8.6 Facilities, Equipment and Rehabilitation Required to Meet the Target Services

8.6.1 Water Supply

(1) Required water supply facilities

Urban water supply:

Urban water supply facilities required by target year shown in Table 8.6.1 were estimated as required number of house connections based on the additional service coverage.

Table 8.6.1 Urban Water Supply Facilities Required by Target Year

DW - Deep Well, SP + Spring, DgW - dug Well and Surf - Surface Water
 Refer to supporting Table 8 6.3 for details.

Note

As reference, following requirements were also estimated:

- daily average water demand at 100 lpcd consumption rate, and
- number of deep wells to meet the daily maximum water demand based on the groundwater productivity.

(daily maximum water demand = 1.3 x daily average water demand)

Information pertaining to the expansion plan of Level III systems was arranged to be indicated in Table 8.6.1 and details in Table 8.6.2, however no information was available during this PW4SP preparation.

Table 8.6.2 Plan for Expansion of Existing Level III System

Note: DW - Deep Well, SP - Spring, DgW - Dug Well, and Surf - Surface Water Intake.

Rural water supply:

Rural water supply facilities required by target year shown in Table 8.6.3 were estimated as number of Level II systems with number of communal faucets and number of Level I wells broken-down to deep and shallow wells. However, no untapped spring suitable for Level II system was confirmed during this PW4SP preparation.

Table 8.6.3	Rural Water	Supply Facilities Requ	ired by Target Year
-------------	--------------------	------------------------	---------------------

(2) Required well drilling and rehabilitation equipment

A

Presently, only each one unit of truck-mounted percussion drilling rig and portable mechanized rotary drilling rig are available at DPWH-DEO in the province. Among these equipment, rotary type rig is only capable to drill shallow wells with less than 10 m

depth owing to its penetration capacity and therefore not applicable for the planned shallow well construction.

Taking into account the maximum utilization of existing equipment, additional number of required equipment is estimated as described below.

Applicable type of well drilling equipment is determined considering the geological formation of the province that 50% of target area is medium to hard formation suitable to percussion type and the rest is soft to medium formation suitable to rotary type. Idling time for equipment overhauling/maintenance and rest days of workers are considered at 25% of the year.

Small size rotary drilling rig (hand-feed spindle type for shallow well): Average performance

1 well/15 days (3 m/day of drilling rate with finishing work)
 Annual accomplishment

- 18 wells/year (365 days/year ÷ 15 days/well x 0.75) Required number

5 sets for the total 445 shallow wells

Medium size rotary drilling rig (truck-mounted top-head drive type for deep well): Average performance

- 1 well/20 days (10 m/day of drilling rate with finishing work)
 Annual accomplishment

- 13 wells/year (365 days/year ÷ 20 days/well x 0.75)

Required number

5 sets for 50% of the total 562 deep wells

Medium size percussion drilling rig (truck-mounted type for deep well): Average performance

1 well/30 days (5 m/day of drilling rate with finishing work)
 Annual accomplishment

- 9 wells/year (365 days/year ÷30 days/well x 0.75) Required number

7 sets for 50% of the total 562 deep wells

Well rehabilitation equipment:

Average performance

63

- 1 well/7 days (well redevelopment and finishing work Annual accomplishment

39 wells/year (365 days/year ÷7 days/well x 0.75)

Required number

2 sets for 10% of 562 Level I deep wells

Support vehicle:

Type - pick-up truck with winch, double cab Required number

- 7 units (5 units for small size rotary rig and 2 units for well rehabilitation)

Considering the utilization of existing percussion drilling rig and well rehabilitation equipment, the following equipment shall be mobilized/procured either by private sector or LGUs to accomplish the physical targets:

5 sets of small size rotary rig for shallow wells,

- 5 sets of medium size rotary rig for 50% of deep wells,

6 sets of medium size percussion rig for 50% of deep wells

2 set of well rehabilitation equipment for 10% of deep wells (at least 1 set shall be held by the provincial government), and

- 7 units of support vehicles for shallow well construction and well rehabilitation.

In addition to the above, service trucks equipped with crane are required for each unit of medium size rotary and percussion rigs for hauling drilling tools and water.

F. MAP OF THE AREA

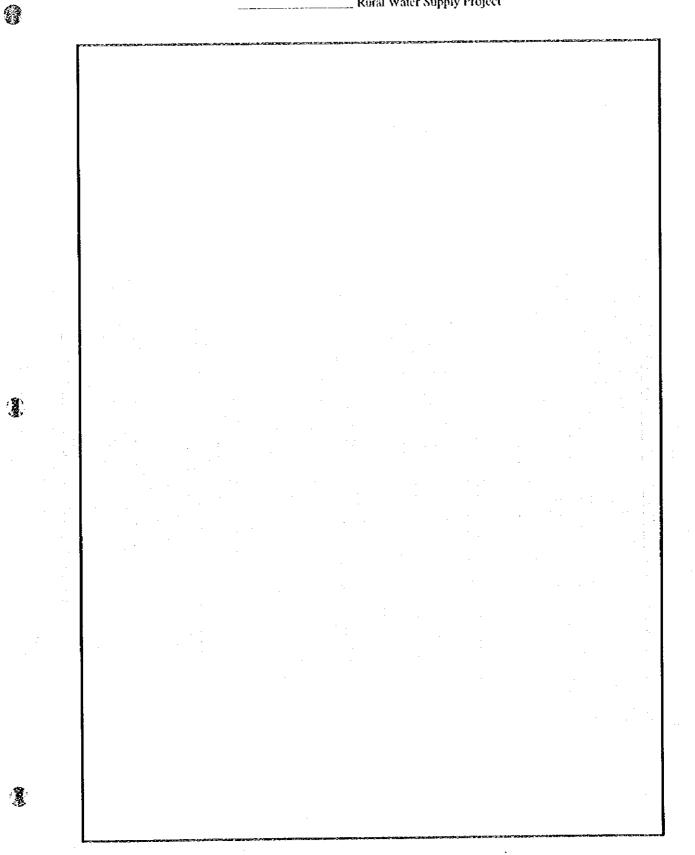

Please attach map of the area proposed to be served. Indicate location of houses, buildings and other structures to be served including roads, the water source(s) and possible locations of storage tanks. The map should preferably be drawn to scale. ۲

0

Important : If map cannot be drawn to scale, indicate distance measurements between important points along roads, or possible routes of distribution pipes with households properly indicated. For rolling terrain, indicate elevation differences between measurement points.

	Annex 6
	DESIGN OF RESERVOIR AND PUMP
	Rural Water Supply Project
	Kona Wale Bappy Project
A. DESIG	N
	I. Determine Capacity of Reservoir, (C r)
	$C_r = 1/4 x$ Average Day Demand
	$C_{t} = \frac{1/4 \times D_{s} (LPD)}{1/4 \times D_{s} (LPD)}$
	$C_{t} = $ liters
	2. Determine Minimum Water Elevation, (WL_{ut}) $WL_{ut} = \text{total head loss + Minimum Pressure in Main (Meters)}$ For Barangay System, Min. Pressure = 5 psi (use 3M.) For Poblacion System, Min. Pressure = 10 psi (use 7M.) $WL_{tt} = \underline{\qquad} M.$ Note : The bottom of the storage tank should be higher than this elevation.
B, DESIC	IN OF PUMP
	1. Determine Pump Capacity, Q_P (LPS)
	Q_p = Max. Day Demand (LPD)/ Operating Time (Sec.)
	$Q_p = 78 P_d/T$ where: $P_d = Design Population$
	T = Operating Time in Seconds
	$Q_{p} = \ LPS$

Calculate Total Dynamic Head, TDH (Meters)
 TDH = Depth of Pumping Level + by Maximum Reservoir Elevation + friction loss

Hp

TDH = _____ m

3. Calculate Brake Horsepower Requirement :

Brake Horsepower = $\frac{Q_{\rho} \times \text{TDH}}{75 \times \text{Efficiency}}$

Brake Horsepower =

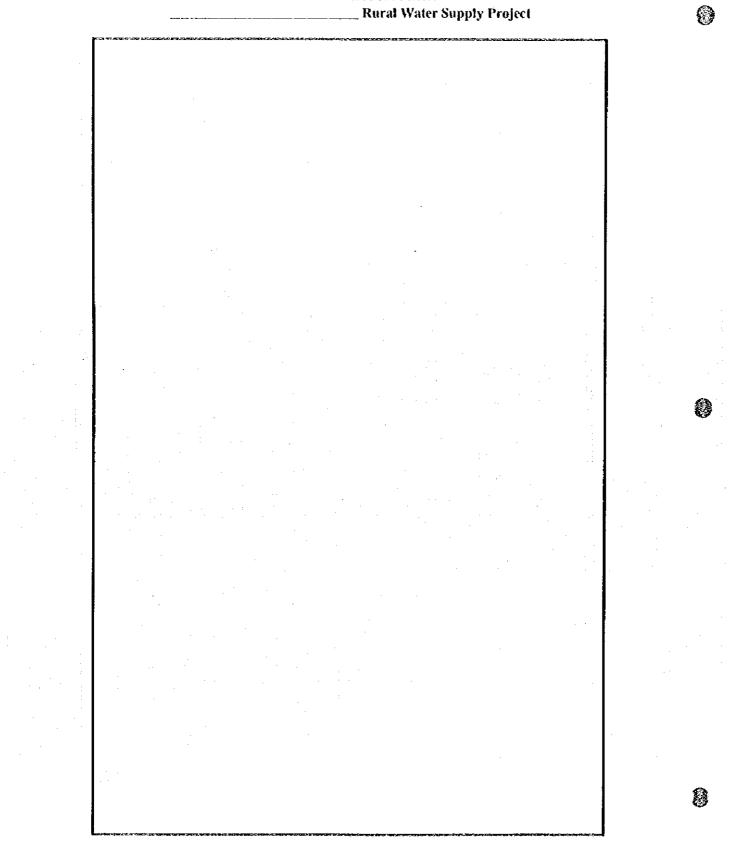

Where :

9.5 Community Development Models

Community Development Model Study (Level I)

Model Site: Sitio Casoy, Barangay Balansay, Mamburao, Occidental Mindoro

1. Socio-Economic Profile of the Model Site

Sitio Casoy is situated in the northwestern part of Barangay Balansay, about 7 kilometers from the town proper of Mamburao. It has a land area of about 10 hectares lying along the national road.

()

鬰

讒

The residents depend primarily on fishing and farming for their main source of livelihood. Other residents are employed either as salespersons or helpers in the poblacion. Some are drivers of public utility vehicles. Commercial activities found in the area include a small rice trading and "sari-sari" stores.

The primary school offers Grades 1 to 3 only. For their health and medical needs, the residents go to the Rural Health Unit which is visited thrice a month by a midwife and a nurse. Community-based organizations includes the Sanggunian Nayon, the Parents-Teachers Association (PTA), Sanggunian Kabataan (SK), and several farmers' cooperatives.

2. Present Water Supply/Sanitation Situation

The residents of Sitio Casoy are being served by shallow wells although not all households have their own wells. Others get water from neighbors with existing wells. There is one public shallow well located at the center of the sitio which was constructed by the DEO but is not operational. The barangay elementary school has no water system. A Level I system has been proposed to be constructed to serve both the school and its premises. But this has remained a plan...

As to the sanitation situation, only about 15% of the total population have toilet facilities. The school has a toilet but due to lack of water, cleanliness could not be maintain. Cases of water-borne diseases, however, are minimal.

3. Assessments

3.1. Water Sources

The residents of Sitio Casoy get their supply of water from shallow wells which are mostly unreliable because these are not provided with protection works to avoid contamination. The barangay elementary school does not have its own water system.

3.2. Sanitation Facilities

Only 15% of the total households have toilet facilities. Those who do not have toilets resort to the bad practice of "wrap and throw". The school has one toilet but because of lack of water supply, sanitation could not be maintained.

3.3. Health

Cases of water-related illnesses have been reported in the sitio. These could be the result from using inadequate water and from the absence of sanitary toilets.

3.4. Institutional Analysis

There are existing people's organizations operating in Sitio Casoy although not one had taken the initiative in improving the water and sanitary conditions in the area. The organizations have not yet realized their potential as catalysts to improve the water and sanitation conditions in the community.

4. Future Development Needs

4.1. Potential Source and Service Level

The construction of one deep well could alleviate the present situation in the area. A shallow well shall also be constructed inside the school premises to serve the students and the teachers. The population to be served by the proposed water system is 300 consisting of 30 households.

The construction of individual toilets will have to be promoted.

4.2. Deputizing Local Organization as BWSA

The residents should identify an organization which can take the lead role in implementing the health and sanitation program in the area. From among the existing community associations in Sitio Casoy, the Parents-Teachers Association (PTA) has expressed willingness to take the responsibility. As such, the PTA can be assume the role and functions of the Barangay Water and Sanitation Association (BWSA). R

蠽

5. Capital and O&M costs

5.1. Water Source Facility and Sanitary Toilets

Capital cost required to construct one (1) deep well of 100 m depth is P255,000 while installation of one shallow well would cost about P57,000. The community, through BWSA can avail grants for this.

Capital cost of individual household toilets shall be shouldered by the homeowners. If a family could not put up the initial capital cost, the BWSA can make arrangements with lending agencies (cooperatives, banks, etc.) for the extension of loan.

5.2. Operation and Maintenance

Cost of operating and maintaining the proposed wells shall be shouldered by the users through their monthly membership dues. The Association, through its treasurer will regularly collect the monthly contribution and deposit them in the bank. All expenses for O&M will be charged from the savings.

6. **Community Involvement**

6.1. **Pre-Construction (Project Preparation and Planning)**

- (1) The Barangay Council, in coordination with the Municipal Sector Liaison (MSL), could initiate meeting among the residents to discuss water and sanitation problems and needs in the area.
- (2) The residents can endorse the PTA to be the core organization of BWSA to implement the water and sanitation improvement project.

- (3) The association should submit a formal request to the municipal/provincial government, duly endorsed by the Barangay Council, for technical and financial assistance in undertaking Level I project in Sitio Casoy. The request is accompanied by a written set of commitments signed by the members/beneficiaries indicating willingness to participate in the project, assume the responsibility for the operation and maintenance, including the collection of fees to pay for the cost of spare parts and labor. An initial reserve fund representing the membership fees of beneficiaries will be collected and deposited in a bank.
- (4) Upon approval of such request, the Association will mobilize its project team to assist project staff in undertaking the following:
 - a) Conduct of community study (barangay diagnostics)

83

Ľ

- b) Identification of the alternative sites available where the deep well and shallow well would be installed.
- c) Negotiation for written permits granting use of land and right of way where the wells would be put up.
- d) Negotiation with qualified local contractor who can undertake well drilling
- (5) Monitoring Activities: During this stage, the Association will submit a progress report to the Municipal Sector Liaison (MSL) indicating the status of project planning and preparation. The report will include such information as the composition and membership of the PTA (BWSA), scope of project to be implemented, project specifications, work plan and schedule, and financial arrangement (if any),

6.2. Construction Phase (Project Implementation)

- (1) During construction of facilities, the BWSA has to assign team/s which shall coordinate and monitor the implementation of the project.
- (2) Beneficiaries could provide labor during well construction, pump installation and preparation of drains and soak way pits.
- (3) In the construction of individual household toilets, the Association could encourage "bayanihan" system where members provide free and voluntary assistance to other

members in undertaking activities such as excavation of pits and construction of latrine structures.

- (4) The community may contribute materials which are locally available for the construction of the facilities. These may take in the form of gravel and sand, roofing sheets, timber or tools for excavation.
- (5) The residents should provide information which may be necessary to expedite the construction of the facility.
- (6) Monitoring Activities: The BWSA will have a meeting discussion with MSL on the status of construction project.

6.3. **Post Construction (Operation and Maintenance)**

- (1) BWSA should monitor whether the contractors conduct proper disinfecting of the wells immediately after their completion. Also, the association shall request PHO to conduct periodic surveillance and, if necessary, disinfection of the wells.
- (2) The Association shall monitor whether the facilities are properly maintained or not.
- (3) Beneficiaries should be involved directly in the operation and maintenance of the facilities. They shall practice to keep the premises of the water facility clean and free from spilt water which may cause contamination of the source. Breakdown should be reported immediately to the BWSA so that repair work must be undertaken immediately.
- (4) Operation and maintenance cost will be shouldered by the beneficiaries through their membership fees. The association shall collect monthly contribution and deposit them in the bank. Expenses for repairs and improvement as well as spare parts commonly used will also be purchased out of this fund.
- (5) The member-beneficiaries should provide labor in the repair and rehabilitation of the facilities.
- (6) The association shall adopt a disaster response program which focuses on securing facilities and in providing water supply in times of emergencies.

6)

- (7) Water quality surveillance should be a priority activity of the BWSA. Members should see to it that regular water examination is being done by the Rural Health Unit or PHO. Results will be furnished to the BWSA.
- (8) Maintenance of individual household toilets should be the responsibility of the owners.
- (9) Monitoring Activities: The BWSA is required to submit annual reports to MSL. The first report should be submitted immediately upon the completion of the project. It should include well log data, number of sanitary toilets constructed, overall cost (both for water system and toilets), project modification (if any), and timetable of maintenance activities. Succeeding reports will indicate breakdowns and repairs, expenses, problems encountered in operating the system and, if possible, recommendations, and other relevant data.

7. Project Elements

1

7.1. Health and Hygiene Education

- (1) Health and hygiene education should be launched as early as the start of the project and should be sustained. In fact, it will be a good entry point in discussing existing water and sanitation issues in the community.
- (2) The MSL, in cooperation with the Rural Health Unit should conduct a continuous health education campaign in the project area. Special presentations can also be done by the RHU staff during meetings of the group. Significantly, the facilities to be established would provide more opportunities to discuss hygiene practices and identify areas for improvement.
- (3) This local effort can be reinforced by multi-media campaign being organized by higher institutions such as the DOH and the government's information agency.
- (4) The barangay elementary school adopt DEC's Teacher-Child-Parent Approach which involves parents and other members of the family in teaching practical lessons in hygiene education.

7.2. Human Resources Development and Training

(1) BWSA members, including women, will be trained on basic hand pump operation and maintenance; simple tasks like replacing rubber washer, etc. Workshops and on-the-job training will be conducted by the municipal government.

()

24

(2) Qualified young members will be enrolled at the National Manpower and Youth Council Training Center which conducts regular training course on Plumbing. Internship of graduates can be arranged with the nearest water district or with the municipal/provincial government.

7.3. Women's Involvement

- The female members of BWSA shall be involved from the start of the project and on major decisions like the selection of sites for the wells and the collection of fees/contributions.
- Women should be involved in operation and maintenance of the facilities, doing simple tasks. They should therefore be included in training programs conducted for the members.
- 3) The women sector must take the lead in health and hygiene education activities in the community.

Community Development Model Study (Level II) Model Site: Barangay San Luis, Mamburao, Occidental Mindoro

1. Socio-Economic Profile of the Model Site

Ð

The proposed project site comprises the five sitios of Barangay San Luis, namely: Sitio Proper, Balete, Matamayor, Subing and Taguan covering an aggregate area of 2094:40 hectares. The topography of the barangay varies from flat to rolling. It is about 5 kilometers from the town proper of Mamburao. Most of the houses are made of bamboo and nipa which are clustered from six to ten. The population of the study area is 1,300 and the number of households is 146. Average size of a household ranges from 8 to 10 persons. About 5% of the residents belong to the minorities.

Only about 5% of the residents are professionals who are mostly engaged in commerce, education and agriculture. Fifty-five (55%) percent are high school graduates. The annual average household income ranges from P 8,000 to P 15,000 derived mostly from agricultural production. Only 5% are engaged in non-agricultural economic activity including: fishing, retailing, poultry and hog raising. Some are gainfully employed in the city. The commercial activities found in the area are small retail stores (capitalization of P 3,000.00) and a number of small rice trading.

The barangay has a primary school and a health center which is visited weekly by a nurse and a midwife. Health situation in the study area is very poor. Common causes of morbidity are diarrhea, tuberculosis, malaria and malnourishment. However, mortality rate is only 1%. The Barangay Council meets twice a month. There is also a Parents-Teachers Association (PTA) and a Farmers Cooperative. These associations are actively participated in by the residents of the barangay.

2. Present Water Supply/Sanitation Situation

The residents generally depend on shallow wells for their water supply. Those who do not have private wells get their water from neighbors. There are few public shallow wells in the area and most of the time they are not functional due to lack of maintenance.

Only about 25% have toilet facilities and there is no existing public toilet.

3. Assessments

3.1. Water Sources

The residents of the 5 sitios do not get adequate supply of water. The shallow wells, their main source, are not adequately protected against contamination. Most of the residents fetch water from distant sources, exposing the water from further contamination. This also consumes much time and energy of those hauling water especially the women and children who are doing most of the job.

3.2. Sanitation Facilities

Most of the residents do not have individual sanitary toilets. They dump their wastes to open spaces.

3.3. Health

The lack of adequate water and sanitary facilities contribute to high incidence of water-related diseases in the area. In fact, diarrhea is the leading cause of illness in the community.

3.4. Institutional Analysis

- (1) The barangay residents express much concern over the deteriorating health condition in the area such that they clamor for the immediate construction of water and sanitation facilities.
- (2) Two community organizations the Fanners Cooperative and the Parents-Teachers Association - are active in Barangay San Luis but both don't deal with the water and sanitation issues in the area.
- (3) Significantly, the residents are willing to organize themselves into a water association while officers of the existing local groups are ready to assume lead role in the water association

4. Future Development Needs

4.1. Potential Source and Level of Service

(1) There is a spring located in the project site, at an elevation of about 40 meter and a distance of about 1 km from the proposed service area which could be the potential source for the

project. Water quality seems to be acceptable although further investigation of the quantity is needed. Stream flow is minimal during dry season and the water is currently used for irrigation.

A detailed topographic survey of the source area extending at least 200 to 500 meters in radius is needed to provide information to protect the intake from flooding and contamination and for the design of the spring box. Technical evaluation shall also be made such as flow rate. The pipeline which will have to cross some rice fields must be deep enough to preclude being plowed up. Enlargement of the eye of the spring shall be done to increase the quantity of water yield. Construction of a spring box around the spring shall be done to protect the source from contamination.

- (2) Level II water system shall be an appropriate for the study area. This will consist of a pipe distribution system from the source to the communal faucets, the number of which shall be determined by the residents.
- (3) All families shall be encouraged to construct individual household toilets.

4.2. Identification of Community Organization

A Rural Water and Sanitation Association (RWSA) could be the most logical organization to implement water and sanitation project in the area. It will be formed to operate and maintain the proposed water system. The leaders of the farmers cooperative and the PTA will form the nucleus of the RWSA officers. Membership will be open to all residents (usually the family head) who would be users of the proposed system.

5. Capital and O&M Funds

5.1. Water System

0

Ľ

X

Capital cost required to construct Level II system is estimated at P2,472,273.00. Of this amount, cost of materials is about 70%, while labor cost accounts for 30%. The capital cost will be shouldered by the RWSA through a loan from the municipal/provincial governments or other lending institutions (LWUA, cooperatives, rural banks, etc.). To bring down the cost of the system, the community should provide free labor in the construction of the system. They can assist in excavations, pipe laying and installation of faucets. The water charges to be collected

by the association from the water consumers will cover administrative cost of RWSA, costs of system operation and maintenance and loan amortization.

5.2. Sanitary Toilets

Capital cost of individual household toilets shall be shouldered by the homeowners. If a family could not put up the initial capital cost, the RWSA can make arrangements for the extension of loan from various institutions. Policies on interest rates and repayment scheme adopted by the lending institutions shall be adopted. The Association will be the guarantor and the collector for this loan.

5.3. Operation and Maintenance

Water charges to be collected by the Association from the water consumers will cover costs of operation and maintenance. Generally, the Association should raise 1% of the total capital cost annually for the system's O&M.

6. Community Involvement

6.1. Pre-Construction (Project Preparation and Planning)

- (1) The barangay residents shall initiate the holding of a meeting to discuss their water and sanitation problems and needs. The officers of the farmers cooperative and the PTA shall facilitate the discussion.
- (2) The people shall organize the RWSA to manage, operate and maintain the water system. Members of the RWSA shall be the main users of the water system. The Association shall appoint committees which shall be responsible for all the undertakings of the cooperative.
- (3) The members shall pay their initial membership dues .
- (4) The RWSA shall request the municipal/provincial government for technical assistance in determining the scope of water and sanitation project they shall undertake.
- (5) The Association shall submit a request to the municipal/provincial government or other lending institutions (such as commercial banks and cooperatives) for the necessary loan to finance the project. The request is accompanied by a commitment sheet signed by the

巍

beneficiaries indicating their willingness to participate in the project, assume the responsibility for the maintenance, including the collection of fees to pay for the cost of operation and maintenance and for loan amortization. A reserve fund representing the initial contribution/membership fee of beneficiaries will be collected and deposited in a bank.

- (6) As soon as there's fund available, the RWSA shall mobilize its own team to assist the municipal/provincial team in:
 - a) undertaking community study (barangay diagnostics)

ŧ,

- b) selection of water source and location of communal faucets
- c) detailed planning and as a baseline for evaluation (including technical and social aspects as well as knowledge, attitudes, practices related to water, sanitation, and hygiene).
- d) negotiation for the acquisition of the right of way
- e) establishing the technology, level and design of the water system.
- f) short listing of local contractors for the conduct of bidding
- (7) The members shall also attend all briefings and presentations related to the project.
- (8) Monitoring: During this stage, the RWSA shall submit a progress report to the Municipal Sector Liaison (MSL) indicating the status of project planning and preparation. The report will include, among others, the scope of project to be implemented, project specifications, work plan and schedule, delineation of responsibilities, and financial arrangements.

6.2. Construction Phase (Project Implementation)

- (1) The beneficiaries shall provide self-help labor in the following activities:
 - a) clearing of the spring premises
 - b) construction of intake box and drainage around the spring
 - c) digging and pipe laying
 - d) installation of public faucets and meter
 - e) preparation of drains and soak way pits
 - f) excavation of pits and construction of latrine structures
- (2) Granting of right of way for pipe laying, construction of pump stations and for installation of other necessary facilities

- (3) Dissemination of information on the on-going construction
- (4) Provision of access to contractors
- (5) The association shall meet with the beneficiaries to set water fees to generate fund that will be used for the system's loan repayment and for operation and maintenance.

8)

6-5

(6) Monitoring Activities: The association will submit progress reports to MSL indicating the status of the project. It contains information such as modifications, project team composition, people's contributions (cash, materials and labor), etc.

6.3. **Post Construction (Facility Operations)**

- (1) The RWSA should monitor the practices of the users to ensure proper handling of the water and sanitation facilities as well as prudent use of water. Every member-consumer should also cooperate with RWSA in the protection of communal faucets/meters from loss or damage. Any member who would cause the loss or damage of facilities shall shoulder all expenses to be incurred in replacing and/or repairing of said facilities.
- (2) The Association should assign person/s to regularly monitor the performance of the water source and public faucets. Water samples should be collected and tested in cooperation with the PHO staff.
- (3) The members should pay their membership dues/water consumption charges regularly in order for the association maintain good service of the water system.
- (4) Maintenance of individual household toilets shall be the responsibility of the owners.
- (5) Monitoring Activities: The association should submit quarterly reports to MSL. The first post-construction report should be submitted immediately upon the completion of the project. It should indicate scope of work (water system) such as: spring development undertaken, number of communal faucets installed, length and diameter of pipes laid, sanitary toilets constructed, modifications (if any), overall cost (both for water system and toilets), and timetable of maintenance activities. Succeeding reports will indicate

breakdowns and repairs, expenses, problems encountered in operating the system and, if possible, recommendations, and other relevant data.

7. Project Elements

 \bigcirc

3

7.1. Training and Hygiene Education

- (1) To create awareness among the residents on the value of safe water and sanitary toilet facilities, the RWSA, assisted by MSL, shall conduct hygiene education in the project area. The campaign should be launched as early as the commencement of the project and should be sustained.
- (2) The hygiene education conducted by RWSA could, in fact, be the entry point for the improvement of water and sanitation systems in the project area. Moreover, the new facilities shall provide more opportunities to discuss hygiene practices and identify areas for improvement.
- (3) The barangay elementary school adopt DEC's Teacher-Child-Parent Approach which involves parents and other members of the family in teaching practical lessons in hygiene education.
- (4) The efforts of the MSL and the school shall be reinforced by multi-media campaign being implemented by other government institutions such as the DOH and the Philippine Information Agency.

7.2. Human Resources Development and Training

- (1) Members of the Association, including women shall be trained on:
 - a) basic utility operation and maintenance
 - b) simple tasks like replacing rubber washer
 - c) leak detection and repair
 - d) meter reading,
- (2) Workshops and on-the-job training will be conducted by the municipal/provincial government.

(3) Qualified young members will be enrolled at the National Manpower and Youth Council Training Center which conducts regular training course on water system operation. Internship of graduates can be arranged with the nearest water district or the municipal waterworks system.

6)

趪

7.3. Women's Involvement

- The RWSA should campaign for female members and give them equal opportunity in the Board and in the management of the Association. They (the women) must be involved from the start of the project and on major decisions like the selection of sites for the wells and faucets and in the collection of fees/contributions.
- Women should be involved in operation and maintenance of the facilities, doing simple tasks. They should therefore be included in training programs conducted for the members.
- 3) The women sector must spearhead in health and hygiene education campaign in the community.

Community Development Model Study (Level III) Model Site: Sta. Cruz, Occidental Mindoro

1. Socio-Economic Profile of the Model Site

The study area covers three barangays in Sta. Cruz, namely: Mulawin, Poblacion I and Poblacion II. Sta. Cruz is a fifth class and the second largest municipality of the province covering an area of 68,140 hectares or 11.6% of the total land area of Occidental Mindoro. The terrain is generally flat. It is 27 kms. southeast of Mamburao. Total population in the study area is 4,540 comprising 906 households. A large majority of the prominent residents come from the old families of Lubang Island and the town of Paluan. Average household size ranges from five to six persons.

Agriculture is the major economic activity in the area. Only 6% of the residents are engaged in fishing. Other minor sources of income include gathering of forest products (like nito, rattan, buri and bamboo). Commercial establishments, including variety stores, agricultural suppliers and rice mills, are found in the area. Poultry, livestock and some fish ponds also thrive in the area. Bamboo and rattan industry can also be found.

There is a primary and secondary school in the study area. A 10-bed capacity community hospital serves the municipality. There is also one Rural Health Unit, a Botika sa Barangay and a health center in every barangay. Two doctors are assigned in the hospital.

The Sanggunian Bayan meets weekly. Various sub-committees have been formed to attend to the different priority services. There are some NGOs in the area, including the PTA, the Youth Club and the South Luzon Jurisdictional Conference (SLJC).

Present Water Supply/Sanitation Situation

2.

The municipality of Sta. Cruz does not have a waterworks system. The residents depend on shallow wells or springs as their sources of potable water. Some of these sources, especially the shallow wells, provide unreliable water quality. However, the MPDC reports minimal cases of health problems encountered. Diarrhea and other water-borne related diseases break out only during rainy season.

About one-third of the total population have toilet facilities. Some 300 sanitary latrines will be installed from the FW4SP project.

3. Assessment

3.1. Water Sources

The present sources do not provide adequate water supply to the residents in the study area. The main sources are shallow wells and spring but these are no provision for protection works to avoid contamination.

3.2. Sanitation Facilities

Majority of the households have no sanitary toilets although the government is presently implementing a project aimed at constructing additional 300 household toilets in the area.

3.3. Health

The health situation in the study area is comparatively better than the rest of barangays in the municipality although some cases of water-related diseases have been recorded especially during rainy season. This can be attributed to contamination of water sources, improper handling and storage of water and lack of sanitation facilities.

3.4. Institutional Analysis

There is no existing waterworks system nor community-based organizations that implement water and sanitation programs. There are few non-government organizations (NGOs) but water and sanitation is not included in their priority programs. The residents, as well as the barangay councils involved, are not yet inclined in mobilizing the people for this purpose.

4. Future Development Needs

4.1. Potential Source and Service Level

Recommended source of water for the proposed water system is deep well. At present, there are no deep wells existing in the area, but good aquifer may be expected with the alluvium deposits. Deep wells should be constructed 1 km or more away from the seashore to avoid salt water intrusion and should be located upstream. Depth of the well should be more than 20 meters. A

椡

complete topographic and/or hydrographic survey is needed around the location of the proposed well to indicate location of existing wells and/or boreholes including surfaces or subsurface geologic features.

Another potential source of water for the proposed water system is a spring located 7 kms. from the poblacion with an elevation difference of 30 to 40 meters. The estimated flow of the spring is about 6 liters per second. A topographic map extending at least 200 meters in radius from the spring site will be needed to provide information on the protection of the intake box from flooding and containination and on the design of water collection works.

Level III (individual house connections) can be a viable water system in the study area because of the density of the houses.

4.2. Identification of Community Organization

As a pre-requisite to the development of the water and sanitation facilities in the area, a community organization should be appointed by the residents. In Bgys. Mulawin, Poblacion I and Poblacion II, there is no existing organization which can assume the responsibility of implementing Level III project. As such, there is a need for the residents of the three barangays to get together and form an organization. Based on preliminary interviews with the people, the formation of a Rural Waterworks and Sanitation Association (RWSA) is a better alternative organization in the area.

5. Capital and O&M Funds

5.1. Water System

()

Capital cost required to construct the Level III system for the study area shall be determined after the conduct of feasibility study and detailed design. The capital cost will be shouldered by the Rural Waterworks and Sanitation Association through a loan from the municipal/provincial government or other sources such as LWUA and commercial banks. Water charges will be collected from the consumers to cover the cost of operation and maintenance, and for loan amortization.

5.2. Individual Sanitary Toilets

Capital cost of household toilets shall be shouldered by the homeowners. If a member could not put up the initial capital cost, the Association can extend loan to the member, terms of payment of which shall be decided by the cooperative. C

Community Involvement

6.

6.1. Pre-Construction (Project Planning and Preparation)

- (1) The residents of the three barangays shall initiate the move for the holding of a general assembly-meeting. The Barangay Councils of concerned areas, in coordination with the municipal/provincial government, can facilitate the meeting. The people shall discuss the water and sanitation problems and needs in the community and decide among themselves the action that will be taken to solve the present problems and answer their needs as far as water and sanitation are concerned.
- (2) The people shall organize the RWSA to assume the management, operation and maintenance of the water supply system. Members of the RWSA shall be the main users of the water supply system. The Association shall elect its officers and a manager who will supervise the operation of the system. It shall also appoint committees which shall be responsible for all the undertakings of the Association.
- (3) The members shall pay their initial membership dues.
- (4) The Association shall request the municipal/provincial government or other sector agencies to provide assistance in determining the scope of water and sanitation project they shall undertake.
- (5) The Association submits a formal request to the municipal and/or provincial government for the necessary financial loan in undertaking the project. The request is accompanied by a commitment sheet signed by the beneficiaries indicating their willingness to participate in the project, assume the responsibility for the maintenance, including the collection of fees to pay for the cost of operation and maintenance and for loan amortization. A reserve fund representing the initial contribution/membership fee of beneficiaries will be collected and deposited in a bank.

- (6) Upon approval the loan, the Association will mobilize teams to assist the municipal/ provincial or other supporting staff in:
 - a) conducting feasibility studies
 - b) negotiation for the acquisition of the right of way
 - c) design of the system
 - d) project bidding

X

- e) project mobilization
- (7) The members shall also attend all briefings and presentations related to the project
- (8) Monitoring: During this stage, the Association shall submit a progress report to the Municipal Sector Liaison (MSL) indicating the status of project planning and preparation. The report will include, among others, the scope of project to be implemented, project specifications, work plan and schedule, delineation of responsibilities, and financial arrangements.

6.2. Construction (Project Implementation)

- (1) Since the construction of the water system will be undertaken by a qualified contractor, the direct involvement of the residents shall be limited to the following:
 - (a) Granting of right of way for pipe laying, construction of pump stations and installation
 - of other necessary facilities
 - (b) Dissemination of information on the construction activities
 - (c) Compliance with new road traffic routes
 - (d) Provision of access to contractors
 - (e) Monitoring of inconveniences caused by the construction
 - (f) Early application for water connection
- (2) Monitoring: The contractor, through the authority (MSL and/or others) will submit to the Association progress reports on the status of the construction project. The report shall include any modification, problems being encountered, and possible solutions.

6.3. Post Construction (Operation and Maintenance)

- (1) The facilities shall be operated and maintained by highly-trained personnel and technicians to be assigned by the RWSA. However, the users should participate in the operation and maintenance of the systems through the following:
 - (a) Paying of water bills on time
 - (b) Reporting of water leaks at the main pipeline, illegal connections and tampering of water meters
 - (c) Giving access to meter readers
 - (d) Conservation of water
 - (e) Campaign for more service connections
 - (f) Monitoring of water quality
 - (g) Attending at association meetings and other activities
 - (h) Safe disposal of waste water
 - (i) Dissemination of health and hygiene information

(2) Individual household toilets shall be the responsibility of the owners.

(3) Monitoring Activities: The Association shall submit quarterly reports to the MSL. The first post-construction report should be submitted immediately upon the completion of the project. It should indicate scope of work, sanitary toilets constructed, modifications (if any), overall cost (both for water system and toilets), and timetable of maintenance activities. Succeeding reports will indicate number of connections, breakdowns and repairs, expenses, problems encountered in operating the system and, if possible, recommendations, and other relevant data.

7. Project Elements

7.1. Training and Hygiene Education

- (1) Health and hygiene education should be launched as early as the initial planning of the project and should be sustained. In fact, it would be a good entry point in discussing existing water and sanitation issues in the community prior to the formation of the association.
- (2) The Municipal Sector Liaison, together with the Rural Health staff should conduct a continuous health education campaign in the barangay. Special presentations can also be

鎓

done by the Rural Health Unit (RHU) staff during meetings of the group. Significantly, the facilities to be established would provide more opportunities to discuss hygiene practices and identify areas for improvement.

- (3) This local effort can be reinforced by multi-media campaign being organized by higher government institutions such as the DOH and the Philippine Information Agency to be coordinated by the municipal/provincial staff.
- (4) The primary schools in the three barangays shall adopt DEC's Teacher-Child-Parent Approach which involves parents and other members of the family in teaching practical lessons in hygiene education.

7.2. Human Resources Development and Training

- (1) Training and human resource development programs shall be directed to those who would manage, operate and maintained the water systems. The Board of Directors, Management and staff of the RWSA shall be sent to the provincial government/other relevant central government agencies to attend basic and advance training programs such as policy making, financial management, systems design, construction supervision, among others.
- (2) Qualified young members and residents of the barangays will also be enrolled at the National Manpower and Youth Council Training Center which conducts water system-related courses. Internship of graduates can be arranged with the municipal/provincial government.

7.3. Women's Involvement

- (1) The Association should campaign for female members and give them equal opportunity in the Board and in the management of the system. They (the women) must be involved from the start of the project and their recommendations must be considered.
- (2) Women should be involved in operation and maintenance of the facilities and allowed to simple repair jobs. They should therefore be included in training programs conducted for the members.
- (3) The women sector must spearhead in health and hygiene education campaign in the community.

10.2.2 Unit Cost of Equipment

8

1

H

Unit cost (CIF Manila) of equipment was referred to the standard cost estimates of DPWH as follows.

(1) Medium size rotary drilling rig

Type:

Truck-mounted top head drive mud circulation type

Rated drilling capacity:

150 m depth for \$250 mm bore hole

Equipment composition:

One unit of truck-mounted drilling rig

Each one set of operating accessories, drilling tools, casing tools and fishing tools

One set of spare parts (equivalent to 10% of above equipment/tool cost)

Unit cost:

Peso 17,370,000 per set

(2) Medium size percussion drilling equipment

Type:

Truck-mounted cable percussion type

Rated drilling capacity:

150 m depth for \$250 mm bore hole

Equipment composition:

One unit of truck-mounted drilling rig

Each one set of operating accessories, drilling tools, pipe handling tools and fishing tools

One set of spare parts (equivalent to 10% of above equipment/tool cost)

Unit cost:

Peso 10,280,000 per set

(3) Well rehabilitation equipment

Equipment composition:

One unit of diesel engine driven air compressor (7.5 kg/sq.cm, 500 liter/min.) One set of air hose and hose fittings Unit cost:

Peso 138,000 per set

(4) Service truck

Type:

Diesel engine driven 4 tons truck equipped with crane

()

Unit cost:

Peso 1,175,000 per unit

(5) Support vehicle

Туре:

Diesel engine driven pick-up truck with electric winch

Unit cost:

Peso 500,000 per unit

(6) Refuse collection truck

Type:

Closed type compactor truck with 5 cu.m of payload capacity

Unit cost:

Peso 1,380,000 per unit including spare parts

10.3 Cost of Required Facilities and Equipment

Table 10.3.4 Costs of Sanitation Facilities Required for Phase II (2010)

10.4 Costs of Sector Management

10.4.1 Breakdown of Community Development and Training Cost

Cost of community development and training was estimated at 12% of the total construction cost of Level I & II water supply facilities and public toilets and at 3% of the total construction cost of Level III water supply systems. This was formulated based on the following:

- (1) The 12% was derived on the basis of DILG's past experience in BWSA formation; and
- (2) The 3% was derived on the basis of LWUA's past experience in the institutional strengthening needs of W.Ds.

踼

()

These ratios adopted for estimating community development and training cost will allow the province to meet with its needs for community development in the sector management. The following breakdown provides a view of the components under this category.

Component	% Share of Cost
1. Preparation for Training Activities	10
1.1 Transportation	1
1.2 Technical Assistance	1
1.3 Food	I
1.4 Supplies and Materials including Production of	6

C. SECTOR IMPLEMENTATION ARRANGEMENTS

0

6

11. FINANCIAL ARRANGEMENTS

11.3 Additional Funding Requirements

Percentages for Annual Investment

Percentages of annual investment for different fields of implementation activities are assumed for each sub-sector as general indication and summarized in Table 11.3.1. Assumptions on investment timing shall be subject to change, especially for individual projects depending on fund availability and relevant conditions such as land acquisition and institutional set-up.

Sub-Sector	Component	1996	1997	1998	- 1999	2000	Total
	Level III System				· · · ·		
Urban Water	Feasibility Study and Detail Design	50	50	0	.: 0	0	100
Supply	Construction & Supervision	0	20	30	30	20 :	100

	Community Development & Training	22	22	22	22	12	100

Table 11.3.1	Percentages for Annual Investment
--------------	-----------------------------------

Urban water supply:

- Engineering services for feasibility study and detailed design will be undertaken in the first two years.
- Construction work accompanied by supervisory services will be commenced partially in 2nd year and in full operation from 3rd year to 4th year.
- Community development will take place from the first year.

Rural water supply (Level I):

紹

- Engineering services for detailed design will be undertaken during the first two years for Level I and completed within the first year for Level II.

 Construction work accompanied by supervisory services will be partially commenced from the first year and in full operation from 2nd year for Level I, while Level II will be completed within first two years.

6

28

- Community development and training will take place from the first year for Level I, while Level II will be completed within the first two years.

Sanitation:

- Engineering services for detailed design will be completed within the first year.
- Construction work accompanied by supervisory services will be partially commenced in the first year and in full operation from 2nd year.
- Community development and training will be in full operation from the first year.
