(4) Solid Waste Disposal

An incinerator will be installed in the airport in the Short-term Modernization Plan so as to treat all inflammable waste by an incinerator.

3.1.5 Aeronautical Ground Light System

A CGL system shall be installed to the Runway 20 before 2003. CGL shall consist of several flood light fixtures installed on a parallel line from the runway and on the extension line of the runway threshold. CGL will perform to indicate the direction of the runway and the location of the threshold by flood lights, so that the pilot will be able to clearly recognize the location. All installation sites of the CGL lighting are located inside of the airport site so that the system can be easily installed.

3.2 Airport Management Study

The following points are required to be taken into consideration in the airport's management modernization.

(1) Strengthening the Airport Management System

- Clarification of airport activities by establishment of Job description and departmental decrees
- b. Organizing activities and Personnel through the institution of discussions, communication, instructions and reports
- c. Standardization for planning, design, construction, operation and maintenance of an airport
- d. Regular training to maintain the level of the expertise
- e. Provision of vehicles, facilities and equipment for the operation and maintenance of the airport
- f. Facilities and spare parts management systems
- g. Precise topographic survey in order to identify each coordinate of the locations concerned

(2) Personnel Management

Developing and improving the current human resources instead of increasing the number of personnel.

(3) Security Control

Fencing of the airport, and introducing a security check system in the terminal buildings

(4) Search and Rescue

Establishment of a SAR organization in DCA

(5) Facilitation

Improvement of facilitation from the present condition such as the partial congestion in the existing international terminal building

3.3 Environmental Impact Study

Through screening and scoping in the Initial Environmental Examination, aircraft noise is selected as the environmental factor to be considered. The noise is expressed as a Weighted Equivalent Continuous Perceived Noise Level (WECPNL) of the ICAO index of noise exposure level, which takes into account the peak noise level and the duration of noise exposure.

The results of the simulation are summarized as follows;

- the extent of aircraft noise in the future is estimated not to increase from the present one.
- there are and will be areas which will suffer from serious noise levels outside the airport.
- the total area affected by aircraft noise with WECPNL more than 70 and 75 at present, and in the year 2003 and 2010 are as follows:

	Area	(ha)
Year WECPNL	More than 70	More than 75
present	830	390
2003	1,000	480
2010	970	470

In order for TIA to exist together with the surrounding communities in harmony, with aircraft noise in particular it is recommended to consider aircraft noise abatement measures.

3.4 Project Implementation Schedule and Cost Estimates

3.4.1 Project Implementation Schedule

The implementation schedule of the Short-term Modernization Plan is shown in Figure 3.4.1.

3.4.2 Project Cost

The cost of the Short-term modernization plan is shown in Table 3.4.1. The total cost of the project is estimated to be about 7,400 million Rupee (US\$ 150 million).

3.5 Economic Analysis

3.5.1 Purpose of Economic Analysis

The main purpose of the economic analysis is to show the effect of the Short-term Modernization Plan for Tribhuvan International Airport (TIA) from the nation's economic well-being viewpoint, and to examine the economic viability of the Project.

3.5.2 Basic Assumptions on the "With Project" and the "Without Project" cases

The economic analysis is conducted by comparing the project costs and the project benefits between the "with" and "without" project situations.

"With project" means the implementation of the investment for the proposed short-term airport modernization plan.

"Without project" means the condition without such an investment for airport improvement works, and in this case the saturation conditions for the international and domestic passengers terminals facilities are evaluated as follows:

- The international passengers terminal facilities are evaluated to be saturated in 1999.
- The domestic passengers terminal facilities are evaluated to be already saturated at present.

In this economic analysis, the incremental analysis is made on the basis of the incremental benefits and the incremental costs which are the difference between those in the "with Project" and the "without Project" cases respectively.

3.5.3 Project Benefits

The following quantified project benefits are assumed:

- a) Benefits due to accommodation of overflowing Nepalese domestic passengers
- b) Benefits due to accommodation of overflowing Nepalese international passengers
- c) Benefits due to accommodation of overflowing foreign domestic passengers
 - c-1) International airfare to be paid to Royal Nepal Airlines and departure tax by international passengers
 - c-2) Expenses generated other than domestic airfares in Nepal by foreign visitors
- d) Benefits due to accommodation of overflowing foreign international passengers
- e) Benefits due to accommodation of overflowing foreign airline aircraft

3.5.4 Project Costs

The investment costs for the Short-term Modernization Plan for Tribhuvan International Airport are estimated as the economic costs applying the conversion factor (0.88) to the estimated financial costs, and are disbursed in 1996 - 2000.

The economic operation and maintenance costs are estimated for the "Without Project" and the "With Project" cases.

3.5.5 Economic Evaluation

The calculation results for the economic evaluation indicators, i.e. EIRR (Economic Internal Rate of Return), NPV (Net Present Value) and B/C (Benefit Cost Ratio) are summarized as below. The annualized cash flow is shown in Table 3.5.1.

- EIRR: 17.1%

- NPV : 2,362 (Rs. million)

B/C : 1.47

(Note: NPV and B/C: at 12% discounted rate)

As the opportunity cost of capital in Nepal is estimated to be approximately 12%, the above value of EIRR shows that this Project can be evaluated as economically viable.

Qualitative Economic Benefits

Besides the quantified economic benefits previously mentioned, the following qualitative conomic effects treated as unquantified benefits in this economic analysis are expected to be also realized from the implementation of the Project:

- Upgrade of passenger service levels in the passenger terminal building by improvement of the passenger handling facilities (i.e. possible reduction of passenger processing time in the passenger terminal building).
- Possible higher efficiency of air cargo handling by the improvement of air cargo handling facilities, which will contribute to control quality and to promote exports.
- Additional short-term job creation effects during the period of construction works.
- Additional long-term job creation effects for operational staff by expanding of passengers terminal buildings.
- Favorable impression effects for foreign visitors to Nepal by upgrading the national gateway, and resultant incentive effects to international tourism development.
- Enhancing the national pride effects for Nepalese through developing a symbolic infrastructure for the national entrance and exit abroad.

By the sensitivity test, in the severest case (costs +20% and benefits -20%), the calculation results show a slightly lower value than the level of 12%.

3.6 Financial Analysis

3.6.1 Purpose of Financial Analysis

The principal objective of the financial analysis is to evaluate the financial viability of the implementation of the short-term Tribhuvan International Airport (TIA) Modernization Plan (the Project) from the viewpoint of the management body of TIA.

3.6.2 Basic Assumptions on the "With Project" and the "Without Project" cases

The basic assumptions for the "With Project" and the "Without Project" cases are made similarly in the economic analysis.

3.6.3 Financial Revenues

The financial revenues are estimated for the following revenue items:

- Aircraft landing/navigation charges
- Passenger service charges (Airport tax)
- Entrance fee
- Parking fee
- Oil throughput
- Space rental
- Advertisements
- Others

3.6.4 Project Costs

The estimated financial investment costs for the Short-term Modernization Plan for Tribhuvan International Airport are disbursed in 1996 - 2000.

The financial operation and maintenance costs are estimated for the "without" and "with" Project cases.

3.6.5 <u>Financial Evaluation</u>

For the FIRR (Financial Internal Rate of Return) calculation, incremental revenue, investment costs for Short-term Modernization Plan and incremental operation and maintenance costs are included into factors.

As a result, the FIRR shows a negative value (-6.2%).

Examination of Revenue Level

As the value of the FIRR of the Base Case shows a negative value, the examination of varying revenue levels compared with the base level revenue is tried, and the trial results of the sensitivity test are summarized as follows:

The turning point to positive value of FIRR is about +40% revenue to base level; and for attaining a FIRR value over the assumed loan's interest rate (1.0%), a revenue level increase of approximately 50% is required.

In case of the tariff levels rising by 50% from the base level (year 1993), the estimated average annual growth rates of tariff levels for the period of seven (7) years during 1993 - 2000 are equivalent to about 6%.

The details of FIRR calculation for Base Case is shown in Table 3.6.1.

3.6.6 Evaluation

As mentioned previously in Section 3.5, the results of economic analysis are favorable. On the other hand, as observed in this Section, the results of financial analysis (for base case) are not optimistic.

Basically, this Project is not so commercially attractive. For a total evaluation of the Project, however, the economic analysis results should be appraised. In other words, it can be emphasized that an airport project as an important transport infrastructure can be generally justified by the economic benefits from the viewpoint of national welfare such as the convenience for Nepalese air passengers and increases of foreign currency income.

Accordingly, it can be considered that the Project is viable from an overall appraisal viewpoint.

When considering reasonable tariff level raising, the financial aspect will show a turn for the better.

Table 3.6.1 Financial Cash Flow for FIRR Calculation

FIRR: -6.2%

4. TECHNICAL STUDY OF URGENT PROJECT

4.1 Scope of the Urgent Project

The installation of ASR/SSR is selected as an Urgent Project to be initiated in the early stage of the Urgent Improvement Plan. Construction of a training facility which is required for radar controllers and maintenance technicians' training is also required.

The Basic Design for practical construction and the human resource development plan concerning the Basic Design are described in the following sections.

4.2 Basic Design

4.2.1 <u>Design Condition for the Radar System</u>

The design conditions for the radar system are as follows:

(1) Specific coverage requirements

Navigation fixes

All of the navigational fixes and air routes within the terminal area are desired to be located within the line of sight (LOS) of the selected radar site.

- Runway approach/departure coverage

Coverage of the final approach should be provided up to the missed approach point, and departure aircraft should be picked up for at least 1 NM from the exiting runway threshold (probably 300 feet above the extended runway surface).

(2) Requirements for facilities construction

The following items should be considered in terms of the construction costs and maintainability:

- Extensive and/or unusual road construction or improvements
- Special installation of a water system and/or electrical power
- Requirements for a remote control and monitoring cable or microwave link
- Grading, landscaping or other property improvements
- Drainage
- Road access

(3) Technical requirements

It is desirable to keep the minimum separation between the ASR/SSR antenna and any above ground structure and radio generating equipment such as radio navigation aids and communication facilities. The ground clutter effect, lobbing, and large reflection objects which may cause false targets should be analyzed.

4.2.2 Site Selection

The radar operation building is preferably to be located near the current operating facility, but the location of the transmitter and receiver facilities shall be decided in consideration of radar coverage, siting conditions and construction conditions.

The construction site for the radar equipment building was studied based on the design criteria. The locations of alternative sites are as follows:

- Mt. Phulchauki Site
- Mt. Nagarkot Site
- Changunarayan Site
- Torebhir Site
- Airport Site

The most suitable site was selected on the airport site. At this site, part of the radar coverage is screened by Mt. Phulchauki and Chandragili, but surveillance for approaches from the south is possible.

4.2.3 Facility Plan

(1) Basic Function of Airport Surveillance Radar

The Airport Surveillance Radar (ASR) system, which consists of a primary radar and secondary beacon radar will be divided into two parts; one is the radar head for the transmitting and receiving of the radar signals and beacon signals. The second part is the operation unit with signal analyzing, processing and display for operations.

The following performances shall be considered for the system design.

Radar Coverage

The requirements of radar coverage shall be satisfied with the following conditions at 25,000 feet vertical coverage and 60 nautical miles in the azimuth range.

- Target Reflection Area

 2 m^2

- Detection Probability

: more than 80 %

False Alarm Rate : 10

- Measures for clutter

Special measures for the occurrence of ground clutter shall be considered due to the topographical conditions of the Kathmandu Valley. The following measures shall be studied.

- application of MTD (moving target detection) based on the I.Q. logic.
- elimination of reflection by ground obstacles by STC.
- Warning by Secondary Radar Signal

The following warning functions shall be provided by the processing signal data processing of the secondary radar.

- MSAW (Minimum Safe Altitude Warning)
- CN (Conflict Alert)

Outline of the Specifications for ASR and SSR

ASR

Output power 500 KW

Frequency S band $(2,700 \sim 2,900 \text{ MHz})$

Type of Amplifier Tube : Klystron

Noise Figure : Less than 4.0 dB

Range Resolution : Not more than 200m at 25 NM Azimuth Resolution Not more than 1.5 degrees at 25 NM Not more than 50m and 0.5 degrees

Accuracy

SSR

Interrogation modes (ground-to-air)

Mode A to elicit transponder replies for identification and

surveillance. $(8 \pm 0.2 \text{ microseconds})$

Mode C to elicit transponder replies for automatic

Pressure - altitude transmission and surveillance.

 $(21 \pm 0.2 \text{ microseconds})$

The performance and characteristics shall conform with the ICAO, Annex 10 specification.

4.2.4 Implementation Plan

The implementation program of the Project is shown in Figure 4.2.1.

4.2.5 Project Cost

The Project Cost for the Urgent Project is as follows:

ASR/SSR and training facility

27,000 thousand US dollar

4.3 **Human Resource Development Plan**

4.3.1 **Training Demand**

By the commencement of radar monitoring at TIA, the following number of personnel will have completed the suitable training.

Operation operation 6 (2 per shift) supervisor 3 (1 per shift)

TIA instructor CATC instructor: 2

DCA staff TOTAL

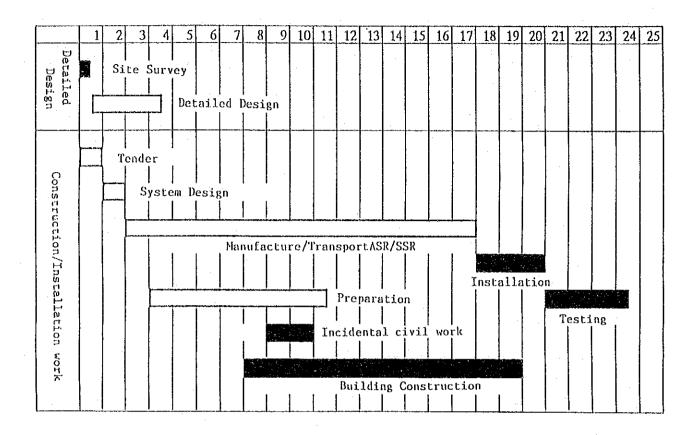

Figure 4.2.1 Project Implementation Program

Maintenance - Radar head : 6 (2 per shift) - Processor : 6 (2 per shift)

- TIA instructor : 3

- CATC instructor: 2 (1 for radar head, 1 for processor)

DCA staff : 3 TOTAL : 20

4.3.2 Time frame of the training

The training will be basically scheduled in the sequence as shown in Table 4.3.1.

4.4 Technical Evaluation

By the Urgent Project, the direct effect on safe operation at the airport is expected as shown in the following table.

Table 4.4.1 Effect of the Urgent Project

	750		
	The Present Situation and Problems	The Methods Taken by This Project	The Effect of the Project and the Degree of Implementation
1.	Tribhuvan International Airport is based on predetermined procedure controls previously issued. This method specifies the aircraft position, direction, height, etc. and when they are difficult to confirm from the ground, and when the aircraft cannot identify its own position, grave accidents may occur.	The Kathmandu Terminal Control Area (25 NM radius) will be provided with terminal radar which can monitor this area. An ancillary building to accommodate the radar equipment and a radar operations building will also be provided.	It will be possible to determine the aircraft's position, direction, and altitude at night and in times of low visibility from the ground with the radar. The radar will permit the aircraft to be controlled and monitored from the ground at all times. Accidents due to the mistaken identity of aircraft can be prevented.
2.	There are high hills on the approach and departure routes at Tribhuvan International Airport, and should the aircraft take an incorrect approach, takeoff, or incorrect heading, it will encounter problems, But these decisions are at the moment left up to the pilot to make.	With the secondary radar, the height of individual aircraft will be monitored automatically and shown on the radar display.	The aircraft's altitude will be monitored by the radar controllers who will notice any irregular display, and can pass on instructions to alter his height or rate of assent or descent.
	attitude, corrections cannot be made, since flying altitude cannot be confirmed from the ground.	be added to the radar data processing equipment.	the radar display if an aircraft has descended or is expected to descend below the minimum descent altitude.
	and arriving aircraft at the airport so that near misses are a serious matter.	processing of radar signal, and a conflict alarm will be made if necessary.	confirms the alarm, he will give the instruction to
5.			Training for the radar controllers and maintenance staff can be executed by Nepalese in their own country.

5. CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

The report studied the Modernization Plan for the long-term modernization of Kathmandu International Airport aiming at the year 2010 and the Feasibility Study on the Short-term Modernization aiming for the year 2003, in view of air safety and ground facilities improvements.

The conclusions of the Feasibility Study are summarized as follows;

(1) Technical Aspects

The Short-term modernization plan within the framework of the Modernization Plan consists of urgent and necessary improvements of facilities and equipment at the airport. These are indispensable to secure air safety and a higher level of the service at the airport and will be selected as being cost-effective.

(2) Environmental Aspects

The environmental impact assessment indicates that there will not be any expected serious influences caused by the project as a whole. However, it will be necessary in the future to introduce exact land use control around the airport, in order for TIA to be in harmony with the surrounding communities, particularly concerning aircraft noise problems.

(3) Economic and Financial Aspects

The project cost is estimated to be Rs. 7,358 million.

The economic and financial analysis gives the following results.

EIRR NPV B/C	Rs.	17.1 % 2,400 million 1.48
FIRR (Base Case) FIRR (Raising Tariff (Case)	-6.2% 1.8 %

The economic indexes imply healthy and good conditions from the view point of the national economy of Nepal. On the other hand, the financial ones show the low level of financial viability of the project because of low revenues and high costs. As the project of TIA modernization is related with the social-economic infrastructure, it is natural to show such low figures, in a sense of public works. In addition, this level will be able to be improved by the application of some measures such as the raising the airport tariffs and/or decreasing the sizes of buildings.

The economic and financial analysis shows the feasibility of the project.

Consequently, it is confirmed that the short-term modernization plan is feasible from the technical, environmental and economic/financial viewpoints.

It is also confirmed that the Urgent Project is technically feasible through the technical evaluation.

As a whole, the Short-term Modernization Plan and the Urgent Project will also contribute to enhance and improve the following performances in the national and regional fields, even though these values are not able to be clearly calculated in the analysis.

- a. improvement of air safety
 - enhancement of the reliability of air transport
 - increase of air transport demand
 - increase of foreign fourists
 - promotion of tourism industry and industries concerned
 - increase of national and regional income
- b. enhancement of comfort of airport users by solving congestion and improving services, which are a requisite of an international airport
- c. promotion of exports and imports in terms of quick and smooth cargo handling
- d. enhancement of domestic air transport and improvement of domestic air transport safety in terms of airport facility development
- e. modernization of Nepalese air transport

5.2 Recommendations

(1) Project Implementation

In order to implement the project as scheduled in this Study, the following measures are recommended.

- a. National and regional consensus for the project implementation should be obtained.
- b. The preparatory and coordination works for the project implementation are advisable to be taken among the parties concerned.
- c. Financial arrangements for project implementation should be prepared, including construction of new aircraft maintenance hangars because this is the first step in the terminal development sequence.
- d. In view of the economic and financial analysis, a proper tariff raising measure in future should be sought, and construction funds to be obtained should have a low interest rate wherever possible.

(2) Urgent Improvement Plan

As the Exchange of Notes on grant aid for a radar system and associated facilities was conducted between the Nepalese and Japanese Governments on January 1994, the Urgent Project has been started. In addition to the radar system (ASR/SSR) installed by the Urgent Project, continuous execution of the all of the urgent improvement plans as a package of the Plan which include additional SSR, LDA/DME and the relocation of the existing CATC is very important to secure and improve the air safety at TIA for achievement of the original objective of technical cooperation.

(3) Human Resources Development

In accordance with the airport modernization, modern systems and new equipment are planned to be introduced. This implies the necessity of higher handling capacities to support these modernized systems in airport operations and management. Therefore human resources development is strongly advised.

To develop the necessary human resources by themselves in Nepal is a primary policy. However, it is expected to that international technical assistance will be utilized at the beginning of the development. As CATC is the core institute of human resources development, it is expected to improve and strengthen its condition.

(4) Radar Approach Control

The purpose of radar control at TIA is to improve and secure the safety of aircraft operations, particularly at the stage of approach to the airport.

At the same time, special attention is required because this is the first time that a radar system has been installed and operated in Nepal.

In this context, the transition of radar control from monitoring to full scale control should be carefully performed with the confirmation of the requisite conditions of (a) obtaining full familiarity with radar operations and techniques by the Nepalese staff, (b) sufficient and adequate training for the staff, and (c) satisfactory radar coverage.

The transition should be affirmatively and steadily performed by spending enough time and utilizing international technical assistance fully.

(5) Operation and Maintenance of Radar

A radar system will be installed and operated for the first time in Nepal so as to improve and secure the safety of aircraft operations. It is clearly required for the radar system to be kept under the normal condition of regular operations and good maintenance at all times. Therefore it is strongly recommended to secure a number of staff and to train them to provide these operations and also to have an adequate budget to sustain these.
