PACIFIC CONSULTANTS INTERNATIONAL

PREFACE

In response to a request from the Government of the Kingdom of Nepal, the Government of Japan decided to conduct the Study on Tribhuvan International Airport Modernization Plan in Nepal and entrusted the study to the Japan International Cooperation Agency (JICA).

JICA sent to Nepal a study team headed by Mr. Shota Morita, Pacific Consultants International, four times between July, 1993 and March, 1994.

The team held discussions with the officials concerned of the Government of Nepal, and conducted field surveys at the study area. After the team returned to Japan, further studies were made and the present report was prepared.

I hope that this report will contribute to the promotion of the project and to the enhancement of friendly relations between our two countries.

I wish to express my sincere appreciation to the officials concerned of the Government of the Kingdom of Nepal for their close cooperation extended to the team.

June 1994

Kenzn

Kensuke Yanagiya

President Japan International Cooperation Agency

June 1994

Mr. Kensuke Yanagiya President Japan International Cooperation Agency Tokyo, Japan

Dear Mr. Yanagiya

Letter of Transmittal

We are pleased to submit to you the final report on the Study of Tribhuvan International Airport Modernization Plan in Nepal.

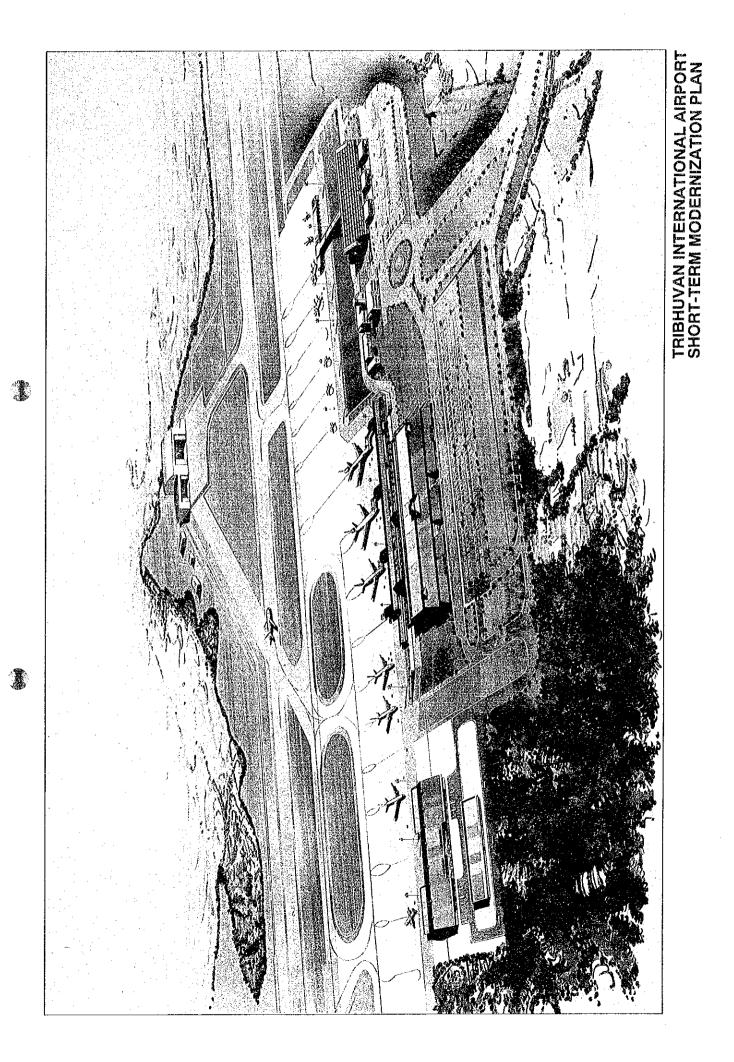

This study has been conducted by Pacific Consultants International based on a contract with JICA, from July 1993 to June 1994. Throughout the study, we have taken into full consideration the present situation of Tribhuvan International Airport and have recommended that His Majesty's Government of Nepal implement this project as a top priority.

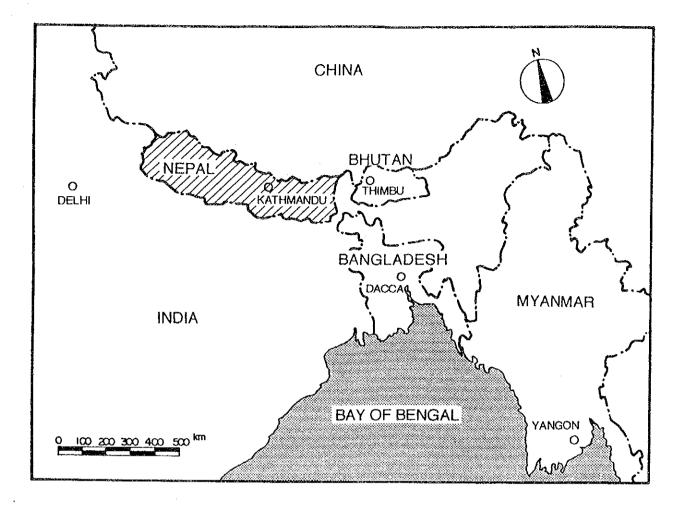

We wish to take this opportunity to express our sincere gratitude to your Agency, the Ministry of Foreign Affairs, the Ministry of Transport. We also wish to express our deep gratitude to the Ministry of Tourism and Civil Aviation and other authorities concerned of the Kingdom of Nepal for the close cooperation and assistance extended to us during our study.

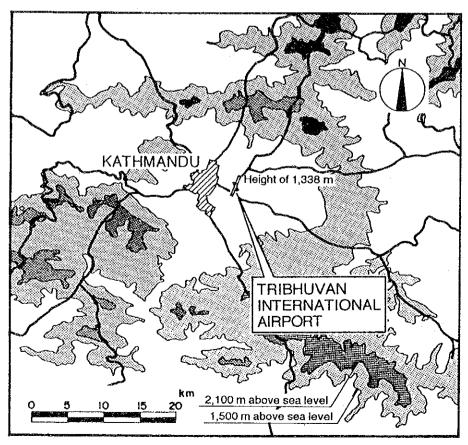

Finally, we hope that this report will be effectively used for the development of Tribhuvan International Airport.

Very truly yours,

Shota Mprita Team Leader Study for Tribhuvan International Airport Modernization Plan Pacific Consultants International

MODERNIZATION PLAN

IN

NEPAL

SYNOPSIS

Background and Objectives of the Study

1

a. Nepal is an inland and mountainous country which possesses the highest peaks of the world. Due to its mountainous terrain and landlocked geographical features, the road system is still underdeveloped.

Thus air transport has a vital role in the national transportation system not only for passengers, but also for freight, both internationally and domestically.

The Tribhuvan International Airport (hereinafter referred to as TIA), which is sited at Kathmandu, the capital of Nepal, is the only international gateway of Nepal and also the central hub of domestic air transport in Nepal. The airport has a 3,050 meter-long runway, and is at an altitude of 1,300 meters.

In recent years, the demand for air transport in Nepal has been increasing steadily. TIA handled 780 and 292 thousand passengers for international and domestic flights respectively in 1992. This implies the urgent necessity of improvements to the airport capacity because of the age and narrowness of the airport facilities.

As mentioned above, TIA is located in the severe Himalayan natural features. This condition gives restraints to aircraft operations and also hinders the regular performance of navigation aids.

Thus the current TIA is not fully equipped with the airport facilities which are expected to be installed in modern international airports, particularly with respect to aeronautical navigation systems.

Under this situation, two air crashes occurred on the peripheral mountains of the Kathmandu valley in 1992.

- b. The objectives of the Study are summarized as follows:
 - formulation of a master plan for the modernization of air safety improvement and ground facilities improvement of TIA for the target year 2010
 - conduct of a feasibility study for the short-term modernization plan of ground facilities improvement for the year 2003
 - conduct of a technical study for an urgent project of air safety improvement

1

2 Airport Modernization Plan

The Airport Modernization Plan, which is the airport master plan of TIA for the target year 2010, consists of the Ground Facilities Improvement Plan and the Air Safety Improvement Plan.

- 2.1 Ground Facilities Improvement Plan
 - (1) Short-term Modernization Plan
 - Construction of a new apron for B747 class aircraft
 - · Construction of a maintenance hangar with a maintenance apron
 - Construction of an isolated aircraft parking position
 - Construction of a perimeter road, security fence, terminal road and carpark
 - Construction of a new international terminal building
 - Construction of a new cargo terminal building
 - · Renovation of the existing international terminal building for domestic use

(2) Long-term Modernization Plan

- Expansion of the passenger terminal apron
- Expansion of the international terminal building
- Expansion of the cargo terminal building
- Expansion of the maintenance hangars
- (3) Ultimate Modernization Plan
 - Expansion of the runway strip width
 - Construction of a parallel taxiway with a minimum separation distance with the runway
 - Expansion of the apron and the terminal buildings
- 2.2 Air Safety Improvement Plan
 - (1) Urgent Plan
 - Installation of ASR/SSR at TIA
 - Installation of an additional SSR to complement the coverage of ASR/SSR
 - Improvement of the communication system for radar operations
 - Installation of Localizer type Directional Aids (LDA) with DME
 - Improvement of CATC
 - Establishment of skill evaluation, rating and a licensing institution for air traffic controllers
 - Establishment of technical skill evaluation for maintenance staff

(2) Short-term Modernization Plan

- Installation of Circling guidance lights (CGL)
- Extension of ATIS coverage
- Replacement and rearrangement of the current meteorological observation equipment with an automatic system
- Replacement of the current Semi-automatic Message Switching System (MSS) with an Automatic Message Switching System
- Others

(3) Long-term Modernization Plan

- Runway lead-in lighting system
- Replacement of the existing system, such as HF, VHF transmitter/receivers, ATS console and VOR/DME due to their age
- Provision for en-route air traffic control due to air route re-structuring at the time of increased traffic volume

2

- Provision for a Microwave Landing System (MLS)
- Provision for an Aeronautical Mobile Satellite Service (AMSS), Automatic Dependent Surveillance (ADS) and Global Positioning System (GPS)

(4) Human Resources Development Plan

In order to cope with operation and maintenance of modern airport facilities and systems, the human resources should be developed well.

The human resources development plan for newly introduced equipment (Radar and LLZ/DME) consists of four phases to meet the sequence from preparation till operation.

2.3 Overall Airport Modernization Plan

The Overall Airport Modernization Plan was established based on the Ground Facilities Improvement Plan and the Air Safety Improvement Plan.

2.3.1 Overall Airport Modernization Plan

The airport modernization plan was established as a master plan for current improvements and future development so as to satisfy traffic demands and technical requirements and to be compatible with the environmental condition for the year 2010 and beyond.

The outline of the plan is as follows;

a. annual passengers

b. annual cargo

- c. annual aircraft movement
- d. target aircraft operated

e. major works

taxiway

apron

2.49 million (1.94 (Int'l) 0.55 (Dom)) 54,000 ton (52,000 (Int'l) 2,000 (Dom)) 29,000 (12,000 (Int'l) 17,000 (Dom)) B747 class

construction of exit taxiways

construction of 11 stands for international aircraft with:

2 for B747 classes

6 stands for domestic aircraft 3 stands for helicopters 6 parking stands for HS748 class

passenger terminal building

construction (floor area: 33,000 sq.m for international passengers)

renovation (floor area: 10,750 sq.m for domestic passengers, converted from the current Int'l PTB)

cargo terminal building

construction (floor area: 10,700 sq.m)

air navigation systems

installation of ASR/SSR, additional SSR, LDA/DME, CGL, etc.

As for the ultimate airport modernization plan beyond the year 2010, widening of the runway strip from 150 m to 300 m and shifting of the parallel taxiway are planned to meet with technical requirements.

2.3.2 Short-term Modernization Plan

The short-term plan consists of the higher necessity and urgent programs. The scope of the short-term modernization plan for the target year 2003 is summarized as shown below;

a.	annual passengers	1.85 million	(1.43 (Int'l)	0.42 (Dom))
b.	annual cargo	38,000 ton	(36,000 (Int'l)	2,000 (Dom))
с.	annual aircraft movement	28,000		17,000 (Dom))
d.	target aircraft operated	MD11 class		
e.	major works	1		

international terminal building

domestic terminal building

cargo terminal building taxiway

aprons

roadways and car parks

other civil words

new construction with 25,000 sq.m floor area

renovation of the current international PTB with 10,750 sq.m floor area

new construction with 7,500 sq.m floor area construction of exit taxiways

expansion of international and domestic aprons

construction of maintenance apron and isolated parking apron

expansion and construction for 1,020 lots with a circulation road

construction of security fence and service roads

3 Feasibility Study of the Short-term Modernization Plan

- 3.1 Implementation Schedule and Project Cost
 - a. The implementation schedule is summarized as follows;

		1995
engineering services for detailed design/tendering	:	1996 - 1997
construction	:	1998 - 2000

b. The project cost is as follows;

item	cost (million US \$)					
	local portion	foreign portion	total			
civil works	6.1	21.4	27.5			
architectural works	10.2	80.7	90.9			
airport utilities	0.6	3.8	4.4			
others	0.1	1.8	1.9			
physical contingency	1.7	10.8	12.5			
engineering services	1.4	12.3	13.7			
total	20.1	130.8	150.9			

4

3.2 Evaluation

From the technical point of view, the short-term plan is selected and planned to meet with the required technical standards and the level of services.

The environmental considerations reveal there will not be any serious impact from the plan on the surrounding area of the airport. However attention will be paid to aircraft noise in the future so as to keep in harmony with the local communities.

The economic and financial studies show the total viability by the following indexes;

EIRR	17.1 %
NPV	Rs. 2,400 million
B/C	1.47
FIRR	- 6.2 % (base case)

The results of the economic analysis are favorable. On the other hand, the results of the financial analysis (for the base case) are not optimistic.

Although a separate study should be considered for the increase of the revenue by making changes in the airport charges, this Project (the airport facility as an important transport infrastructure) gives benefits to the national economy for the increase of foreign income and the conveniences for the air travel of the Nepalese; when evaluated from an overall viewpoint its implementation can be considered to be adequate from the economic and financial stand.

4 Technical Study of the Urgent Project

4.1 The purpose of the Urgent Improvement Plan is to establish the system to prevent the recurrence of an aircraft accident. The work items to be implemented urgently was selected as the Urgent Project due to the longer time required for manufacturing and installation than other items. As the result, the following items were selected as the Urgent Project among the Urgent Improvement Plan:

- Installation of a radar
- Construction of a radar operation building
- Construction of a training center and installation of training equipment

Basic Design was carried out for system design and facility planning prior to the detailed design of manufacturing of the equipment and construction.

4.2 The project cost is as follows;

- ASR/SSR and training facility:	26,000 thousand US dollar
- Construction of radar operation building	ng
and other buildings:	5,000
- Others:	3,000

4.3 The human resources development plan for the operation and maintenance of the Project was established, as the radar system will be introduced at first in Nepal, and the healthy operation will rely on the staffs in charge.

5

5 Conclusions and Recommendations

5.1 Conclusions

Through the Study, it is confirmed that the Short-term Modernization Plan is feasible from the technical, environmental and economic/financial viewpoints. Furthermore, it is confirmed that the Urgent Project is technically feasible through the technical evaluation.

As a whole, the Short-term Modernization Plan and the Urgent Project will also contribute to enhance and improve the following performances in the national and regional fields, even though these values are intangible in the analysis.

a. improvement of air safety

b. enhancement of comfort of airport users by solving congestion and improving services c. promotion of exports and imports

d. enhancement of domestic air transport and improvement of domestic air transport safety e. modernization of Nepalese air transport

5.2 Recommendations

a. For implementation of the project, the following are recommended.

- national and regional consensus
- preparatory and coordination works between the parties concerned
- financial arrangements
- b. The Urgent Improvement Plan of TIA aims particularly at easing the work load of a pilot who is seriously kept busy in maintaining the aircraft position during approaching, and at giving precise information of an aircraft position to an air traffic controller for more secured control. Thus the plan is very important to be achieved, because of recovering the air safety of TIA and showing the quick effect of air safety.

Therefore it is quite necessary to achieve the plan as soon as possible.

The Urgent Project has been implemented as the first stage of the plan, since the diplomatic note on the detailed design of the radar system and other facilities was exchanged between Nepal and Japan on January 1994.

The Project was selected in the urgent improvement plan taking into account the rather long period of the production of radar system and the construction of the concerned buildings, which is estimated to govern the overall project period. Therefore ASR/SSR and the training facility are expected to be completed as the first stage. And the succeeding installation of the additional SSR and LDA/DME and also the improvement of CATC as the second stage of the plan will fully complete the object.

c. Human resources development

In accordance with the airport's modernization, new and modern systems and equipment are planned to be introduced. This implies the necessity of higher handling capabilities so as to support these modernized systems in airport operations and management. Therefore human resources development is strongly requested.

To develop the necessary human resources by themselves in Nepal is a primary policy. However it will be expected to utilize international technical assistance at the beginning of the development so as to accelerate the process. As CATC is the core institute of human resources development, it is strongly expected that they improve and strengthen their conditions.

d. Radar approach control

As a radar system will be introduced for the first time to Nepal, the radar service is planned to start by monitoring aircraft and then to change to full scale radar control with confirmation of the requisite conditions of (a) getting fully familiar with the operations and techniques by the Nepalese staff, (b) sufficient and adequate training for the staff and (c) satisfactory radar coverage.

The transition should be affirmatively and steadily done by spending sufficient time for familiarization and by utilizing international technical assistance fully.

e. Operation and maintenance of radar

It is clearly required for the radar system to be kept in a good condition by regular maintenance. To ensure this, it is strongly recommended that to secure the number of staff required, to train them well and to provide an adequate budget to sustain these.

1. BACKGROUND AND OBJECTIVES OF THE STUDY

(1) Nepal is an inland country bordered by China and India, and is also a mountainous country which possesses the highest peaks of the world. The total land area is 147,000 km² and the population of 19 million (in 1992) is widely spread over the land.

Due to its mountainous terrain and landlocked geographical features, the road system, which needs high construction costs, is still underdeveloped. Thus air transport has a vital role in the national transportation system not only for passengers but also for freight, both domestically and internationally.

The industrial structure also indicates that the country is still in the initial stage of economic transition with agricultural shares of 60% in production and 90% in the number of workers. His Majesty's Government of Nepal recognizes that the diversification of the country's industrial structure, particularly towards an outward foreign exchange earning economy, is essential for sustainable growth, and emphasizes that tourism development is to be pursued in its Eighth Plan (1992~1997).

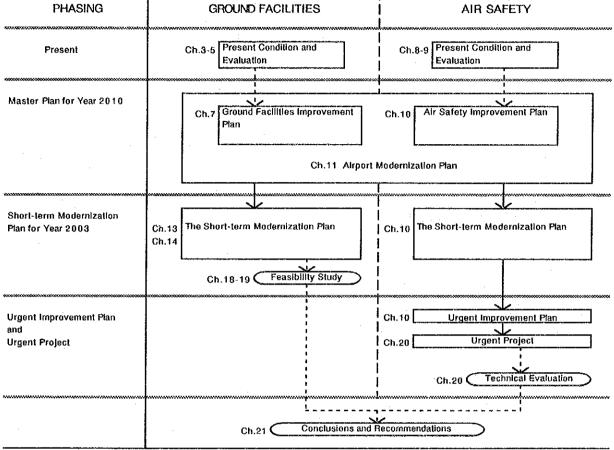

The tourism industry has been growing fast and has now become the highest foreign exchange carner. Two air crashes in the peripheral mountains of the Kathmandu Valley in 1992 will likely impact tourism adversely unless immediate measures are taken to create a positive image of TIA.

(2) The Tribhuvan International Airport (hereinafter referred to as "TIA"), which is sited at Kathmandu, the capital of Nepal, is the only international gateway of Nepal and also the central hub of air transport in Nepal. In recent years, the demand for air transport in Nepal has been increasing steadily. TIA handled 780 and 292 thousand passengers on international and domestic flights respectively in 1992. Particularly it shows the high growth in international transport, such as 25% and 10% increases in the annual number of passengers and cargo respectively between 1987 and 1992. This shows the urgent necessity of improvements to the airport capacity because of the age and narrowness of the airport facilities.

As mentioned above, TIA is located in severe Himalayan natural features. This condition limits aircraft operations and also hinders the regular performance of navigation aids. Thus TIA does not have the kind of airport facilities which are expected to be installed in modern international airports, particularly in respect to aeronautical navigation aids.

- (3) Because of the above reasons, the modernization of the Tribhuvan International Airport, and particularly the improvement of the air navigation and air traffic control systems, is a matter of urgency and necessity. For this purpose, a comprehensive study needs to be carried out as the accelerating step towards the project implementation.
- (4) The objectives of the study are summarized as follows:
 - 1) Formulation of a Master Plan for the modernization of air safety improvement and ground facilities improvement of TIA for the target year 2010
 - 2) Conduct of a feasibility study for the Short-term Modernization Plan targeting year 2003
 - 3) Conduct of a technical study for an Urgent Project of air safety improvement.
 - 4) Conduct of technology transfers in and through the course of the Study.

(5) Figure 1.1 shows the work flow of the Study. Major work items are indicated with the related chapter in the Main Report.

Ch. : Chapter in the Main Report

2. AIRPORT MODERNIZATION PLAN

The Airport Modernization Plan, which is the airport master plan of TIA for the target year 2010, consists of the Ground Facilities Improvement Plan and the Air Safety Improvement Plan.

2.1 Ground Facilities Improvement Plan

2.1.1 Outline of the Existing Tribhuvan International Airport

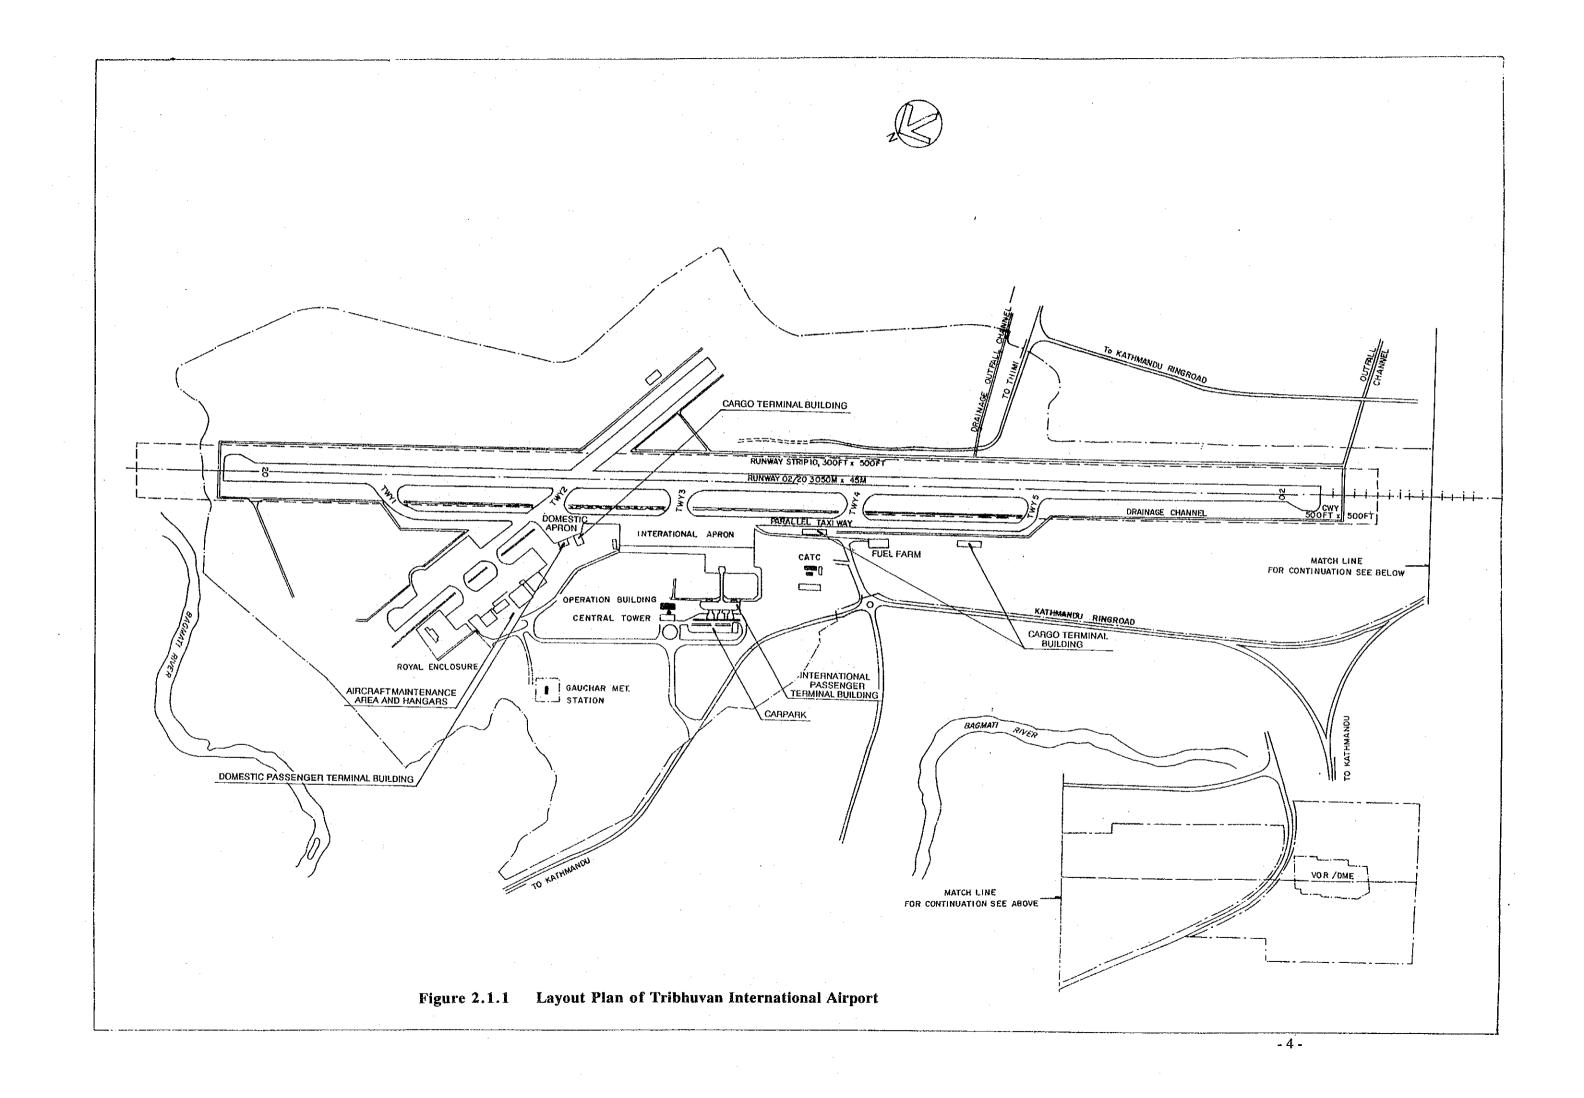

The major facilities of the airport are summarized as follows:

Runway :	3,050 m x 45 m
Runway Strip :	3,140 m x 150 m
Taxiways :	Partial parallel taxiway
Apron :	International apron (6 aircraft stands), Domestic apron (5,640 sq.m), Maintenance apron, and VVIP apron
Buildings :	International passenger terminal building Domestic passenger terminal building Cargo terminal building Operation/airlines building
Air navigation systems :	DVOR/DME, NDB (Locator), Fan marker beacon, ALS, PAPI, Sequence flash light system, Runway threshold lights, Runway edge lights, Taxiway edge lights, Apron flood lights, Aerodrome beacon, ATS direct speech, HF, VHF, Semi automatic message switching system, Illuminated wind direction indicator, etc.

The air traffic at TIA in 1992 is listed below:

International passengers :	780,297
Domestic passengers :	292,137
International freight :	15,833 ton
Domestic freight :	680 ton
International aircraft movements :	7,597
Domestic aircraft movements :	16,991

A layout plan of the existing airport is shown in Figure 2.1.1.

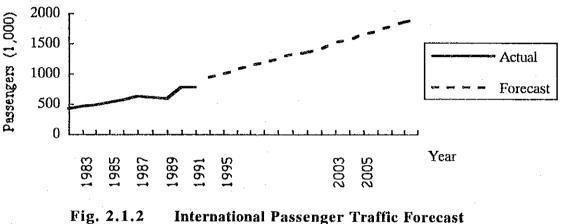

2.1.2Air Traffic Demand Forecast

For the annual air traffic demand forecasts at Tribhuvan International Airport, the forecast years are 1995, 2000, 2003, 2005 and 2010 covering the following categories:

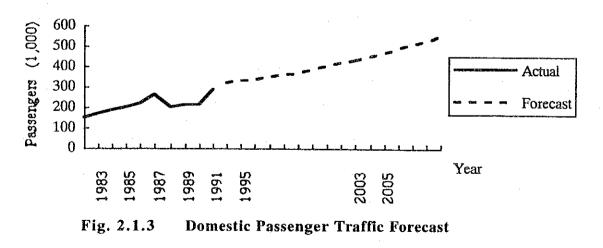

- International passengers
- **Domestic** passengers
- International cargo
- Domestic cargo
- Aircraft movements

The forecast method is the regression analysis using the economic indices of GDPs in the related countries/areas as explanatory values.

The future international air passenger traffic demand is shown in Fig. 2.1.2.

The future domestic air passenger traffic demand is shown in Fig. 2.1.3.

The future international air cargo traffic demand is shown in Fig. 2.1.4.

- 5 -

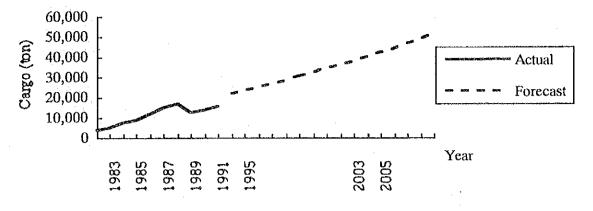

Fig. 2.1.4 International Cargo Traffic Forecast

The future domestic air cargo traffic demand is shown in Fig. 2.1.5.

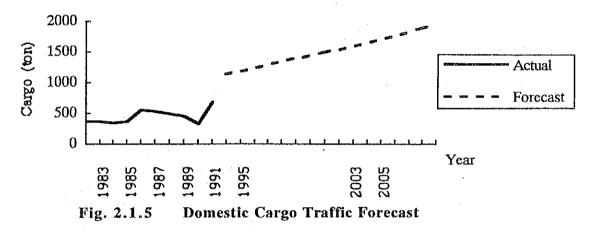

Table 2.1.1 shows the summary of air traffic demand forecasts on an annual basis. The breakdown of the annual traffic demand into a design basis is made. Table 2.1.2 shows the summary of future aircraft movements by planning year.

Year	International	Domestic	International	Domestic
	Passengers	Passengers	Cargo	Cargo
	(1,000)	(1,000)	(ton)	(ton)
1995	940	320	21,850	1,130
2000	1,250	370	31,050	1,380
2003	1,430	420	36,410	1,530
2005	1,570	450	40,350	1,630
2010	1,940	550	51,600	1,940
(Annual Average				
Growth Rates)				
1995-2000	5.9%	2.9%	7.3%	4.1%
2000-2005	4.7%	4.1%	5.4%	3.5%
2005-2010	4.3%	4.1%	5.0%	3.5%

2.1.3 Airport Facility Requirements

The facility requirements for Tribhuvan International Airport were established for the year of 1995, 2000, 2003, 2005 and 2010, and the results are summarized in Table 2.1.3. The facility requirements are estimated basically in compliance with the relevant standards and recommended practices of the International Civil Aviation Organization (ICAO). Those of the Federal Aviation Administration (FAA) of the United States, Japan Civil Aviation Bureau (JCAB) and International Air Transport Association (IATA) are also referred to in areas where the ICAO does not cover or where more practical planning is possible by using these standards.

2.1.4 Evaluation of the Existing Airport

Compared to the present conditions and the surrounding environment of TIA, the requirements for the facilities were analyzed and evaluated for planning.

Table 2.1.4 summarizes the comparison of the characteristics of the existing facilities and the ICAO recommendations. Table 2.1.5 shows the capacity of the existing airport facilities and future demands.

2.1.5 Ground Facilities Improvement Plan

(1) General

This section describes the airport master plan for ground facilities of Tribhuvan International Airport by studying the development policy for the future through the comparison study.

For establishment of the improvement plan for TIA, the following basic policies are taken into consideration:

- Maximum utilization of the terrace where the existing airport is situated in order to avoid a large amount of earth works for the expansion
- Staged implementation of the improvement so as to utilize the newly-built facilities as much as possible
- Maximum utilization of the existing facilities and setting up of a priority for each improvement works, considering financial constraints

Each facility improvement will be classified into the following stages.

Short-term Modernization Plan aiming at the year 2003 Long-term Modernization Plan aiming at the year 2010 Ultimate Modernization Plan for continuous development beyond the year 2010

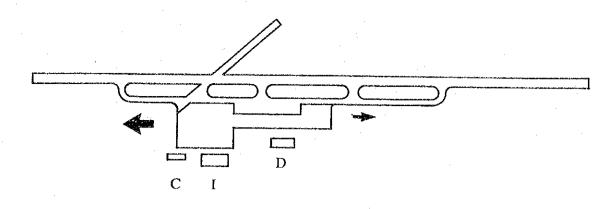

Terminal Area Development

(2)

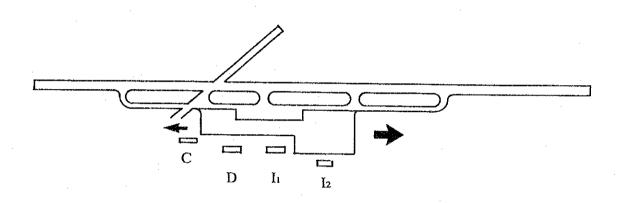

As the first step of the airport master planning for TIA, the location of the future terminal area development is studied. As alternative locations, the following three cases are established.

- Case 1: Developing the present terminal mainly to the north in order to accommodate large type of aircraft. The international terminal will be located at the northern part with the domestic terminal at the southern part.
- Case 2: Developing the present terminal mainly to the south. The international terminal will be located at the southern part and domestic terminal at the northern part.
- Case 3: Expanding the present international terminal for international use, and constructing a new remote terminal for domestic use.

The pros and cons are compared in Table 2.1.6. As a result of the comparison, the development to the north (Case-1) is selected as the best alternative.

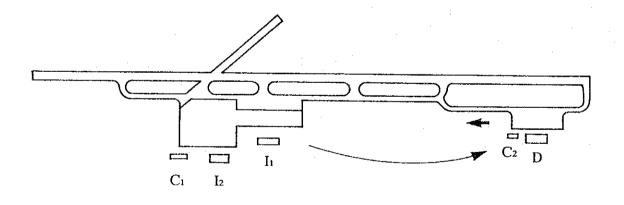

Case 3 Remote Terminal

International Passenger Terminal Domestic Passenger Terminal Cargo Terminal

I : D : C :

Alternative case		Case 2	Case 3		
	Northern Developm of Present Termina	ent Southern Development I of Present Terminal	Present Terminal + New Remote Termina		
Evaluation item			(Dom PTB or CTB)		
A. Convenience for Airport Users					
1. Passenger & Cargo					
1) Transfer between Int'l and Dom	- Good	- Good	X Poor		
2) Easy identification of PTB	- Good	- Easy	X Not easy		
3) Vehicle circulation on landside	- Simple	X Not simple	- Simple		
2. Airport Operation					
1) Vehicle circulation on airside	- Good	- Good	X Poor		
2) Flexibility of spot assignment	- Good & Easy	- Good & Easy	X Poor & Complicated		
3) Cargo handling & conveying	- Easy	- Easy	X Not easy		
4) Airport administration& security	- Easy	- Easy	X Not easy		
B. Expandability of terminal	- Easy and Compact	X Not difficult but more land aquisition needed	X Easy but inconvenience not improved		
C. Cost consideration	- Small volume of earth work	X Medium volume of earth work	X Large volume of earth work		
Total Evaluation	0	3	8 3		

Table 2.1.6 Comparison of Terminal Area Developments

(3) Terminal Area Layout Planning

Based on the selected case of the terminal area development to the north, the basic configuration of aprons is defined as follows:

- The northern portion of the aprons will be for international use because of the long depth
- The southern apron will be the domestic use

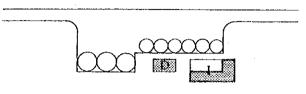

There are three alternative terminal layout plans as shown in Figure 2.1.7 taking into account the full usage of the existing international terminal building.

CASE-A : In this case the present international terminal building will be expanded to accommodate the needs in the design year, with the domestic terminal building sited north of the international terminal building. Therefore the use of international terminal buildings and the international and domestic aprons will cross each other. Work for land fill will be necessary to construct a flat area for the expansion.

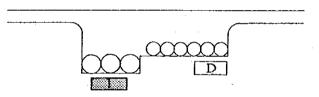

- CASE-B : In this case the present international terminal building will be converted to a domestic terminal building. A new international passenger terminal building will be constructed north of the domestic terminal building.
- CASE-C : In this case a second international terminal building will be constructed to accommodate the excess demand which the present international terminal building cannot handle. Therefore the domestic terminal building will be sited between the two international terminal buildings.

Features of each alternative above are compared in Table 2.1.7. As the result of the comparison, CASE-B is selected as the best concept of the layout plan.

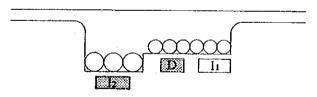

Case - B

Case - C

2.2 Air Safety Improvement Plan

2.2.1 Present Condition of Air Safety

- (1) Air Navigation System
 - a) Air Traffic Control System

Air traffic control facilities at TIA are specified into two major functions, ACC and Control Tower.

The ACC has the responsibility to provide an air traffic control and information service within the KTM FIR. The service area of ACC is divided into two sub sectors, East and West. The ATC tower is in charge of approach control, aerodrome control and surface movement control at TIA.

b) Radio Navigation System

Major radio navigation aids currently installed at TIA are DVOR/DME, NDB, locators, fan marker beacons, etc. They are provided at preferable sites complying with the instrument approach procedures and the standard instrument departure procedures of the airport.

The replacement of DVOR/DME, which has been providing the major navigation service at TIA, is in progress by the Navigation Aids Project offered by the Australian Government.

c) Aeronautical Telecommunication Systems

Aeronautical Telecommunication Systems are specified into two categories by system function as an aeronautical fixed communication service and a mobile service.

a Aeronautical Fixed Communication Service

A point to point aeronautical telecommunication network and circuit are established at TIA by means of radio links, land lines and HF radio.

i) International Teletype Network (AFTN) and domestic teletype network

A semiautomatic teletype message switching system (MSS), processing with a 70 MB memory capacity, has been operated at the message switching center. A total of 16 lines, which are capable of handling messages from/to 13 input /output terminals and 3 receiving only terminals, are provided at ATS sections, the meteorological office, the briefing room, the airlines office and CAL.

Domestic teletype messages are provided by one of the MSS terminals which are installed at the Domestic Communication Center. This will be mentioned later,

ii) ATS Direct Speech

Since 1990, the Kathmandu/Calcutta and Kathmandu/Varanasi ATS voice communication circuits have been upgraded from HF voice communication to leased common carrier lines. However, the reliability of the line is low due to the poor local line quality. Some of the problems will be improved after the establishing of a UHF radio link between TIA and the Nepal Telecommunication Corporation (NTC) station which is being coordinated by the Australian Project.

iii) Domestic Radio Telecommunication

An HF radio telephone communication network is established between the Kathmandu Communication Center and thirty-two domestic airports. Two domestic HF communication centers controlling the eastern and western networks are located in the operation building. All domestic aeronautical information is handled here and relayed to the centers. Information is converted to teletype messages for the MSS at the center.

Aeronautical Mobile Service

b

i) International HF Mobile Service

SEA-1 (1A) and MID-2 flight information services are provided. However, communication difficulties at night time are reported due to no optimum frequency assignment.

ii) HF Domestic Aeronautical Mobile Service

A flight information service is provided to domestic en-route flights with two HF frequencies. Communication difficulties at night and at twilight are reported due to in-adequate frequency assignment.

iii) VHF Aeronautical Mobile Service

A radio relay station is located on the top of Phulchauki mountain so as to establish satisfactory coverage for the VHF communications required for the ACC and RCC.

- d) Aeronautical Ground Light Systems
- a Types of lighting systems installed

The following aeronautical ground lighting systems are installed and operated at the airport.

- a. Precision Approach Light System (CAT -I) (RWY 02)
- b. PAPI (RWY 02 and 20)
- c. Sequenced Flash Light System (RWY 02)
- d. Runway Edge Light System (RWY -02 and 20)
- e. Runway Threshold Light System (RWY 02 and 20)
- f. Runway End Light System (RWY -02 and 20)
- g. Runway End Identification Light System (RWY 20)
- h. Taxiway Edge Light System
- i. Taxiway Guidance Light System
- j. Illuminated Wind Direction Indicator
- k. Apron Flood Light System
- I. Acrodrome Beacon

b Power supply

There are three substations for the lighting systems. The first one is located in the main substation named P0. The second one, located at the south end of the runway, is named P1 and the third, P2 is at the north end of the runway.

The two main transformers are specified as 380V/5.5 KV, 3-phase, 250 KVA and are installed in the substation P0. The power supply to each substation is distributed by a 5,500V link distribution system.

c Control system

All aeronautical lighting systems are remotely controlled by a control console installed in the control tower. Remote control relay panels are installed in each substation and connected to the console by control cables.

- (2) Human Resource Development
 - a) Outline of current training courses

The following training is provided at the Civil Aviation Training Center (CATC):

Courses	Training Period
Work shop seminar	3 to 4 days
Aviation security for junior police	16 days
Aviation security for senior officers	4 weeks
Air Traffic Control officer refresher course	7 weeks
Technical officer refresher course	6 weeks
Conversion from communication officer	
to ATC officer	23 weeks
Basic ATC officer	16 months

2.2.2 Evaluation of Air Safety

- (1) Air Navigation System
 - a) Air Traffic Control System

The necessary improvements to the air traffic control system are as follows:

a. Introduction of an approach radar control service at Kathmandu TMA

Since an aircraft flying by instrument flight rules (IFR) in the Kathmandu control air space is controlled based on a procedural method, the flying position of the aircraft can be verified only by the controller's vision or position reports from the aircraft by means of radio communication.

In order to ensure safe operations even in poor weather conditions, visual verification of the aircraft's position for controllers by use of radar would be beneficial. A terminal radar system, therefore, should be introduced as soon as possible.

b. Expansion of radio service coverage

A transmitter should be provided for the exclusive use of ATIS at a suitable site such as the Mt. Phulchauki relay station.

b) Radio Navigation System

The following facilities should be improved in order to enhance the reliability of the system:

a. Only a VOR/DME is installed at TIA as guidance for an instrument approach. However, the accuracy of the system is not sufficient for final approach guidance to the runway.

Therefore, it would be desirable to install ILS at TIA which is the most accurate and easily-handled equipment at present. Although a glide path may not be applicable to TIA, because of the mountains intruding upon the glide slope angle, a localizer is established to be helpful to enhance the safety of approach aircraft to TIA.

Therefore, both guidance systems, not only LLZ/DME but also the current VOR/DME, are recommended so as to improve safety.

- b. Locators, East and South, are still operational, but they have already reached the end of their useful lifetime.
- c) Aeronautical Telecommunication Systems

The following systems should be improved to provide sufficient services and ensure the reliability of an aeronautical fixed communication service:

- a. HF communication should be replaced with another communication system due to the poor reliability of the system. The existing HF system will be retained only as a back-up system for aeronautical communications.
- b. The Message Switching System (MSS) does not have enough capacity in the system memory, and the function of the system is limited due to its semi-automatic nature. The implementation of an improved system is required to meet the completion of the fixed communication system development.
- c. A multiple network is required to ensure communication reliability.
- d) Aeronautical Ground Light Systems

All lighting systems operated at TIA follow the recommendations of ICAO Annex 14. However, guidance lighting systems for approach and departure to and from Runway 20 are not installed, which would be important and useful systems to ensure a circling approach course set up close to the mountains.

(2)Air Traffic Control Service

The one-way route system has been introduced to the ATS routes structure in the vicinity of TIA. However, due to the recent increase of aircraft operations to and from TIA, problems have arisen with this ATS route system especially on the inbound routes. In the Third ASIA/PACIFIC Regional Air Navigation Meeting of ICAO, recommendations for the revision of the one-way route system in the vicinity of major acrodromes, and the establishment of arrival and departure routes instead of the one-way routes system were accepted.

Therefore, to ensure the safe and expeditious air traffic flow, the existing one-way route system in the vicinity of TIA should be urgently modified to a two-way routes system.

Human Resource Development

The following points on the Human Resource Development are recommended.

CATC should be strengthened in terms of structure and equipment so as to develop the necessary training of DCA personnel. Improvement of the training environment should be promoted by relocation and construction of a training building with the necessary modern training facilities.

Instructors with the required technical levels should be maintained in sufficient numbers for CATC courses.

Personal records of OJT should be maintained so as to be utilized for their rating and technical ability evaluation.

2.2.3 Air Safety Improvement Study

(1)Study of ILS and LLZ Approach Procedures to RWY 02

a) ILS Approach Procedure

Installation of ILS for Runway 02 is not suitable since the GP angle 6°22'54" is too steep and not practicable for safe aircraft operations. An ILS approach with offset for Runway 02 was also studied. However, 7,500 feet AMSL class mountains still remain in the intermediate and final approach segments.

b) LLZ Approach Procedure

Since there is no suitable site for the installation of onset LLZ antenna for Runway 02, installation of an offset LLZ antenna is unavoidable; LLZ Approach Procedure were studied and a draft made. However, the slope of the final approach phase of this procedure is still steep due to obstacles located to the south of the airport.

(2)Study of IGS Approach Procedure to RWY 20

> It is considered that the establishment of a practical IGS approach procedure for Runway 20 is very difficult due to the many obstacles in the final approach area.

(3)

(3) Study of Approach Procedure Alternatives to the IGS Approach to RWY 20

The possibility to establish approach procedures for Runway 20 over the ravine were studied, and it is considered that the plans basically have the possibility to make safe aircraft operations provided that a new VOR/DME is installed at the point at approximately R-328/7.4 nm of KTM VOR/DME for the construction of a missed approach course.

(4) Study of Radar System

A terminal radar system consisting of an ASR/SSR is the most important element in the air safety improvement plan. At first, a radar system will be operated for the monitoring of approaching aircraft, and after the familiarization period, it will transfer to the full-scale control of the Kathmandu terminal control airspace.

a) Objectives of the radar approach control service

The objective of the radar approach control service in Kathmandu TMA is to provide a radar advisory service for approaching and/or departing aircraft at the starting stage.

b) Approach routes in Kathmandu TMA

The existing Sierra instrument approach procedure should be maintained even after the commission of the radar operation, because this is most familiar to the international airlines pilots and is the almost sole approach path to TIA.

Beside of the current approach route, new routes has been studied by the Nepalese authority to solve the concentration and the congestion of the traffic around Simara at present and in future, which is described in 2.2.2, by introducing the bi-directional routes and developing new approach routes between Sierra and Romeo fixes.

c) Required coverage for the terminal radar

The terminal radar must cover the approaching and arriving routes. On the basis of the above requirement, the Kathmandu terminal radar should cover the Sierra Approach Route. In addition to this, it is required to cover the east and the west approach routes which are planned to restructure the airspace use.

- d) Radar system
 - i) site of radar

Because of severe topographical condition of the Kathmandu Valley, there was no fully satisfactory site to cover the requirement of the radar performance. The airport site is most desirable for final approach control, but the radar is estimated to cover only within the valley. On the other hand, a radar on the top of a mountain can perform well above the altitude of the radar site but this cannot cover inside the valley, where TIA lies, due to the characteristics of the radio.

As the result of this study, the following both sites are necessary to satisfy the required radar coverage for terminal radar control.

- ASR/SSR at TIA
- an additional radar on the top of a mountain (such as Mt. Phulchouki)

- ii) radar configuration
 - a. To monitor and control all of arriving aircraft to an airport, it is necessary to install ASR/SSR at an airport, because of thicker traffic and handling aircraft without an equipped transponder.
 - b. As for an additional radar at a mountain top, there are two kind of systems; ASR/SSR or SSR.

Due to the current PANS-RAC (1985) of ICAO, SSR information without primary radar information shall not normally be used for the provision of separation to aircraft except as specified by Regional Air Navigation Agreements. Nevertheless, ICAO is on the way to revise the status of radar control by SSR to be more positive, based on the technology development and the advanced reliability of SSR equipment.

Mt. Phulchouki was selected as the best site when compared with other mountain sites. However, the area is quite limited for the construction of a structure, so that it would be difficult to construct both an ASR and SSR on this site. And at the altitude of SSR coverage (more than 9,000 ft), there will be less altitude change of approaching aircraft than at the lower altitude. And at this kind of altitude, as most of bigger aircraft are equipped with a Transponder, it is thought that it will be able to provide the separation by SSR, with the regular check of the SSR wave accuracy in the case of terminal radar control.

- c. Considering these conditions totally, SSR is planned for an additional radar on a mountain top of Mt. Phulchouki.
- e) Required procedure of SSR operation

According to the current PANS-RAC, it is required that this terminal radar system should be specified by Regional Air Navigation Agreements, after the authorization of the Nepal government and establishing the operation criteria.

- 2.2.4 Air Safety Improvement Plan
- (1) Phased Improvement

The Air Safety Improvement Plan has three phases as shown below:

- a) Urgent Improvement Plan with the top priority to improve the current condition of TIA
- b) Short-term Improvement Plan aiming at the year 2003
- c) Long-term Improvement Plan aiming at the year 2010
- (2) Air Safety Improvement Plan

The Plan consists of the following programs;

- a) Urgent Improvement Plan
 - Installation and operation of an Airport Surveillance Radar (ASR) supported by a Secondary Surveillance Radar (SSR) at TIA for approach monitoring and approach control
 - Installation of an additional SSR to complement the ASR/SSR coverage at TIA for aircraft surveillance

- Improvement of the communication system for radar operations
- Installation of Localizer type Directional Aids (LDA) with collocated Distance Measuring Equipment (DME)
- Improvement of CATC, including buildings and equipment for practical training
- Establishment of a skill evaluation, rating and licensing institution for air traffic controllers to conform to the ICAO recommendations
- Establishment of technical skill evaluations for maintenance staff
- b) Short-term Improvement Plan
 - Extension of ATIS coverage
 - Replacement and rearrangement of the current meteorological observation equipment with an automatic system
 - Replacement of the current Semi-automatic Message Switching System (MSS) with an Automatic Message Switching System
 - Communications network improvement for both the domestic teletype network and international AFTN simultaneously.
 - Packet switching with an open system interconnection (OSI) model
 - Optimum frequency allocation for HF fixed and mobile services and replacement of antenna with a suitable antenna system
 - Replacement of East and South Locators
 - Establishment of an ATS direct speech circuit between Kathmandu and domestic major airports / international airports by means of a communication satellite microwave radio link
 - Establishment of a domestic teletype network by means of a satellite microwave radio link instead of the existing HF point to point communications
 - Replacement of the Locators of NDB
 - Establishment of maintenance management planning and spare parts control
- c) Long-term Improvement Plan
 - Replacement of the existing system, such as HF, VHF transmitter/receiver, ATS console and VOR/DME due to their age
 - Provision for en-route air traffic control due to air route re-structuring at the
 - time of increased traffic volumes
 - Provision for a Microwave Landing System (MLS)
 - Provision for an Aeronautical Mobile Satellite Service (AMSS), Automatic Dependent Surveillance (ADS) and Global Positioning System (GPS)

(3) Human Resources Development Plan

In order to cope with operation and maintenance of modern airport facilities and systems, human resources should be developed sufficiently.

The human resources development plan for the newly introduced equipment (Radar and LDA/DME) consists of the following four phases to meet the sequence from preparation full operation.:

- I. Preparation Phase (up to facility accomplishment)
 - Airspace adjustment and approach procedures
 - Approach radar control training
 - Training required for the introduction of LLZ/DME
 - Training for instructors
 - Basic theoretical training
 - Vendor training
 - Maintenance training

- II. Hand-over phase (from facility accomplishment to hand-over)
 - Facility hand-over field training

III. Familiarization Phase (from hand-over to commencement of operation)

- Simulator training
- Laboratory training
- Practical training
- Familiarization training

IV. Operation phase (from operation to localization)

- Simulator and OJT training
- Training for backup personnel
- Management training

(4) Cost Estimate

(2)

(1) Urgent improvement plan

orgent improvement pluit	(thousand dollar)
- ASR/SSR and training facility	
	27,000
- LDA or LLZ/DME	3,000
 Additional SSR 	3,500
 Improvement of CATC 	10,100
Short-term development plan	

- CGL	60
- MSS	3,200
- AMOS	1,100
- ATIS	70
- CSAT	3,000
- Locators	700

(3) Long-term development plan

- SSR (cn-route)

5,000

2.3 Overall Airport Modernization Plan

2.3.1 Airport Modernization Plan

Based on the Ground Facilities Improvement Plan and the Air Safety Improvement Plan, the Airport Modernization Plan for Tribhuvan International Airport for the target year 2010 is established as shown in Figure 2.3.1. Figure 2.3.1 shows the Airport Modernization Master Plan for Tribhuvan International Airport for the target year 2010. Major work items to be included in the Airport Modernization Plan are summarized as follows:

(1) Urgent Plan

- a) Air Safety Improvement Plan
 - Installation of ASR/SSR at TIA
 - Installation of an additional SSR on the top of Mt. Phulchauki
 - Improvement of the communication system for radar operations
 - Installation of LDA collocated with DME
 - Improvement of CATC
 - Establishment of skill evaluation, rating and a licensing institution for air traffic controllers
 - Establishment of technical skill evaluation for maintenance staff

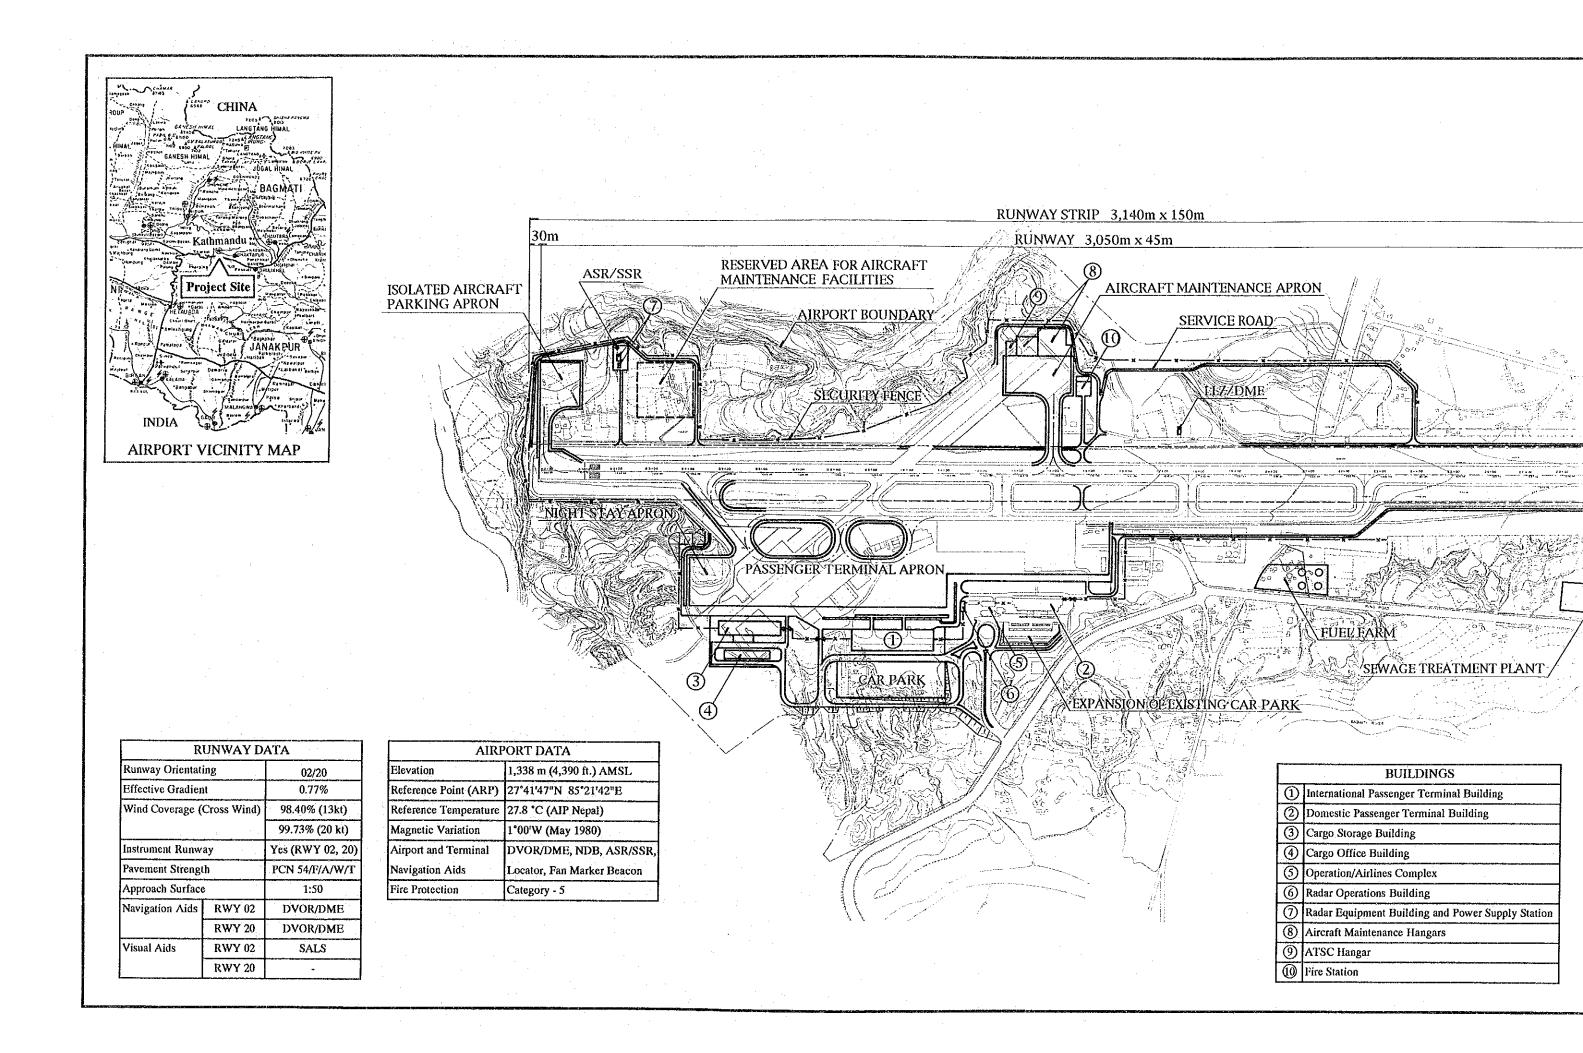

(2) Short-term Modernization Plan

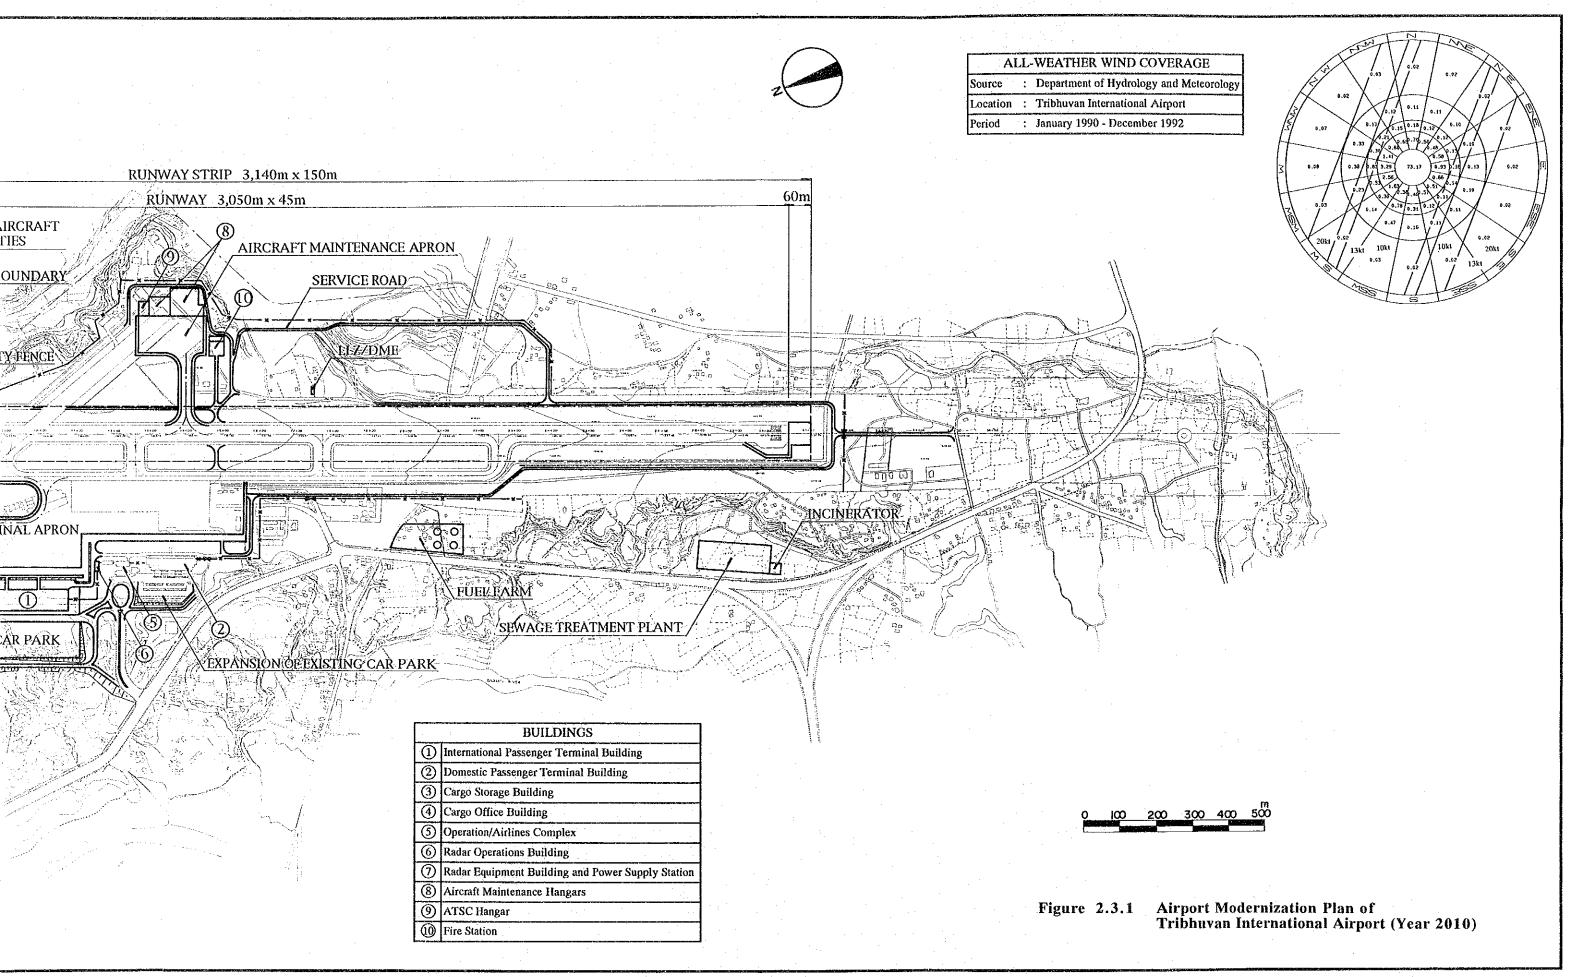

- a) Air Safety Improvement Plan
 - Installation of Circling guidance lights (CGL)
 - Extension of ATIS coverage
 - Replacement and rearrangement of the current meteorological observation equipment with an automatic system
 - Replacement of the current Semi-automatic Message Switching System (MSS) with an Automatic Message Switching System
 - Others
- b) Ground Facilities Improvement Plan
 - Construction of a new apron for B747 class aircraft
 - Construction of a maintenance hangar with a maintenance apron
 - Construction of an isolated aircraft parking position
 - Construction of a perimeter road, security fence, terminal road and carpark
 - Construction of a new international terminal building
 - Construction of a new cargo terminal building
 - Renovation of the existing international terminal building for domestic use

(3) Long-term Modernization Plan

a) Air Safety Improvement Plan

- Runway lead-in lighting system
- Replacement of the existing system, such as HF, VHF transmitter/receivers, ATS console and VOR/DME due to their age
- Provision for en-route air traffic control due to air route re-structuring at the time of increased traffic volume
- Provision for a Microwave Landing System (MLS)
- Provision for an Aeronautical Mobile Satellite Service (AMSS), Automatic Dependent Surveillance (ADS) and Global Positioning System (GPS)

- b) Ground Facilities Improvement Plan
 - Expansion of the passenger terminal apron
 - Expansion of the international terminal building
 - Expansion of the cargo terminal building
 - Expansion of the maintenance hangars

(4) Ultimate Modernization Plan

- a) Ground Facilities Improvement Plan
 - Expansion of the runway strip
 - Construction of a parallel taxiway with a minimum separation distance with the runway
 - Expansion of the apron and the terminal buildings

2.3.2 Initial Environmental Examination

(1) Contents of the Examination

As the initial environmental examination, the social and natural conditions and pollution in the area were studied. Through the scoping, aircraft noise was selected as the major environmental item for environmental impact assessment.

(2) Results of the Examination

1) Urgent Improvement Plan

The installation of the air safety facilities will contribute to the enhancement of safety at TIA, but there will be no change or impact on the environmental conditions.

2) Modernization Plan

Aircraft noise was selected through the Initial Environmental Examination for Environmental Impact Assessment.

There is aircraft noise around the airport already. This has not yet become a serious problem, but there is the possibility of aircraft noise becoming a social issue due to an increase of aircraft operations.

This will be studied by means of an aircraft noise forecast simulation.

2.3.3 Short-term Modernization Plan

The Short-term plan consists of modernization items which have a comparatively high urgency in the airport modernization master plan, from the viewpoint of airport safety and the level of services provided.

The work items of the Short-term modernization plan are shown in Table 2.3.1.

Table 2.3.1 Short-term Modernization Plan of Tribhuvan International Airport

I. Ground Facilities Improvement Plan

- A. Civil Works
 - 1. Passenger Terminal Apron

Construction of a new apron for B747 class aircraft

2. Aircraft Maintenance Apron

Construction of a new apron in front of the new aircraft maintenance hangar for B767 class aircraft

3. Isolated Aircraft Parking Position

Construction of an isolated aircraft parking position for one (1) B747 class aircraft

- 4. Apron Service Road
- 5. Perimeter Road
- 6. Security Fence
- 7. Terminal Roadway and Car Parks
- **B.** Architectural Works
 - 1. International Passenger Terminal Building

Floor area : 25,000 sq.m, three stories

2. Domestic Passenger Terminal Building

Renovation of the existing passenger terminal building, Floor area: 10,750 sq.m

3. Cargo Terminal Building

A cargo storage building and an office building, Total floor area : 7,500 sq.m

4. Aircraft Maintenance Hangar

For one B767 class and one HS748 class aircraft, Floor area : 6,500 sq.m

C. Airport Utilities

1. Electrical Power Supply

Installation of an emergency generator (500 KVA)

2. Water Supply

Installation of new elevated water tanks $(400t \times 2)$

3. Sewage Disposal

Construction of a new sewage treatment plant (460 t)

4. Solid Waste Disposal

Installation of a new incinerator (2.4 t)

II. Air Safety Improvement Plan

A. Urgent Improvement Plan

- 1. ASR/SSR in TIA and SSR at Mt. Phulchauki
- 2. Additional SSR
- 3. LLZ/DME or LDA
- 4. Training Facilities

B. Short-term Modernization Plan

1. CGL (Circling Guidance Light)

2. MSS (Message Switching System)

3. CSAT (Satellite Communication System)

4. AMOS (Automatic Meteorological Observation System)

5. Locator

3. FEASIBILITY STUDY OF THE SHORT-TERM MODERNIZATION PLAN

As the navigational aids are included in a package of Air Safety Improvement Plan through the technical study, and also these are not generally applicable to economic analysis, the feasibility study handles ground facilities improvement.

3.1 Preliminary Design

3.1.1 <u>General</u>

The preliminary design of the facilities for the Ground Facilities Improvement Plan of the Short-term Modernization Plan is carried out on the selected work items in Section 2.3.3.

The objective of the preliminary design is to clarify the basic concept and design criteria, and to the outline specifications and dimensions of the facilities for the purpose of cost estimates. The airport layout plan and terminal area layout plan in the short-term modernization plan are shown in Figures 3.1.1 and 3.1.2 respectively.

3.1.2 <u>Civil Works</u>

(1) Passenger Terminal Apron

The passenger terminal apron will be expanded so as to have a sufficient number of aircraft stands for the year 2003. For the new apron in front of the new terminal building, the position of the aircraft nose is set at 359 m from the runway centerline, 110 m deeper than the existing one, so that B747-400 class parking aircraft will not infringe upon the transitional surface even when the runway strip is expanded to 300 m in future. The apron depth including the apron taxiway is to be 130 m so as to keep the minimum clearance between the apron taxiway center line and the parking aircraft, as stipulated in Annex 14 of ICAO, and to minimize the pavement area.

The existing apron will be used for the parking of HS748 and DHC6 class aircraft, so that no expansion work is planned in the Short-term Modernization Plan period.

(2) Aircraft Maintenance Apron and Hangar

The location of the hangar was decided so that the buildings may be constructed within the flat space on the terrace, and a B767 class aircraft which is parking on the maintenance apron will not infringe upon the transitional surface for the 300 m-wide runway strip in the future.

In the Short-term Modernization Plan, two maintenance hangars are planned; one is for B767 class aircraft and the other is for HS748 class aircraft. A maintenance apron will be in front of the hangar which has sufficient space for one B767 and one HS748 parking.

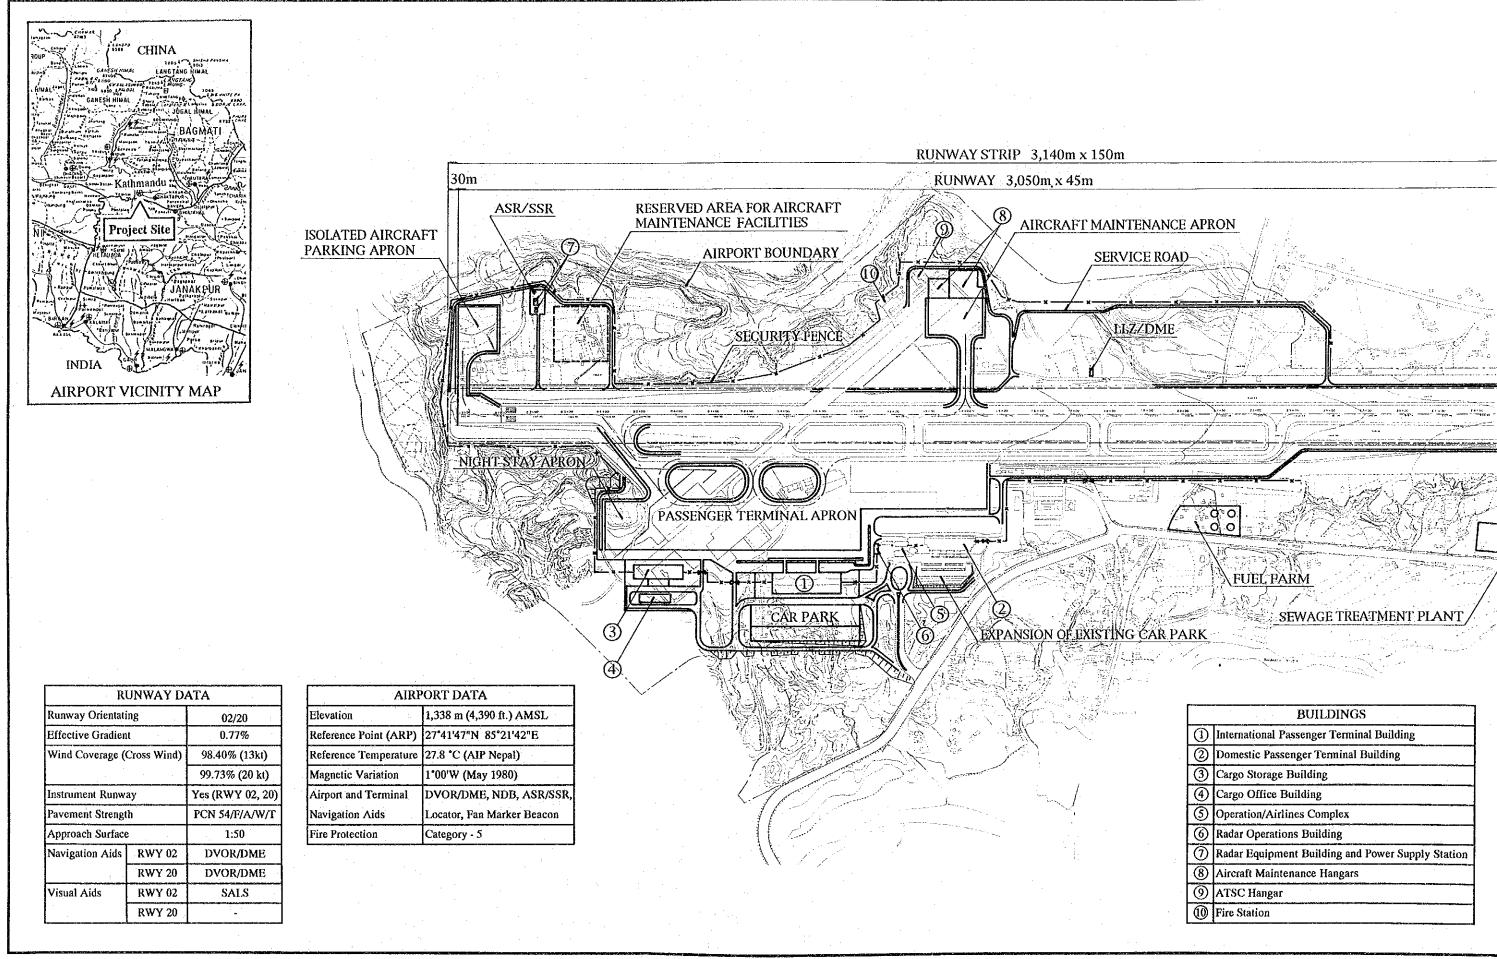

(3) Other Facilities

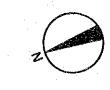

Development of the following civil facilities is planned in the Short-term Modernization Plan.

- Isolated aircraft parking position to accommodate one B747 with a self-maneuvering parking configuration

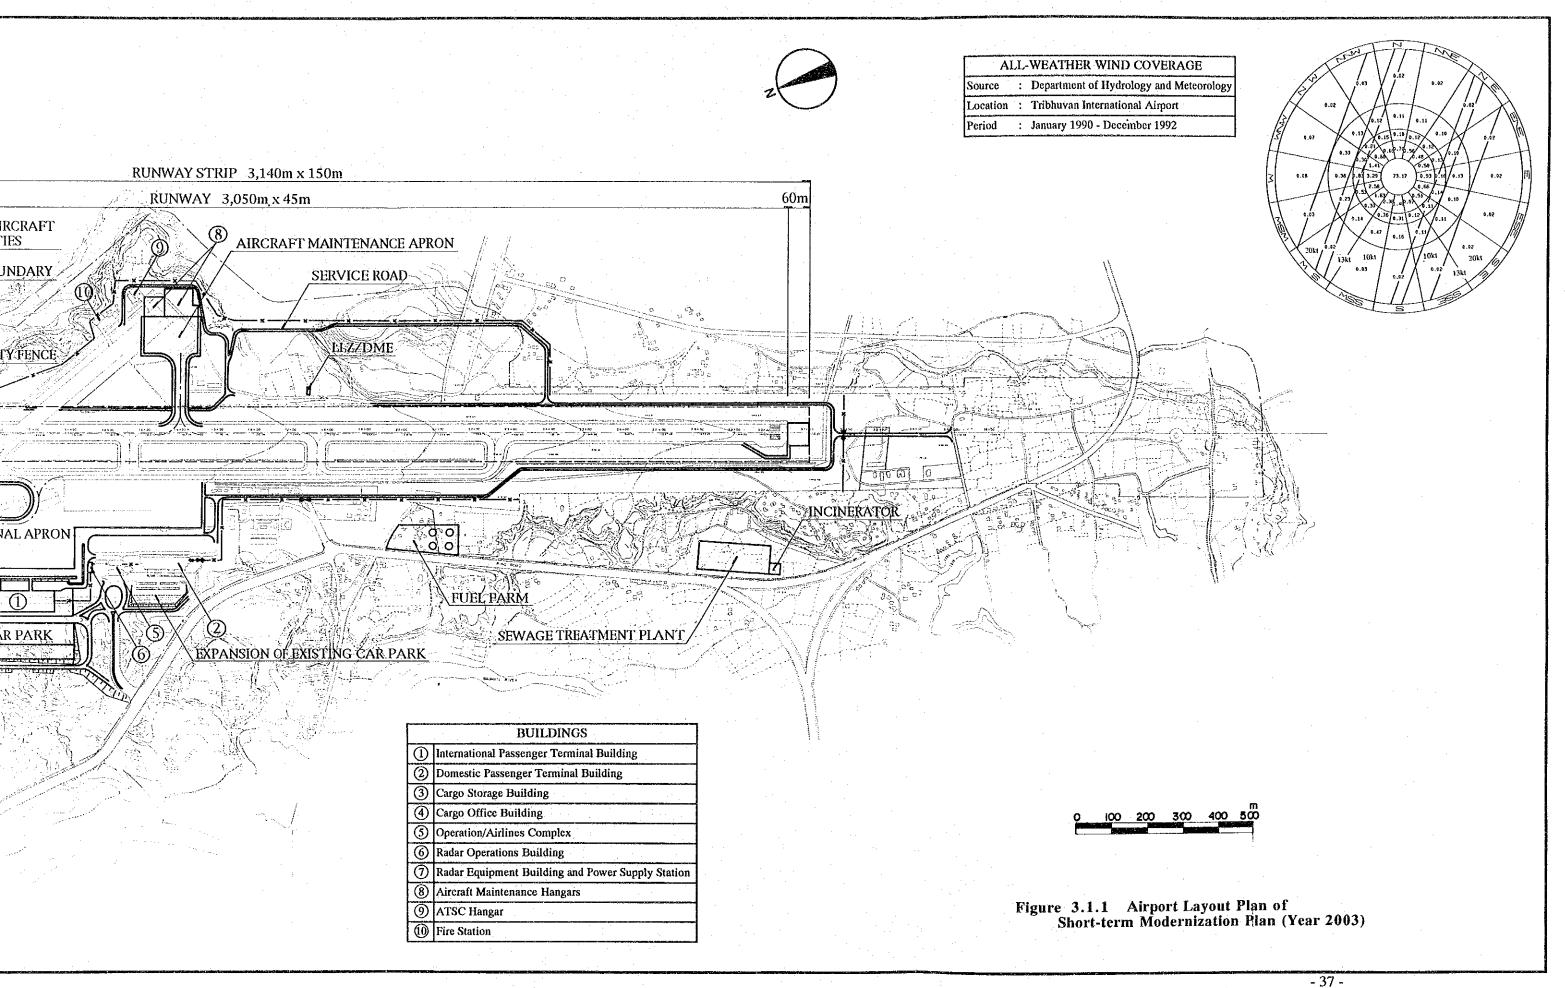

- Apron service road
- Perimeter road (new construction and paving of existing unpaved roads)
- Terminal Road and Car Parks
- 3.1.3 Architectural Works
 - (1) International Passenger Terminal Building

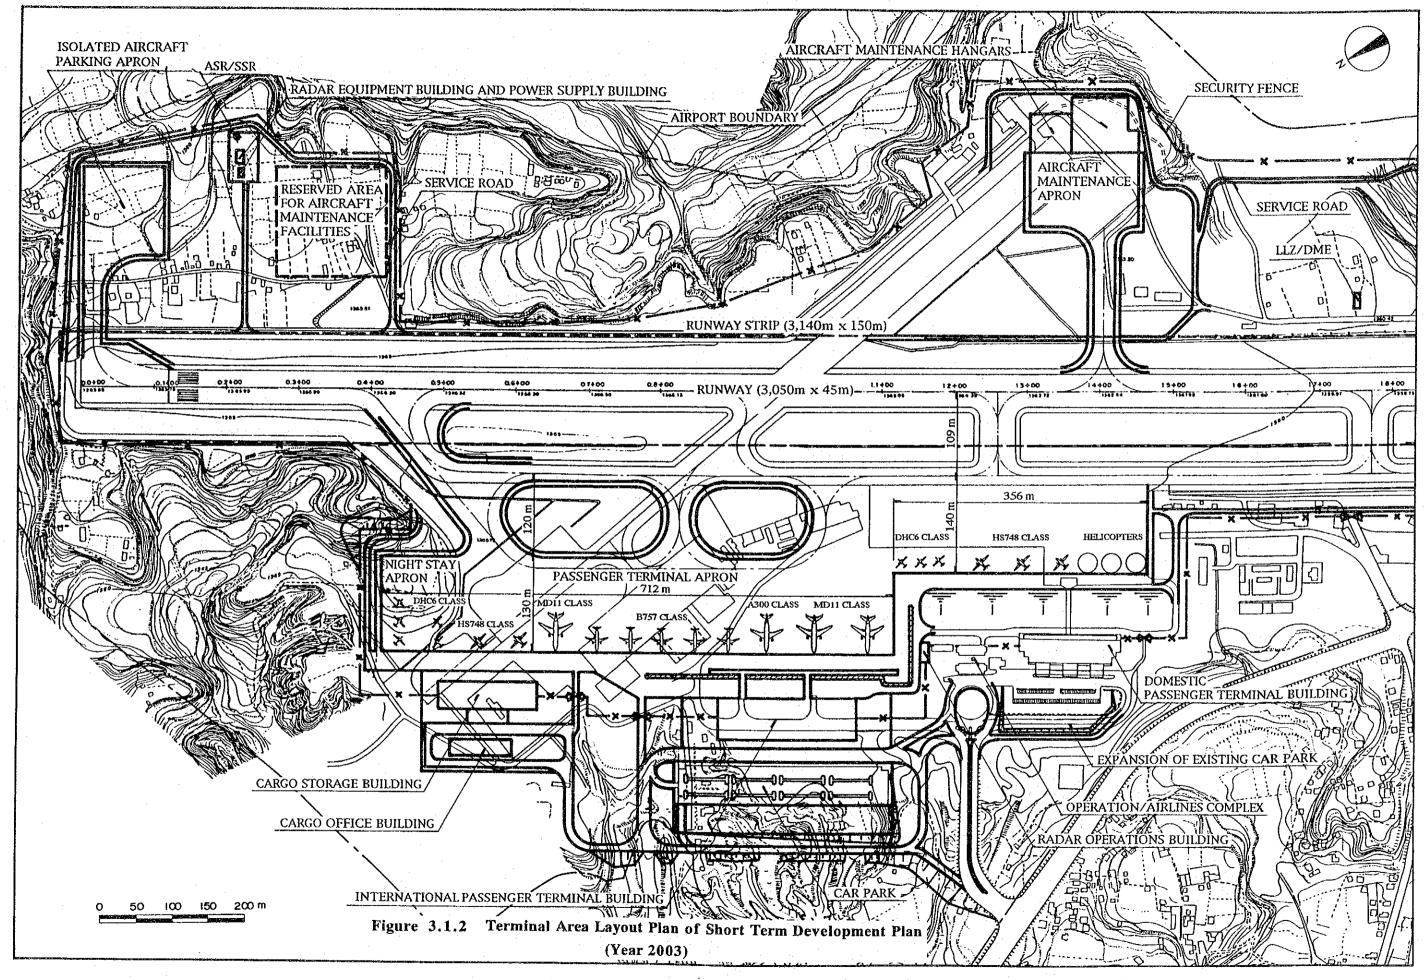

A new international passenger terminal building is designed in a linear frontal concept with one and a half processing levels taking into account the passenger demand and the provision of passenger boarding bridges. The international passenger terminal building will have a total floor area of about 25,000 sq.m with a 3-story reinforced concrete structure.

AJ	LL	WEATHER WIND COVERAGE
Source	:	Department of Hydrology and Meter
Location	:	Tribhuvan International Airport
Period	:	January 1990 - December 1992

- 38 -

(2) Domestic Passenger Terminal Building

The terminal building has presently a total floor area of about 10,750 sq.m with a 3-story reinforced concrete structure. The architectural renovation floor plans were studied based on the architectural design considerations and passenger and baggage flows explained in the previous sections.

(3) Cargo Terminal Building

New cargo terminal buildings will be located to the north of the new international passenger terminal. The terminal buildings consist of a cargo storage building and an office building and will have a total floor area of about 7,500 sq.m for the short-term modernization (2003).

The cargo storage building will accommodate international and domestic services. The international and domestic cargo volumes in the year 2003 are expected to be 36,400 tons and 1,500 tons respectively.

Therefore, the cargo storage building will mainly accommodate international services.

The cargo storage building will be a single story building with a steel frame structure and will be about 5,400 sq.m in total floor area. The office building will accommodate airline offices, customs offices, AQ (animal quarantine) and PQ (plant quarantine) offices, agent offices etc., and will be a single story of a reinforced concrete structure with a total floor area of about 2,100 sq.m.

(4) Maintenance Hanger

A new maintenance hangar will be located to the east of the runway, almost in front of the terminal across the runway and will accommodate one B-767 and one HS748 aircraft for the short-term modernization (2003). The maintenance hangar will have a total floor area of about 6,500 sq.m and will be a steel frame structure.

3.1.4 <u>Airport Utilities</u>

(1) Electrical Power Supply

The supplying capacity and reliability of the existing transmission lines will be insufficient for the new power demand at each stage of the Short-term Modernization Plan. The NEA, therefore, will be required to construct new exclusive transmission lines as soon as possible during the period of the Short-term Modernization Plan.

(2) Water Supply

The capacity of city water supply system should be increased in accordance with the increase of water demand. For this purpose, and the capacity of the wells are to be studied at first, and then a request for increasing the capacity of the city water supply shall be made to the responsible authority.

(3) Sewage Disposal

A new sewage treatment plant will be constructed to treat all effluent and discharge to drainpipes connected to the river nearby the airport.
