

(3) Hub Port in the Persian Gulf

Though Dubai port is the major player in world trade, Abbas Port will hopefully perform as a major transshipment port in future.

(4) Core of the District Development

Chabarhar port has been improved following the district development plan for a long time and the port and city will continue to be developed.

The Persian coastal area is not an easy place to live, but considering the future of Iran it is necessary to develop the Persian Gulf coastal area. The port will act as the core in this area.

(5) For Civil Amusement

In future, green areas, amusement facilities and so on will be provided in the port area for workers and citizens.

3.4 Future Status of Inland Transport Network

In this section, we try to illustrate the future network concerning the general situation of Iranian transportation in connection with the "Future Aspect of Transport Network" which is described in the 2nd Five Year Plan.

3.4.1 Road

(1) Present networks of freeways and expressways

Present freeways and expressways are arranged around the major cities-Tehran, Tabriz, Mashhad, Esfahan. Future plan of freeway and expressway is compatible with the present road network. Current projects of freeway and expressway are divided into two directions. One is in the west and east direction that corresponds with Asian Highway the other is in the north and south direction, connecting the Caspian Sea and the Persian Gulf.

1) Freeway

Tehran---Qazvin	150 km
Tehran---Qom	160 km
Esfahan---Zarrinshahr	40 km

2) Expressway

Tehran-Qazvin road	
Tehran---Vard Avard	70 km
Tehran-Mashhad road	
Tehran---Rudehen	60 km

Tehran-----Mamazan	40 km
Tehran----Varamin	50 km
Sari-----Qaemshahr	50 km
Mashhad--Quchan	130 km
Tabriz-----Maragheh	30 km
Tehran-Arak road	
Tehran----Robotkarim	50 km
Qom--Esfahan--Shiraz road	
Esfahan---Meymeh	120 km
Esfahan---Qomsheh	80 km
Esfahan---Mobarakeh	60 km
Shiraz-----Marvdasht	70 km
Other road	
Kerman---Baghin	25 km

(2) Future networks of Freeway and Expressway

1) Tehran-Arak freeway

This freeway is to be constructed between Tehran and Arak through Saveh. Tehran-Saveh section will be 115 kilometers long and completed by 1994. Total length of this section is 293 km.

2) Qazvin-Zanjan freeway

This freeway is to be constructed between Qazvin and Zanjan through Takistan. This section is 170 km. This route is a part of Asian Highway Route 1 and connects the Turkish border through Bazargan.

3) Tehran-Mashhad expressway

This project is the Tehran-Mashhad expressway, via Semnan, Shahrood, Sabzevar and Neishabur, which started in 1988. This expressway is planned as the access road between the Isfahan and Semnan provinces, which will be significant for establishing connections between the southern provinces and Mazandaran, Semnan and Khorasan provinces. This route is an alternative route to Asian Highway Route 1 and this network consists of about 894 km.

4) Qom-Esfahan expressway

Esfahan-Meymeh section (120km) is already completed and Qom-Meymeh section is to be constructed.

5) Esfahan-Shiraz expressway

Esfahan-Marvdasht section (70km) is already completed.

6) Ahwaz-Esfahan expressway

This is the line under study. This route is shorter to Tehran than the one from B.Khomeini. Tehran and Esfahan will be connected with Persian Gulf(B.Khomeini).

(3) International Road Networks

1) Present network and future network

Iran is connected to Europe and Central Asia by road through Turkey, Azerbaijan, Turkmenistan, Afghanistan, and Pakistan.

Present main transport routes are Turkey through Bazargan and Azerbaijan through Astara. Transport networks between Iran and Central Asia will be important in future.

Europe : Turkey, Azerbaijan	
Present network (Existing freeway, Qazvin-Tehran 150 km)	
Turkey : Bazargan--Tabriz--Zanjan--Qazvin---Tehran	879 km
Azerbaijan : Astara---Rasht---Qazvin-----Tehran	514 km
Future network	
Asia Highway(A-1)	
(Ankara)-Bazargan-Tbriz-Tehran-Sari-Mashhad-Taybad-(Herat)	
Almatoi-Istanbul Highway	
(Ankara)-Razi-Tabriz-Tehran-Gorgan--(Ashkhabad)	
Central Asia : Turkmenistan, Afghanistan, Pakistan	
Present network	
Turkmenistan : Sarakhs--Mashhad---Semnan---Tehran	1,079 km
Afghanistan : Taybad---Mashhad--Semnan---Tehran	1,118 km
Pakistan : Mirjaveh--zahedan--Kerman--Yazd--Tehran	1,651 km
Future network	
Asia Highway(A-1)	
(Ankara)-Bazargan-Tbriz-Tehran-Sari-Mashhad-Taybad-(Herat)	
Asia Highway(A-2)	
Tehran-Isfahan- Kerman-Zahedan-Mirjaveh-(Quetta)	
Almatoi-Istanbul Highway	
(Ankara)-Razi-Tabriz-Tehran-Gorgan--(Ashkhabad)	
Tehran-Mashhad expressway	
Tehran-Semnan-Mashhad	
Persian Gulf	
Present network(Existing expressway, Esfahan-Tehran 280 km)	
B. Khomeini---Ahvaz----Khorramabad--Arak---Tehran	1,024 km

B. Bushehr---Shiraz---Esfahan-----Tehran	1,228 km
B. Abbas---Sirjan---Shahrehabak-----Tehran	1,334 km
Chahbahar---Iranshahr---Kerman---Yazd---Tehran	1,961 km

Future network

Asia Highway(A-2)	
Tehran-Esfahan-Kerman-Zahedan-MirJaveh-(Quetta)	
Ahwaz-Esfahan expressway	
(Tehran)-Esfahan-Ahwaz-B.khomeini(Persian Gulf)	
B.Abbas-Esfahan expressway	
(Tehran)-Esfahan-B.Abbas(Persian Gulf)	
B.Bushehr-Esfahan expressway	
(Tehran)-Esfahan-B.Bushehr(Persian Gulf)	

Caspian Sea

Present network(Existing expressway, (Qazvin-Tehran 150 km)

B. Anzali--Qazvin--Tehran	365 km
Nowshahr---Amol---Tehran	278 km

Future network

Anzali-Qazvin expressway	
(Tehran)-Qazvin-B.Anzali(Caspian Sea)	

Almatoi-Istanbul Highway :

This highway connects Almatoi(Kazakhstan), Bishkek(Kirghizistan), Tashkent(Uzubekistan), Ashkhabad(Turkmenistan), Tehran(Iran) and Istanbul(Turkey). Length of road is about 6,000 km ; part of this road is strategically important as it connects Far East Asia to Europe through Central Asia and Middle East.

Related Iranian road network is Tehran-Bazargan road(Turkey border).This route is a part of Asian Highway Route 1 ; Tehran-Qazvin section has already been constructed while Qazvin-Zanjan section is under construction.

Tehran-Mashhad expressway :

This is an alternative route to Asian Highway Route 1 and is located at the south area of the Asian Highway.

Asia Highway(A-1) :

This highway connects Istanbul(Terkey),Tehran(Iran), Kabul(Afghanistan), Delhi(India) and South East Asia.This road is strategically important as it connects South East Asia with Europe through South Asia and Middle East.

Asia Highway(A-2) :

This route runs south part of Asia Highway(A-1) and connects Iraq, Tehran(Iran), Lahore(Pakistan), Delhi(India) and South East Asia.

(4) Future Cargo Networks (Expressway)

1) B.Khomeini--Ahvaz--Esfahan--Tehran

Running north and south, this route connects the Caspian Sea and the Persian Gulf(B.Khomeini). There is a Steel Complex(Ahvaz,Esfahan,Mobarakeh),Petrochemical Complex,and Oil Refineries along this route.

2) B.Abbas--Yazd--Tehran

This is a route running in the north and south direction that will connect Tehran and Esfahan with the Persian Gulf(B.Abbas). Unloaded cargo of Caspian Sea port will be transported to the Persian Gulf through B.Abbas.

3) B.Busher--Shiraz--Esfahan--Tehran

Also running north and south, this route will connect Tehran and Shiraz with the Persian Gulf(B.Busher)

4) B.Anzali--Qazvin--Tehran

Tehran will be connected with Caspian Sea(B.Anzali)by this route. Freeway was already constructed in the Tehran-Qazvin section, but in the Qazvin-B.Anzali section, road condition is not good due to the Alborz mountain range.

5) Bazargan--Tabriz--Tehran--Mashhad--Sarakhs

This route corresponds to Asian Highway 1 and will connect Iran with Turkey and Azervijan.

This route a is very important section of the Asian Highway, connecting East Asia(Turkey, Iran) with Central Asia and East Asia.

(5) 2010 master plan of road network

We propose future road network in 2010 as shown Fig 3.4.1.1 Main routes of future road network are from major ports to tehran

Expressway

- 1) B.Khomeini---Ahvaz---Esfahan---Qom---Tehran
- 2) B.Abbas-----Yazd-----Qom---Tehran
- 3) B.Busher---Shiraz---Esfahan---Qom---Tehran
- 4) B.Anzali-----Qazvin-----Tehran
- 5) Bazargan--Tabriz---Tehran--Mashhad--Sarakhs

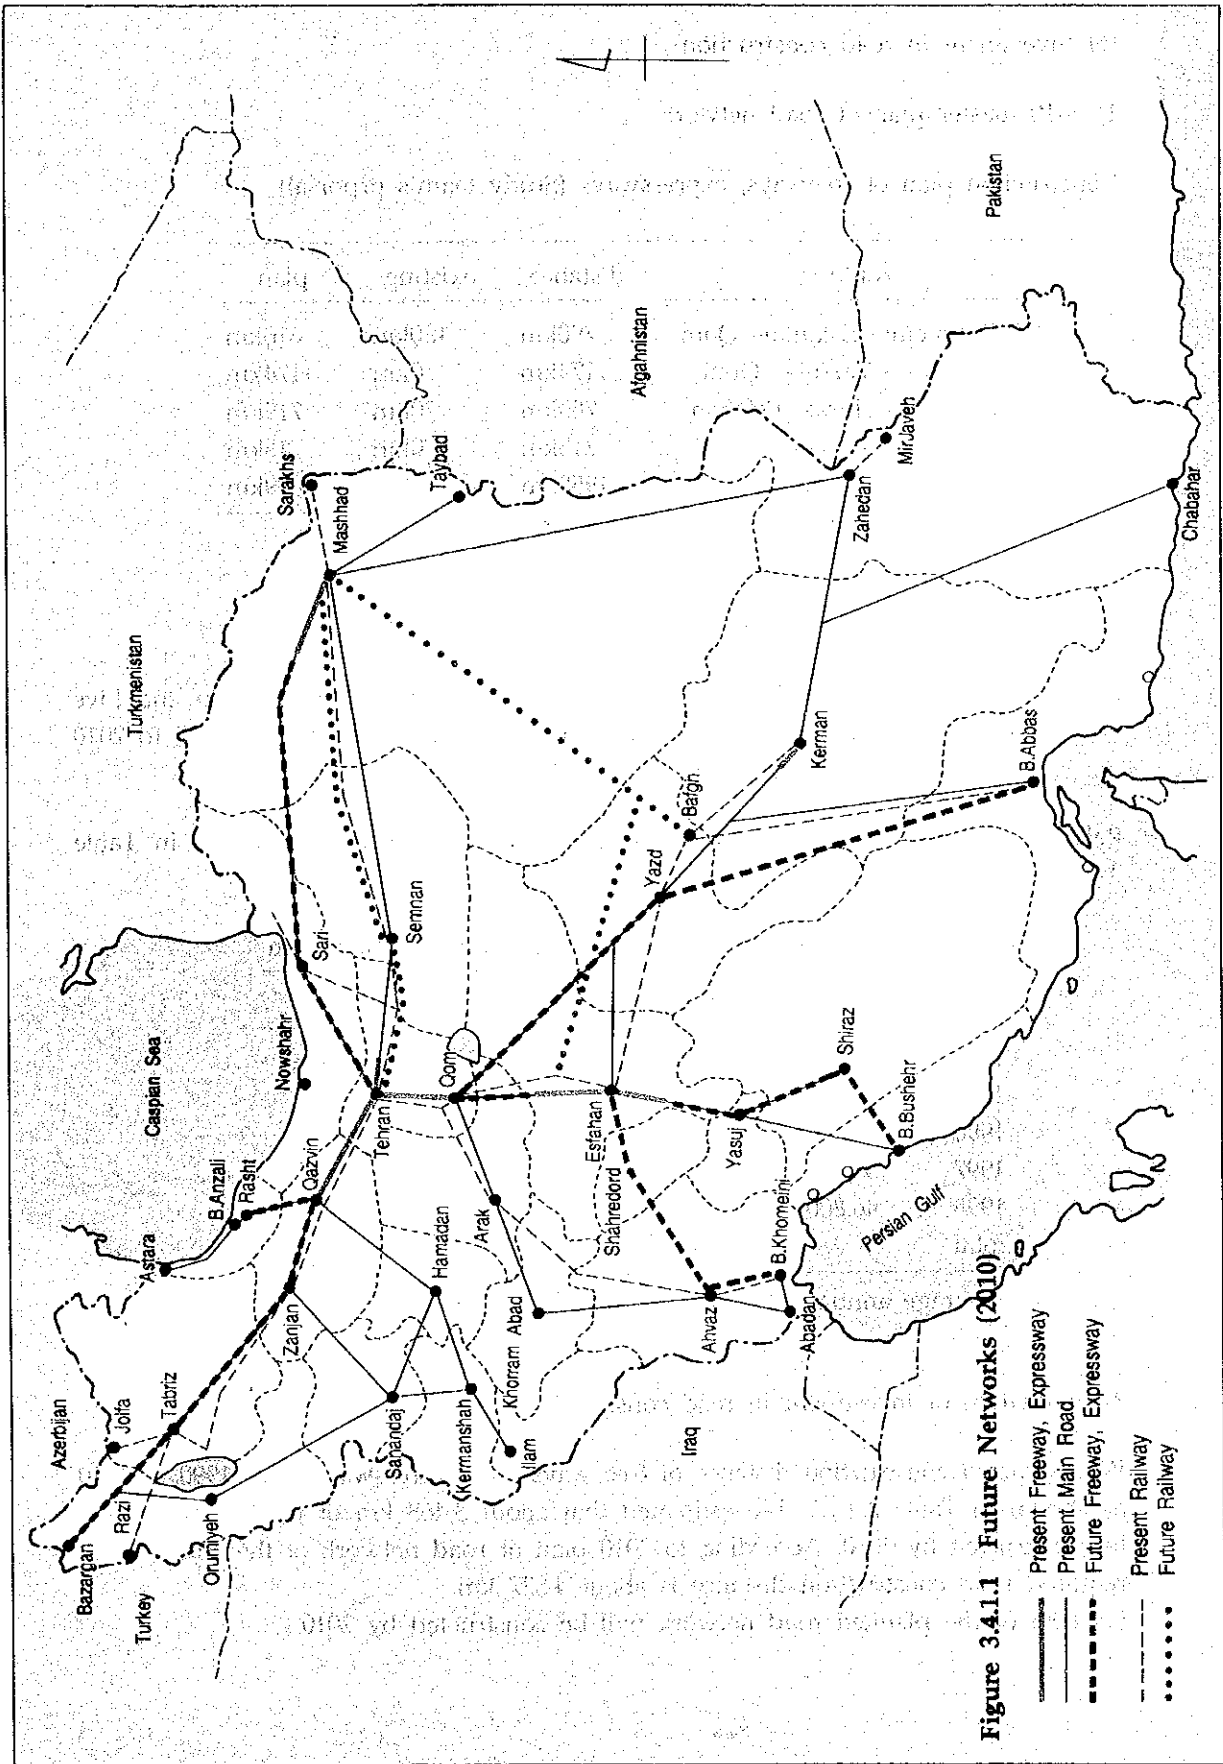

Figure 3.4.1.1 Future Networks (2010)

(6) Investment in road construction

1) 2010 master plan of road network

Construction plan of freeways, expressways (Study team's proposal)

route	distance	existing	plan
1) B.Khomeini--Esfahan--Qom	790km	180km	610km
2) B.Abbas----Yazd----Qom	1174km	0km	1174km
3) B.Busher----Shiraz--Esfahan	789km	70km	719km
4) B.Anzali-----Qazvin	215km	0km	215km
5) Bazargan--Tehran--Sarakhas	1958km	150km	1809km
Total construction plan	4,527,466km		

2) Forecast of road construction

Base : Investment proposed for freeways and expressways construction in 2nd Five Year Plan 1994-1998, Study team estimated the investment from 1999 to 2010 based on the investment of 2nd Five Year Plan.

Relation between investment and distance of road construction is shown in Table 3.4.1.1.

Table 3.4.1.1 Freeways and Expressways Construction Plan

year	investment	distance km	
1994	21,300	62	344 million Rls/km
1995	26,000	76	
1996	32,100	93	
1997	37,600	109	
1998	46,800	136	
total		476	

average annual increase 21.8 %

3) Evaluation of investment in road construction.

We estimated construction distance of free ways and expressways from 1990 to 2010 as shown in Table 3.4.1.1. We estimated that about 3,465 km of road network will be constructed by 2010, According to 2010 plan of road network of the study team, required road construction distance is about 4,527 km.

So, 80% of the planned road network will be constructed by 2010.

3.4.2 Railway Network

(1) Future networks of railways

1) Bafq-Bandar Abbas railway

This is the biggest project under construction and is expected to be completed by 1995. Hence the southernmost part of the country will be linked with the north and Bandar Abbas will be connected with Tehran by rail.

The line from Bander Abbas to Tezerj,(about 200 kilometers) is being constructed and there are plans to electrify the whole line later.

2) Mashhad-Bafgh railway

This line stretches 800 kilometers from Mashad to Bafgh, the construction of which was approved in early 1989.

A northward extension of the line (165km)is being conducted to link Mashad to Sarakhs. The line of Turkmenistan to Sarakhs (about 130 km) is being constructed.

3) Tehran-Mashhad railway

This is a one thousand kilometer double-truck railway line. Tehran-Garmsar line is being constructed and studies for a further 900 kilometers have been completed.

4) Bad-Meybud-ChadoorMine railway

This is the by-pass line from Esfahan to Bafg. From Bad to Meybud and from Meybud to ChadoorMine,lines of about 254 kilometers and 200 kilometers are being constructed respectively.

5) Bander Khomeini-Ahvaz railway

The foundation work for the double-truck railway was completed in early April in 1989.The by-pass line from Nezamieh to Miandasht is being constructed.

(6) High speed passenger cargo

There is a plan to introduce high speed passenger service. The maximum speed is 200 km/h to 250 km/h.

Tehran-----Mashhad

Tehran-----Ishafan-----Shiraz

Tehran-----Zanjan-----Tabriz

(2) International railway networks

1) Present network

In the present network, borders from where the goods are transported by railways are:

- Azerbaijan - Julfa
- Turkey - Razi
- Turkmenistan - Sarakhs (Under construction)
- Pakistan - Mirjaveh
- Persian Gulf - B.Khomeini

Iran is linked by rail to three countries. The most active route at present is the one to Azerbaijan Republic through Julfa. Expansion of railway between Mashhad and Sarakhs straddles the Iran-Turkmenistan border.

2) Future network

Under Study Lines

Country	New Line	Purpose
Turkmenistan :	Tehran--Mashhad	Turkmenistan is connected with Tehran by double-track line
: Bafgh--Mashhad		Turkmenistan is connected with B.Abbas
Pakistan :	Kerman--Zahedan	Pakistan is connected with Tehran and B.Abbas
Azerbaijan :	Astara--Qazvin	Azerbaijan is connected with Tehran by another route
: B.Anzali is connected with Tehran		
Persian Gulf :	B.Bushehr--Tehran	B.Bushehr is connected with Tehran through Esfahan
: Chabahar--Zahedan		Chabahar is connected with Pakistan and Mashhad and Tehran

(3) Investment in railway construction

1) 2010 master plan of railway network

Construction plan of railways (Study team's proposal)

route	distance	existing	plan
1) Sarakhs--Mashhad--Bafgh	918km	0km	918km
2) B.Abbas-----Bafgh	582km	382km	200km
3) Bad-----ChadoorMine	454km	0km	454km
4) Mashhad-----Tehran	894km	0km	894km
Total construction plan			2,466km

2) Forecast of railway construction

Base : Investment proposed for railway construction in 2nd Five Year Plan 1994-1999. Study team estimated the investment from 1999 to 2010 based on the investment of 2nd Five Year Plan.

Table 3.4.2.1 Railways Construction Plan

year	investment	distance km	
1994	*151,650	108	1,400 million Rls/km
1995	185,750	133	(4 times expressways)
1996	223,075	159	
1997	242,850	173	* total railway investment
1998	295,700	211	multiplied by 0.25
average annual increase 18.3 %			
2010	total	5,184 km > 2,466 km (2010 plan)	

Relation between investment and distance of railway construction is shown in Table 3.4.2.1.

(4) Future cargo networks (railways)

1) Bafgh--B.Abbas railway

From this railway route, Tehran and Esfahan will be connected with the Persian Gulf(B.Abbas). Now B.Khomeini is the only port that is connected with Tehran by railway.

There are several high-grade iron ore mines along Bafgh-B.Abbas railway. This railway will be used to transport iron ore to Mobarakeh Steel Complex(Esfahan) and steel products and iron ore will be exported from B.Abbas by train.

2) Tehran--Mashhad--Sarakhs railway

Mashhad-Sarakhs line(165km) and Tedzhen(Turkmenstan)-Sarakhs line(130 km) are currently being constructed. By this route,central Asian republics will be connected with Iran and the Persian Gulf by railway. This route is a very important section of Transasian railway, connecting East Asia(Turkey, Iran) with Central Asia and East Asia.

3) B.Khomeini--Ahvaz double-truck railway

This railway will be used to transport iron ore from B.Khomeini to Ahwaz Steel Complex and steel products will be exported from B.Khomeini by train

4) Sarakhs--Mashhad--Bafgh railway

This is a route running in the north and south direction that will connect Central Asia with Persian Gulf(B.Abbas) through Bafgh-B.Abbas railway.

(5) 2010 master plan for railway networks

Double track line	Single track line
Mashhad-----Tehran	Sarakhs--Mashhad--Bafgh
	Bafgh-----B.Abbas
	Bad-----ChadoorMine

3.4.3 Air Transport

(1) Expansion project

1) Imam Khomeini Airport

This is Tehran's second International airport, located 35 km southwest of Tehran.

1st phase : 1996 12 million passenger 200,000 tons cargo
2nd phase : 2011 18 million passenger 300,000 tons cargo

2) Other Airports Plans

Ilam, Tabas, Zanjan, Yasouj, Shar-e Kord, Arak

3.4.4 Rough Estimate of Transportation Capacity

Sea-borne cargo will be about 80 million tons in 2010, We checked the capacity of inland transportation networks

From the railway statistics, number of locomotives, passengers & net freight transport volumes are shown in Table 3.4.3. The km per tonnage, which is given by total ton-km divided by total cargo weights, is about 600 km. This ton-km value is so large due to the scale of land, and very close to the distance between Tehran and Ahvaz or Tabriz.

Road transportation route from major ports to Tehran or other cities is similar to the railway route.

The km per tonnage of road transportation is considered too close to that of railway transportation.

Flow chart of analysis method is shown as follows.

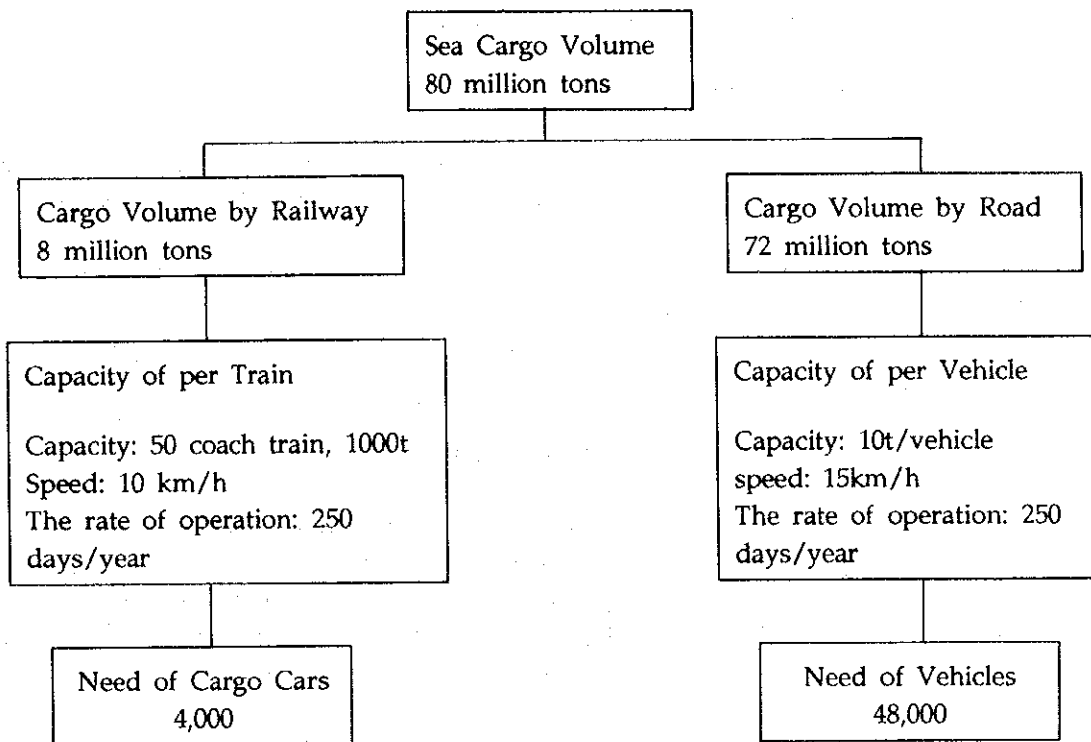

Figure 3.4.4.1 Rough Estimate of Transportation Capacity

We roughly estimated the number of vehicles and cargo cars for sea cargo, It is in need of 48,000 vehicles and 4,000 cargo cars by 2010.

3.5 Overall Cargo Flow Demand on Long Term Basis

3.5.1 Methodology for Demand Forecast

Two methods are used to forecast the commercial cargo volume handled at the Ports of Imam Khomeini, Bushehr, Rajaei, Bahonar, Chabahar, Anzali, Nowshahr port.

One is a macro forecast which is for estimation of total cargo volume without any detailed commodity-wise break-down.

The other is a micro forecast, which is for commodity-wise estimation of cargo volume.

For the macro forecast, two methods are used.

One is to grasp the trend of cargo handling volume on the basis of the past data and forecast the future volume by a time series analysis.

The other is to relate the past cargo handling volume to national social or economic indices such as population or GDP, and to forecast the future cargo volume using future estimates of these national figures.

For the micro forecast, the following two methods are mainly used:

A. Future volume of each major cargo, such as cereals, petroleum products, fertilizers and metallic products, is forecasted independently.

First, the supply and demand of the entire nation are forecast for the target years. The deficit in volume between production and consumption is assumed to be equal to the total import volume.

Then, the cargo volume that will be handled at the ports is estimated based on the rate of population in the hinterland, previous data on the cargo handling rate and other relevant factors (for example, the capacity of silo or factory).

B. For other cargoes, the volume is forecasted based on the correlation between the volume handled at the ports and the previous and forecast national indices such as GDP and population. This is the same method as is used for the macro forecast.

The flow charts for cargo forecast are shown in Figure 3.5.1.1, 3.5.1.2 and 3.5.1.3.

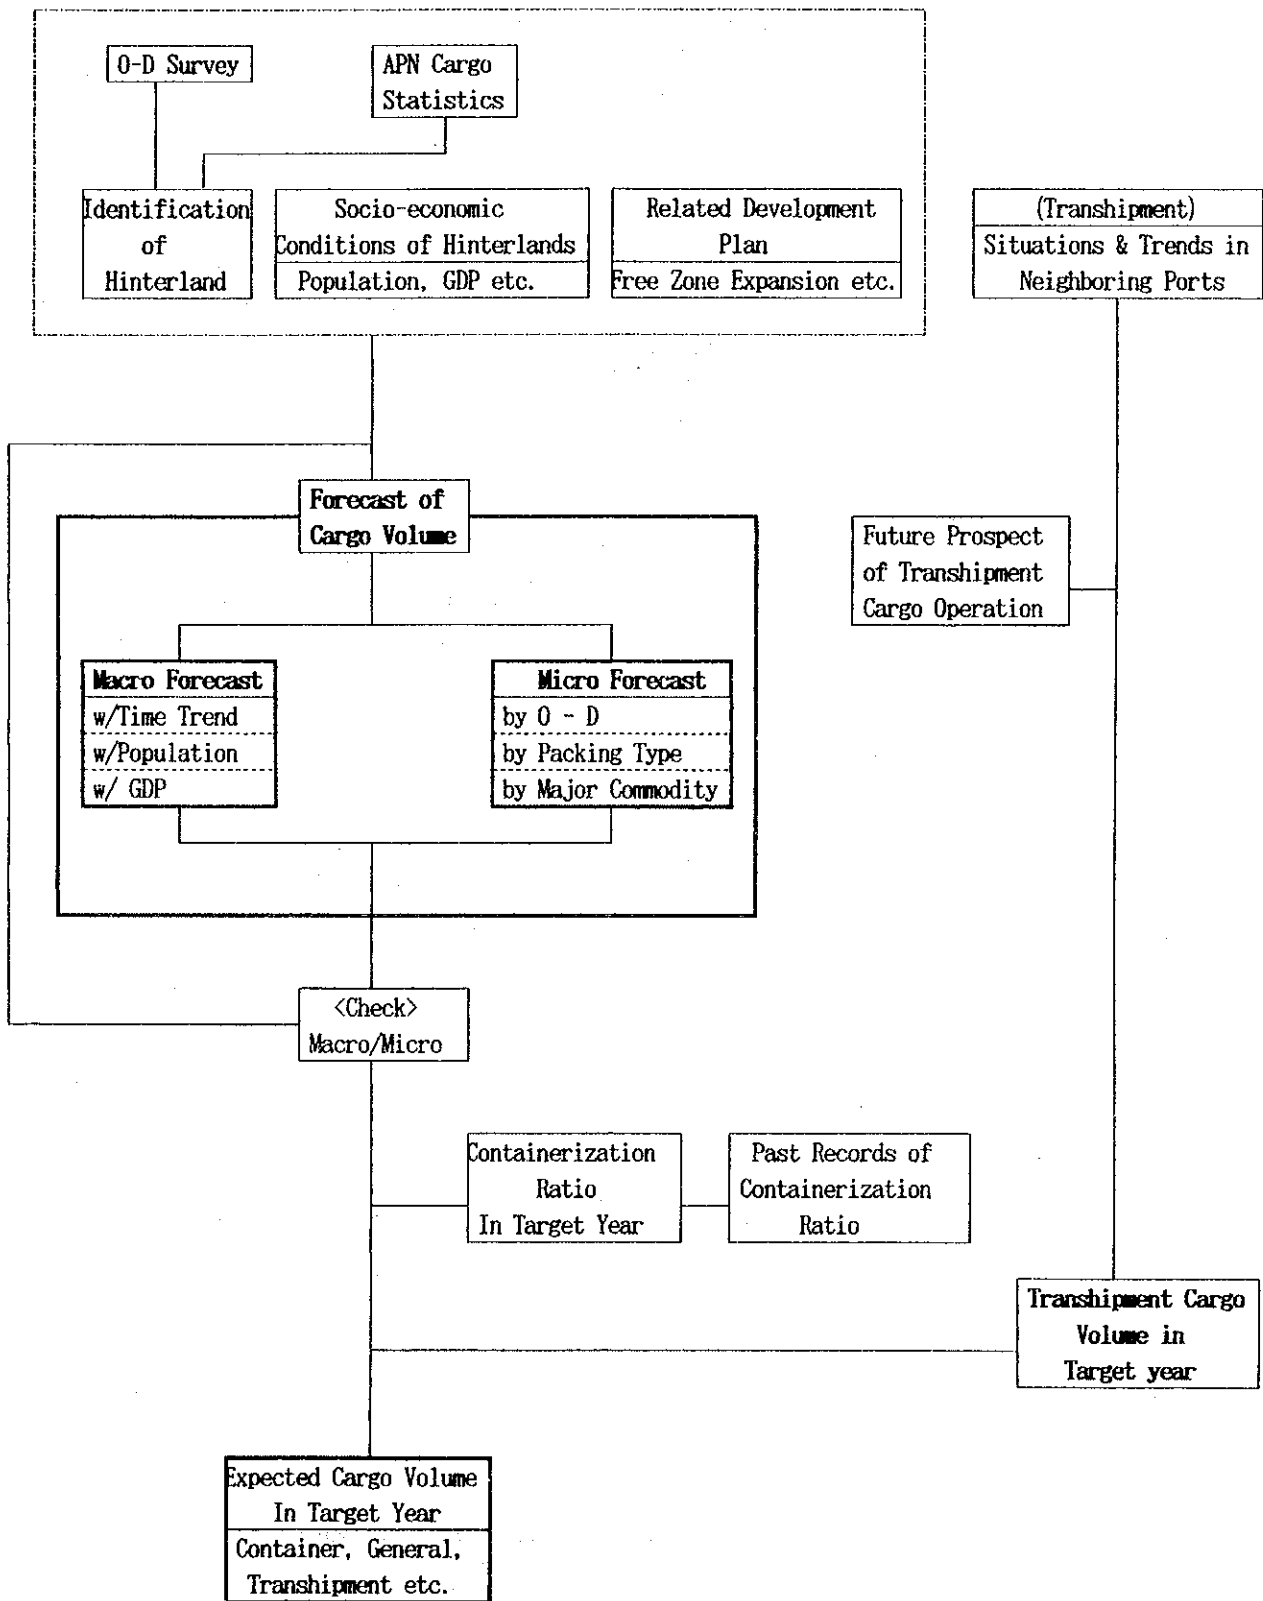

Figure 3.5.1.1 Flow Chart for Total Cargo Forecast

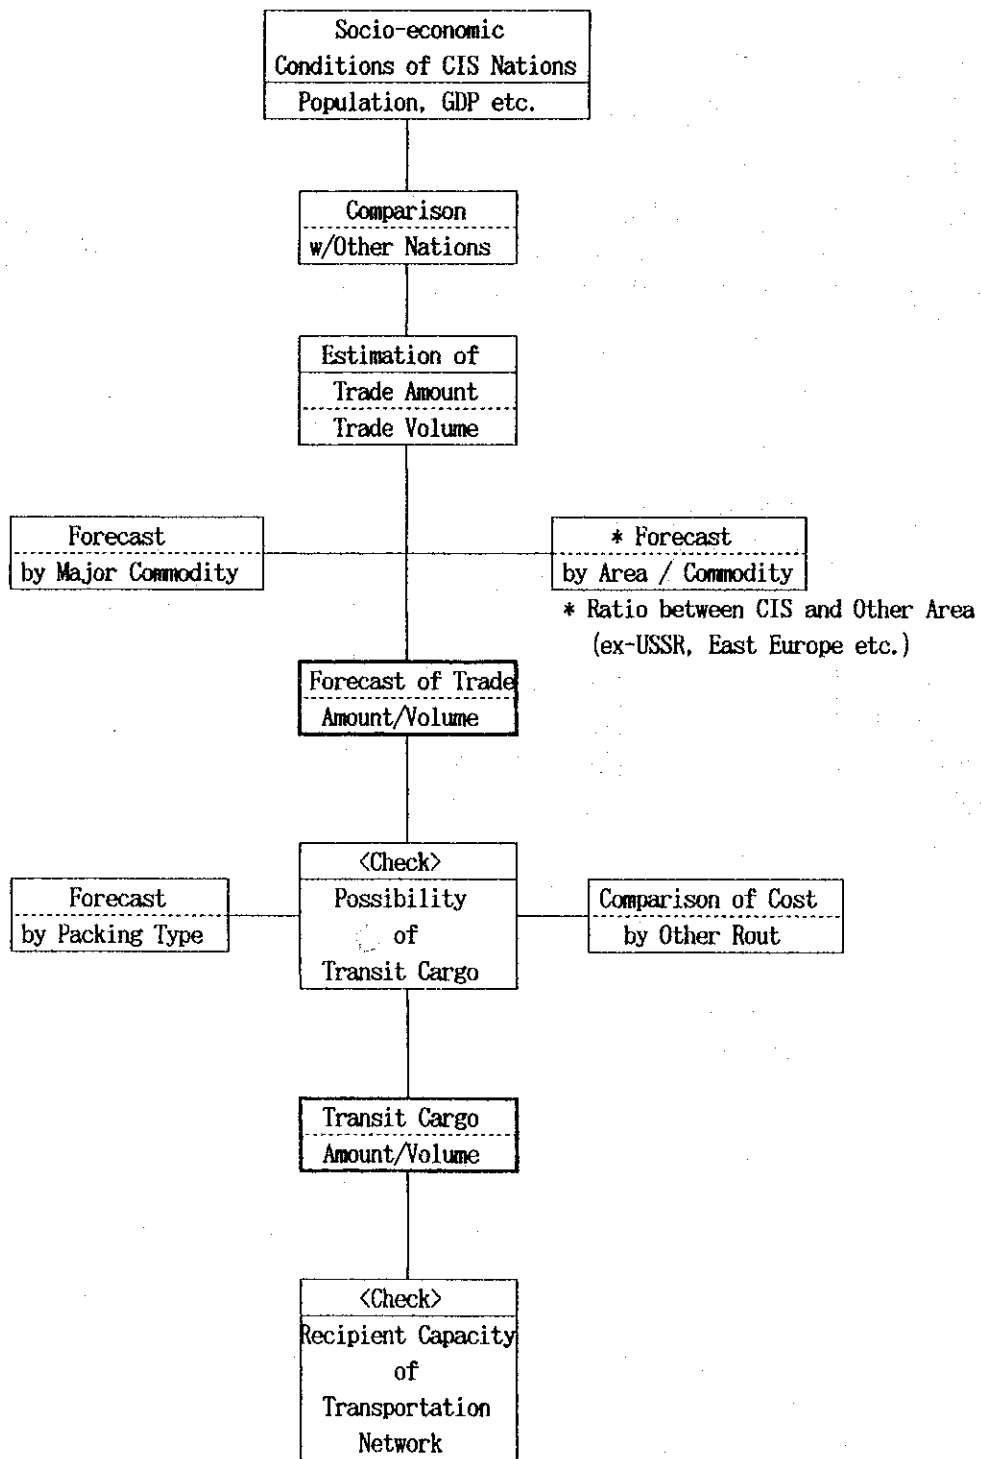

Figure 3.5.1.2 Cargo Demand Forecast from CIS Nations

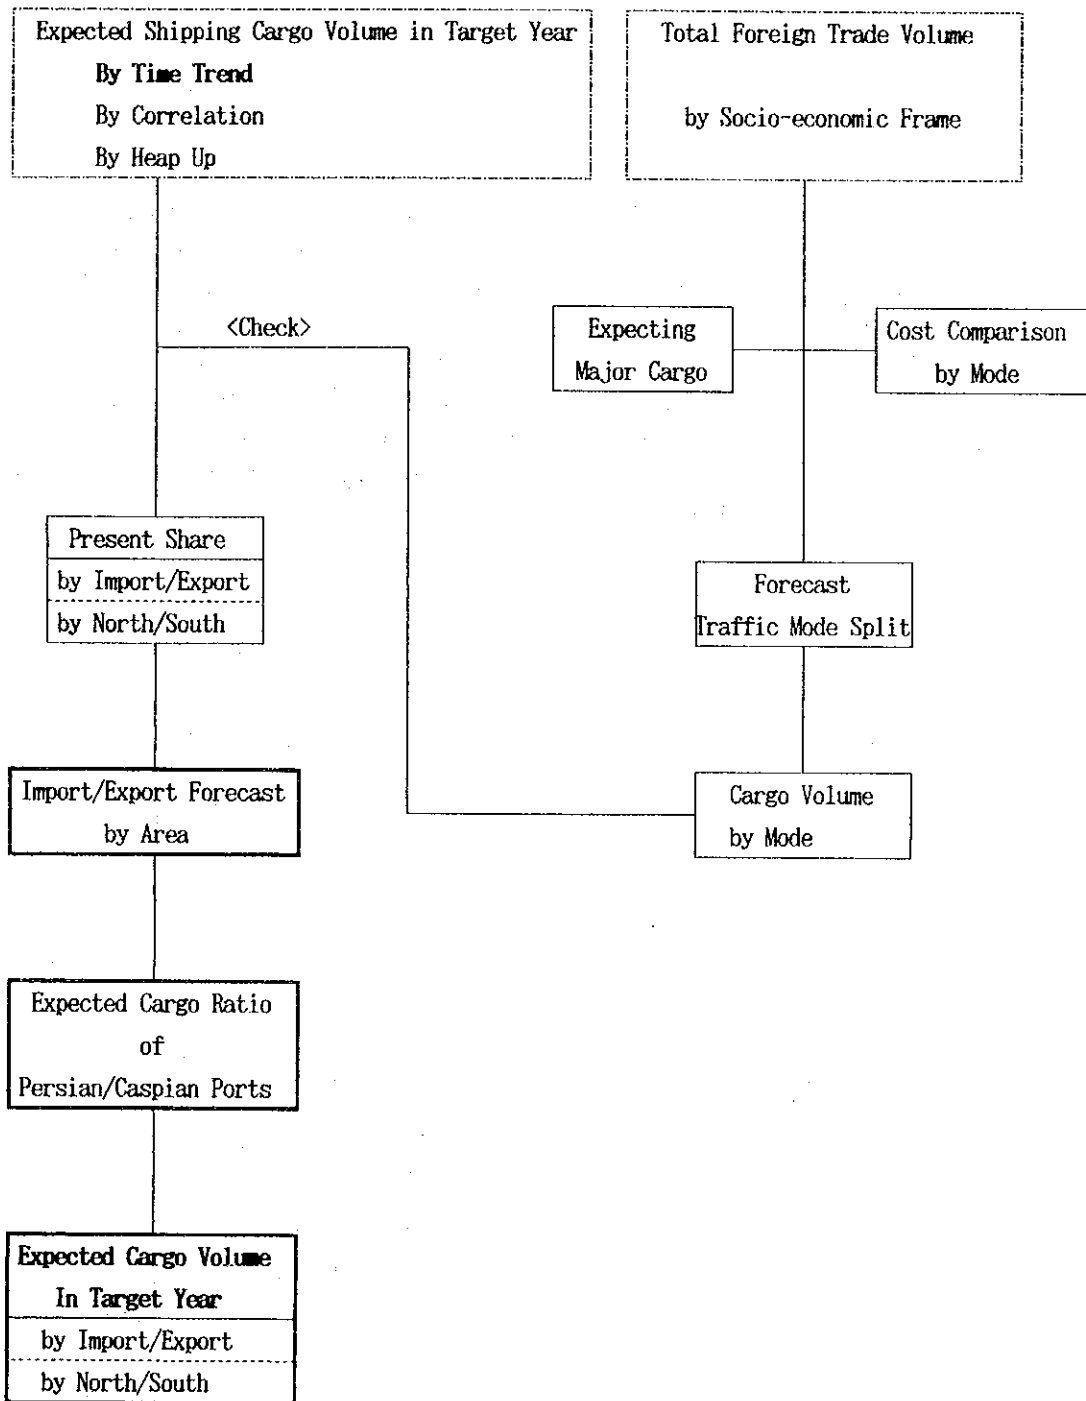

Figure 3.5.1.3 Forecast for Ratio of Import/Export and North/South Ports

3.5.2 Macro Forecast

(1) Time series analysis

1) Methodology

As shown in Table 3.5.2.1 and Table 3.5.2.2, the handling volume of each commodity at the seven ports varied greatly year by year showing no obvious trends. But as indicated in Figure 3.5.2.1, the total unloaded and loaded cargo volume by package type was relatively stable. So the cargo volume of each package type for the target years will be forecasted using a time series analysis. However, as shown in Table 3.5.2.3 and Figure 3.5.2.2, there was a significant drop in volume from 1983/84 - 88/89 in unloaded non-oil cargo which seems to have been caused by the fall in oil prices and the war. Thus data of cargo traffic from 1983/84 to 1987/88 are regarded as being irregular and therefore discarded.

Figure 3.5.2.1 Cargo Traffic Movement
(total unloaded and loaded cargo volume)

Table 3.5.2.1 Total Handling Volume of Each Commodity

Import & Export

Unit: 1,000 tons

COMMODITY	1988/89		1989/90		1990/91		1991/92		1992/93		1993/94

Figure 3.5.2.2 Non-Oil Cargo Traffic

2) Result of forecast

The cargo volume is assumed to be expressed as;

$$V = aT + b$$

where V ; Handling volume at the seven ports
a,b ; Constants
T ; Year

The constants are determined by the least fitting method. Import and export use the following equations.

Import; $V = 1985.1 \times \text{Year} - 3932482$ ($r^2=0.8996642$)

Export; $V = 644.2 \times \text{Year} - 1279910$ ($r^2=0.8629387$)

Note: r^2 is determination coefficient, r is correlation coefficient
(when number is close to 1.0, correlation with each other is considered very strong)

Under the above assumptions, the forecast cargo volume to be handled at the eleven ports is given as;

		2000/01	2010/11
Handling volume (thousand tons)	Import	37,804	57,655
	Export	8,433	14,874
	Total	46,237	72,529

The cargo volume forecasted by using time series analysis is shown in Appendix II-4.1.

(2) Correlation with social and economic indices

Generally speaking, the cargo handling volume of a port has a close relation with the social and economic indices of the country. In this section, the total cargo volume handled at the major ports will be forecasted based on the correlation between the past handling cargoes and total Iranian population or GDP(as shown in Table 3.5.2.4).

Table 3.5.2.4 Cargo Volume, Population and GDP

year	Cargo Volume		Population		GDP	
	(1,000 tons)		(1,000 persons)		(Billion IRI)	
1987/88	16,591		51,073		10,368	
1988/89	13,678	-17.56%	52,779	3.34%	9,468	-8.68%
1989/90	17,604	28.70%	54,364	3.00%	9,782	3.32%
1990/91	20,646	17.28%	55,869	2.77%	10,930	11.74%
1991/92	23,639	14.50%	57,234	2.44%	12,181	11.45%
1992/93	24,830	5.04%			12,911	5.99%
1993/94	27,149	9.34%				
1994/95						
1995/96						
1996/97						
1997/98						
1998/99			* 67,300			

Source: Cargo volume ----- PSO (Ports & Shipping Organization)

Population ----- PBO (Statistical Center of Iran)

GDP ----- Central Bank of IRI

* Population of 1998 is based on The Second Five-Year Plan of Iran

1) Correlation with population

Total cargo volume is forecasted by its relation with population. The correlation between cargo volume and population for 1988 through 1992 can be expressed by the following equation.

$$\text{Import; } V = 1.4080835 \times \text{Population} - 60557.06 \quad (r^2=0.9437131)$$

$$\text{Export; } V = 0.4463336 \times \text{Population} - 22887.42 \quad (r^2=0.8019181)$$

When population in target years mentioned in Chapter 3.2.1-(1) is inserted into this equation, the forecast of cargo volume to be handled at the study ports is given as;

		2000/01	2010/11
Handling volume (thousand tons)	Import	38,035	59,627
	Export	8,364	15,208
	Total	46,399	74,835

The cargo volume forecasted by correlation with population as mentioned in Chapter 3.2.1-(2) is shown in Appendix II-4.2.

2) Correlation with GDP

Total cargo volume is forecasted by its relation with GDP. In Chapter 3.2.1-(3), GDP in case of four scenarios depends on future economic conditions. GDP value in case-2

which is presumed to be most suitable for this Study will be used for forecasting the cargo volume in target years. The correlation between cargo volume and GDP for 1988 through 1992 can be expressed by the following equation.

$$\text{Import; } V = 2.145266 \times \text{GDP} - 5701.367 \quad (r^2=0.8718841)$$

$$\text{Export; } V = 0.706303 \times \text{GDP} - 5801.413 \quad (r^2=0.8609125)$$

When GDP(case-2) in target years mentioned in Chapter 3.2.1-(3) is inserted into this equation, the forecast of cargo volume to be handled at the study ports is given as;

		2000/01	2010/11
Handling volume (thousand tons)	Import	36,969	65,572
	Export	8,247	17,665
	Total	45,216	83,237

The cargo volume forecasted by correlation with the four cases of GDP as mentioned in Chapter 3.2.1-(3) is shown in Appendix II-4.3.

(3) Result of macro forecast

The result of macro forecast in target years is shown below.

		2000/01	2010/01
Handling volume (thousand tons)	Import	36,969 - 38,035	57,655 - 65,572
	Export	8,247 - 8,433	14,874 - 17,665
	Total	45,216 - 46,468	72,529 - 83,237

3.5.3 Micro Forecast

(1) Selection of Major Commodity Groups

Considering the present cargo volume, long term trend and package type by commodity, the cargo handled at the study ports is classified by packing type and divided into unloaded and loaded cargoes for the micro forecast.

1. <Unloaded(Import)>

(1) Dry Bulk

- 1) Barley
- 2) Wheat
- 3) Corn

(2) Liquid Bulk

- 1) Petroleum products

- 2) Vegetable oil
- (3) Bag Cargo
 - 1) Fertilizers
 - 2) Sugar
 - 3) Rice
 - 4) Soy bean
- (4) Refrigerated Goods
 - 1) Meat
- (5) Steel Material
 - 1) Metallic product
- (6) Mineral
 - 1) Coal
- (7) General Cargo
 - 1) Container cargo
 - 2) Others

2. < Loaded (Export) >

- (1) Dry Bulk
 - 1) Sulphur
- (2) General Cargo
 - 1) Dried fruits & nuts
 - 2) Container cargo
 - 3) Others

(3) Result of Micro Forecast

The micro forecast is conducted by the method explained above. The detailed process is described in Appendix II-5. The results of the micro forecast, showing import, export and total cargo volumes by major commodity groups, are shown in Tables 3.5.3.1, 3.5.3.2 and 3.5.3.3.

(4) Check by Macro Forecast

Table 3.5.3.4 and Figure 3.5.3.1 shows a comparison of cargo volumes obtained by the

Table 3.5.3.1 Result of Micro Forecast of Total Cargo

macro and micro forecast methods described in Chapter 3.5.1.

Table 3.5.3.4 Comparison of Forecasted Cargo Volume

		2000/01	2010/11
Import	Macro Method	36,969 - 38,035	57,655 - 65,572
	Micro Method	32,455	53,315
Export	Macro Method	8,247 - 8,433	14,874 - 17,665
	Micro Method	8,936	23,768
Total	Macro Method	45,216 - 46,468	72,529 - 83,237
	Micro Method	41,391	77,083

Figure 3.5.3.1 Comparison of Forecasted Cargo Volume

Only the result of the micro forecast corresponds with total cargo volume of target year 2010/11 in the macro forecast. The other results, import and export cargo volumes of each target year do not correspond with that of the macro forecast.

Further, considering the trade ratio of import and export cargo volume from the viewpoint of the future economic frame as mentioned in chapter 3.3, the trade ratio of import and export cargo volume as shown in the macro forecast will not be realistic and also trade of import and export cargo will continue to be controlled by the government policy. Therefore, import cargo volume will not increase at the same rate as that of 1988/89 to 1992/93, while export cargo volume will increase at a greater pace than past records would suggest. Accordingly, macro forecast results will not be adopted in this study.

In conclusion, results obtained by the micro forecast method are adopted as the final estimation of cargo volume for the study ports.

(5) Check by trade frame

To calculate the export & import cargo weights, the export & import values were divided by the average values for each price per weight (\$/ton). Mean values for export and import for each \$/ton can be calculated from the data of the recent years as \$814/ton and \$1,099/ton, respectively.

During the period of 1999/00 to 2010/11, we predict that the average export commodity's price will increase and import commodity's price will decrease due to industrialization. Thus to calculate the export & import weights, the export & import trade values can be divided by each \$/ton; export price is \$908/ton and import price is \$815/ton. Other cases are given in Appendix II-2.2, II-2.3.

FUTURE TRADE CARGO VOLUME (1,000 TONS)
(CASE-2)

YEAR	EXPORT VOLUME	IMPORT VOLUME	TOTAL VOLUME
1987/88	1,132	15,348	16,480

Figure 3.5.3.2 Future Trade Value

3.5.4 Forecast of Regional Cargo Traffic Distribution

The data of actual situation is available in Chapter 1, Section 1.4 based on which the target proportion of the cargo volume in future foreign trade is assumed. Before the calculation some conditions are presumed as follows to decide the basic share of the cargo volume by region.

- Basically the regional cargo volume is estimated by the time series analysis.
- In the case of unavailable or shortage of cargo data, the acceptable proportion of the cargo volume by region will be preferred considering the maximum share in the past five years.
- The trial is for the Case-2 only.
- Land bridge cargo, the world transshipment cargo, oil-product and oil are excluded.

(1) The proportion of the world cargo volume to/from by region is estimated by using the forecasting methods shown in Table 3.5.4.1.

Table 3.5.4.1 Forecasting Methods of World Cargo

Region	Import	Export
Free trade zone	Annual growth ratio of 7.2%*	Equal to import
Afgan/pakistan	Time series analysis	Considering the past shares
Turkey	Time series analysis	Considering the past share
CIS republic	Annual growth ratio by import	Annual growth ratio of export cargo
Arabic countries	Annual growth ratio by import	Considering the past share
Persian Gulf	cargo	Considering the past share
Oceania	Time series analysis	Considering the past share
North America	Average of the past five years	Considering the past share
Far East Asia	Time series analysis	Considering the past share
South East Asia	Time series analysis	Considering the past share
Mediterranean	Time series analysis	Considering the past share
Western Europe	Time series analysis	Considering the past share
Eastern Europe	Time series analysis	Considering the past share
South America	Time series analysis	
Africa		

[* annual average growth rate of the total cargo volume between 1993-2010]

Resulting cargo volumes and proportions are shown in Table 3.5.4.2 and 3.5.4.3.

(2) Forecast of cargo flow by transport mode

In the Table 3.5.4.3, the import cargo volume share from Afganistan and Pakistan is 0.9% in 2010 and this cargo will be transported on land presumably. Turkey's share is 2.9% and this cargo will be also transported on land presumably.

The cargo volume share from Western Europe to Iran is 28.1% and this cargo will be transported on two routes and by different transport modes. One route is on land and the other is by ship through the Suez Canal. The cost of each transport mode was estimated in Chapter 1. A summary of which is as shown in Table 3.5.4.4.

Table 3.5.4.4 Cost of Transport from Western Europe per TEU

Route by ship	2,700 US\$,	32Days (Persian Gulf)
Route by ship	3,040 US\$,	20Days (Caspian Sea)
Route on land	4,332 US\$,	12Days

To roughly estimate the cargo volume, it is assumed that the cargo will be transported by the cheapest mode, therefore the cargo volume is proportionate with a reciprocal number of the cost. That is to say;

$$\begin{array}{l}
 \text{By ship :} \\
 \text{Persian} \\
 \text{Gulf}
 \end{array}
 :
 \begin{array}{l}
 \text{By ship} \\
 \text{Caspian} \\
 \text{Sea}
 \end{array}
 :
 \text{On land} =
 \frac{1}{2,700} : \frac{1}{9,120} : \frac{1}{4,332}$$

$$= 52\% : 15\% : 32\%$$

In above calculation, the transport cost (\$9,120) through the Caspian Sea, which cannot be used for four months in winter, is assumed as three times higher than normal cost. The cost of on land route is average cost of rail way and trucks.

Therefore the import cargo volume share on land from Western Europe will be estimated by multiplying 27.3% (See the Table 3.3.5.3) and 32%. As the result about 9% of total cargo will come to Iran on land.

Using the same method, the cargo volume share from Eastern Europe is estimated as follows.

$$\begin{array}{l}
 \text{By ship :} \\
 \text{Persian} \\
 \text{Gulf}
 \end{array}
 :
 \begin{array}{l}
 \text{By ship} \\
 \text{Caspian} \\
 \text{Sea}
 \end{array}
 :
 \text{On land} =
 \frac{1}{2,700} : \frac{1}{2,630} : \frac{1}{2,715}$$

$$= 33\% : 34\% : 33\%$$

On the other hand, it is assumed that the import/export cargo from CIS countries will be divided equally between sea and land because the rail way network will be improved in 2010/11.

Estimated cargo volume by transport mode in 2000/01 and 2010/11 is summarized as shown in Table 3.5.4.5.

Table 3.5.4.5 Estimated Cargo Volume

(Unit: 1,000 tons)

3.5.5 Forecast Volume of Caspian (north) and Persian (south) Ports

Iranian ports (PSO's ports) are spread out roughly in two areas. One group of ports is located in the north part of Iran, and faces the Caspian Sea, while the other ports face the Persian Gulf, and are located in the south of Iran. In view of the functional allotment of port activities between the northern and southern ports, handling cargoes in the aforesaid areas will not interfere with each other. Hereinafter, the future cargo handling volume forecasted in preceding chapters will be distributed to north and south ports.

(1) Present ratio of cargo volume handled between north and south ports

Tables 3.5.5.1, 3.5.5.2 and 3.5.5.3 indicate the total, import and export cargo handled in north and south ports from 1988/89 to 1993/94. Recently, the weight of port activities in the north ports shows a tendency to decrease. Among all commodities unloaded(import) at the north ports, petroleum product is the largest cargo in terms of volume as shown in Table 3.5.5.4. As shown in Figure 3.5.5.1, handling volume

of petroleum product at the north port shows a stable tendency up to 1992/93.

Table 3.5.5.1 Total Cargo Handled in All Ports

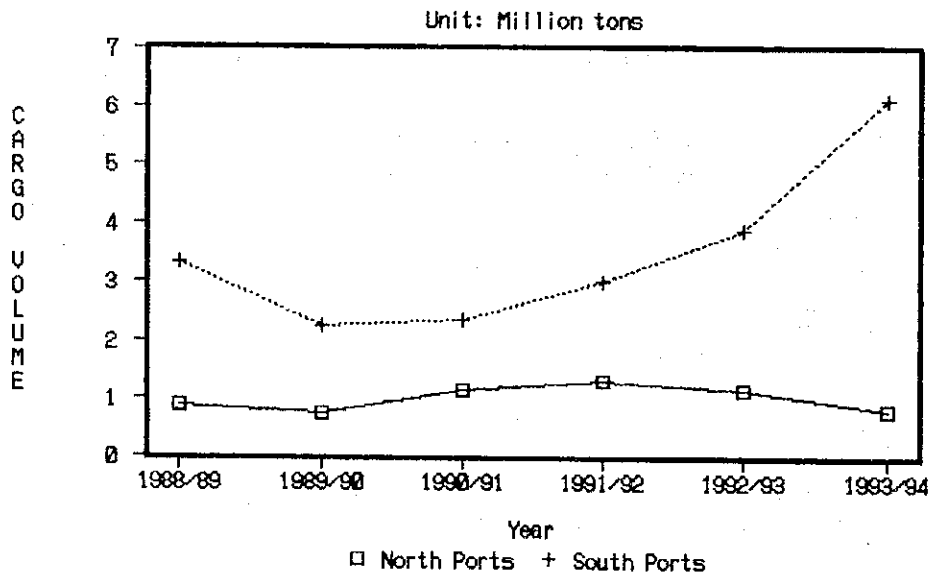

Figure 3.5.5.1 Unloading Volume of Petroleum Products

(2) Forecast ratio of cargo volume in the target years

The difference between handling ratio of petroleum product and other cargo (non-oil) cannot be ignored. Therefore, the forecast handling ratio of each cargo will be examined.

A. Forecast ratio of petroleum product (Import)

It is assumed that the handling ratio of petroleum product for import at the north/south ports in 2010/11 will be the same as the average ratio from 1988/89-1993/94 and import volume at the north/south will increase at the same rate every year from 1994/95 to 2010/11. Forecast of handling ratio and volume for the target years is as shown below.

	1993/94		2000/01		2010/11	
	North	South	North	South	North	South
Handling ratio	11.7%	88.3%	15.7%	84.3%	24%	76%
Handling Volume (thousand tons)	809	6,114	1,212	6,501	2,160	6,840

B. Forecast ratio of non-oil cargo (Import)

It is assumed that the handling ratio of non-oil cargo for import at the north/south ports in 2010/11 will be 9.5% for north and 90.5% for south and import volume at the north/south will increase at the same rate every year from 1994/95 to 2010/11. Forecast of handling ratio and volume for the target years is as shown below.

	1993/94		2000/01		2010/11	
	North	South	North	South	North	South
Handling ratio	3.9%	96.1%	5.5%	94.5%	9.5%	90.5%
Handling Volume (thousand tons)	615	15,113	1,357	23,385	4,205	40,110

C. Forecast ratio of total cargo (Export)

The handling ratio of total cargo for export at the north/south ports in future is estimated at 3.3% for north and 96.7% for south and forecast of handling ratio for the target years is as shown below.

	1993/94		2000/01		2010/11	
	North	South	North	South	North	South
Handling ratio	1.1%	98.9%	1.7%	98.3%	3.3%	96.7%
Handling Volume (thousand tons)	50	4,446	155	8,781	781	22,987

D. Forecast ratio of total cargo (Import & Export)

From A, B and C, the expected ratio and volume of total cargo in the target years is shown below.

	1993/94		2000/01		2010/11	
	North	South	North	South	North	South
Handling ratio	5.4%	94.6%	6.6%	93.4%	9.3%	90.7%
Handling Volume (thousand tons)	1,474	25,675	2,724	38,667	7,146	69,937

Finally, forecast volume in each year at the north/south ports from 1994/95 to target year 2010/11 is as shown in Tables 3.5.5.5, 3.5.5.6 and 3.5.5.7.

3.5.6 Transit Cargo

(1) Cargo to/from free trade zone

In the Qeshm Free Trade Zone many companies are supposed to import and export substantial amount of cargoes. Repackaging and labeling will also be conducted here. Volume of the future trading cargoes in/out of free trade zone depends mainly on the number of companies and their activities.

If the future condition of the development area in Qeshm Island can be ascertained, the volume of cargo generated/attracted can be obtained by multiplying the basic cargo volume per area and square meter.

But both sets of data are difficult to obtain. Therefore the future cargo handling volume of this area is assumed on the basis of the value predicted by relevant organization at about 2 million tons which is considered to be the minimum level.

Cargo to/from the Kish Free Trade Zone will be estimated with the actual data and that will be included in the total cargo demand forecast.

(2) Land-bridge cargo

Economic conditions in four countries, Kazakhstan, Uzbekistan, Kirghisiztan and Turkmenistan, is expected to recover in the short term and import and export more actively. The trade frame is 27.3 billion rubles of export value, 68.7 billion rubles of import value in 1990 as shown in Table 1.1.3.2.

In 1990, the value of Russian imports totalled 120.651 billion dollars while that of Russian exports was 104.177 billion dollars (Overseas Economic Cooperation Hand Book 1993, p.466). From another source, the value of Russian imports is given as 446.6 billion rubles and that of exports is 642.4 billion rubles. From the two sets of data, the exchange rate is estimated; 3.7 rubles is equal to 1 dollar for imports and 6.2 rubles is equal to 1 dollar for exports. The average exchange rate is about 4.9 rubles for a dollar.

2010/11	8,508	12.2%	8,633	12.3%	8,152	11.7%	17,095	24.4%	497	0.7%	10,329	14.8%	1,265	1.8%	15,458	22.1%	69,937

It should be noted that Russia's import and export value showed a negative growth ratio of 45.6% and 29.4% from the previous year.(The Trade between Japan and Foreign Countries, JETRO, 1993)

Using the above exchange rate the total export and import value in 1990 of four CIS countries is 5.5 billion dollars and 14 billion dollars respectively.

On the basis of the above rate, the total future trade frame of the four CIS countries can be estimated.

In the four CIS countries the export value will reach 7.932 billion dollars in 2000, up from 5.5 billion dollars in 1990. Similarly, the import value will reach 18.813 billion dollars in 2010, up from 14 billion dollars in 1990. In 2010, the export and import values will be 9.933 billion dollars and 25.286 billion dollars respectively, based on an annual growth rate of 3.0%(See Table 3.3.3.2. Indicator of World trade volume, low case).

For the future trade frame, the average value of import and export are applied under the concept that the future value of imports and exports should be balanced in CIS countries.

The target of foreign trade share with other republic countries for the four CIS countries is about 28% in 2010, and 15% in 2000 based on the in/out trade ratio of former U.S.S.R.(See Table 1.1.3.2). The 28% is the outer republic trade ratio of all U.S.S.R and the 15% is the highest ratio among four CIS countries at present.

The trade value which moves from four CIS countries to other countries is to be estimated by multiplying this rate and future trade value.

As seen in Table 3.3.6.1, cargo that will occasionally use the land bridge mainly originates from Eastern Europe and the U.S.S.R and is destined for Africa, Middle East and Asia, or vice versa.

As the results of calculation based on the Table 3.5.6.1, 12% of the cargo originates from Eastern Europe and the USSR while 9.2% is destined for Eastern Europe and so on.

It is acceptable to use the above rates for the future condition for the CIS countries because they want to trade with outer republic countries at a greater rate than now. These rates will be targets for the CIS countries in future foreign trade.

Table 3.5.6.1 Network of World Merchandise Trade by Region. 1988

(Unit: Billion U.S.dollars)

To obtain the cargo volume, the unit values per ton shown in Table 3.5.6.2 are used.

Table 3.5.6.2 World Trade Growth 1970-1988

Year	World trade volume	
	US\$ Bn.	tonnes Mn.
1970	312	2,561
1975	873	3,039
1980	2,009	3,645
1982	1,856	3,259
1984	1,991	3,312
1986	2,119	3,366
1988	2,076	3,529

From the Table 3.5.6.2, the average unit value is about 767 dollars per ton. The import and export value can be converted to volume as shown in Table 3.5.6.3.

Table 3.5.6.3 Land-Bridge Cargo Volume

(Unit: Mn. Tons)

Year	Total value(Bn.\$)	Total volume	trade with out countries	land-bridge cargo of four CIS countries	
				From	To
2000	26.21	34.172	5.126	0.62	0.47
2010	35.22	45.919	12.857	1.54	1.18

3.5.7 Forecast Volume of Study Ports

In the preceding Chapter 3.5.4 and 3.5.5, the future cargo handling volume was distributed to north and south ports. Hereinafter, aforesaid cargo volume in the target years will be distributed to each study port under consideration of transportation mode.

Study Ports are as follows.

North ports (four ports) -----	Anzali, Noshahr, Amir Abad and Fereydunkener
South ports (seven ports) -----	Imam Khomeini, Rajaei, Bahonar, Bushehr, Behesti, Khorramshahr and Abadan

(1) Cargo handling volume of study ports

Cargo volume in the target years will be distributed to each study port. It is assumed that the present share of cargo volume among the study ports will be maintained generally in future. Moreover the study team has made careful consideration based on port development plans of the PSO on the cargo to be handled at the new ports (Amir Abad, Fereydunkener, Khorramshahr and Abadan). Forecast of cargo handling volume in target years 2000/01 and 2010/11 at each port is as shown in Table 3.5.7.1 and 3.5.7.2.

(2) Commodity-wise cargo volume of study ports

Cargo volume of each study port in the target years will be broken down by commodity. Present commodity shares at each study port are basically expected to be maintained.

In the previous chapter, total volume of each commodity to be handled at the study ports in the target year was determined. Then, using the Fratar growth-factor method⁽¹⁾, we have made a series of fine adjustments to determine the volume to be handled at each port in the years leading up to the target year. Forecast of commodity-wise cargo handling volume in the target years 2000/01 and 2010/11 at each port is as shown in Table 3.5.7.3 and 3.5.7.4.

(1) The total volume of each commodity is known, as is the total cargo volume at each port. What remains to be determined is the commodity share at each port, and this is done using the Fratar growth-factor method: the X-axis (cargo volume of each port) and Y-axis (total volume of each commodity) are alternately calculated until agreement is reached.

(3) Check by cost analysis

We check the distributed cargo volume share by lough cost analysis among the Persian Gulf Port.

1) Hinterland

Considering the transport network and distribution of industries, we set the hinterlands by each port.

Ports and their hinterland are shown in Table 3.5.7.5 and Figure 3.5.7.1.

Table 3.5.7.5 Ports and their Hinterlands

Hinterland (Province)	Core City	Port
Tehran, Zanjan, Semnan, Gilan Mazandaran, East Azarbayejan West Azarbayejan	Tehran	Khomeini port Rajaei port
Esfahan	Esfahan	Khomeini port Rajaei port
Khuzestan, Kohgiluyeh & Boyer-Ahmad, Chaharmahal & Bakhtiari	Ahvaz	Khomeini port Rajaei port Bushehr port
Markazi, Bakhtaran, Kordestan Hamadan, Lorestan, Ilam	Arak	Khomeini port Rajaei port
Fars, Bushehr	Shiraz	Khomeini port Rajaei port Bushehr port

Kerman, Sistan & Baluchistan Hormozgan	Kerman	Rajaei port Bushehr port Behesti port
Khorasan	Mashhad	Khomeini port Rajaei port Behesti port
Tehran	Tehran	Anzali port

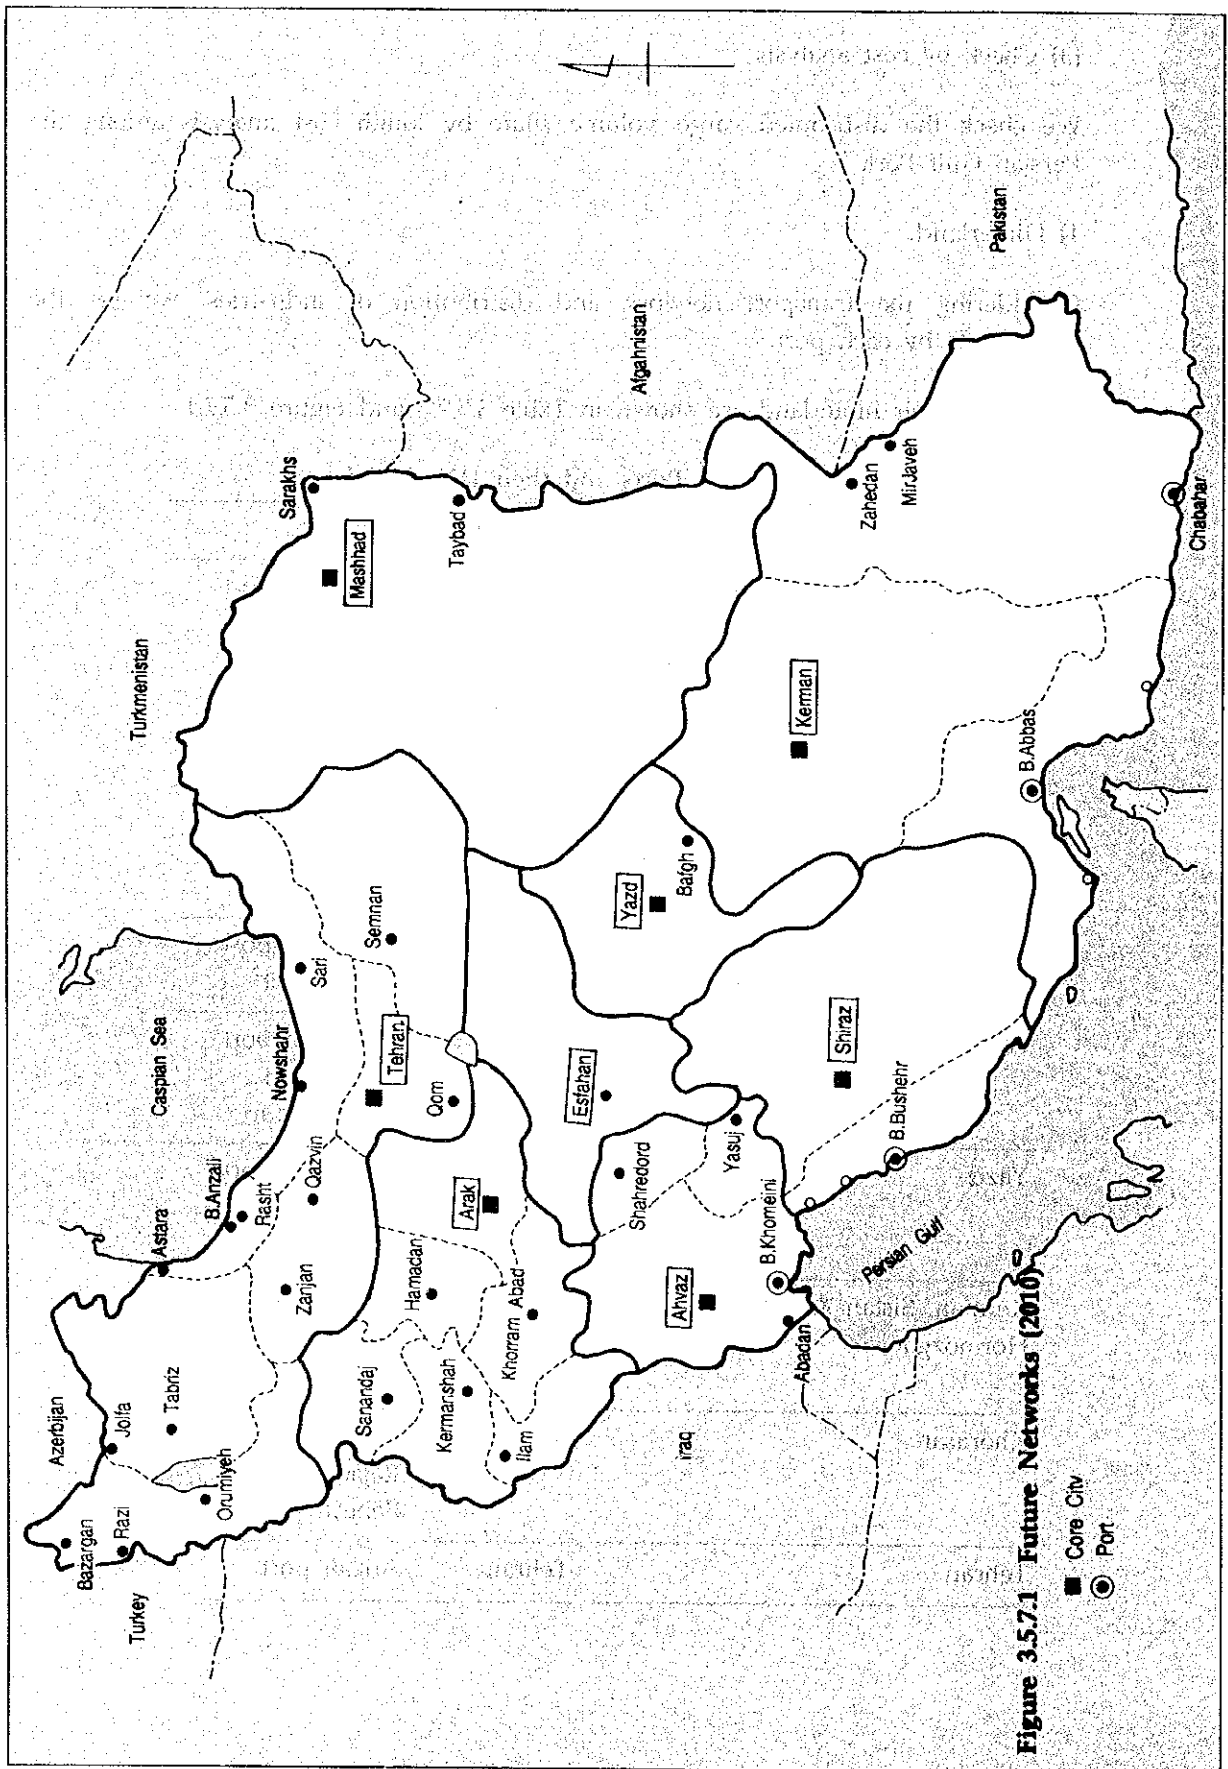

Figure 3.5.7.1 Future Networks (2016)

2) The share of four ports at the Persian Gulf

Vessels calling to the Persian Gulf ports come from all over the world. Main sea routes are through the Suez Channel for vessels from Europe and America and through the Indian Sea via Singapore for vessels from Asia.

Imam Khomeini port is located in the bottom of the Persian Gulf, has disadvantages in terms of ship cost and transport time, however, Imam Khomeini port is near to Teheran comparing with other major ports along the Persian Gulf coast. The two gateway ports, Imam Khomeini and Abbas, will compete with one another once the railway is completed at Abbas port. The share is estimated by cost analysis.

For the hinterland of each port in the Persian Gulf, the surrounding land is separated into eight areas considering transportation infrastructure, road and railway.

The area of consumption and production in Iran is closely related to the population distribution. The volume of cargo that flows to/from ports is related to the regional population.

Considering actual port activities, Imam Khomeini port should be the center of foreign trade. Future cargo share of each port in the Persian Gulf is forecasted based on micro forecast and checked by transportation cost analysis as shown in Table 3.1.1.1.

Table 3.5.7.6 Share of Cargo Volume among Four Ports (2010/11)

Port	1993	2010 By Micro Forecast	Case 1 By Cost Analysis	Case 2 By Cost Analysis	Case 3 By Cost Analysis
Khomeini	53%	50%	45%	48%	61%
Abbas	41%	44%	45%	42%	30%
Bushehr	3%	4%	4%	4%	4%
Chabahar	3%	2%	6%	6%	6%

Note: Import/Export cargo volume is equal to 100% with four ports at The Persian gulf ports in Iran. In this report, share is set by the "Micro Forecast".

Case 1; Cost is \$5.0 per ton between Abbas and Imam Khomeini with sea lane.

Case 2; Cost is \$2.5 per ton between Abbas and Imam Khomeini with sea lane.

Case 3; Cost is \$5.0, railway will not connect from Abbas to existing railway.

3.6 Functional Allotment Among Major Iranian Ports

In this section, the functional allotment among major Iranian Ports is proposed as follows.

3.6.1 Commodity Wise Movement of Sea Born Cargo

Imam Khomeini port and Abbas port are the two major ports in Iran and each is expected to handle more than ten million tons of foreign trade cargo. In particular, Imam Khomeini and Abbas port will handle many commodities in Iran because of its advantageous location near the high population density area. Raw materials, aluminum powder, rice, wheat, general cargo and so on will also be handled at these ports.

These two ports are the main ports in Iran while Bushehr, Abadan, Khoramshahr and Chabahar port are sub ports of which roles are to serve mainly their respective districts.

Anzali port is the main port in the Caspian Sea and Now shahr, Amir Abad and Fereydunkenar will be sub ports.

Other ports will have relatively minor though nonetheless important roles.

(1) Bulk cargo

Since the maximum available depth of entrance channel at Imam Khomeini port is only 12.2 m, which cannot accept recent grain ship, the ships larger than Panamax type normally light their draft at Abbas port.

The liquid bulk, chemical product, oil product also are handled at Abbas port, Bushehr port and Chabahar port. But the facilities are inadequate and will need to be improved as soon as possible.

Raw material cargo, including iron ore, aluminum powder and so on are handled at Imam Khomeini port. Iron ore will come from the steel company jetty near Bandar Abbas.

Grain is handled at Bushehr, Chabahar port to the inland silos for the district and this role will be retained in future but the quantity is not very large.

Grain and liquid bulk cargo are handled at Anzali, Now Shar port. The cargo volume will increase in the future from CIS countries and so on.

Amir Abad port is under construction, however, it is near the CIS countries and the railway sidings. Bulky cargo from Central Asia will increase.

(2) Heavy cargo

Heavy cargo such as materials for the project needs to be handled at the two major ports, as well as at Chabahar and Anzali port, which countries handle heavy cargo. The capacity of equipment for heavy cargo handling at their ports, however, needs to be improved, accordingly. Bushehr port handles the material for the oil project and Chabahar port handle the material for the development projects on going in the hinterland.

(3) Ro-Ro cargo

Ro-Ro ships will increase both in the Caspian Sea and the Persian Gulf. In the Caspian Sea there is a ferry line between Baku and Krasnovotuk; ferry ships are useful for ports which do not have sufficient port facilities. Since CIS countries want to transport cargo to/from Europe through the Caspian Sea by road and rail. It is recommended in this case that containerization be introduced extensively, since the container is suitable style of transportation for transshipment operation in particular.

The port facility for the Ro-Ro ship needs to be prepared by Imam Khomeini port and Anzali port.

In the Persian Gulf, trade between the Arab coastal countries and Iran will increase with variety of ship types including Ro-Ro ship, lighter, rush ship.

(4) Transit and transshipment Cargo

Cargo to/from the CIS countries going through Iran by rail and truck will use Anzali port , Amir Abad port, Nowshahr port (the Caspian Sea side) Imam Khomeini port and Abbas port (the Persian Gulf side).

The transit cargo volume cannot be estimated precisely because of the limited data; however, the port facility shall be prepared for handling a cargo volume of about two million tons.

The cargo to/from Kish Island and Qeshm Island will be handled by near port for a while because of shortage of port facility in their Islands Lengeh port should respond this requirement.

(5) Container cargo

Imam Khomeini and Abbas port will handle mainly container cargo with target volume in 2010/11 is 18.3 million tons. Considering the prevailing cargo style at the Caspian Sea, container cargo will increase. Anzali port will handle the container cargo regularly. Bushehr and Chabahar port will handle the container as the sub port and for the district.

3.6.2 Industry and Commerce

Traffic demand for industrial and commercial oriented cargo will be increased in each major port. From the view point of regional development, the port should support the manufacturing activity more than now, through timely provision of convenient space for local industrial or commercial enterprises with various related port services.

Imam Khomeini and Abbas port will prepare the land for that purpose and the facilities shall be improve to support for nation of new industrial/commercial complex.

3.6.3 Storage

The port is required to prepare storage facilities in its area for the transshipment cargo, container cargo, general cargo, bulk cargo, liquid bulk cargo, heavy cargo, frozen cargo, bagged cargo. The current shortage of warehouses seems to hamper the Iranian transport system. It often happens that shippers don't act in moving their cargo from the port area, therefore the shed becomes filled soon to capacity.

3.6.4 Others

(1) Passengers and domestic cargo

Passenger ships will call at Abbas, Bushehr and Imam Khomeini port in the Persian Gulf.

Passenger ship will call Anzali and Now Shahr port in the Caspian Sea.

Abadan and Khoram Shar port will be reconstructed and handle the cargo, passengers between Kuwait and so on.

Domestic cargo will increase for the reason that the port network will be constructed sufficiently and the cargo will be loaded and unloaded at main port, the cargo will be transported to other ports by coastal ship, in particular at Genaveh and Lengeh port.

(2) Fishery

Requirements of total capacity of fishery port function will increase at all PSO ports. Fereydunkenar and Amir Abad port (the Caspian Sea), Jask and Deylam port (the Persian Gulf) should response for the requirement in 2010/2011.

(3) Refuge

Requirements of total capacity of refuge port function will increase.

Anzali, Now Shahr Fereydunkenar and Amir Abad (the Caspian Sea), Chabahar port (the Persian Gulf) should response for the requirement.

3.6.5 Results

Based on the above, the functions of major ports in 2010/11 are summarized as follows.

Table 3.6.1 Functions of Major Ports

Ports Function	Imam Khomeini	Abbas	Bushehr	Chabahar	Anzali	Now Shahr
Foreign Trade	AA	AA	A	A	A	B
Domestic Trade	A	A	A	C	B	C
Commercial	AA	AA	A	A	A	B
Industrial	AA	AA	B	B	B	B
Container Cargo	AA	AA	A	B	A	B
Bulk Cargo	A	A	B	A	B	C
Heavy Cargo	A	A	B	B	A	B
Ro-Ro Cargo	A	A	-	-	A	-
Transshipment Cargo	A	AA	-	-	A	-
Liquid Cargo	C	AA	AA	A	A	B
Fishery	C	A	A	A	A	C
Passenger	B	A	A	-	A	A
Refuge	-	-	-	B	A	A

Allotment Degree

AA: High

A: Medium High

B: Medium Low

C: Minimal

-: Not Handled

Function

Foreign Trade

'AA'- total foreign cargo volume is more than 10 million tons

'A'- total foreign cargo volume is more than 2 million tons

'C'- total foreign cargo volume is less than 1 million tons

Domestic trade

'A'- domestic cargo volume is more than 1 million tons

'C'- domestic cargo volume is more than 100,000 tons

Commercial	'AA'- cargo volume more than 5 million tons 'A'- cargo volume more than 0.5 million tons 'C'- cargo volume less than 50,000 tons
Industrial	'AA'- cargo volume for industry is more than 3 million tons 'A'- more than 0.5 million tons 'C'- less than 50,000 tons
Container cargo	'AA'- cargo volume is more than 1 million tons 'A' - more than 100,000 tons 'C' - less than 50,000 tons
Bulk cargo	'A' - cargo volume is more than 0.5 million tons 'C' - less than 50,000 tons
Heavy cargo	'A'- constantly handling heavy cargo mainly for projects 'C'- occasionally handling heavy cargo
Ro-Ro cargo	'A'- existence of Ro-Ro ship line or frequent calls by Ro-Ro ships 'C' - a Ro-Ro ships call infrequently
Transit cargo	'AA'- transit cargo volume is more than 0.5 million tons 'A'- transit cargo volume is more than 100,000 tons 'C' - transit cargo volume is less than 50,000 tons
Liquid Cargo	'AA'- cargo volume is more than 2 million tons 'A'- more than 1 million tons 'C'- less than 50,000 tons
Fishery	'A' - authorized as main fishery port by SHIRAT 'C' - port being used by fishing boat
Passenger Refuge	'A' - existence of foreign passenger line 'A' - calmness level is less than 50 cm in the port

3.7 General Development Strategy of Each Major Port

(1) Function of Each Major Port

The packing style of each item in Table 3.6.1 can be envisioned in Table 3.7.1. The cargo allotment degree of each major Iranian port by packing style and by kind of ship is shown from Table 3.7.2 to Table 3.7.4 which was made using Table 3.6.1 and 3.7.1.

The definition of the allotment degree is the same as in Table 3.6.1.

Table 3.7.1 Exchange Items to Packing Style

Items in Table 3.6.1	Items by packing style
Commercial	Break bulk cargo and Container cargo
Industrial	Dry bulk cargo, Break bulk cargo and Heavy cargo
Container cargo	Container cargo
Bulk cargo	Dry bulk cargo
Heavy cargo	Heavy cargo (majority in case) and Break bulk cargo
Ro-Ro cargo	Ro-Ro cargo
Transshipment Cargo	Container cargo
Passenger	Passenger
Domestic trade	Break bulk cargo Dry bulk cargo
Fishery	Fishing

Table 3.7.2 Cargo Allotment Degree of Imam Khomeini Port and Abbas Port by Packing Style

Port	Trade	Kind of ship	Kind of cargo	Cargo allotment degree
Imam Khomeini	Foreign	Break bulk ship	Break bulk cargo	AA
		Heavy cargo vessel	Heavy cargo	A
		Container vessel	Container cargo	AA
		Dry bulk carrier	Dry bulk cargo	A
		Ro/Ro vessel	Ro/Ro cargo	A
		Liquid bulk carrier	Liquid bulk cargo	C
	Passenger ship	Passenger	B	
	Domestic	Dry bulk carrier	Dry bulk cargo	A
Fishery	Fishing boat	Fishing	C	
Abbas	Foreign	Break bulk ship	Break bulk cargo	AA
		Heavy cargo vessel	Heavy cargo	A
		Container vessel	Container cargo	AA
		Dry bulk carrier	Dry bulk cargo	A
		Ro/Ro vessel	Ro/Ro cargo	A
		Liquid bulk carrier	Liquid bulk cargo	AA
	Passenger ship	Passenger	A	
	Domestic	Dry bulk carrier	Dry bulk cargo	A
Fishery	Fishing boat	Fishing	A	

**Table 3.7.3 Cargo Allotment Degree of Bushehr Port
and Chabahar Port by Packing Style**

Name	Function	Kind of ship	Kind of cargo	Cargo allotment degree
Bushehr	Foreign	Break bulk ship	Break bulk cargo	A
		Heavy cargo vessel	Heavy cargo	B
		Semi container ship	Container cargo	A
		Dry bulk carrier	Dry bulk cargo	A
		Liquid bulk carrier	Liquid bulk cargo	AA
		Passenger ship	Passenger	A
	Domestic	Break bulk ship	Break bulk cargo	A
		Dry bulk carrier	Dry bulk cargo	A
	Fishery	Fishing boat	Fishing	A
Chabahar	Foreign	Break bulk ship	Break bulk cargo	A
		Heavy cargo vessel	Heavy cargo	B
		Semi container ship	Container cargo	B
		Liquid bulk carrier	Liquid bulk cargo	A
		Dry bulk carrier	Dry bulk cargo	A
	Domestic	Break bulk ship	Break bulk cargo	C
		Dry bulk carrier	Dry bulk cargo	C
	Fishery	Fishing boat	Fishing	C

Table 3.7.4 Cargo Allotment Degree of Anzali Port and Now Shar Port

Name	Function	Kind of ship	Kind of cargo	Cargo allotment degree
Anzali	Foreign	Break bulk ship	Break bulk cargo	A
		Heavy cargo vessel	Heavy cargo	A
		Semi container ship	Container cargo	A
		Dry bulk carrier	Dry bulk cargo	A
		Ro/Ro vessel	Ro/Ro cargo	A
		Liquid bulk carrier	Liquid bulk cargo	A
		Passenger ship	Passenger	A
	Domestic	Break bulk ship	Break bulk cargo	B
		Dry bulk carrier	Dry bulk cargo	B
Fishery	Fishing boat	Fishing	A	
Now Shahr	Foreign	Break bulk ship	Break bulk cargo	B
		Heavy cargo vessel	Heavy cargo	B
		Break bulk ship	Container cargo	B
		Dry bulk carrier	Dry bulk cargo	B
		Liquid bulk carrier	Liquid bulk cargo	B
		Passenger ship	Passenger	A
	Domestic	Break bulk ship	Break bulk cargo	C
		Dry bulk carrier	Dry bulk cargo	C
Fishery	Fishing boat	Fishing	C	

(2) Basic Cargo Flow at Each Major Port by Packing Style

The required port facilities at each major port are suggested based on Tables 3.7.2-3.7.4 and Tables 3.5.7.3. An outline is provided below.

1) Imam Khomaini Port

Basic cargo flow between shipper/consignee and berth by packing style at Imam Khomaini port is assumed based on Table 3.7.2 and Table 3.5.7.3 to Figure 3.7.1.1.

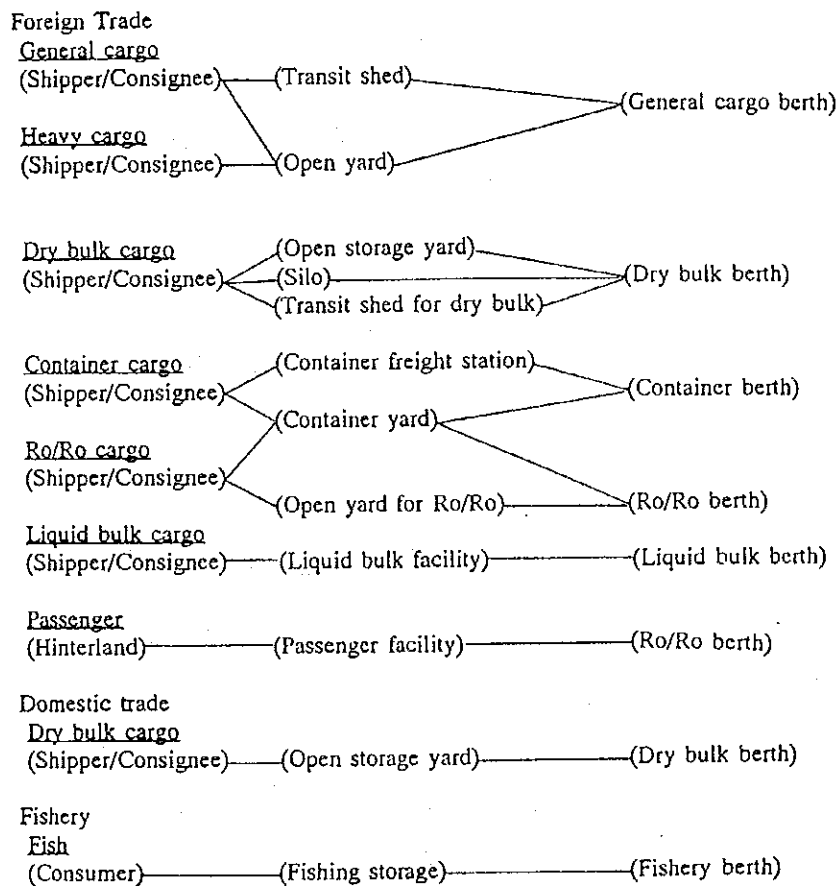

Figure 3.7.1.1 Basic Cargo Flow at Imam Khomeini Port

At Imam Khomainsi port, the major commodities of heavy cargo are plants (apparatus) and large machinery. These cargoes will be handled at the general cargo berth which will be used as multipurpose berths.

Many ferry boats play between Iranian major ports and Arabic countries on the coast of the Persian Gulf and Iranian islands. The center of the major Iranian ports for ferry transportation is Abbas port and Bushehr port. Passengers for above routes use not only passenger ships but also ferry boats because the ferry boats offer liner service and passengers can transport large baggage easily. At Imam Khomainsi port, passengers have been using ferry transportation recently. Therefore the passenger facilities at Imam Khomainsi port will also function as a passenger berth after the completion of the ferry berth.

2) Abbas Port

The basic cargo flow by packing style at Abbas port is envisioned in Figure 3.7.1.2 based on Table 3.7.2 and Table 3.5.7.3.

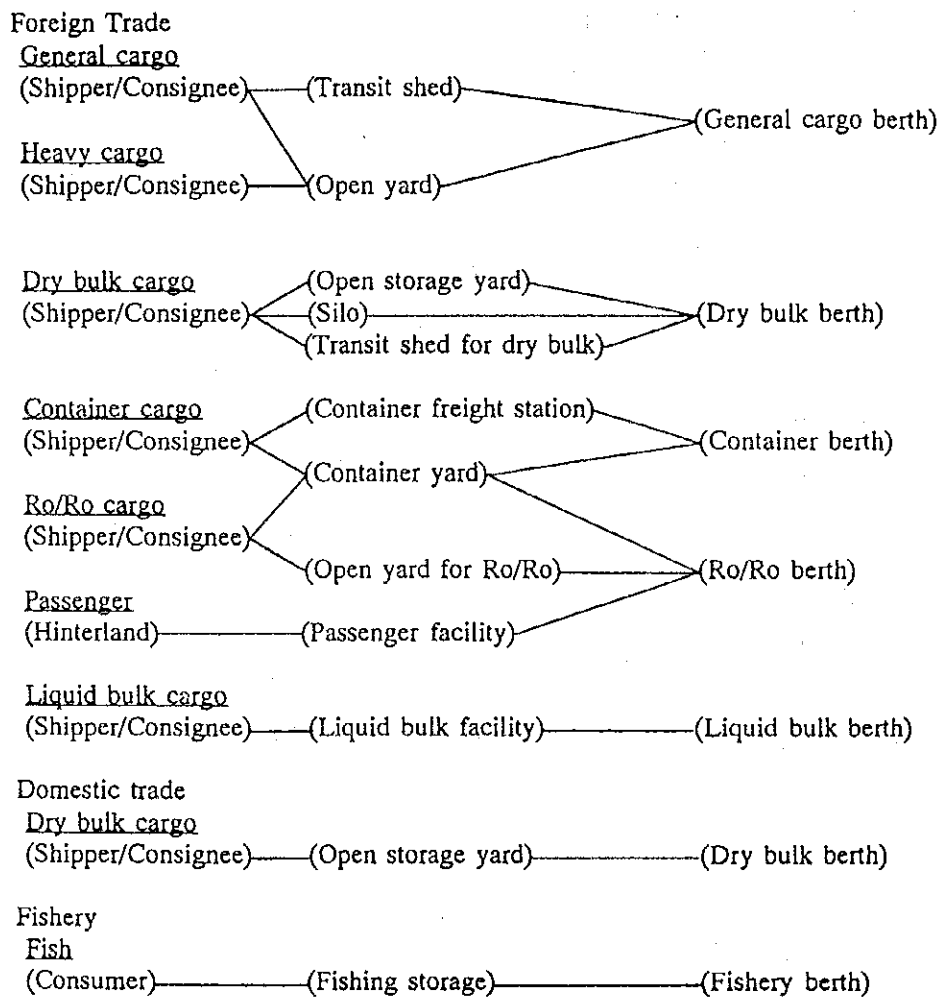

Figure 3.7.1.2 Basic Cargo Flow at Abbas Port

The basic cargo flow by packing style at Abbas port is similar to Imam Khomainsi port.

3) Bushehr Port

Figure 3.7.1.3 shows the basic cargo flow by packing style at Bushehr Port.

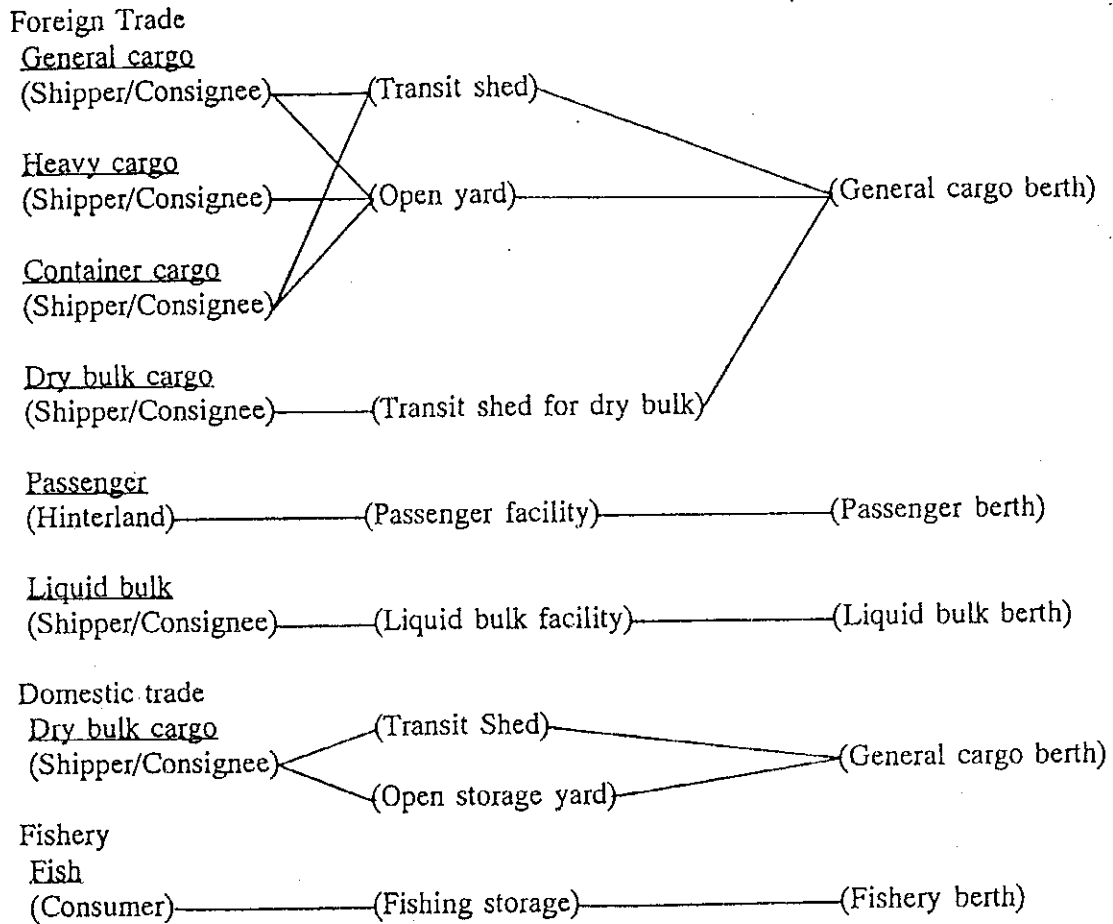

Figure 3.7.1.3 Cargo Flow at Bushehr Port

The main commodity of dry bulk cargo at Bushehr port will be import wheat which is handled from ship to hopper. Then, the wheat will be bagged through the hopper or transported to transit shed for dry bulk cargo by truck. So, dry bulk cargo will be handled at the general cargo berth.

4) Chabahar Port

The basic cargo flow by packing style is assumed based on Table 3.7.3 and Table 3.5.7.3 to Figure 3.7.1.4.

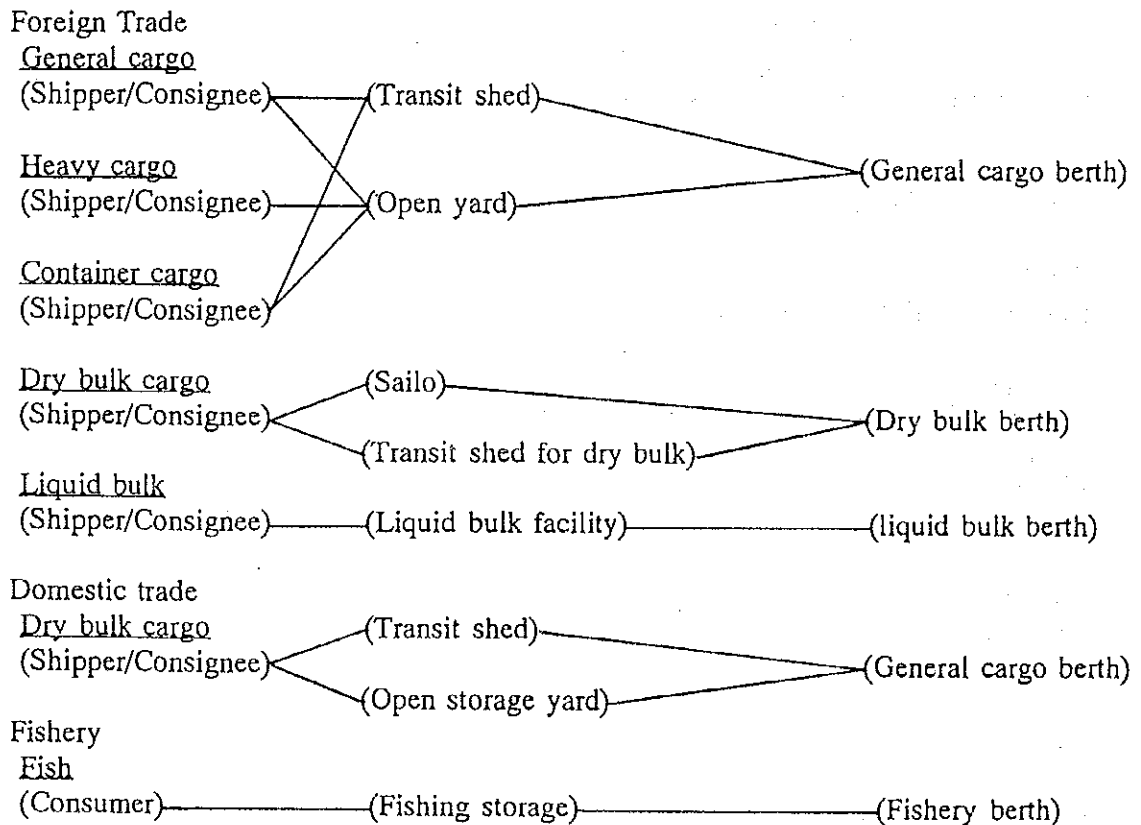

Figure 3.7.1.4 Basic Cargo Flow at Chabahar

According to Table 3.7.3, the cargo allotment degree of future container cargo at Chabahar port is Medium(B). This container cargo will be transported by semi-container vessels. According to cargo statistics of PSO, dry bulk cargo whose major commodity is wheat is the largest in volume at Chabahar port. Considering the above, general cargo, heavy cargo and container cargo in Chabahar port will be handled at the general cargo berth which is used as a multipurpose berth. Then, container cargo will be marshalled and stored in the open yard for conventional general cargo.

Behesti jetty in Chabahar port cannot be used in monsoon season due to heavy waves. Therefore, construction of break-water is given high priority in Chabahar port.

5) Anzali Port

The basic cargo flow by packing style at Anzali port is assumed in Figure 3.7.1.5 based on Table 3.7.4 and 3.5.7.3.

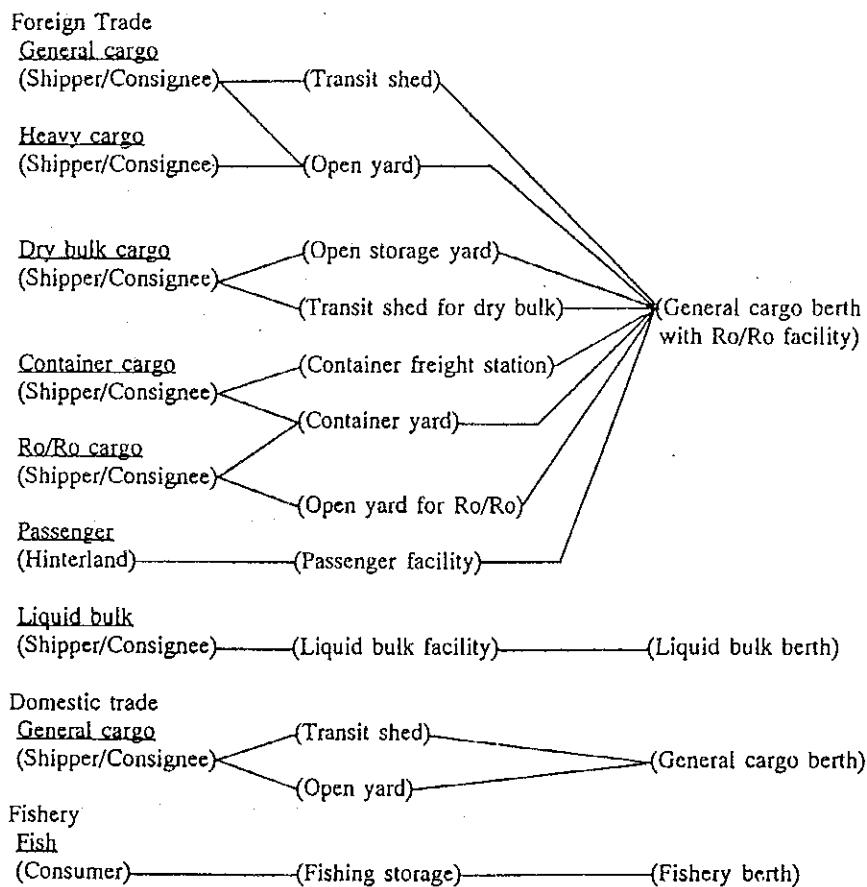

Figure 3.7.1.5 Basic Cargo Flow at Anzali

The future expansion area at Anzali port is limited because this port is surrounded by the city area. According to Table 3.7.4, the basic cargo allotment degree of all the handling cargo at Anzali port is less than High (AA). Therefore, all of the handling cargo at Anzali port except liquid bulk cargo will be handled at the general cargo berth which functions as a multipurpose berth for effective use of the quay.

The sorting area at Anzali port shall be expanded in the near future. In particular, container yard, and sorting facilities for conventional break bulk at Anzali port shall be expanded to meet the increase in container cargo and conventional break bulk cargo.

The water-line in the north area of Anzali port is not suitable for a berthing facility due to stormy waves. Therefore, the break-water shall be expanded or a newly constructed, after which the mooring facilities will be expanded.

6) Nowshahr Port

The basic cargo flow by packing style at Nowshahr port is assumed in Figure 3.7.1.6 based on Table 3.7.4 and 3.5.7.3.

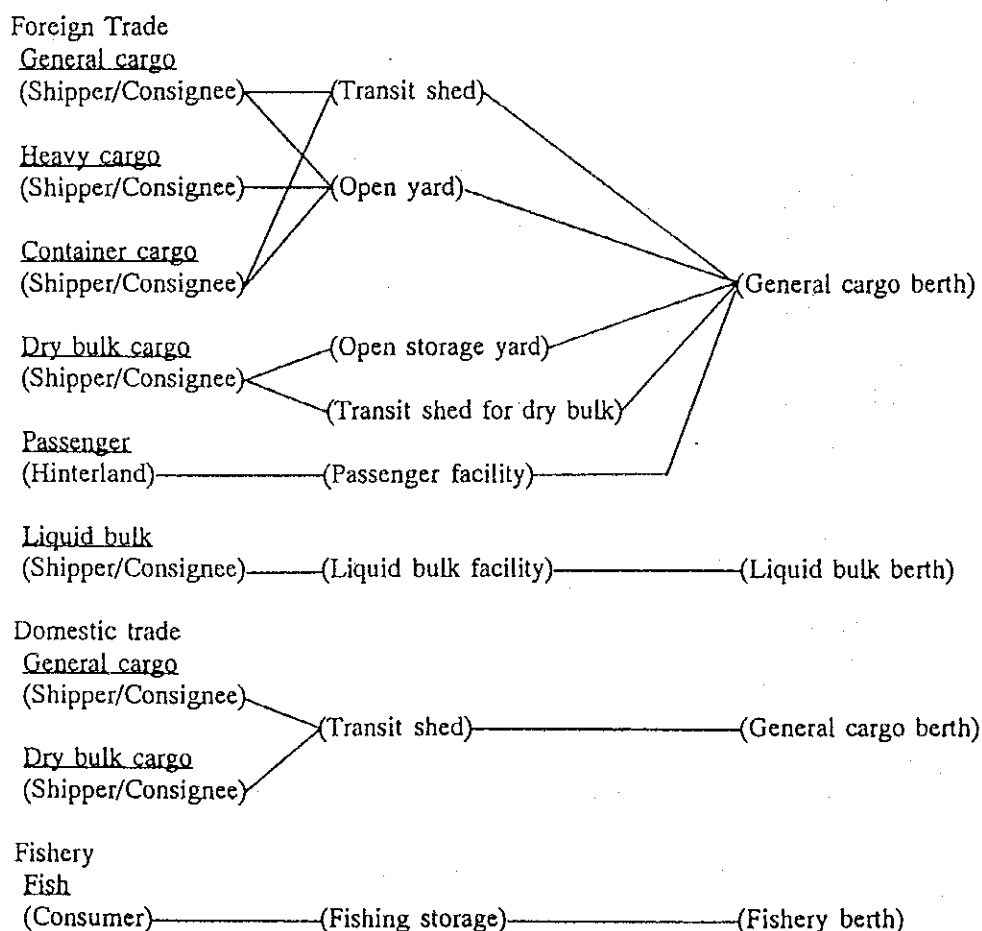

Figure 3.7.1.6 Basic Cargo Flow at Now Shahr

According to Table 3.7.4, basic cargo allotment degrees of all of the cargo by packing style except passenger at Now Shar port are Medium(B) or Minimal(C). Then, the cargo handling volume of Iranian ports on the coast of the Caspian Sea is about 1/16 of total cargo handling volume of all Iranian ports. (Refer to Section 3.5.) Considering the above, all of the foreign trade cargo at Now Shar port will be handled at the general cargo berth which functions as a multipurpose berth. Container cargo at this port will be marshalled and stored at the open yard for conventional break bulk cargo.

(3) Required Port Facilities at Each Major Port

Considering the basic cargo flow by packing style and present situation at each major port, the basic required main port facilities at each major port are shown in Table 3.7.5.

Table 3.7.5 Required Port Facilities at Each Major Port

Name of Port		Imam Khomaini Port	Abbas Port	Busher Port	Chabahar Port	Anzali Port	Now Shar Port
Kind of Berth							
Foreign Trade	General cargo berth	*	*	*	*	*	*
	Container berth	*	*				
	Ro/Ro berth	*	*				
	Dry bulk berth	*	*		*		
	Passenger berth			*			
Domestic trade	Liquid bulk berth	*	*	*	*	*	*
	General cargo berth			*			*
	Dry bulk berth	*	*				
Fishery	Fishery berth	*	*	*	*	*	*
Kind of Sorting Facility							
Foreign Trade	Transit shed	*	*	*	*	*	*
	Open yard for General Cargo	*	*	*	*	*	*
	Container Freight station	*	*			*	
	Container Yard	*	*			*	
	Open yard for Ro/Ro	*	*			*	
	Open Storage Yard	*	*			*	*
	Silo	*	*		*		
	Transit shed for dry bulk	*	*		*	*	*
	Passenger Facility	*	*	*		*	*
Domestic trade	Liquid bulk Facility		*	*	*	*	*
	Transit shed			*		*	*
	Open yard for General Cargo			*		*	
	Open Storage Yard	*	*				
Fishery	Fishing Storage	*	*	*	*	*	*
Break water					*	*	*

Note: *: Required Facility

(4) Required Port Related Business at Each Major Port

1) Imam Khomaini Port

All packing style cargoes are handled at Imam Khomaini Port. In particular, in 1992, break bulk cargo (general cargo and bagged cargo), container cargo and dry bulk cargo are about 23 percent, 18 percent and 44 percent of total cargo handling volume of each packing style at Iranian major ports respectively. And then break bulk cargo and container cargo are given high priority in Table 3.7.2. Concerning the mooring facility at Imam Khomaini Port, general cargo berth and container berth are given high priority in Table 3.8.1.2.

The distance between Imam Khomaini Port and Tehran which is the major hinterland of Imam Khomaini Port is about 1,000 km. In addition, 44 percent of imported dry bulk cargo at all major Iranian ports in 1992 was handled at Imam Khomaini port.

Based on the above, the functions of the business for break bulk cargo, container transportation and heavy cargo should be attracted to the area behind Imam Khomaini Port with priority. And then, construction of the expressway between Imam Khomaini and Esfahan via Ahwaz should be given high priority.

2) Abbas Port

At Abbas Port, all packing style cargoes are handled, especially break bulk cargo, container cargo and liquid bulk cargo which are given high priority in Table 3.7.2 because these cargo volume in 1992 accounted for more than 75 percent of total foreign cargo handling volume at this port, moreover, the total foreign cargo handling volume of this port accounts for more than 40 percent of total foreign cargo handling volume of major Iranian ports. Cargo volume of dry bulk cargo at this port in 1992 accounted for more than 19 percent of foreign cargo handling volume at this port. In addition, in Table 3.8.1.2, general cargo berth and container berth are given high priority.

The largest hinterland of Abbas port is Tehran which is a great distance away with approximately 1,300 km from Abbas port.

In 1992, about 40 percent, 80 percent, 45 percent and 55 percent of total dry bulk cargo, total container cargo, total break bulk cargo and total liquid bulk cargo respectively at Iranian major ports were handled at Abbas port. According the result of the cargo forecast of this study, these percentage will change to approximately 35, 62, 35 and 49 in 2010 respectively.

Based on the above, the functions of the port related business for dry bulk cargo, break bulk cargo, liquid bulk cargo and container transportation should be attracted to the area behind Abbas port. For land transportation, the construction of the railway between Tezerj and Bandar Abbas and the express way between Esfahan and Bandar Abbas via Yazd should given priority.

3) Bushehr Port

The major packing styles of cargo at Bushehr port are break bulk cargo including bagged cargo, liquid bulk cargo, container cargo and dry bulk cargo. In particular, liquid cargo volume at this port to total liquid cargo volume of major Iranian ports is about 18 percent in 2010. Also, there are many passengers between Buser and Arabic countries and the coastal Iranian islands on the Persian Gulf. In Table 3.8.1.2, general cargo berth is given high priority.

Therefore, the functions of port related business for break bulk cargo, liquid bulk cargo and passenger should be attracted to the area behind Buser port.

4) Chabahar Port

The major packing styles of cargo at Chabahar port are break bulk cargo(including bagged cargo), container cargo, dry bulk cargo and liquid bulk cargo. In particular, liquid bulk cargo and bagged cargo have large volumes, more than 1 million tons in 2010. So, the cargo allotment degrees of these cargoes is given middle high priority (A) in Table 3.7.3. And then, general cargo berth at Chabahar port is given high priority in Table 3.8.1.2.

The hinterland of Chabahar port is mainly southeastern Iran. Chabahar port is the supply base to the southeastern Iran for wheat, rice, sugar and fertilizer.

Based on the above, the functions of port related business for break bulk cargo, dry bulk cargo and liquid bulk cargo should be attracted to the area behind Chabahar port. And then, the rail-way between Chabahar and Kerman and Chabahar and Zahkdan should be constructed as soon as possible.

5) Anzali Port

Anzali port is a gateway port for international trade of the Caspian sea. The major packing styles of cargo are liquid bulk cargo, break bulk cargo and container cargo. Also, this port has a lot of passengers because there is a route of passenger ships between Anzali and Baku which is located on the west coast of the Caspian sea in the Republic of Azerbaijan.

Therefore, the cargo allotment degrees of packing style of these cargoes(liquid bulk cargo, break bulk cargo and container cargo including Ro/Ro cargo) in Table 3.7.4 are given middle high(A) priority. In Table 3.8.1.3, general cargo berth and liquid bulk berth in Anzali port are given high priority. Imported oil products which is major commodity of liquid bulk cargo is sent from Anzali to Rasht by pipe-line.

Based on the above, the functions of port related business for break bulk cargo, container cargo including Ro/Ro cargo and passenger should be attracted to the area behind Anzali port.

Anzali port and Tehran which is the major hinter-land of Anzali port is connected by Main road which is one of the load classification in Iran. So, transportation of container trailer for 40 foot sea container is available between Anzali and Tehran, but this route some times stops during the year due to landslides. Therefore, a road which would always be available to transport container trailer for 40 foot sea container should be constructed.

6) Nowshahr Port

Now Shahr Port is one of the major ports in Iran which is located on the coast of the Caspian Sea. The major packing styles of cargo at Now Shahr Port in 2010 are break bulk cargo, container cargo and liquid bulk cargo. Also, passengers are included in the target year of the Master Plan.

The total cargo handling volume of Nowshahr Port is the smallest of the major Iranian ports. So, cargo allotment degree of all packing style cargoes except passenger is Medium(B) or Minimal(C) in Table 3.7.4.

Therefore, the function of port related business for break bulk cargo, liquid bulk cargo and passenger should be attracted to the area behind the port with priority.

The design road of some bridges on the approach road of Nowshahr Port is not sufficient for the traffic of heavy-weight trucks including container trailer. Therefore, these bridges should be expanded as soon as possible.

3.8 Framework of General Development Scenarios for Major Iranian Ports

3.8.1 Framework of Planning Stage and general Development Scenario for Major Iranian Port

The major packing style of each commodity in Table 3.5.3-(4)-2) and 3.5.3-(4)-2)-3 can be envisioned in Tale 3.8.1.1.

Table 3.8.1.1 Exchange Items to Packing Style

Items in Table 3.5.3	Items by packing style
Dry bulk cargo	Dry bulk cargo
Liquid bulk cargo	Liquid bulk cargo
Bagged cargo	Break bulk cargo
Container cargo	Container cargo
Refrigerated cargo	Container cargo
Steel Material	Heavy cargo(majority in case)
Mineral	Dry bulk cargo
General cargo	Break bulk cargo

The cargo handling volume by commodity in Table 3.5.1-(4)-2)-2 and 3.5.3-(4)-2)-1 can be re-arranged in Figure 3.8.1.1 and 3.8.1.2 using Table 3.8.1.1.

Figure 3.8.1.1 Cargo Handling Volume at Major Ports on the South Iranian Coast

Figure 3.8.1.2 Cargo Handling Volume at Major Ports on the North Iranian Coast

According to Figure 3.8.1.1 and 3.8.1.2, there are two types of cargo transition. One is a gradual and constant transition and the other is an abrupt transition. The former type is break bulk cargo, heavy cargo and dry bulk cargo, liquid bulk cargo and the latter type is container cargo in Figure 3.8.1.1 and 3.8.1.2.

The largest volume cargo in 2010 at major ports on the southern coast in Iran is break bulk cargo with about 50 percent. The second largest volume cargo is container cargo with about 23 per cent. The third and the fourth largest are liquid bulk cargo and dry bulk cargo respectively.

In 2000, the largest volume cargo is break bulk cargo with about 54 percent. The second is liquid bulk cargo with about 17 percent, followed by dry bulk cargo and container cargo respectively.

Considering section 3.7 and above, the priority of preparation of major port facilities at each major port on the southern coast of Iran is shown in Table 3.8.1.2.

Table 3.8.1.2 Priority of Required Port Facilities at Each Major Port on the Southern Coast of Iran

Name of Port		Imam Khomaini Port	Abbas Port	Busher Port	Chabahar Port

Note:***:Required facility with first priority for construction
 **:Required facility with second priority for construction
 *:Required facility with third priority for construction

A part of container cargo and break bulk cargo in Table 3.8.1.2 and 3.8.1.3 will be handled by Ro-Ro handling system.

3.8.2 Investment for Port Development

(1) Maximum handling capacity at Iranian Ports

Maximum handling capacity after improving existing facilities and operation system is calculated for 15 ports by berth. (See Appendix II-6)

The results is shown in Table 3.8.2.1.

Table 3.8.2.1 Maximum Handling Capacity and Required Number of Berths
South Port (Imam, Khomeini, Abbas, Bushehr, Chabahar, Khoramshahr, Abadan)

Berth (South Ports)	Number	Total Length (m)	Capacity (1,000 ton/Year)
Conventional*	71	12,152	36,710
Container	10	2,081	11,564
Sub Total	81	14,233	48,274
Under Construction	5	932	2,300
Total	86	15,165	50,754
Cargo Volume			Forecast 2010/11 61,304
Over Cargo Volume			10,730

North Port (Anzali, Nowshahr, Amir Abad, Torkaman)

Berth (North Ports)	Number	Total Length (m)	Capacity (1,000 ton/Year)
Conventional*	6	1,324	1,720
Container	2	200	680
Sub Total	8	1,524	2,400
Under Construction	9	1,970	1,865
Total	17	3,494	4,265
Cargo Volume			Forecast 2010/11 4,421
Over Cargo Volume			156

Note: Excluding Oil, Oil Products.

(2) Required number of berth

In the Persian Gulf, total required number of berth in 2010/11 is 19, while the same is 14 in the Caspian Sea.

(3) Estimated cost of required port development

The cost, improving the existing facilities and to construct the new facilities, is estimated as follows.

Table 3.8.2.2 Cost of Port Development

Total Construction Cost	US\$ 1,854 Mn.
Government Funds	US\$ 1,800 Mn.
Lack of Funds	US\$ 54 Mn.

3.9 Environmental Aspect

The environment is a very important matter in Iran, which is a signatory country of several environment related treaties: for example, "Convention on International Trade in Endangered Species of Fauna and Flora", "United Nations Convention on the Law of the Sea", "Convention on Wet-lands of International Importance Especially as Waterfowl Habitat", "Convention Concerning the Protection of the World Cultural Heritage".

PSO is drafting regulations to prevent oil pollution. The regulations are being prepared by concerned authorities such as DOE, PSO and Navy, and include measures for prevention of oil spills and provision of waste oil disposal plant and data regarding waste oil diffusion. This regulation includes various clauses such as:

- a) Category of wastes
- b) Oily water from engines
- c) Oily water from engine room
- d) Other like bilge

A special committee consisting of government organizations concerned with environmental conservation such as DOE, Navy and PSO and environmental specialists has been established to exchange of information.

However, the environmental conservation system for ports is not sufficient. In particular, routine inspection system for water and seabed material quality, standards of sea water quality test and geological test of seabed are lacking in the present regulations.

In this study, site survey which involved taking samples for sea water and seabed material at Imam Khomeini Port and Anzali Port was conducted to ascertain the environmental conditions. According to the result of the survey at Imam Khomeini Port, the quality of sea-water and seabed material is not very good. Concerning Anzali Port, the floating waste and water plants observed at the basin in the port suggest that the environmental condition has been deteriorating. In addition, waste water from Anzali city flows out to Anzali lagoon which has a passage that leads through Anzali Port.

Based on the above, the study team makes the following preliminary recommendations:

- 1) Standards of air, sea water and seabed material quality in the port area should be set in consultation with DOE.
- 2) Routine inspection system for water and seabed qualities should be established.
- 3) A laboratory for minimum requirement analysis of the samples for sea water and seabed material should be established.

4) Engineers to sample environmental quality and analyses data should be trained and assigned to all major ports.

Screening Sheets and Scoping Sheets at each port are attached to Appendix II-3, III-8.

3.10 Cargo Handling Equipment and Maintenance System

3.10.1 Purpose of Cargo Handling Equipment to be installed at the quay side

The purpose of cargo handling equipment are understood generally as follows;

- a. To get high productivity at the port
- b. To reduce the cargo handling cost at the port

However the idea shown above is not always correct.

The final purpose of the cargo handling equipment to be installed at the quay side is to reduce the total cost of cargo transport and handling.

Therefore, the handling cost at the port will be increased by the occasional introduction of cargo handling equipment.

The cost saved due to a ships quick dispatch might be larger than the additional cost increased in the above case.

3.10.2 Determination of the Appropriate Amount of Cargo Handling Equipment

(1) Optimum possession level of cargo handling equipment

To handle cargoes reliably and functionally, the minimum requirement of cargo handling equipment should be owned and maintained by the P.S.O.

A "possession level" numerical is shown VALUE A "VALUE A" is deciding the annual operating days (hours) divided by the annual available days (hours) of each unit of equipment.

However the desirable VALUE A is influenced by the number of unit of the same (nearly) capacity of each kind of equipment.

Although this item is very important, any available data for this formula could not get at all the ports.

The study for VALUE A is indispensable for planners to consider the required number of cargo handling equipment.

It is recommended that the related data should be collected and the study for the relation between VALUE A and actual problems due to shortage of cargo handling equipment should be done.

(2) Adequate stock of spare equipment

PSO should stock spare equipment of cargo handling equipment in addition to net amount of required equipment, giving due consideration to the number of days required for repair, except for the following special cases;

- 1) The number of equipment possessed is a few (one to three units) and, furthermore their purchase price is high

2) Annual operating days (hours) are so short that preventive maintenance is possible during the interval of operation.

If spare equipment is possessed, it is essential to carry out sufficient preventive maintenance in order to reduce the number of interruption in cargo handling work caused by break-down of the equipment and to minimize the number of days required for corrective maintenance. Moreover, preventive maintenance should be carried out so as not to interfere with cargo handling operation.

The ratio of adequate stock of spare equipment is influenced by the total non-operational days (required preventive maintenance days plus required corrective maintenance days) The ratio is about 10% usually.

(3) Ratio of operational days for cargo handling equipment (VALUE B)

The value B is calculated by the following formula

$$B = (P + C) / 365$$

P: Required preventive maintenance days

C: Required corrective maintenance days

The simple average figures of the VALUE B at each port are shown in Table 3.10.1.

1) The following items are understood from the above Tables

a. The figures are generally affected by the site and kind of equipment.

However, the dispersion of the figure is too large and it could be affected by other factors.

b. For high figure

The available data for actual working days on each piece equipment has not been obtained but most of equipment may not be worked so much. Then the corrective maintenance days for break-down by working is very small and furthermore, the preventive maintenance had not been done.

c. For low figure

The reasons can be divided into two items

* The required corrective maintenance day was very long because it takes long time for the delivery of parts.

* There is not any intention of repairing because the equipment is not unnecessary.

2) Dispersion

It is not a good phenomenon to show large dispersion on VALUE B on each equipment.

The dispersion shall be reduced by good management for the equipment.

Table 3.10.2.1 Ration of Operational Days for All Cargo Handling Equipment

Ratio(%) of operational Day in 1991

Port	Mobile Crane	Forklift	Tractor	Average
I. Khomeini	73	74	74	73
Rajae	90	78	95	87
Anzali	65	60	84	69
Nowshahr	89	98	98	95
Bashehr	90	95	95	93

3) Desirable VALUE B

The VALUE B will be calculated by the required days for preventive maintenance and corrective maintenance. However, the corrective maintenance will be affected by the level of the preventive maintenance.

Thus the VALUE B is finally decided by the level of preventive maintenance.

It is generally acceptable that the value is less than 0.1. Therefore the ratio of the adequate stock of spare equipment is 0.1.

3.10.3 Preparation of the Procurement/Disposal Plan

The Study team could find only procurement plan but no disposal plan at Tehran. It is impossible to set high productivity at ports where no cargo handling equipment is provided and the cost for cargo handling equipment including initial cost, operation cost and maintenance cost is great.

There it is very important to maintain the optimum capacity for the cargo to be handled at each port.

Therefore PSO Tehran and PSO each port shall formulate the procurement plan combined with the disposal plan.

For efficient, stable and safe cargo handling operation, cargo handling equipment must be kept in satisfactory condition, keeping in mind life span such as economical service life, regulation service life and service life from the viewpoint of parts procurement.

(1) Economical service life

Service life is calculated by the total cost including procurement cost and aggregate amount of the maintenance cost. The calculative formula is follow.

$C = \text{Procurement cost} + \text{Aggregate amount of the maintenance cost}$

$Y = \text{Passed year}$

$\text{VALUE } D = dc/dy$

When dc/dy becomes zero (0), the Y is the most economical service life. In order to determine the economical service life, the following records for each equipment should be kept.

- a. Actual operating days
- b. Actual repair costs (cost of parts for preventive and corrective maintenance)
- c. Actual repair costs (cost of parts for preventive and corrective maintenance, and personnel expenses required in the maintenance shop and the outside contract costs)

(2) Service life from the aspect of parts procurement

Though the life of equipment is within the regulation service life and has not exceeded the economic service life, possession of equipment is some time difficult for the shortage of spare parts.

This is especially true that operating rate of some equipment is low, but cannot be abandoned because of their special use.

The following are recommended by the Study Team:

The PSO should make a replacement or disposal plan, in consideration of the following three factors for the cargo handling equipment: namely regulation service life, economical service life and service life from the aspect of parts procurement.

3.10.4 Establishment of Effective Maintenance System

In order to keep each piece of handling equipment in a good condition for safety and to keep the most of its original function display, maintenance (checking and repair) is indispensable. It can be roughly divided into two categories.

- i. Preventive maintenance
- ii. Corrective maintenance

Preventive maintenance is to check and repair before the equipment breaks-down or its function deteriorates, and to avoid break-down and ensure its original function. On the other hand, corrective maintenance is a passive form of maintenance which restores the original function of the equipment by carrying out repairs after the trouble occurring.

(1) Need for preventive maintenance

In order to handle cargo economically, cargo handling equipment must be used economically, basic concepts are as follows:

- 1) To ensure the high operating availability ratio (refer to VALUE B)
- 2) To ensure preventive maintenance costs and corrective maintenance costs are kept to a minimum
 - a. Operating availability ratio B (VALUE B) is determined by the sum of preventive maintenance days and corrective maintenance days.
 - b. Number of corrective maintenance (number of break-down x number of days required for repair) depends on the quality of preventive maintenance.
 - c. Corrective maintenance cost (number of break-down x required cost) depends on the quality of preventive maintenance cost.
 - d. The kind of spare parts to be kept will be reduced because the break-down which required spare will be reduced by sufficient preventive maintenance.

(2) Ratio of preventive maintenance and corrective maintenance

Optimum preventive maintenance level can be achieved by minimizing the sum of preventive maintenance and corrective maintenance.

However, as mentioned above, as the corrective maintenance cost depends on the preventive maintenance cost, the sum of maintenance cost is determined by the preventive maintenance cost.

Therefore, either the best preventive maintenance level or its cost shall be found and the maintenance should be carried out accordingly.

The most optimum preventive maintenance level will be found by both the preventive cost curve and corrective cost curve which are drawn on actual results.

Therefore, it is necessary to keep the records of repair cost for each piece of equipment from this aspect, too.

At present, the number of necessary days for optimal preventive maintenance cannot be determined in the ports without the past data of maintenance.

Ports with the past records should carry out the optimum preventive maintenance by getting the necessary days.

The minimization of total maintenance costs plus decreasing the corrective maintenance days serves not only to decrease the total maintenance cost, but also to decrease losses caused by a sudden pause in the cargo handling operations due to equipment trouble.

(3) Maintenance days (target figure for the total days of preventive maintenance days and corrective maintenance days)

The number of simple overall maintenance days in six ports averages 19% per year: Some ports have simple average of more than 25% per year. Since there is specific data now, the number of corrective maintenance days is assumed to be more than that of preventive maintenance days.

The following is recommended by the study team. It is preferable to determine each maintenance day and contents of maintenance so that the target figure of the number of total maintenance days should be less than about 37 days (365×0.1). In the case of a large piece of equipment not having enough spare facilities, sufficient preventive maintenance should be carried out during the idle time of cargo operation, without any concern the above days, economical preventive maintenance days and corrective maintenance days.

(4) Interval of preventive maintenance

As cargo handling equipment is composed of an enormous number of parts, it is impossible to carry out individual preventive maintenance based on their necessary life span or intervals at which they have to be checked.

Therefore, it is more rational to carry out preventive maintenance by grouping together the parts or components of equipment. The grouping shall be made not according to the used time, but by each actual operation hour.

If a simple maintenance system for every 500 hours is adopted, then the checking for the parts with 100 hours life span or with 500 hours checking interval will be neglected totally, and this will also lead to trouble, shortening of the life span or increasing the total repair cost.

The interval in a preventive maintenance in order to change parts or to check parts is recommended as follows:

It is preferable to carry out preventive maintenance by dividing 3 or 4 preventive maintenance groups.

(5) Unit of the combinations for carrying out preventive maintenance logically

The

interval should be based on actual operating hours, but there is another way of carrying out preventive maintenance without connecting the actual operating results.

This way is to carry out preventive maintenance in a set period of time by making an assumption regarding actual operating hours within a certain limited period of time based on the actual data of the past, and by determining what are checked and repaired in advance. This is so-called weekly, monthly or yearly maintenance.

This has the advantage that the repair plan is easier to make, and that the amount of idle time will decrease because the maintenance shops can handle the preventive maintenance in a regular fashion.

(6) Preventive maintenance manual

In order to put preventive maintenance into practice accurately and promptly, manuals for preventive maintenance are essential.

Generally, manuals for preventive maintenance are included in the brochures furnished by manufacturer, which are usually supplemented by various paper and reports concerned with tests and inspections, etc.

This general manual tends to only mention general cases. To promote more reasonable preventive maintenance, it is recommended that the PSO produce an original manual by improving on the manufacturers general manuals.

The devised version should be made on actual local data for maintenance, such as the contents of work, weather conditions, peculiarities of equipment operators and workers at maintenance shop etc.

(7) Role of maintenance shop

All the ports operate a maintenance shop to carry out maintenance of equipment smoothly and economically. PSO policy as far as the above is concerned will be as follows.

The main work of a maintenance shop is to carry out preventive maintenance on equipment possessed by the PSO. In addition, a maintenance shop also carries out corrective maintenance in accordance with its abilities.

Corrective maintenance beyond the capacity of the maintenance shop will be assigned the outside, giving due consideration to the following:

- 1) General repairs (preventive maintenance) are more smoothly and cheaply carried out by maintenance shops than that of the outside contractors.
- 2) Complicated and special repairs can be assigned the outside.

3.10.5 Stocking of the Appropriate Spare Parts

(1) Appropriate Spare Parts

To possess a sufficient amount of parts it is necessary for reducing the maintenance period, but possessing too many spare parts is not a preferable measure because of the resulting heavy financial burden. The most appropriate amount of spare parts

to be possessed must be determined from an economical point of view.

The biggest and the only merit of possessing spare parts is the reduction of the maintenance period. The demerits, on the other hand, are as follows:

- 1) Burden of interest.
- 2) Inventory control costs.
- 3) Losses caused by deterioration of quality attendant on long-term inventory.

Therefore, the appropriate amount of spare parts is determined by the time loss caused by non-working hours of equipment, the interval of parts required, term of delivery and unit costs.

The PSO ports should keep the following records for each spare part:

- 1) For parts delivered out of the storehouse; purchase data, date of use, purchase price, equipment requiring the part and type of maintenance (preventive or corrective).
- 2) For parts newly purchased; required term of delivery, data of use, purchase price, equipment requiring the part and type of maintenance.

As a matter of fact, spare parts for both preventive and corrective maintenance will be kept together, and will be used without distinguishing preventive maintenance from corrective maintenance. However, it will be easier to separate them when determining the appropriate amount of parts. The appropriate amount, in principle, is determined by analyzing the past data.

(2) Management of Spare Parts

The number and types of spare parts have been increased, and their names differ from manufacture to manufacture, even though their function and size may be the same.

Inevitably, the management business (purchase, inventory, taking out of storage and using) has become complicated.

Therefore most of ports have introduced the computer system.

If the computer system is not operated fully, the following administrative problems tend to occur:

- 1) Negligence in finding the necessary spare parts causes delay in adequate maintenance timing and consequently under parts will be left in the warehouse for a long time.
- 2) Spare parts with the same function and size but with more than two names are stocked at different places, thus causing duplication.
- 3) The difference between the registered parts and those actually stocked becomes notable, and so a large number of parts are always lacking and the necessary parts must be purchased whenever trouble occurs.

3.10.6 Management and Utilization of Records and Data

(regarding the cargo handling equipment, maintenance shops and spare parts)
Determination of the appropriate amount of cargo handling equipment, the best effective maintenance system for cargo handling equipment and for stocking the appropriate spare parts cannot easily be achieved. Only fully analysis of all the actual records and data will be able to produce a reasonable and economical system.

The collected records shall be in putted into small-capacity computer and stored on cassettes or floppy disks.

Necessary records and data shall be taken from cassettes or floppy disk whenever necessary and will be utilized for making various types of statistics and analyses.
