SUPPORTING REPORT B

SOCIO-ECONOMIC STUDY

1. GENERAL

The Republic of Honduras is located in the Central American region, and is bounded by the Republic of Guatemala on the West, El Salvador on the South and Nicaragua on the East and Southeast. It has a territorial extension of 112,088 km² and a population of approximately 4.5 million. The country has a coastline of 880 km on the Caribbean Sea to the North and 153 km on the Pacific Ocean to the South.

General speaking, its topography is characterized by ample and fertile valleys surrounded by forest mountains, and provides favorable conditions for agriculture, cattle breeding and forestry under a suitable weather condition.

The Republic of Honduras takes the form of a representative democratic republic. It is operated through three authorities: Legislative, Administrative and Judicial authorities. The national administration is conducted by twelve Ministries (Ministerios or Secretarias).

The Ministry of Communications, Public Works and Transportation (Secretaria de Comunicaciones, Obras Publicas y Transporte; SECOPT), which is in charge of the present study as Honduran counterpart, is divided into Six Bureaus (Direccion General) and one Institute for public services, and supervises some public enterprises of Ferrocarril National de Honduras, Empresa Nacional de Energia Electrica (ENEE) and Empresa Hondurena de Telecomunicaciones (HONDUTEL), etc. (*Fig.* B.1.1).

The Bureau of Public Works (Direccion General Obras Publicas) is administratively composed of seven Departments (Departamentos) which have several Divisions respectively, as illustrated in *Fig.* B.1.2. It has some 400 employees in total in 1993.

The country is administratively divided into 18 Departments under the jurisdiction of the Central Government, and the Governor of each Department is appointed by the Central Government. The Department is further divided into several Municipalities (municipios) which amount to 289 units in the country as a whole. Respective municipalities have a right of self-government, and the head of Municipality is elected by the popular vote. The least unit of community in the Municipality is called Town (Pueblo) or Village (Aldea). The Study Area extends over four Municipalities of San Pedro Sula, Choloma, La Lima and Puerto Cortes in the Department of Cortes and has an area of 717 km² in total. San Pedro Sula has a population of 326,943 (1988 Census) as the second largest city of Honduras and forms the greatest industrial zone in the country. In the rural area, the agriculture is well-developed, especially on cattle-farming, banana plantations and sugar cane field.

While, this area has been frequently damaged by hurricanes, for example, flood damage caused by the 1974 hurricane is estimated at the amount of Lps. 71 million approximately. The flood protection is therefore recognized to be an essential subject for the economic development and improvement of the social environment in this area.

The present Supporting Report states about a socio-economic situation of the country as a whole and the Study Area, with the aim of clearing a socio-economic position of the present project and of providing some basic data required for a socio-economic evaluation of the project. These descriptions are given in the following Chapters 2 and 3.

2. NATIONAL SOCIO-ECONOMIC BACKGROUND

2.1 Gross Domestic Product (GDP) and Gross National Product (GNP)

The Honduran GDP at current market price amounted to Lps. 16,406 million in 1991 against Lps. 8,128 million in 1987, at an average annual growth rate of 19.2 % during this period. But the real growth rate showed 3.1 % per annum during the same period (*Table B.2.1*).

The agricultural sector, which is the major economic activity of this country, accounted for 21 or 22 % of the total GDP for the period 1987-1991. The manufacturing industrial sector, which follows the agricultural sector, increased from the share of 15 % in 1987 to 17 % in 1991.

The GNP at current price amounted to Lps. 15,274 million in 1991 against Lps. 7,724 million in 1987 at an average annual growth rate of 18.6 % for this period. But, the real average growth was a rate of 3.0 % for the same period.

The per capita GNP at current price amounted to Lps. 3,107 in 1991 on the increase by Lps. 1,316 from the value in 1987, and the average annual growth rate was 14.8 % for

this period. However, the real growth was only a rate of 0.2 % per annum. This growth rate indicates that the average living standard of Honduran people was little improved for the said period.

2.2 External Trade

2.2.1 Export

Honduran exports was US\$ 779.9 million in 1991 on the decrease by US\$ 71.1 million from the 1989 exports. This decrease rate was about 4.3 % per annum on average (see *Table B.2.2*).

The exports of bananas and coffee which have respective shares of approximately 40% and 20% of the total exports amounted to US\$ 333.4 million and US\$ 145.9 million in 1991. But those amounts show the decrease of US\$ 18.3 million and US\$ 45.0 million respectively, compared with the 1989 exports, or the average decrease rates of 2.6 % and 12.6 % per annum.

As is obvious from *Table* B.2.2, although about 70 % of the major export commodities was trending toward decrease on the exports, the export of commodities such as petroleum products, frozen meat, shrimp/lobster and detergents were increasing during the same period, especially exports of shrimp/lobster amounted to US\$ 104.6 million in 1991 on the increase by US\$ 32.2 million against the 1989 exports, that is, it corresponded to an increase rate of 20 % per annum on average.

2.2.2 Import

During the period 1989-1991, the average imports of Honduras indicated approximately US\$ 880 million per annum, in a little annual variation. The import commodities can be classified broadly into four categories; (1) consumption goods, (2) prime materials, gas and lubricants, (3) capital assets and construction materials, and (4) others. The share in imports of these commodities accounted for 23 %, 51 %, 25 % and 1 %, on average for the said period, respectively (see *Table B.2.3*). More than 90 % of the total imports were occupied by commodities required for the daily life and the social and economic activities of Honduran people.

2.2.3 Balance of External Trade

As is evident from the discussion above, during the period 1989- 1991, the Honduran

external trade indicated that the imports exceeded the exports every year, and that such a trade deficit was trending toward increase in proportion to decrease in the exports. Actually, the deficit in 1991 amounted to about US\$ 100 million.

2.3 Balance of International Payments

In the international payments of Honduras, the current account, which consists of trade balance, service account and transfer account, indicated a deficit every year during the period 1989- 1991, i.e. its deficit was US\$ 194.3 million in 1989, US\$ 112,4 million in 1990 and US\$ 219.8 million in 1991. These deficits were due mainly to the deficits of trade balance and service account (see *Table B.2.4*).

The deficit of current account in each year was compensated by the capital account, which included an external loan, in order to maintain the balance of international payments. As a result, the external loan of Honduras was being accumulated year by year.

2.4 Government Finance

The financial revenue (or expenditure) of the central government amounted to Lps. 4,643.7 million in 1991 on the increase by Lps. 2,241million against the 1987 revenue (or expenditure), i.e. the increase rate showed 17.9 % per annum on average for the period 1987-1991. But the real increase was approximately 3 % per annum.

During the said period, more than 80 % of the government revenue were occupied by tax revenue and internal and external debts. For example, in 1991 the tax revenue, internal debt and external debt were Lps.2,529.3 million (54 %), Lps. 235.2 million (5 %) and Lps. 1,010.3 million (22 %), respectively. Among the revenue, the external debt was considerably being increased in recent years (see *Table B.2.5*).

On the other hand, the government expenditure was mainly composed of current expenditure, capital expenditure (investment) and amortization of public (internal and external) debt which accounted for 58 %, 17 % and 22 % of the total expenditure in 1991, respectively.

Regarding the external debt, the revenue was exceeding the amortization during the said period, for example, the difference between both amounts in 1991 was Lps. 507.8 million.

2.5 Strategy for the Integral Development for the Period 1990-1994

2.5.1 Basic Policy and Objectives

The SECPLAN published a strategy for the National Integral Development for the period from 1990 to 1994, which was prepared by the Honduran Government on November 1990. The main points of the strategy are summarized below:

In view of economic crisis of the country, the government designed an implementation program for economic stabilization and structural adjustment, and cooperation required from the international financial communities. One of the main objectives of the government is to improve the level of economic activity based on a growth strategy of export.

2.5.2 Economic Growth in Recent Years

The Honduran economic performance in recent years was characterized by a slow economic growth and a widespread financial imbalances.

The real GDP scarcely increased at a rate similar to the population growth, i.e. the average real increase in the per capita income was only 0.2 % per annum during the period 1987-1991. Such low increase in the income affected mainly the living conditions of rural inhabitants, thus deepening the poverty conditions.

Due to the low level of domestic savings and the inelastic export supply, the real expenditure of the central government had to be financed with an increasing demand of external resources. This raised the external debt to US\$ 3,301 million (up to June 1990), of which US\$ 3,010 million belonged to the public debt and US\$ 291 million concerned the private debt.

According to a survey which was carried out by the World Bank to classify Honduras as an IDA (International Development Association) country, the per capita GDP reached US\$ 483 in 1989. Honduras is one of the poorest countries in the Western Hemisphere, and the socio-economic indicators are among the lowest in Latin America. Unemployment affected some 350,000 people and 75 % of the population was living in poverty condition.

Recent survey on the income per worker confirmed the uneven income distribution; 40 % of the poorest population received 7.3 % of the total income, while 10 % of the

richest population received 50 % of it.

The agricultural sector, which generated 27 % of the GDP and 75 % of exports, reduced its growth from 4.2 % in 1987 to 1.4 % in 1989. The industrial sector, which accounts for 16 % of the GDP, also declined its growth drastically during 1988-1989.

2.5.3 Economic Perspectives

For the period 1990-1994, an economic recuperation is projected at a growth rate ranging between 3 % and 4 %. Such performance will be due greatly to an expected increase in exports and private investment.

The total amount of financial requirements for the period 1990-1994 will be US\$ 2,489 million, which include grants for the balance of payments, operations to pay-off arrears and repayments.

It is envisaged that current account deficit of the balance of payments will be reduced from 7.7 % of the GDP to 4 % towards 1994, due to gradual improvement in the exchange rate and the increased production in the main traditional and non-traditional export products.

Given the expected effects of the support and promotion policies for export, the exports will increase, in nominal terms, at an average annual rate of 12 %, based on the projection that banana sales will increase by 7 % (4 % increase in export volume and 3 % rise in prices).

The exports of coffee will increase at an average annual rate of 16%, as a result of the 11% rise in prices and the 5% increase in export volume. Besides, it is estimated that the export growth in non-traditional goods will continue.

The import goods are envisaged to increase at an average annual rate of 7.3 % (in CIF), under assumption that oil prices will level off towards US\$ 26 per barrel by 1994.

Capital flows reveal that the balance of payments will require special support from the international financing community for adjustment of the external debt, because that payments' gap will amount to US\$ 150-200 million per annum.

2.5.4 Strategy

1) Global Strategies

The implementation of policies and measures oriented are as follows:

- To increase the exports of traditional goods, providing the use of more efficient technologies.

- To diversify and enlarge the non-traditional export supply, introducing of the productive transformation and integration.

- Taking advantage of the international market opportunities derived from the opening of new markets.

- To use, in priority order of programs and projects, the criteria defined by their social urgency and degree of contribution for modernization and introduction of new technologies in all fields.

- To increase food production under adequate conditions of food security, by means of proper technologies according to availability of the regional productive resources.

These measures will be supported by the efficient and active participation of private sector. The public sector will assume the role of a complementary management agent in the reactivation.

2) Strategy for Agricultural Sector

- To strengthen, modernize and speed up the production of traditional crops by incorporating new technologies and better management of the agricultural market at both national and international levels.

- To liberalize domestic and foreign trades of the basic grains.

- To encourage the diversification in non-traditional export products.

- To strategically orient the development of infrastructure in the support of productive zones.

- To encourage the adoption of suitable organic agricultural technologies to improve the production of small farmers located in the vulnerable rural areas.

- To reconstruct and strengthen the financial system of the agricultural sector.

- To develop a network of refrigeration centers as a national project with public and private investments.

3) Strategy for Industrial Sector

- To strengthen the industrial structure by technical assistance and by encouraging and creating the credit lines.

- To increase agro-industrial and industrial productions by supporting the activity of fields with idle capacity able to produce for the export, and by promoting non-traditional projects oriented to the import-substitution.

- To encourage the training for managers and workers to improve productive administration and efficiency of the industrial enterprises.

- To strengthen the private and public organizations to implement the specific productive development programs directed as the weakest sectors of the manufacturing production.

- To strengthen contribution of the Government to the scientific and technological process of national industrialization.

4) Strategy for Infrastructure

- To improve the operational capacity and efficiency of infrastructure and services on the land transportation.

- To expand the road system to incorporate the new production areas.

- To improve airports, terminals and equipment on the air transportation.

- To improve the operational efficiency of ports, so that the services become attractive to exporters.

B-8

- To promote a master plan study for construction and enlargement of rural roads, and also to rehabilitate the roads to encourage the marketing of agricultural and forest products.

- To encourage rehabilitation and reconstruction plans of bridges in the zones affected by the floods, as well as in other productive areas.

- To newly invest in the energy sector to enlarge, improve and install the generation and transmission capacities which will contribute to sustain or promote the economic growth.

- To improve communication system to satisfy the needs of people, and to enlarge the system in the most important 25 cities.

3. SOCIO-ECONOMIC CONDITION IN THE STUDY AREA

3.1 Location and Administration

The Study Area is located in the northern part of Honduras, and extends from $15^{\circ}24'$ to $15^{\circ}48'$ north latitude and from $87^{\circ}46'$ to $88^{\circ}07'$ west longitude. It has an area of 717 km².

The Study Area is included in the Department of Cortes and spreads over four Municipalities; San Pedro Sula, Choloma, La Lima and Puerto Cortes (See Fig. B.3.1). The Municipality is divided into cities (municipios), towns (Pueblos) and villages (Aldeas) in accordance with a population-scale. San Pedro Sula, the second largest city of Honduras, forms a central area of administration, industry and commerce in the Study Area.

3.2 Population and Housing

3.2.1 Population and Housing Censuses

1) Population Census

(1) National Population

Since 1960, the Republic of Honduras has conducted the population censuses three

SOCIO-ECONOMIC STUDY

times; the 1961, 1974 and 1988 Censuses. According to the censuses, population of the country as a whole amounted to 4,443,721 in 1988 through 2,656,948 in 1974 and 1,884,765 in 1961. The average annual growth rate showed 2.68 % and 3.74 % for the periods 1961-1974 and 1974-1988, respectively. The population growth for the period 1974-1988 is recognized to be a fairly high rate in view of the general trend of other countries in the world (see *Table* B.3.1).

As a result, population density of the country increased from 17 persons/km² in 1961 and 24 persons/km² in 1974 to 40 persons/km² in 1988.

(2) Regional Population

The population of the Department of Cortes, which includes the Study Area, increased from 200,099 in 1961 and 369,616 in 1974 to 662,772 in 1988, at the average annual growth rates of 4.83 % for the period 1961-1974 and 4.26 % for the period 1974-1988. These percentages indicate that the Department of Cortes was an area with higher population growth than the whole country for the said periods (*Table B.3.1*).

Accordingly, the population density increased considerably in 1988 compared with 1961 and 1974, or 51 persons/km2 in 1961, 94 persons/km2 in 1974 and 168 persons/km2 in 1988. In the Censuses 1974 and 1988, the Department of Cortes indicated the highest population density among 18 Departments.

The total population of the four Municipalities of San Pedro Sula, Choloma, La Lima and Puerto Cortes amounted to 500,886 in 1988 through 281,247 in 1974 from 137,988 in 1961. The average annual growth rate showed 5.63 % for the period 1961-1974 and 4.21 % for the period 1974-1988. The population of each municipality is given in *Table* B.3.2.

In this table, the population growth in the Municipality of San Pedro Sula is given as a comparatively low rate of 3.54 % per annum for the period 1974-1988, because the Municipality of La Lima was separated from the Municipality of San Pedro Sula in the census 1988. Concerning the total population of both Municipalities of San Pedro Sula and La Lima, it came to 372,721 in 1988 and the growth rate showed 4.51 % per annum on average for the period 1974-1988.

In 1988, the whole of the said four Municipalities related to the Study Area showed a population density of 268 persons/km² which corresponded to 1.6 times of the average population density of the Department of Cortes. In the same year, the population

densities in two Municipalities of San Pedro Sula and La Lima were 361 persons/km² and 395 persons/km², respectively (*Table* B.3.2).

The population censuses indicate that the Study Area and its surrounding areas were trending toward urbanization rapidly since 1961. In the said four Municipalities, the population in the urban area accounted for 77 % of the total population in 1988 against 66 % in 1974 and 58 % in 1961. These percentage is far higher than figures of the whole country and the Department of Cortes. Especially in the Municipality of San Pedro Sula, the proportion of urban population came to 88 % in 1988 on the rapidly growth since 1961. Details are given in *Table* B.3.3.

2) Housing Censuses

According to the National Housing Censuses, in the four Municipalities of San Pedro Sula, Choloma, La Lima and puerto Cortes, number of residential houses occupied amounted to 106,302 in 1988 through 54,467 in 1974 from 24,930 in 1961, in nearly proportion to the population. The average number per unit area in 1988 is estimated at 57 houses/km², composed of 77 houses/km² in San Pedro Sula, 29 houses/km² in Choloma, 85 houses/km² in La Lima and 35 houses/km² in puerto Cortes (see Table B.3.4).

The Censuses indicated that the family size per house was trending toward reduction as the whole of country since 1961. The average family size in the said four Municipalities came to 4.71 persons/house in 1988 through 5.16 persons/house in 1974, reducing gradually from 5.54 persons/house in 1961. The average size in 1988 shows smaller figure than those of the whole country and the Department of Cortes. Detail for each Municipality is given in *Table* B.3.4.

3.2.2 Population Projections

1) National Population Projection

According to the population census, the Honduran population amounted to 4,444 thousand in 1988 with the average annual growth rate of 3.74 % during the period from 1974 to 1988.

Taking results of the population censuses in the past into consideration, the SECPLAN made a forecast of Honduran population, assuming that the annual growth rate of population will be 2.5 % in the year 2000 and 1.4 % in 2025. It expects that the the

Honduran population will amount to 6.2 million in 2000 and 10.1 million in 2025.

2)

Estimates of Population and Number of Residential Houses in the Study Area

The municipal population shown in *Table* B.3.4 is the whole figure of each municipality, not population in the Study Area where is composed of a part of each municipal territory. Therefore with the object of getting a basic data required for analyzing the potential flood damage in the Study Area, the JICA Study Team surveyed the 1992 population together with number of buildings in the Study Area, by means of a questionnaire survey for each community and by using other available data.

According to the said survey result, the 1992 population in the Study Area is estimated at approximately 520,000, composed of 384,000 in the San Pedro Sula area, 101,000 in the Choloma area, 20,000 in the La Lima area and 15,000 in the Puerto Cortes area.

Out of the 1992 population in the Study Area, the urban population is estimated at 467,000 accounting for 90 % of the whole, and the population of 48,000 (9 %) and 5,000 (1 %) distribute in the rural and mountain areas, respectively. Number of buildings in the Study Area is estimated at 107,000 in total, and its regional distribution is nearly proportional to the population distribution. *Table* B.3.5 provides a breakdown of the distribution of population together with number of buildings in the Study Area. Furthermore, the Study Team surveyed population and number of buildings by Barrio/Colonia in the Rio Choloma basin during the period 1992-1993, for the purpose of estimating the potential damage caused by flood from Rio Choloma, and the result is given in *Table* B.3.6 and *Fig.* B.3.2.

The population in the Rio Choloma basin in 1992 is estimated at about 58,500 in total, composed of 54,500 in the central city area, 3,400 in the highland area and 500 in the lowland area. Buildings distribute in proportion to the population, and its number is estimated at about 13,000 in the Rio Choloma basin.

Apart from the survey by the Study Team, a population projection was carried out on the urban population of the San pedro Sula Municipality, by the Hydro-Service and Cinsa Consultants in 1991.

The projection was made until 2001 by preparing two Scenarios A and B; the average annual growth in population was assumed to be a low rate of 4.93 % for the Scenario A and a high rate of 6.34 % for the Scenario B. According to this projection, it is expected that the urban population of the San Pedro Sula Municipality will amount

unit : square km

between 520,000 and 620,000 in 2001.

3.3 Land Use

3.3.1 General Situation

The Study Area has an area of 717 km^2 . It is characterized by ample and fertile valley and forest mountains, and provides favorable conditions for agriculture, cattle breeding and forestry. San Pedro Sula, which is the second largest city of Honduras, has expanded on the basis of such favorable condition.

During three months, September through November of 1992, the JICA Study Team surveyed the land use situation in the Study Area conducting field visits and using existing land use maps and aerial photographs. The result is illustrated in *Fig.* B.3.3.

A breakdown of the land use by river basin in the Study Area is given in *Table B.3.7*, and the total area of each river basin is summarized as follows:

1. Chamelecon A1 (lower basin)	25
2. Cuabanos Canal	125
3. Rio Choloma	104
4. Chamelecon A2 (middle basin)	39
5. Rio Blanco/San Roque Canal	186
6. Rio El Sauce	118
7. Rio El Sauce (viejo)/Chotepe Canal	100
8. Chamelecon A3 (upper basin)	11
9. La Lima Airport	9
Total	717

The Study Area is broadly composed of two zones; highland and lowland, which are divided by the north-south trunk road, Route CA-5. The present situation of land use is described below.

3.3.2 Highland Zone

The highland zone, where lies the western part in the Study Area, is covered by a tropical rain forests which consist of pine, cedar and wide leaves trees (mahogany, mango, almond, palm, avocado, etc.). These forests extend as far as the southern part (highland of the San Pedro Sula) and function as a natural protection zone for water resources.

In the northern part of the highland, upper reach of the Rio Choloma, traditional crops such as maize, beans and rice are broadly cultivated, and villages and pasture lands are scattered in these crop lands. The area of the whole highland zone is estimated at about 304 km^2 , or 42 % of the Study Area. A detailed land use of the high land zone together with the lowland zone is provided in *Table* B.3.8.

3.3.3 Lowland Zone

In the central area of the lowland zone where lies the eastern part of the Study Area, the predominant use is natural and cultivated pastures for cattle breeding.

The lowland zone along the Rio Chamelecon forms a mixed agricultural land which is composed of small villages and fields of sugar cane, pasture, bananas, maize, rice, various vegetables, brushwood, etc. In addition to such land use, the large-scale plantations of sugar cane and bananas are spread in the southern part of the San Pedro Sula. The area of the whole lowland zone is estimated at about 413 km², or 58 % of the Study Area (*Table* B.3.8).

3.3.4 Urban Area

The major urban areas are located in three cities of San Pedro Sula, Choloma and La Lima. The first two cities spread over both highland and lowland zones, and the La Lima city lies the southern part of the lowland zone. The San Pedro Sula city and its surrounding areas form a large industrial zone as well as commercial and residential zones. *Fig.* B. 3.4 and *Table* B.3.9 show detailed land use situations of the San Pedro Sula city in 1992.

Each municipal office of San Pedro Sula and Choloma has a urban development scheme. According to these scheme, in the near future it is expected that the urban area in the Study Area will amount to more than 20,000 has., including the La Lima urban area of 950 has. A breakdown of land use by each city is provided in *Table* B.3.10,

and its general view is illustrated in Fig. B.3.5.

3.3.5 Choloma Area

It is expected that a high priority will be given to an improvement works of the Rio Choloma, under the result of the Master Plan Study. In consideration of this matter, the land use situation in the Choloma area was surveyed in more detail as shown below:

1) Rio Choloma Basin

The Rio Choloma basin has an area of 104 km^2 in the whole of highland and lowland. Fig. B.3.6 and Table B.3.11 give the present land use of the Rio Choloma basin. In the lowland, the natural and cultivated pastures for cattle breeding accounts for 70 %, the agricultural fields of maize, beans, sugar-cane, vegetables, bananas, fruits, etc. have an area of 9 %, and remaining 21 % is built-up area. Almost all the highland in the Rio Choloma basin are cultivated for agricultural and pasture uses except a little area of forest and brushwood.

2) Choloma City and Its Suburbs

Fig. B.3.7 illustrates a historical development pattern of the built-up area in the Choloma city from 1954 to 1992. According to this figure, the built-up area in 1992 become about eight times as large as that in 1954. The breakdown of land use in the Choloma city in 1992 is provided in *Table* B.3.12.

In 1990, the Choloma municipality and Choloma city were favored by the President Degree 37/87 on a creation of the Export Processing Zone (EPZ) so as to promote the establishment of export industry to attract the overseas investments. During two years of 1990 and 1991, several units were built in the EPZ by the overseas enterprises from Korea, Taiwan, U.S.A., etc.

It is said that one EPZ will create about 350 jobs and 15,000 employees within coming 4 or 5 years. It is expected that such high rate of employment opportunity will produce an extraordinary increase in population in the Choloma city and its suburbs and that as a result it will promote an enlargement of the urban area. *Fig.* B.3.8 illustrates an urban development plan of the Choloma city.

Besides, detailed land use, location of public facilities and building density in the Choloma city were surveyed for the purpose of estimating the potential damage caused by floods of the Rio Choloma, and these general maps are provided in *Figs.* B.3.9, B.3.10 and B.3.11, respectively. It is noted that almost all the central area of the Choloma city are located within the inundation area caused by the 1974 flood.

3.4 Agriculture

Honduras is a traditional agricultural country which labor force of this sector accounts for nearly 50 % of that of the whole industrial sector. The agricultural products are represented by maize, beans, rice, sorghum, coffee, bananas, plantains, sugar cane, african palm, cotton and tobacco. Of these products, three crops of maize, beans and rice are mainly consumed in the country as principal foods of Honduran people. During the period 1987-1991, productions of these crops increased at the average annual rates of 8.7 %, 15.1 % and 11.0 %, and in 1991 amounted to 12,293, 1,741 and 1,905 quintals, respectively (see *Table* B.3.13).

The country is divided into seven agricultural regions; (1) Southern, (2) West-Central, (3) Northern, (4) Atlantic Coastal, (5) East-Northern, (6) East-Central and (7) Western, and the agricultural statistics are mainly made by Region, not by Department. The Study Area is included in the Northern Region (Region No.3).

In the agricultural year 1992/1993, production of maize in the Northern Region (Region No.3) was estimated at 2,791,870 quintals with the cultivated area of 99,610 manzanas, accordingly the yield came to 28.03 quintals/manzana (1 manzana = 0.7 ha, 1 quintal = 45.36 kg). The cultivated area and production in the Region No.3 accounted for 17 % and 19 % of those in the whole country, respectively (see *Table* B.3.14).

In the said year and Region, the cultivated area and production of beans were 8,170 manzanas and 92,970 quintals which corresponded to 10 % and 11 % of those in the whole country respectively, and as a result the yield came to 11.38 quintals/manzana.

Regarding rice, the cultivated area and production were 6,790 manzanas and 339,280 quintals which corresponded to 33 % and 39 % of those in the whole country respectively, and the yield came to 49.97 quintals/manzana.

On the other hand, bananas, coffee and sugar cane are important as major export goods of Honduras. During the period 1987-1991, the production of coffee and sugar cane in the country increased at the average annual rate of 5.9 % and 4.1 %, and in 1991 amounted to 2,215 x 10^3 quintals and 68,896 x 10^3 quintals, respectively. While,

during the same period the bananas production was trending toward decrease at the average annual rate of minus 4.5 %, and the 1991 production was $21,142 \times 10^3$ quintals (*Table* B.3.13).

The plantations of bananas and sugar cane are broadly exploited in the Department of Cortes and the Study Area. The bananas plantation in the Department of Cortes has an area of approximately 2,200 ha which correspond to 11 % of the total in the country, and concerning the plantation area the Department of Cortes ranks second following the Department of Colon among Departments. The area of bananas plantation in the Study Area is estimated at about 600 ha.

In 1992, the area of sugar cane plantation is estimated at 6,000 ha in the Department of Cortes and 2,700 ha in the Study Area. The plantation area of the Department of Cortes stands first among the whole Departments.

Apart from the agricultural crops, Honduras has an extensive cattle farming industry which is being operated using the wide pasture. According to statistics, number of cattle which was carved for edibles of Honduran people and for export use as a frozen meat amounted to about 205,000 heads in 1986, and more than 50 % of the meat production in the country were made in three Departments of Cortes, Francisco Morazan and Choluteca. Number of the cattle carved in the Department of Cortes in 1984 and 1986 amounted to 83,400 and 39,500 heads, respectively (see *Table* B.3.15).

Pigs also are an important livestock as edibles for inhabitants. Pork production in the country amounted to 157,200 heads in 1986, including 74,600 heads in the Department of Francisco Morazan and 29,700 heads in the Department of Cortes, i.e. concerning pork production the said two Departments accounted for more than 60 % of the whole country.

3.5 Manufacturing Industry

Honduras produces various industrial goods such as cement, iron bar, textiles, wheat flour, sugar, pasteurized milk, vegetable oil and fats, cigarettes, beer, soft drink, and distilled and other liquors. Almost all of them are consumed in the country, except some quantities of export goods; cement, sugar, etc.

The majority of these goods are manufactured in the San pedro Sula city and its surrounding areas where are the greatest industrial zone in the country. In 1992,

number of factories in the Municipalities of San Pedro Sula is estimated at about 1,500, according to survey of the JICA Study Team.

During the period 1987-1991, in Honduras the productions of cement, fiber cement plates, wheat flour, vegetable oil and soft drink showed high growth of the average annual rates of 11.3 %, 10.2 %, 7.2 %, 8.5 % and 10.9 %, respectively. While sugar and pasteurized milk were decreasing their productions at the average annual rates of minus 1.7 % and minus 1.4 %, respectively during the same period. Detailed productions of these goods are given in *Table* B.3.16.

3.6 Wholesale, Consumer and Retail Prices

3.6.1 Wholesale Prices

Table B.3.17 shows an average wholesale price index in Tegucigalpa and San Pedro Sula for the period from 1987 to 1992. The wholesale prices indicated remarkable rise during the said period, especially in 1990 and 1991. The average annual rate of price rise was 19.5 % for the domestic goods and 18.9 % for the imported goods for the said period.

Among all commodities, the prices of chemicals in the domestic production showed the highest rise, or the average annual rate of 31.8 % for the same period. On the other hand, in the imported goods, the prices of pharmaceuticals rose at the highest average annual rates of 24.2 %.

3.6.2 Consumer Prices

During the period 1987-1992, the consumer prices also indicated high rise, even though the rate was somewhat lower than that of wholesale prices. As shown in *Table* B.3.18, rise in the mean price of general goods indicated an average annual rate of 15.6 % for the country as a whole and 15.9 % at the market in the San Pedro Sula. Among all goods, food price indicated the highest rise rate, or an average annual rate of 18.5 %.

3.6.3 Retail Prices

Table B.3.19 gives retail prices of general foods in Tegucigalpa and San Pedro Sula for the period from 1987 to 1991. Although the difference between both prices in Tegucigalpa and San Pedro Sula was little about all foods, but rise in the prices themselves was considerable. During the said period, the average annual rise rate was 20 % or more for red beans, corn grain, rice, beef loin, pork loin, pasteurized milk, eggs, potato, tomato, plantain and tomato paste, especially over 40 % for tomato.

3.7 Wage

The Government has controlled the minimum wage to ensure a living standard of workers since 1981. According to a minimum wage by industrial sector as of July 1991, both sectors of agriculture (including forestry and fishery) and construction indicated the lowest minimum wage, ranging Lps. 9.25 to Lps. 12.35 per day and Lps. 9.20 to Lps. 12.40 per day, respectively.

On the other hand, the highest minimum wage was given in the metallic mining sector, ranging from Lps. 13.90 to Lps. 18.40 per day, i.e. this sector indicated the high wage by about 50 % compared with agriculture and construction sectors (see *Table B.3.20*).

SUPPORTING REPORT C FLOOD AND FLOOD DAMAGE SURVEY

1 FLOOD AREA SURVEY

A questionnaire survey was carried out by the study with the aims of the followings:

- In order to clear the flood conditions in the past, flood area, depth of flood, thickness of sediment deposits and duration of flood were surveyed for major floods through questionnaires,
 - In order to get data and information of flood damages in the past flood, houses and assets in the flood hazard area were surveyed and studied.

The survey area is divided into three zones and shown in *Figs*. C.1.1 and C.1.2. They are explained as follows:

1) Zone-A: Western area of San Pedro Sula (Fig. C.1.1)

-A-1: Calpules (lower reach of the Rio El Sauce)

-A-2 Santa Marta (lower reach of the Rio Blanco)

-A-3: Lima (Western part of La Lima, Old Lima)

2) Zone-B:

Eastern area of San Pedro Sula (Fig. C.1.1)

-B-1: Fesitranh (upper reach of the Rio Blanco)

-B-2: Universidad (upper reach of the Rio El Sauce)

-B-3: Chamelecon (Southern part of San Pedro Sula)

3) Zone-C: C

-C: Choloma and northern part of the study area (Fig. C.1.2)

-C-1: Choloma (along the Rio Choloma)

- -C-2: Monterrey (eastern part of Choloma, including of La Ceibita, La Galves, La Devis, La Montanuela, San Roque and La Danta)
- -C-3: Blanquito (along the national road, including of Quebrada Seca, Rio Bijao, El Triunfo, Baracoa and Campana)

A questionnaire survey has been carried out from September 1992 through October 1992 for the past flood areas and flood damages. The form used in the questionnaire survey is shown in *Table* C.1.1 and *Table* C.1.2. 260 sites and 580 households are visited and interviewed in the flood hazard area. The numbers of households interviewed are shown in *Table* C.1.3.

The table shows that out of the 628 households interviewed, 523 households (83 percent) have experienced flood damages in the past. Although the study area was suffered from the floods in 1935, 1945, 1954, 1969, 1974, 1979 and 1990, the questionnaire survey has been carried out on the largest flood of 1974, the current large flood of 1990 and yearly flood.

The supplementary survey was carried out in May and June 1993 for the Feasibility Study area which is identified in the Master Plan.

2 FLOOD CONDITIONS AND FLOOD DAMAGES IN THE PAST

2.1 Outlines of the Questionnaire Survey

Table C.1.3 shows that 523 samples (84 percent) among 628 samples show that they have had flood experiences in the past. The actual situations of the survey areas are explained as follows:

(1) Zone-A

The households of 147 have experienced flood damages. Their locations and experienced floods are explained as follows:

- In A-1, it is 60 samples to have flood experiences, of which 23 and 21 samples indicated yearly flood and the 1974 flood respectively.

- In A-2, it is 66 samples to have flood experiences, of which 36 samples indicated the 1990 flood.
- In A-3, it is 21 samples to have flood experiences, of which 13 samples indicated the 1990 flood.
- (2) Zone-B

The households of 172 have had flood experiences as follows:

In B-1, it is 49 samples to have flood experiences, of which 25 samples indicated the 1974 flood.

In B-2, it is 42 samples to have flood experiences, of which 39 samples indicated 1974 flood.

In B-3, it is 81 samples to have flood experiences, of which 40 samples indicated the yearly flood.

(3) Zone-C

The households of 195 have had flood experiences as follows:

In C-1, it is 74 samples to have flood experiences, of which 36 samples indicated the 1974 flood.

In C-2, it is 50 samples to have flood experiences, of which 20 samples indicated the 1974 flood.

In C-3, it is 71 samples to have flood experiences, of which 39 samples indicated the 1974 flood.

The total numbers of the sample houses (or buildings) are 427, of which 323 houses (or buildings) are residential, 46 houses (or building) are farmhouses. The rest of them

are commercial, industrial, school, clinic, church and office buildings as shown in *Table* C.2.1.

The residential houses are divided into 4 classes as follows:

(1)	High class	More than Lps. 150,000,
(2)	Middle class	Lps. 150,000 to 80,000,
(3)	Low class	Lps. 80,000 to 20,000,
(4)	Poor class	Less than Lps. 20,000,

2.2 Description of the Past Floods

1) 1974 flood (the hurricane Fifi)

The flood caused by the hurricane Fifi is the largest flood ever experienced in the study area. The all rivers in the study area caused floods and the flood area map was prepared and shown in *Fig. C.2.1. Table C.2.2* shows the situations of the 1974 flood caused by the hurricane Fifi. The average duration of inundation is 10 days in the study area. The average depth of flood water was 106 cm above the ground level and 79 cm above the floor level. The thickness of sediment deposits was 28 cm above the ground level.

The flood areas, submerged deeper than 100 cm above the building floor, covered widely in Calpules, Fesitranh and Chamelecon. Also sedimentation areas, thickness about 10 cm above the building floor level, were identified in Fesitranh, Santa Marta, Choloma and Monterrey.

During the Feasibility Study stage, supplementary surveys were carried out in the Rio Choloma basin. The flood situations informed and recorded in the newspapers of Tiempo and La Prensa, were summarized in *Table* C.2.3.

C-4

2) 1990 flood (the hurricane Gilbert)

Chamelecon, Choloma and Monterrey were affected by the flood water from the Rio Chamelecon and the Rio Choloma. The areas of Calpules and Santa Marta were also inundated during the flood. The flood area map was prepared and shown in Fig. C.2.2.

Table C.2.4 shows the situations of the 1990 flood caused by the hurricane Gilbert. The average flood water depth was 79 cm above the ground level and 49 cm above the floor level. The sediment deposits were 13 cm in thickness. The duration of inundation was 7 days.

3) Yearly flood

The yearly flood area map is prepared and shown in *Fig.* C.2.3. Calpules, Santa Marta, Universidad, Fesitranh, Chamelecon, Choloma, Monterrey and Blanquito that are located in the low lying areas, are affected by floods yearly from the Rio Chamelecon and its tributaries because of poor flood mitigation facilities and poor drainage facilities. *Table* C.2.5 shows the conditions of the yearly floods.

TABLE C.2.3 MAJOR EVENTS AND TOPICS AT THE DAYS OF FIFI IN CHOLOMA

Day	Time	Major events at Choloma City	At La Jutosa/Ocotillo/Majaine/Portitlo
	i		
17 Sept.(Tue)		Rain began at 10:00 p.m. contineously	Rain began at 10:00 p.m. contineously
18 Sept.(Wed)		Heavy rain with strong wind all the day	Heavy rain with strong wind all the day
		The airport was closed and all flights were cancelled	
	18:00	General warning by radio, but with no detail	General warning by radio, but with no detail
:		information, so that people were not so cautious	information, so that people were not so cautious
		The road(SPS-Pto Cortes) is flooded with water up	
		to 30 cm	
	22:00	Water depth of the road increased by 1 m	:
19 Sept.(Thr)	1:00		Flood water with sand and stones came at Ocotillo
		Some people were evacuated to other places	Water higher than the root of the houses at Ocotillo
	3:00	Flood water hits Choloma city area and the road and	People evacuated to the mountain at OcotilloA.a Jutos
		railway bridges were washed away in a few minutes	25houses(85persons) were damaed at Portillo(14ha)
		Almost all the city area was inunded and 2/3 of the	16 persons were killed by land slide at Ocotillo
		Choloma submerged	100 houses(1000 persons), 5 ha of village area were
		People were lloated and drowned, and some people	destroyed, and livestock and all crops were totally
		evacuated at 2nd floor of neighbor's houses	washed away at La Julosa
	6:00	Flood water depth went down	10 houses(80 persons) were washed away with land
20 Sept.(Fri)		Choloma was still flooded, there are no power supply	slide and the road was washed away at Majaine
		and water	Water depth approx. 10 meter at La Jutosa
		Up to this date there have been 70 bodies burried in	95% of La Jutosa and Ocortillo were destroyed
		Choloma and 22 bodies in Quebrada Seca	
		At a school in Quebrada Seca, the water depth is 2 m	
		There are hundreds of people on the roots of the	
		houses were asking for help	- .
· · · · · · · · · · · · · · · · · · ·		80% of the people in Choloma city lost thier houses	_
21 Sept.(Sat)		2/3 of Choloma city are flooded	-
22 Sept.(Sun)		Choloma city is isolated	Flood water was stabilized at La Jutosa
23 Sept (Mon)		Electricity supply was recovered in some area	People suffered from no lood/communication and sick
24 Sept.(Tue)			People recieved foodstull from the rescue(French aid)
25 Sept.(Wed)		People recieved food, clothing, medicines, etc. by air	
28 Sept.(Sat)		One water well was built, capacity 60,000 gal/day	-
4 Od.		Rescue from University Tegc, started to work	••••••••••••••••••••••••••••••••••••••
		Railway briges was reconstructed	=
		Road was connected by temporal bridge	~
9 Oct		3 water well were built but with no distribution tank	
10 Oct.		1,640 bodies have been incinerated and 240 people	125 bodies were found and burried
		are missing in Choloma by this time	
		People were suffering from the sickness	
		Recontruction works were started	
After 1 month		Electricity supply was recovered	Road was connected to Choloma at Ocotillo
		Provisional wooden bridge was built	
After 3 months		Water supply was recovered completely	······································
Aller 1 year		Reconstruction work were completed so far	Completion of new settlement area in La Nueva
			Jutosa with church, hospital and school
After 2 years		Permanent concrete bridge was built	Completion of reconstruction at the Ocotillo

Memorandam of the1974 flood in Choloma(major sources; newspapers and interview to the residents)

Estimation of Flood Damages to the People and Houses(Rio Choloma Area)

	Damaged/Injured	Destroyed/Killed
La Jutosa	80-100 houses, 1,500 persons	50 people were killed
Ocolillo	40-50 houses, 1,000 persons	31 people were killed
Choloma city*)	3,000 houses, 15,000 persons	2,000 people were killed
Other areas	500 houses, 1,500 persons	
TOTAL	Approximately 4,000 houses and 20,000 persons	Approximately 2,500 people killed

Reference Information

Around 90,000 people were injured in San Pedro Sula

Approximately 1,600 ha area of banana were destroyed in the Sula Valley

60% of the railway was destroyed in Honduras

Total cost of the damage was \$300-400 millions in Honduras

Preliminary estimate show that there could be a total of 10,000 deaths in nationwide

*)Especially at Guayabal, San Antonio, Pueblo Nuevo, La Playa and Conception
