Annex 3-2 Identification of Distress Type

Asphalt Surfaced Pavements

1. Alligator or Fatigue Cracking
2. Bleeding
3. Block Cracking
4. Corrugation
5. Depression
6. Joint Reflection Cracking from PCC Slab
7. Lane/Shoulder Dropoff or Heave
8. Lane/Shoulder Joint Separation
9. Longitudinal and Transverse Cracking (Non-PCC Slab Joint Reflective)
10. Patch Deterioration
11. Polished Aggregate
12. Potholes
13. Pumping and Water Bleeding
14. Raveling and Weathering
15. Streaking

Concrete Pavements

1. Spalling (Transverse and Longitudinal Joint/Crack)
2. Spalling (Corner)

E.1 DISTRESS TYPE (ASPHALT SURFACED PAVEMENTS)

Name of Distress: Alligator or Fatigue Cracking

Description:

Alligator or fatigue cracking is a series of interconnecting cracks caused by failure of the asphalt concrete surface (or stabilized base) under repeated traffic loading. The cracking initiates at the bottom of the asphalt concrete surface (or stabilized base) where tensile stress and strain is highest under a wheel load. The cracks propagate to the surface initially as one or more longitudinal parallel cracks. After repeated traffic loading, the cracks connect, forming many-sided, sharp-angled pieces that develop a pattern resembling chicken wire or the skin of an alligator. The pieces are usually less than 1 foot on the longest side. Alligator cracking occurs only in areas that are subjected to repeating traffic loadings. Therefore, it would not occur an entire area that is not subjected to loading is rated as block cracking which is not a load-associated distress. Alligator cracking is considered a major structural distress.

Name of Distress: Bleeding

Description:

Bleeding is a film of bituminous material on the pavement surface which creates a shiny, glass-like, reflecting surface that usually becomes quite sticky. Bleeding is caused by excessive amount of asphalt cement in the mix and/or low air void contents. It occurs when asphalt fills the voids of the mix during hot weather and then expands out onto the surface of the pavement. Since the bleeding process is not reversible during cold weather, asphalt will accumulate on the surface.

Name of Distress: Block Cracking

Description:

Block cracks divide the asphalt surface into approximately rectangular pieces. The blocks range in size from approximately 1 ft2 to 100 ft2. Cracking into larger blocks are generally rated as longitudinal and transverse cracking. Block cracking is caused mainly by shrinkage of the asphalt concrete and daily temperature cycling (which results in daily stress/stain cycling). It is no load-associated, although load can increase the severity of individual cracks from low to medium to high. The occurrence of block cracking usually indicates that the asphalt has hardened significantly. Block cracking normally occurs over a large proportion of pavement area, but sometimes will occur only in non traffic areas. This type of distress differs from alligator cracking in that alligator cracks form smaller, many-sided pieces with sharp angles. Also unlike block cracks, alligator cracks are caused by repeated traffic loadings and are, therefore, located only in trafficked areas (i.e., wheel paths).

Name of Distress: *Corrugation*

Description:

Corrugation is a form of plastic movement typified by ripples across the asphalt pavement surface . It occurs usually at points where traffic starts and stops. Corrugation usually occurs in asphalt layers that lack stability in warm weather, but may also be attributed to excessive moisture in a subgrade, contamination of the mix, or lack of aeration of liquid asphalt mixes.

Name of Distress: Depression

Description:

Depressions are localized on pavement surface areas having elevations slightly lower than those of the surrounding pavement. In many instances, light depressions are not noticeable intil after a rain, when ponding water creates "birdbath" areas; but the depressions can also be located without rain because of strains created by oil dropping from vehicles. Depressions can be caused by settlement of the foundation soil or can be "built in" during construction. Depressions cause by roughness and when filled with water of sufficient depth could cause hydroplaning of vehicles.

Name of Distress: Joint Reflection Cracking from PCC Slab

Description:

This distress occurs only on pavements having an asphalt concrete surface over a jointed portland cement concrete (PCC) slab and they occur at transverse and longitudinal joint (i.e., cement stabilized, lime stabilized). This distress does not include reflection cracking away from a joint or from any other type of base (i.e, cement stabilized, lime stabilized) as these cracks identified as "Longitudinal and Transverse Cracking". Joint Reflection cracking is caused mainly by movement of the PCC slab beneath the asphalt concrete (AC) surface because of thermal and moisture changes; it is generally not load iniciated. However, traffic loading may cause a breakdown of the AC near the initial crack, resulting in spalling. Acknowledge of slab dimensions beneath the AC surface will help to identify these cracks.

Name of Distress: Lane/Shoulder Drop-off or Heave

Description:

Lane/Shoulder drop-off or heave occurs wherever there is a difference in elevation betweeen the traffic lane and the shoulder. Typically, the outside shoulder settles due to consolidation or a settlement of the underlying granular or subgrade material or pumping of the underlying material. Heave of the shoulder may occur due to frost action or swelling soils. Drop-off of granular or soil shoulder is generally caused from blowing away of shoulder material passing trucks.

Name of Distress: Lane/Shoulder Joint Separation

Description:

Lane/Shoulder joint separation is the widening of the joint between the traffic lane and the shoulder, generally due to movement in the shoulder. If the joint is tightly closed or well sealed so water cannot enter (or if there is no joint due to full-width paving), then lane/shoulder joint separation is not considered a distress. If the shoulder is not paved (i.e., gravel or grass), then the severity should be rated as high. If a curbing exists, then it should be rated according to the width of the joint between the asphalt surface and curb.

Name of Distress: Longitudinal and Transverse Cracking
(Non-PCC Slab Joint Reflective)

Description:

Longitudinal cracks are parallel to the pavement's centerline or laydown direction. They may be caused by (1) a poorly constructed paving lane joint, (2) shrinkage of the AC surface due to low temperatures or hardening of the asphalt, or (3) a reflective crack caused by cracks beneath the surface course, including cracks in PCC slabs (but not at PCC slab joints). Transverse cracks extend across the pavement centerline or direction of laydown. They may be caused by items (2) or (3) above. These types of cracks are not usually load-associated.

Name of Distress: Patch Deterioration

Description:

A patch is an area where the original pavement has been removed and replaced with either similar or different material.

Name of Distress: Polished Aggregate

Description:

Aggregate polishing is caused by repeated traffic applications. Polished aggregate is present when close examination of a pavement reveals that the portion of aggregate extending above the asphalt is either very small or there are no rough or angular aggregate particles to provide good skid resistance.

Name of Distress: Potholes

Description:

A bowl shaped hole of various sizes in the pavement surface. The surface has broken into small pieces by alligator cracking or by localized disintegration of the mixture and the material is removed by traffic. Traffic loads force the underlying materials out of the hole, increasing the depth.

Name of Distress: Pumping and Water Bleeding

Description:

Pumping is the ejection of water and fine materials under pressure through cracks under moving loads. As the water is ejected, it carries fine material resulting in progressive material deterioration and loss of support. Several cases of pumping of stabilized base material have been observed for example. Surface staining or accumulation of material on the surface close to cracks is evidence of pumping. Water bleeding occurs where water seeps slowly out of cracks in the pavement surface.

Name of Distress: Rutting (Streaking)

Description:

A rut is a surface depression in the wheel paths. Pavement uplift may occur along the sides of the rut; however, in many instances, ruts are not noticeable only after a rainfall, when the wheel paths are are filled with water. Rutting stem from a permanent deformation in any of the pavement layers or subgrade, usually caused by consolidation or lateral movement of the materials due to traffic loads. Rutting may be caused by plastic movement in the mix in hot water or inadequate compaction during construction. Significant rutting can lead to major structural failure of the pavement and hydroplaning potential. Wear of the surface in the wheel paths from studded tires can also cause a type of rutting.

Name of Distress: Raveling and Weathering

Description:

Raveling and weathering are the wearing way of the pavement surface caused by the dislodging of aggregate particles (raveling) and loss of asphalt binder (weathering). They generally indicate that the asphalt binder has hardened significantly.

E.2 DISTRESS TYPES (JOINTED REINFORCED CONCRETE PAVEMENTS)

Name of Distress: Spall (Transverse and Longitudinal Joint/Crack)

Description:

Spalling of cracks and joints is the cracking, breaking, or chipping (or fraying) of the slab edges within 2 feet (0.6m) of the joint/crack. A spall usually does not extend vertically through the whole slab thickness but extends to intersect the joint at an angle. Spalling usually results from (1) excessive stresses at the joint or crack caused by infiltration of incompressible materials and subsequent expansion, (2) disintegration of the concrete from freeze-thaw action of "D" cracking, (3) weak concrete at the joint (caused by honey-combing), (4) poorly designed or constructed load transfer device (misalignment, corrosion), and/or (5) heavy repeated traffic loads.

Name of Distress: Spalling (Corner)

Description:

Corner spalling is the raveling or breakdown of the slab within approximately 1 foot (0.3m) of the corner. However, corner spalls with both edges less than 3 inches (8cm) long will not be recorded. A corner spall differs from a corner break in that the spall usually angles downward at about 45 degrees to intersect the joint, while a break extends vertically through the slab. Corner spalling can be caused by freeze-thaw deterioration, "D" cracking, and other factors.

Annex 3-3 Evaluation of Existing Conditions

Section A-1:

Int. Guanacaste/Belen/Nandaime - Guanacaste

Investigation Results

Subsection	Surface and Slope Condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	Local Potholes Patch deterioration Shoulders severely deteriorated Overlaid Slope erosion L=3.7km (40%) Roadway width=6.3m Shoulders width=1.3m

20.0km-25.0km	Patch deterioration Potholes		
25.0km-30.0km	Longitudinal cracking		
30.0km-35.0km	-ditto- Drainage problems (flodding)		37.0
35.0km-40.0km	Potholes, Raveling Patch deterioration Improper (poor) asphalt mix Weak pavement Without shoulders, narrow		
40.0km-45.0km	-ditto-		
45.0km-48.0km	-ditto- (Bleeding)		
48.0km-55.0km	(Superficial treatment) Longitudinal continuous asphalt patching		
55.0km-68.5km (Somotillo)	-ditto-		61.3

Section B-12:

Somotillo - Guasaule

Investigation Results

Subsection	Surface and Slope Condition	Alignment	
		Horizontal	Vertical
0.0km- 6.1km	(Superficial treatment)		

<Section B-101:>

Section B-102:

Int.Rivas/Sapoa/San Juan Del Sur - San Juan Del Sur

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	maintained		
5.0km-10.0km	-ditto-		
10.0km-15.0km	-ditto-		10.0
15.0km-19.9km	-ditto-		

Section B-103:

Int. Nandaime/Rivas/Tola - Tola

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	Gravel slightly undulated		
5.0km-10.0km	-ditto-		5.8
10.0km-15.0km	-ditto- 13.5km: existing 1-lane Con.Br.		

<Section B-104:>

Section B-105:

Int.Nejapa/Las Esquinas/San Rafael del Sur-San Rafael del Sur

Investigation Results

Subsection	Surface and Slope Condition	Alignment	
		Horizontal	Vertical
	(PCC pavement 20cm, with a thin asphalt seal coat 2cm. Transverse joints each 6m, Longitudinal joint at the middle, i.e. 3.0m)		
0.0km-3.3km	Tinny asphalt seal coat Desegregation of the asphalt Spalling Potholes (of the PCC) Joint reflection cracking from PCC slab Non existence of a proper base coarse was verified Narrow carriage way (6.0m) Without shoulders Drainage is lacked Rock and earth slumps		0.0-5.0
3.3km- 6.7km	-ditto- Longitudinal deep cracking Block cracking of the PCC		
6.7km-10.0km	-ditto-		
10.0km-21.3km (San Rafael del Sur)	-ditto-		

Section B-106:

Int.Managua/Diriamba/Mateare - Mateare - Izapa

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	slightly raveling		1.5
5.0km-10.0km	-ditto-		
10.0km-15.0km	slightly raveling bleeding depression		
15.0km-20.0km	many patched portion on shoulder alligator crack		
20.0km-25.0km	-ditto-		
25.0km-30.0km	alligator crack		
30.0km-35.0km	alligator crack longitudinal crack		
35.0km-40.0km	longitudinal crack		35.0
40.0km-45.0km	-ditto-		
45.0km-50.0km	maintained		49.9
50.0km-55.0km	-ditto-		
55.0km-60.0km	-ditto-		
60.0km-61.3km	-ditto-		60.0

<Section B-107>

<Section B-108>

<Section B-109>

Section B-110:

Int. Chinandega/Leon/Malpaisillo - La Cruz de la India

Investigation Results

Subsection	Surface and Slope Condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	Raveling, Patch deterioration Roadway width=8.0m		
5.0km-10.0km	Streaking, critical alligator cracking Shoulder dropoff Raveling, potholes, patch deterioration Roadway width=6.9m		
10.0km-20.0km	-ditto- Longitudinal and transverse cracking Overlaid Roadway width=7.2m	10.3	
20.0km-25.0km	-ditto- Roadway width=8.2m		
25.0km-30.7km	-ditto- Roadway width=7.3m		
30.7km-32.0km	(Superficial treatment)		
32.0km-34.6km	Asphalt pavement in critical condition		
34.6km-35.0km	Overlaid (good condition) Roadway width=8.0m		
35.0km-40.0km	Overlaid (fair to good condition) Roadway width=6.2m Without shoulders		
40.0km-46.3km	-ditto-		
46.3km-52.4km	-ditto- (Center line with longitudinal and continuous depression) Roadway width=6.5m Without shoulders		
52.4km-55.1km	-ditto-	52.5/54.1	54.1
55.1km-60.1km	-ditto- Roadway width=6.3m	56.9/60.7	
60.1km-65.0km	-ditto- Rock slump	62.6/64/64.9	
65.0km-70.0km	-ditto-	69.2/70.0	
70.0km-73.7km (La Cruz de la India)	-ditto- Roadway width=7.0m	70.0/73.7	

Section B-111:
La Cruz de la India - Int.Esteli/Sebaco

Section B-112:

Int.Chinandega/Leon/Posoltega - Posoltega

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km- 2.5km	Longitudinal, Transversal crack		

Section B-113:

Int.Chinandega/Leon/Ingerio San Antonio - Ingerio San Antonio

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km-5.0km	slightly raveling on center line		
5.0km- 7.7km	-ditto-		

Evaluation of Existing Conditions

ROUTE C (MANAGUA - GRANADA)

Section C-1:
Centro de Granada - Int.Managua/Granada/Tipitapa
<El Coyotepe>

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	Longitudinal crack		
5.0km-10.0km	Longitudinal and alligator crack		
10.0km-15.0km	alligator crack		10.0/14.1/ 15.0
15.0km-20.2km	-ditto-		

Section C-2:

Int.Nindiri/Catarina/Masaya - Managua

Investigation Results

Subsection	Surface and Slope Condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	Tinny overlay Raveling Potholes Patch deterioration Block and alligator cracking Mix with a poor asphalt content Probably weak structure pavement Poor condition		
5.0km-10.0km	Tinny overlay Transverse and longitudinal cracking Big and deep located potholes Critical block and alligator cracking Rough surface Poor condition Roadway width= 7.2m Shoulders width=1.0m		
10.0km-20.0km	-ditto-		
20.0km-26.0km	(4 traffic lanes road starts) Transverse and longitudinal cracking Located potholes and block cracking		

Section C-101:

Int. Managua/Nindiri/Esquipulas - La Concepcion - Masatepe

Investigation Results

Subsection	Surface and Slope Condition	Alignment	
		Horizontal	Vertical
0.0km- 3.8km	Concrete blocks pavement (Until Tikuantepe) Poorly drained New construction, but seriously damaged by drainage effects Roadway width=7.3m		
3.8km- 8.4km	Asphalt pavement New construction Rough surfacing Asphalt mix and gradation fairly designed Roadway width= 6.5m Shoulders width=1.0m		
8.4km-18.0km	(La Concepcion) -ditto-		
18.0km-31.5km	Earth road Roadway width=3.8m (Until Masatepe)		

ROUTE D (SAN BENITO - EL RAMA)

Section D-1:
San Benito - Las Banderas

Investigation Results

Subsection	Surface condition	Alignment	
		Horizontal	Vertical
0.0km- 5.0km	maintained	0.0	0.0
5.0km-10.0km	maintained		8.6/10.0
10.0km-11.3km	maintained
