment.

To cope with these situations, the Algerian government has promoted a local development plan for decentralization, and at the same time has been increasing the construction of houses, schools and medical facilities in the populous areas.

Table 1.1.3 reveals that the percentage of the population under the age of 20 is very large, more than 55%. Therefore, the creation of new jobs will continue to be an important political issue.

According to the projection by Conseil National de la Planification, it is expected that the population of Algeria will continue to increase and reach 33,000 thousand in 2000. Also the United Nations estimates that the population of Algeria will reach 33,000 thousand in 2000 and 41,000 thousand in 2010 (Global Estimates and Projections of Population by Sex and Age, The 1988 Revision).

## 1.2 Economic Activities

Since the late 1960s, the Algerian economy, as measured by the GDP evolution, had witnessed impressive growth. The average annual rate of growth was 7% during the 1970s, and 5% between 1980 and 1985.

As a result of rapid industrialization due to income received from oil exports during the 1970s, the structure of the economy underwent rapid changes characterized by a significant increase in the contribution of industry to GDP. Indeed, while the share of agriculture relative to GDP declined from 15% to 8% between 1965 and 1980, the share of industry grew from 34% to 44% during the same period (As shown in Table 1.2.1).

After 1980, to adjust the imbalance in the inter-industrial relationship caused by rapid industrialization, the development strategy changed its course slightly in order to achieve more balanced economy. Although it continued to focus on manufacturing, the economic policy aimed at reinforcing agriculture, water supply, housing, education and professional training, as well as basic economic infrastructures.

As a result of the reform programs, the Algerian economy evolved favorably, with steady growth in domestic industries and a constant surplus in the trade balance, thanks to high hydrocarbon exports, as shown in Table 1.2.2.

However, since 1986, Algeria has experienced an economic stagnation due to falling demand for hydrocarbon, a collapse of hydrocarbon prices, and a poor harvest marked by persistent drought. GDP growth fell from about 5% per year during 1981-1985, to about 1.1% in 1986, and recessions in 1987 and 1988 resulted in a further decline 0.7% and 2.1% respectively (As shown in Table 1.2.2).

The sharp drop in export receipts (-46% in 1986) created a deficit and payment pressures, which led to 20% decrease in the volume of imports in 1986, 1987 (As shown in Table 1.2.3). Accordingly, private consumption per capita declined by 1.4% in 1986, 0.7% in 1987, 8% in 1988, and gross domestic investment per capita declined by 8.8% in 1986, 9.7% in 1987, 8.3% in 1988 (As shown in Table 1.2.4). Furthermore, this economic stagnation has at times generated a disruption in the supply of certain basic goods, as well as sharp increases in domestic prices.

As a solution to these difficult conditions, the government has been promoting drastic socio-economic reforms, such as reintroducing market mechanisms into the economy, transforming public enterprises into commercial enterprises, liberalizing the price system to bring it in line with the restoration of market mechanisms and so on. In addition, the new policy of encouraging joint ventures with foreign companies is expected to stimulate the growth of investments.

In the supply and demand conditions of the international hydrocarbon market, the U.S. and U.S.S.R. will reduce their output of hydrocarbon products, leaving OPEC countries a larger share of the world market, while demand will increase steadily in countries with newly industrializing economies (NIEs) and so on. Taking into account these international hydrocarbon market conditions, and providing that the socioeconomic reforms in Algeria are successful, the Algerian economy will be revitalized in the near future. In fact, GDP showed a growth rate of 3.4% in 1989, and 3% in 1990 (at constant price).

### 1.3 General View of Industry

The Hydrocarbon industry (oil and natural gas), Heavy chemical industry (developed in large part from rich income derived from hydrocarbon exports) and Agriculture compose Algeria's principal industry.

Because of the past rapid industrialization created an imbalance in the industrial structure, the Algerian government implemented a program of reforms in order to attempt more balanced economy by reinforcing agriculture and light industry and improving the efficiency in industry.

Sectoral breakdown of GDP is shown in Table 1.3.1.

#### 1.3.1 Hydrocarbon industry

Hydrocarbon resources are very important for Algerian economical development. Exports of hydrocarbon products compose about 95% of total exports.

As regards oil, the verified estimated amount of oil reserve is 9.2 billion barrels, and the output is about 700,000 barrels per day.

As regards natural gas, the verified estimated reserve is 3,610 billion cubic meters but it is acknowledged that the actual figure is close to 8,000 billion, and ranking fourth in the world, behind the Soviet Union, Iran, and the United States. Furthermore, the output of natural gas is increasing, and reached to 96 million tons per year in 1989.

Algeria has been diversifying its hydrocarbon exports. In fact, during the 1960s and 1970s, hydrocarbon exports income consisted almost entirely crude oil. But in 1989, diversification of hydrocarbon exports was rather achieved, and the

share of crude oil declined to 21%, whereas petroleum products increase to 26%, condensate increase to 28%, and natural gas increase to 26% (As shown in Table 1.3.2).

### 1.3.2 Industry

As a result of the economic stagnation due to the collapse of the hydrocarbon price, industrial production indices by sector changed only slightly in 1987 and 1988.

However, in spite of the overall stagnant tendency, there was a considerable rise in the sector related to private consumption such as food industry, energy and water supply sector (As shown in Table 1.3.3).

In order to encourage economic activity, the Algerian government is trying to promote a series of reforms, such as transforming public enterprises into commercial enterprises and making better use of existing production capacities to raise the productivity.

The movement of principal products since 1980 is shown in the Table 1.3.4.

### 1.3.3 Agriculture

In order to relieve the heavy burden of food imports due to low agricultural productivity, the Algerian government introduced a series of reforms such as the partial liberalization of the agricultural sector from administrative controls, both the distribution networks and the pricing of certain products, and a privatisation of the state farms.

Despite these measures, they have not achieved the expected results, because of persistent droughts in 1983, 1987, 1988, a locust invasion in 1988, and a shortage of production materials (such as agricultural machines, fertilizer and seeds) caused by the stagnant economy since 1986. In particular, droughts in 1987 and 1988 brought a very poor harvest, resulting in a severe increase in food imports.

The principal products are wheat, barley, potatoes, beans, citrus fruits, olives, grapes and dates (As shown in Table 1.3.5).

The rate of self-sufficiency in cereals is about 30%, and the supply of sugar and coffee beans is exclusively dependent on imports. A few products such as citrus fruits and dates are exported. Imported foodstuffs have more than a 20% share of total imports, and in 1989, as a result of drought, the share rose to almost 29% (As shown in Table 1.4.1).

The Algerian government is making efforts to increase productivity in the middle or long term by planning an irrigation project and by conducting a study for seed reform.

## 1.4 Trade and Balance of Payments

The exports of hydrocarbon products (crude oil, condensate, petroleum products, natural gas and so on) had about a 95% share of the total exports, and played an important role in Algerian economic development.

The value of hydrocarbon exports was on an upward trend until 1985, but it declined abruptly with the collapse in oil price in 1986, as shown in Table 1.4.2. Since 1987, however, it has experienced a steady resurgence, climbing to 69 billion DA in 1989.

In recent years, diversification of hydrocarbon exports has been achieved, and the share of crude oil has decreased to 21% of the total hydrocarbon exports value.

Besides hydrocarbon, there are a few other export products of value such as wine, phosphate ore, dates, citrus fruits and so on.

The Algerian government has been attempting to increase nonhydrocarbon exports to alter the current export structure that depends exclusively on hydrocarbon, and in this context, it is noteworthy that exports of industrial goods and machines have been increasing steadily.

As regards import products, in 1989, industrial materials had a 36% share, machine and equipment had a 23% share, and foodstuffs remained a high share of 29% (which is 12% larger than its share in 1986).

The counterparts of trade are shown in Table 1.4.3. The European Community occupies a share of more than 60% in exports and 50% in imports.

The U.S. has a share of 19% in exports, and this figure will increase in the future as exports of natural gas resume.

As regards the balance of payments (as shown in Table 1.4.4), in 1986, the surplus in the balance of trade decreased suddenly because of the collapse in oil prices. Consequently, in 1988, the current balance showed a deficit of 2 billion U.S.dollars. In 1989, the current balance still showed a deficit due to an increase in imports. In the total balance, there has been a deficit since 1986.

## 1.5 Transportation

Algeria has a vast land area, with almost 90% lying in the Sahara Desert, just south of the Atlas Mountains. Therefore, the role of domestic transport facilities is very important for socio-economic activities.

### 1.5.1 Roads

The road network in Algeria includes 47,000km of main (national) and secondary (prefectural) roads and 43,000km of local (community) roads. (As shown in Table 1.5.1). More than 85% of the main roads are paved. The number of cars and volume of transport is shown in Table 1.5.2. The number of cars rapidly increased from 850,000 in 1981 to 1,200,000 in 1985, and it is supposed that the number of cars will continue to increase in the future.

### **1.5.2 Railways**

Algerian railways extend 3,800km in length, and an east-west line connects the northern coastal cities, and four north-south lines connects the inland cities. Passenger traffic dominates the east-west line, and cargo traffic is characterized by industrial materials and products. The second railway modernization project is in progress.

### **1.5.3 Aviation**

An extensive domestic air network plays an important role in Algerian domestic transport because of the vast land area and climate conditions in Algeria. There are about 30 airports in Algeria, with the 12 major ones serving as international airports. Besides Air Algeria as a flag carrier, there are 20 foreign airlines are serving to Algeria.

### **1.5.4 Ports and Shipping**

#### **(1) Ports**

There are 13 commercial ports in Algeria operated by 10 port enterprises. Some ports, such as Bethioua, Bejaia, Arzew and Skikda, specialize in hydrocarbon exports (liquefied natural gas, ammonia, crude oil and so on). Excluding hydrocarbon exports, imports dominate traffic, and much of the general cargo (60% in 1990) is handled by the Port of Algiers, Annaba and Oran, as shown in Table 1.5.3. These three ports have continued to serve as the main ports in Algeria, namely Oran in the western region, Algiers in the central region and Annaba in the eastern region of the country.

#### **(2) Ships**

The movement of the number of ships (entrance and departure) from 1985 to 1990 is shown in Table 1.5.4. The number of ships entering the ports has been on the decline for the last five years. Taking into account that cargo volume has been increasing, it is supposed that the average ship size has been enlarging.

### (3) Cargo

As shown in Table 1.5.5, in accordance with strong economic growth, imports increased sharply, at over 11% per year during 1979-1984. General cargo traffic imports (such as manufactured goods and foodstuffs) increased at about 9% per year and imports of cereals and cement increased at 16% and 23% per year respectively. During the same period, exports, consisting mainly of hydrocarbon products, remained flat.

But during 1984-1987, port traffic was on the decline following its peak of 78 million tons in 1984, as a result of the government's efforts to stabilize its external debt, placing restrictions on imports following the slowdown of hydrocarbon exports in 1985 and the fall in hydrocarbon price in 1986.

During the same period, imports of cement and building materials fell from 4.1 million tons to 1.5 million tons, a reduction of 60%. But imports of cereals and food production rose, unaffected by the slowdown in the economy, and cereal imports exceeded 5.5 million tons in 1988 because of a poor harvest.

Since 1988, there has been a gradual resurgence in port traffic because of increases in the volume of foodstuffs, intermediate and capital goods imports and petroleum products exports.

In 1990, Algerian ports handled a total of 83 million tons of traffic, including about 67 million tons of oil products, 8 million tons of solid bulk cargo and 8 million tons of general cargo. Cereal and foodstuffs imports remained at the high level of 5 million tons and 3 million tons respectively.

As regards to exports, hydrocarbon products increased 6% and reached 64 million tons in 1990. Total export volume has been increasing by about 4% per year since 1987 and amounted to 66 million tons in 1990.

### (4) Container traffic

As shown in Table 1.5.6, container traffic has not increased in the last five years as a result of the decline in general cargo imports corresponding insufficient foreign exchange and absence of appropriate facilities. It is supposed that container traffic will grow through the increase of general cargo import, provided foreign exchange conditions improve.

## CHAPTER 2 NATURAL CONDITIONS

### 2.1 Topography

Algeria, located in the northwest of the African continent and in the southwest of the Mediterranean, covers an area of approximately 2.4 million km<sup>2</sup> with a coastline of nearly 1,000 km. It borders Morocco on the west, Tunisia on the east and Niger, Mali and Mauritania on the south across the Sahara Desert which accounts for almost 90% of the territory.

The coastline forms, for the most part, precipitous cliffs as the edges of the Atlas Mountains running almost parallel from east to west fall into the Mediterranean.

The project ports of Oran, Algiers and Annaba are backed by plains 15 to 30 km wide by 8 to 18 km long and are located in circular coastal zones ranging in length from 15 to 30 km. The three sites are cities representing respectively the western, central and eastern parts of Algeria.

### 2.2 Meteorology

#### 2.2.1 Climate

The climate of the coastal areas of Algeria is characteristically Mediterranean and is broadly divided into the wet season and the dry season. However, the coastal area is characterized by limited rainfalls and a mild climate.

As seen from Fig. 2.2.1 and Table 2.2.1, Oran, located closer to the Moroccan border, has an average annual rainfall about 330mm, or nearly 50% of that of Algiers and Annaba, and fewer rainy days (35 days per year which experience a rainfall of 5 mm/day or more). However, Oran is very similar to the other two cities in atmospheric temperature and humidity.

## 2.2.2 Wind

Figs 2.2.2 and 2.2.3 and Tables 2.2.2 through 2.2.4 present the results of analyses of the wind observation records (accuracy: 8-daily observation) covering Algiers, Oran and Annaba for the 1986-1990 period and available from the weather stations of the three cities.

### (1) Frequency of Occurrence of Wind Direction

The frequency of occurrence of wind direction at the three project ports varies depending on the wet or dry season typical of the Mediterranean climate characteristics and on the local topographic features. Generally, however, winds from WSW prevail during the wet season (October to March), while N winds predominate.

#### 1) Algiers Area

The frequency of occurrence is 64.7% with winds from the WSW, SW and W directions predominant during the wet season and from the ENE, NE and E directions prevailing during the dry season. The WSW, SW and W winds occur with a frequency of 14.26%, while a frequency of 9.8% has been obtained for the ENE, NE and E winds.

In terms of the wind scale, winds below 4 m/sec occur with a frequency of 34%, those ranging from 5 to 9 m/sec with 26.2%, those ranging from 10 to 14 m/sec with 2.3% and those of 15 m/sec and over with a frequency of 0.1%. Winds having directions which are substantially the same as the overall frequency of wind directions prevail, but W and WSW winds tend to be increasingly predominant with an increase in wind velocity.

#### 2) Oran Area

The wind frequency is 94.7% with WSW, SW and W winds and N winds prevailing. The frequency of occurrence of the former group is 33.8% against 17.0% for the N winds.

By the wind scale, winds below 4 m/sec occur with a frequency of 54.3% followed by those of 5 to 9 m/sec with 31.6%, those of 10 to 14 m/sec with

4.7% and those above 15 m/sec with 0.5% WSW and N winds tend to occur with a higher frequency as wind velocity increases.

### 3) Annaba Area

The wind frequency is 74.4% with WSW, SW and W winds prevalent during the wet season and NNE, N and NE winds predominant during the dry season. The frequency of occurrence is 19.4% for the former group of winds and 11.5% for the latter group. In terms of the wind scale, winds below 4 m/sec occur with a frequency of 32.9% followed by those of 5 to 9 m/sec with 32.8%, those of 10 to 14 m/sec with 4.5% and those of 15 m/sec and over with 0.3%. NNE and W winds tend to be predominant with an increase in wind velocity.

#### (2) Frequency of Strong Wind

Generally, winds of 10 m/sec or more in velocity which may hamper the arrival and departure and loading and unloading of ships, are called strong winds. Analyses are often undertaken to determine the frequency of strong winds and their possible impacts on port activities and ship movements.

Field observation records of strong winds (10 m/sec or more) in the three ports of Algiers, Oran and Annaba obtained from the local weather stations have been analyzed with the results presented on Figs. 2.2.3 and Table 2.2.2.

The field data of the port of Algiers indicate that strong winds occurred a total of 264 times during the 1986-1990 period (frequency of occurrence 1.8%). The prevailing winds came from the directions WNW to WSW and ENE with the frequency of 48.1% for the former wind group and 14.4% for the latter.

In the port of Oran, strong winds occurred a total of 539 times (frequency of occurrence 3.7%) during the same five-year period. W to WSW winds prevailed with a frequency of 77.4%.

In the port of Annaba, N to NNE strong winds were prevalent and occurred with a total of 495 times (frequency of occurrence 3.4%) during the same 5-year period, the prevailing winds were N-NNE winds, with a frequency of 44.6% and W winds with 11.3%.

### (3) Abnormal Weather

In the Mediterranean areas strong winds accompanied by rain often sweep for an extended period when a high atmospheric pressure overhangs or an atmospheric depression passes.

For the purpose of this study an investigation has been undertaken to determine the frequency of occurrence of strong winds of long duration their maximum velocity and characteristics of rainfall accompanying such winds (rain intensity of 5 mm/hr or more or amount of rain of 30 mm/day or more). The investigation results are presented in Tables 2.2.3 and 2.2.4.

From the tables it is seen that the number of days when strong winds swept for 12 hours or more, averages 5 days for the Algiers area, 11 days for the Oran area and 7 days for the Annaba area. Rain brought by strong winds fell during an average of 2 days per year in the Algiers and Oran areas and during an average of one day per year in the Annaba area.

In case of strong winds, the maximum wind speed during the 1981-1990 was 39 m/sec from the W direction in Algiers and Oran and 33 m/sec from the same wind direction in Annaba.

Table 2.2.5 gives information on spells of abnormal weather experienced in Algeria during the period from 1898 to 1989.

- 1989: Tempete au Port de Skikda (Fevrier)

### 2.2.3 Rainfall

#### (1) Amount of Rainfall

Similar rainfall patterns were observed between the Algiers and Annaba areas. The average annual rainfall is approximately 680 mm and the monthly rainfall during the wet season (October to March) averages approximately 90 mm. The maximum rainfall of 110 mm has been recorded in November.

In the Oran area, the average annual rainfall is 330 mm, or nearly 50% of that of Algiers and Annaba, while the monthly average rainfall remains almost constant at 40 mm. During the dry season, the three project sites suffer from an acute shortage of rain with the monthly average rainfall of less than 10 mm.

#### (2) Intensity of Rainfall

From weather observation data covering the three project sites for the period 1986-1990, the maximum hourly rainfall figures for the respective years were extracted to estimate the probable rainfall per hour for different return periods. The estimation results are presented in Table 2.2.6 and 2.2.7. In the tables, the rainfall intensity for the 50 years return period is 26 mm/hr for the Algiers area, 22 mm/hr for the Oran area and 9 mm/hr for the Annaba area.

## 2.3 Marine Conditions

### 2.3.1 Tide

At the project ports of Algiers, Oran and Annaba, long-term tide observations have not been carried out and harmonic analysis of tidal components based on field data have not been undertaken. For this reason, detailed tidal information on the three ports is not available.

This section gives an overview of the tide conditions of the project ports based on an analysis of some existing data.

According to the MEDITERRANEAN PILOT (1978), the general tidal range for the entire Algerian waters is about 0.30 m. The tides in the Port of Annaba are as shown in Fig. 2.3.1. The mean tide for a given period during the field survey by the JICA Team (39 days from October 16, 1991 to December 4; observation accuracy = Observations made four times a day at 08.00 hr, 10.00 hr, 12.00 hr, 14.00 hr and 16.00 hr) was approximately 0.20 m and the maximum value of the tidal range (difference between HWL and LWL) was 0.45 m.

For the tides of the Ports of Algiers and Oran, the value of NGA = +0.34 ZH has been adopted as in the case of the Port of Annaba.

(Unit: m)

H.H.W.L	+ 1.14 NGA: (Highest High Water Level)
D.H.W.L	+ 0.84 NGA: (Depression High Water Level)
H.W.L	+ 0.34 NGA: (High Water Level)

A.L.W.L	- 0.44 NGA: (Anticyclone Low Water Level)
L.L.W.L	- 0.74 NGA: (Lowest Low Level)

Fig. 2.3.1 TIDES IN THE PORT OF ANNABA

### 2.3.2 Current

The main current in the Algerian waters is an eastward current as illustrated in Fig. 2.3.2. The currents speed is reported as 1/4 knot in slow-moving areas and 3/4 knot in fast-moving areas.

In the sea areas adjacent to the Port of Annaba, off-shore currents travel at a speed of 1 to 2.5 knots as seen from Fig. 2.3.2' and weak currents branching off from the currents are moving in the vicinity of the harbor entrance.

Off-shore from the Port of Arzew located close to Oran, currents have been observed moving at an average speed of 1 knot and a maximum speed of 3 knots. In the neighborhood of the harbor entrance, a counter current is observed to move at a very low speed equivalent to less than 1/5 of the off-shore current speed.

The currents in the vicinity of the entrances to the three project ports are presumed from the topography of the areas to have branched off from the off-shore currents. For this reason, the entrance currents have a very low speed and are considered unlikely to be an obstacle to incoming and outgoing vessels.

### 2.3.3 Wave

#### (1) Frequency of Wave Occurrence

##### I) Wave Characteristics of Offshore Areas

Figs. 2.3.3 to 2.3.5 and Tables 2.3.1 to 2.3.3 present the results of our analysis of deepwater waves in the areas nearly 50 km off the three project ports. These figures and tables have been prepared on the basis of U.S. Navy materials compiled from visual observation reports from ships sailing in the Mediterranean during the 1963-1970 period.

##### (i) Algiers Sea Area

The frequency of occurrence of wave heights above 0.5 m is 58.4%, of which 17.2% represents wave heights of 2 m or more. The period of relatively high waves is approximately 7 sec, but swell-like waves are also observed. The direction of advance of waves is similar to that in which strong winds blow and W and NE waves prevail.

##### (ii) Oran Sea Area

Wave heights above 0.5 m occurs at a frequency of 60.6%, of which 15.4% represent those above 2 m. Relatively approximately 7 sec and there can be observed slightly more swell-like waves than in the Algier waters.

##### (iii) Annaba Sea Area

Wave heights above 0.5 m occur with a frequency of 60.9%, of which 21.1% represents those greater than 2 m. Most of the waves have a period of about 7 sec, but swell-like waves tend to occur with a higher frequency than in the other two sea areas.

There can be seen any correlation between wave directions and the frequency of strong winds, and waves from the W direction having a longer fetch prevail.

## 2) Characteristics of In-shore Waves Attacking Project Sites

In planning the expansion of the three Project ports of Algiers, Oran and Annaba all of which have a steep seabed, it is necessary to build a breakwater so as to secure a certain degree of calmness for the harbor basins and approach channels to shelter them from oncoming waves.

For determining an appropriate breakwater length, it is prerequisite to undertake an in-depth analysis of the wave characteristics.

Analysis was made of the frequency of occurrence of N to E waves considered to affect the calmness of the harbor basins by invading them through the entrances of the project ports. The analytical results are presented in Fig. 2.3.6.

For estimating the frequency of wave occurrence by direction, the topography was considered and an analysis was made of the speed of winds sweeping the sea and thereby generating waves.

The characteristics of the waves attacking the project ports are as follows:

### [1] Port of Algiers

N to E waves of 0.5 m or more in height attacking the entrance of the Port of Algiers have a frequency of 6.1% and ENE directions prevail. The frequency of occurrence of waves of 1.0 m or more in height is only 1.0% and N to NE waves are prevalent, but NE waves occur with a slightly higher frequency.

### [2] Port of Oran

In the Port of Oran, N to E waves occur with a frequency of 11.3% and the N waves account for a majority of the waves. NNE to E waves represent a minimal percentage.

### [3] Port of Annaba

In the Port of Annaba, the N-E waves occur with a frequency of 17.5% and high waves above 1.0 m have a frequency of 8.7%, a higher value than in the other two project ports.

In terms of the direction of advance, the waves coming from the NNE direction are slightly more prevailing than waves from other directions, but in the entire N to ENE range high waves are observed.

 (Wave orientation and height computed from the  
 analysis of wind speeds, on the basis of wind  
 data for each area in 1988 - 1990)

## (2) Incoming Waves in Case of Exceptional Situation

### 1) Estimation of Deepwater Waves

Estimation of Deepwater Waves to serve the purpose of breakwater and seawall designs, analysis was made of the maximum deepwater waves attacking the project ports of Algiers, Oran and Annaba. In the analysis, the waves were estimated by the method illustrated in Fig.2.3.7.

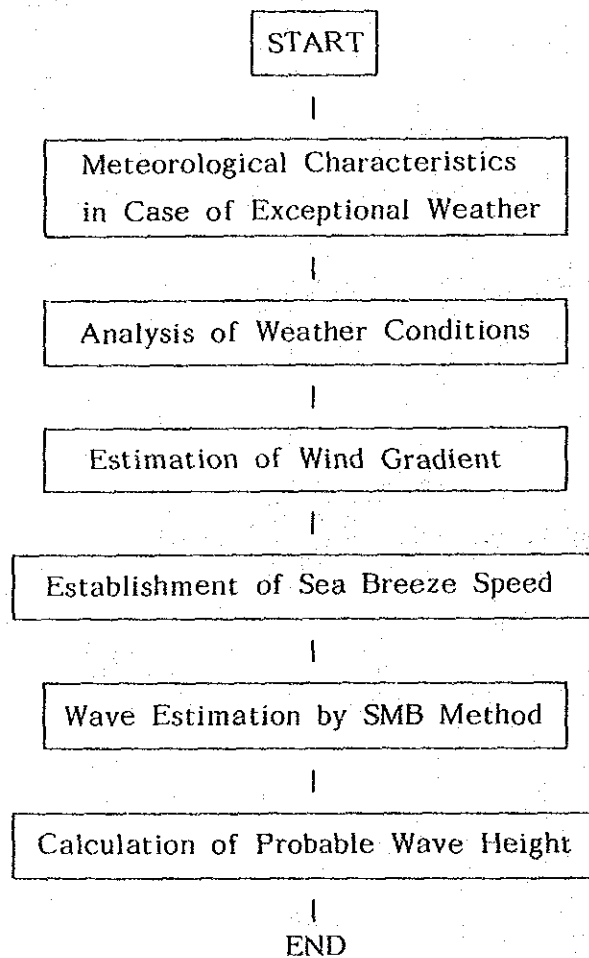

Fig. 2.3.7 Process of Wave Estimation and Analysis

The establishment of weather conditions and of the speed of the sea breeze was a key factor in estimating the maximum deepwater wave. For the weather conditions, the meteorological characteristics of the project ports were analyzed by the use of exceptional weather maps available and the data of Table 2.2.5 listing exceptional weather conditions during the 1898-1991 period. In addition, evaluation was made of the basic conditions for wave estimation, such as the direction of the sea breeze and travel speed of atmospheric pressures.

For the establishment of the sea breeze speed, analysis was made of the conversion factor for wind, gradients wind speed and duration and other factors based on the analysis of the weather conditions of the Japan Sea, located at similar latitudes to those of the Mediterranean, as well as analysis of the wave observation data obtained during exceptional weather. After the analysis specific conditions for estimation of the maximum deepwater wave were examined.

Table 2.3.4 gives the results of the deepwater wave estimation.

Table 2.3.4 Wave Estimation Results  
(Max. Wave Height)

		1965-1991							
		Oran-Port		Algiers-Port		Annaba-Port

7		—————		—————		NE	5.1 (1991.10.20)	9.0	

## 2) Analysis of Probable Wave Height

On the basis of the estimation results of Table 2.3.4 calculation was made of the probable deepwater wave heights for the three project ports. The calculation results are given in Table 2.3.5.

Table 2.3.5 Calculation of Probable Deepwater Wave Parameters

Return Period (Year)	Algiers Port		Oran Port		Annaba Port	
	Height (m)	Period (sec)	Height (m)	Period (sec)	Height (m)	Period (sec)
100	9.8	12.5	9.9	12.8	10.1	12.3
70	9.4	12.2	9.6	12.5	9.5	11.9
50	8.9	11.8	9.3	12.3	9.0	11.6
40	8.6	11.5	9.1	12.1	8.6	11.3
30	8.1	11.2	8.8	11.8	8.1	11.0
25	7.8	10.9	8.6	11.6	7.8	10.8
20	7.4	10.6	8.4	11.4	7.4	10.6
15	6.8	10.2	8.0	11.1	6.9	10.2
10	5.9	9.4	7.3	10.4	6.2	9.7

#### 2.3.4 Littoral Drift

Detailed observations of littoral drift have not been undertaken in and around the port of Algiers, Oran and Annaba. As the only exception, however, there have been available the results of a qualitative littoral drift analysis covering the area adjacent to the entrance to the Port of Annaba. Fig.2.3.8 gives the results of the analysis.

With respect to the three project ports, our preliminary assessment of such potential sources of littoral drift, as the sea bottom configurations, type of bottom material, discharging rivers, current speed and direction, and wave characteristics have not indicated any possibility of serious littoral drift taking place in the inner harbors or in the vicinity of the harbor entrances. Except part of a curved shoreline in the Port of Annaba running southeast where a small amount of drift sand was visible, the coastal areas of the three ports seem to be free from littoral drift and generally in a very stable condition.

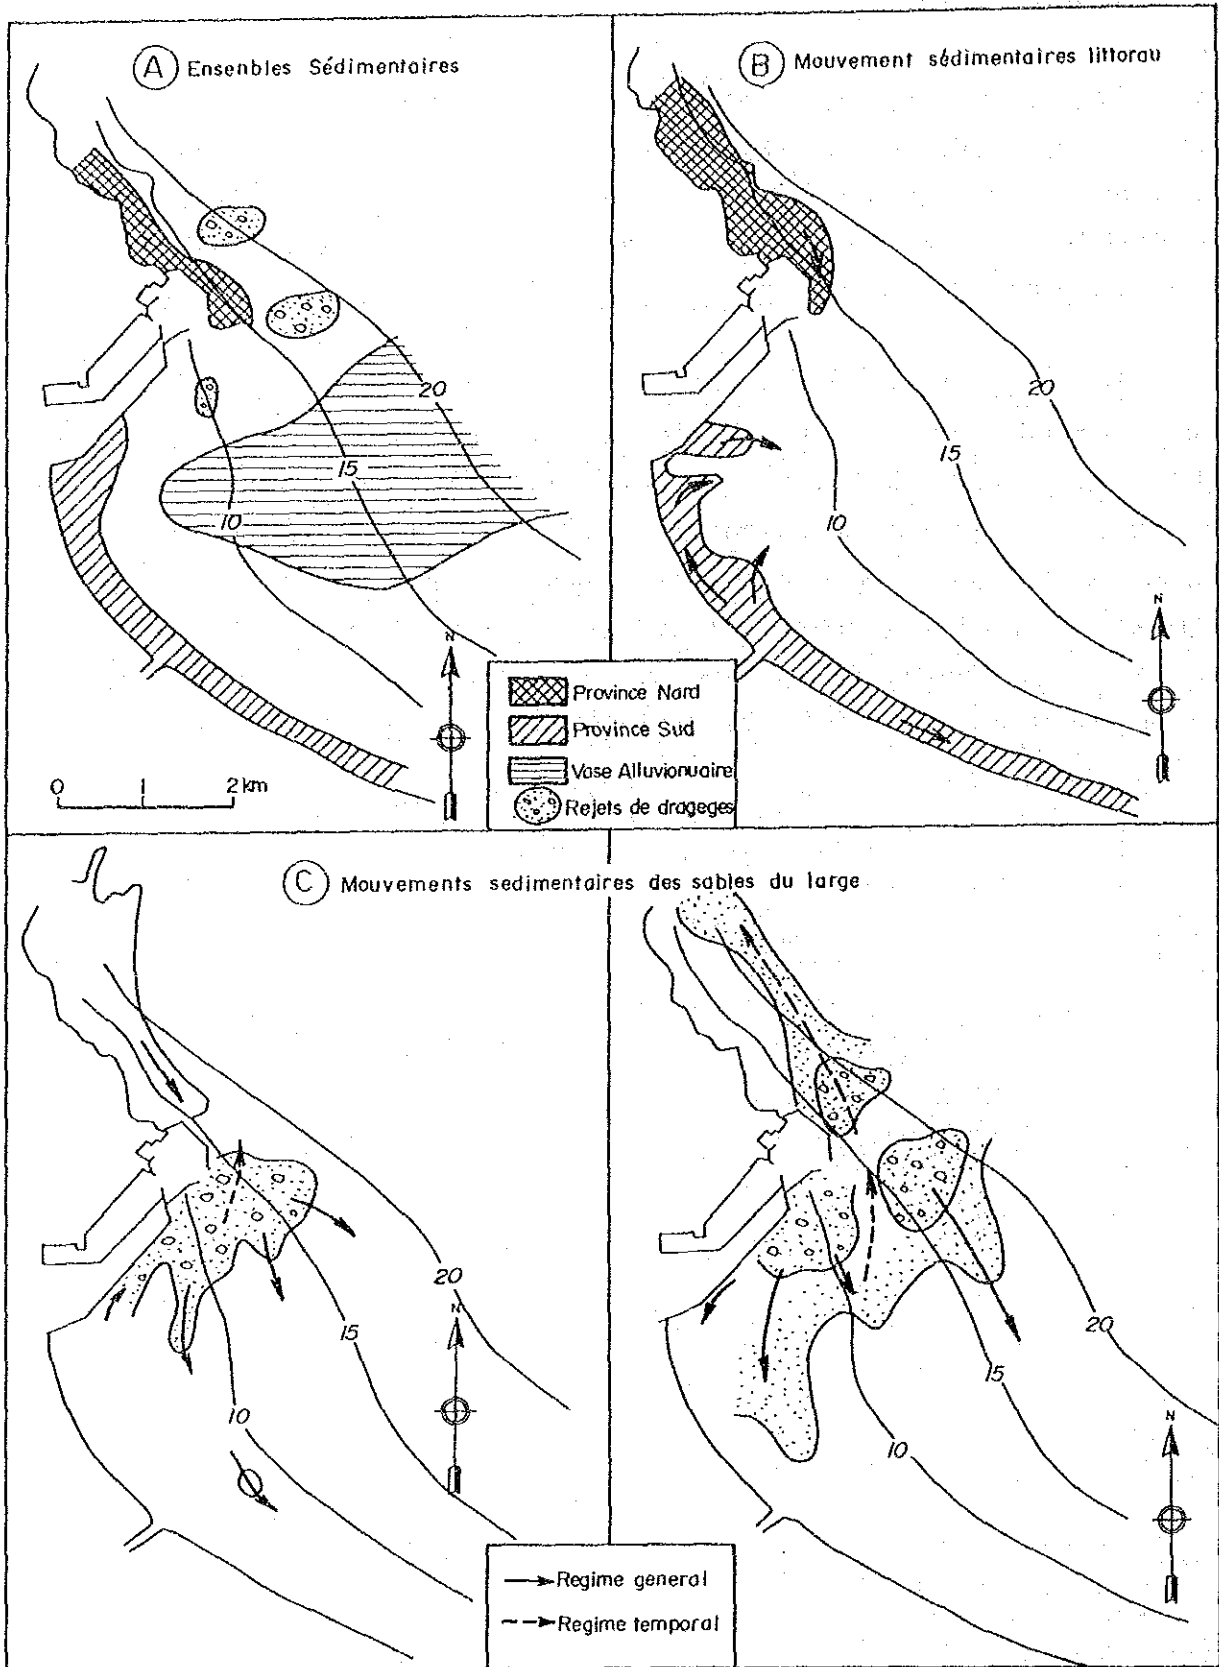

Fig. 2.3.7 Littoral Drift of the Annaba Port Area

## 2.4 Geological investigation

### 2.4.1 General

The geological conditions at the three project sites of interest have been inquired by a series of cored drillings of the sea bottom, carried out in the period from October 1991 to February 1992. The purpose was to examine the foundation conditions of the port facilities to be designed for the development of the ports of Algiers, Oran and Annaba. The work was planned as follows:

Table 2.4.1 Drilling data

Location/Hole nr.		Depth (m from the sea floor) Tests	Nr.of Standard Penetration laboratory	Nr of samples tested in the
Algiers	S1	18	4	6
	S2	19.5	1	4
	S3	24	1	6
Oran	S1	15	4	8
	S2	13.5	5	7
	S3	13.5	3	5
Annaba	S1	46	13	7
	S2	31.5	4	7
	S3	37	8	4
Total	9	218 m	43	54

The drilling has been done by the Algerian contractor SONATRAM using a drilling machine of hydraulic rotary type, made by Wirth, in Germany, for operation on and under water.

In the case of Algiers and Annaba the drilling has been done from a floating drilling platform. The latter is supported by 4 legs, 19 m long.

The length of the legs limits the use of the platform to a water depth less than 15 m. The legs are manipulated by air compressors and using thick steel cables. Furthermore there is a hydraulic power source and a water pump on the platform, which were both coupled to the drilling machine. The core samples have been taken with a wire-line type, double core barrel, 117 mm in exterior
