PREFACE

In response to a request from the Government of the Lao People's Democratic Republic, the Government of Japan decided to conduct the Feasibility Study on the Construction of the Mekong Bridge at Pakse in the Lao People's Democratic Republic and entrusted the study to the Japan International Cooperation Agency (JICA).

JICA sent to Laos a study team headed by Mr. Junji Mashiba and composed of the members of Nippon Koei CO., LTD. and Construction Project Consultants, INC. two times between July 1995 and March 1996.

The team held discussions with the officials concerned of the Government of Laos, and conducted field surveys at the study area. After the team returned to Japan, further studies were made and the present report was prepared.

I hope that this report will contribute to the promotion of the project and to the enhancement of friendly relations between our two countries.

I wish to express my sincere appreciation to the officials concerned of the Government of the Lao People's Democratic Republic for their close cooperation extended to the team.

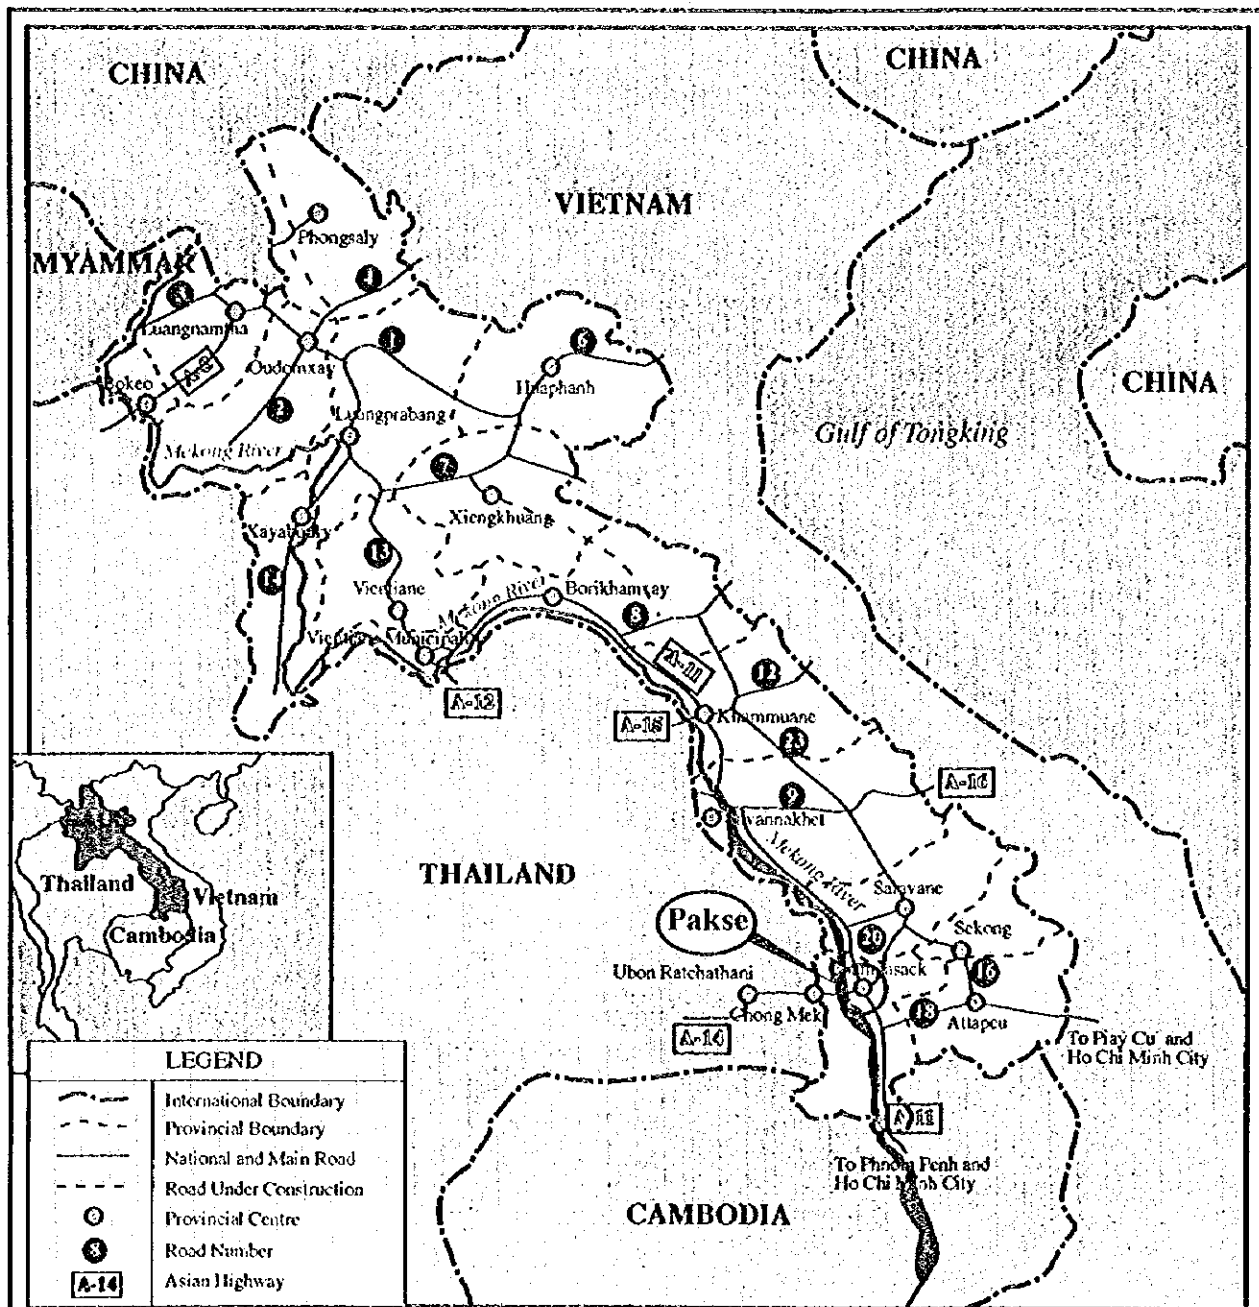

June 1996

Kimio Fujita

EXECUTIVE SUMMARY

A CONCLUSIONS AND RECOMMENDATIONS OF THE STUDY

A.1 Proposed Bridge Route

The proposed bridge route was selected from the three alternatives grading the appraised points on the evaluation items which consist of economic evaluation, engineering evaluation and environmental evaluation. The route is located at 2 km downstream of the existing ferry route.

A.2 Project Facilities

The outline of the project facilities is shown below:

(1) Bridge

- Location : 2 km downstream of existing ferry route
- Bridge width : Total width 11.8 m
Carriageway 3.5 m each in both direction
Shoulder 0.5 m each on both sides
Sidewalk 1.5 m each on both sides
- Bridge length : 1,380 m
- Span length : Main spans 102 m x 10, 150 m, 100m
Side spans 70 m, 40 m
- Bridge type : Continuous rigid frame PC (extra-dosed) box girder
- Foundation type : Extrusion type cast-in-situ RC pile

(2) Approach roads

- Road width : 11 m
- Carriageway : 3.5 m each in both direction
- Shoulder : 2 m each on both sides
- Total length : 3,030 m
Pakse side 680 m
Phontong side 2,350 m
- Pavement : DBST for carriageway and SBST for shoulder

A.3 Project Cost

The estimated project cost is shown below:

(Unit: US\$1,000)

Classified Cost	Foreign Currency	Local Currency	Total
Construction Cost	42,884	9,884	52,768
Engineering Cost	3,324	369	3,693
Land Acquisition Cost	-	485	485
MCTPC' administration Cost	-	792	792
Contingency	8,622	2,036	10,658
Total	54,830	13,566	68,396

A.4 Project Feasibility

The project of the construction of the Mekong bridge at Pakse is technically feasible.

The Economic Internal Rate of Return (EIRR) of the project is estimated at 8.0%. This result is based on the only quantifiable direct benefits such as savings in river crossing time and savings in ferry waiting time. In addition to the direct benefits, the Pakse bridge will stimulate the regional economy and is expected to generate huge amount of indirect benefits. Considering such wide range and long term indirect benefits, the implementation of the Pakse bridge will be sufficiently justified.

A.5 Necessity of the Project

Necessity of the Mekong bridge at Pakse is emphasized from the following aspects:

- 1) Eliminating the bottleneck point at Mekong river and provide safety transportation facility
- 2) Formation of regional all-weather road network with other road improvement projects
- 3) Formation of international road network linking with neighboring countries
- 4) Promotion of regional and nationwide development (agricultural, industrial, commercial and tourism development)
- 5) Betterment in living conditions

A.6 Conclusions and Recommendations

A.6.1 Conclusions

It is found that the Project of the construction of the Mekong bridge at Pakse is technically feasible. The construction of the Mekong bridge also is judged viable by the economic evaluation which shows an IRR of 8 % considering the present economic status in Lao PDR.

The Project will accompany various intangible benefits that will contribute to the

development and well-being of the region in and around the project area.

The Project also will contribute to forming a prospective transportation network of the East West corridor formulation in Indochina.

The construction of bridge will not be anticipated to cause any serious technical, environmental and social issues in the course of bridge construction and after the completion.

It is concluded that the Mekong Bridge construction at Pakse is an indispensable project and that it is a realistic solution for the development of economy as well as road transportation of the country.

A.6.2 Recommendations

It is preferable that the completion date of the Project will be set taking into consideration the time of the completion of the relevant Projects ADB 7th projects going on currently.

The detailed design stage for the implementation of the Project, the works of which comprise site investigation, design of roads and structures and preparation of tender documents should be started before the beginning of rainy season.

B SUMMARY OF THE STUDY

B.1 Introduction

B.1.1 Study Background

Although the southern provinces of Lao PDR are rich in agricultural resources such as rice, coffee, fruit, crops, timber product, etc., and Pakse is located at only one hour distance from the Thai border, such commodities have not been transported efficiently because of a bottleneck to cross the Mekong river.

The crossing over the Mekong river was and is always a key issue for the improvement of road network in Indochina countries. The road rehabilitation projects for NR10 and NR13S, in the Southern provinces, are under way by the assistance of Asian Development Bank (ADB), therefore efficient international links centered at Pakse will be completed with the construction of the Mekong bridge at Pakse.

Under such situation the Government of Lao PDR requested to the Government of Japan for the feasibility study on Construction of Mekong Bridge at Pakse.

In response to the request the Government of Japan has decided to conduct the Feasibility Study on Construction of Mekong Bridge at Pakse.

Accordingly, JICA the official agency responsible for the implementation of the technical cooperation program of the Government of Japan, undertook the Study and organized a study team. The Study Team commenced the study July 1995 and the study was completed in May 1996.

B.1.2 Objectives of the Study

The objectives of the Study are to conduct the feasibility study for the construction project of Mekong bridge at Pakse including its approaches for the period up to the year 2010.

B.1.3 Reports

A set of documents was prepared as the Final Reports which consist of the following four volumes

- Summary
- Volume I : Main Report
- Volume II : Annexes
- Volume III : Drawings

Volume I (Main Report) has been structured to reflect the overall approach, methodology and results of the Study including conclusions and recommendations.

Background information, sources of information and detailed calculations are presented in Volume II (Annexes). Volume III (Drawings) provides drawings for bridge and road design, and associated works. The Summary summarizes the findings, conclusions and recommendations.

B.2. Socio-Economic Conditions

B.2.1 Present Conditions

(1) Population of the Country

The total population of the Lao PDR is about 4.6 million in 1995. An average annual growth rate of population from 1985 to 1995 was 2.4 % per annum. Population density of the whole country and Vientiane are 19 persons and 136 persons per km² respectively.

(2) National Economy

The nominal Gross Domestic Product (GDP) has amounted to 1,108,620 million Kip and per capita GDP was estimated at about US\$ 260 in 1994. The actual GDP in constant prices has recorded an average growth rate of 6.2% per year for the period of 1990 to 1994. Although agriculture is still a dominant sector in Laos, that share in GDP has decreased from 60.7% in 1990 to 56.4% in 1994. On the other hand, the industrial sector has expanded its share from 14.4% in 1990 to 17.5% in 1994.

(3) Present Conditions of the Study Area

Population in the Study Area, 4 southern provinces, is estimated at 913,000 in 1995 which is about 25% of the whole country. Among the provinces in the Study Area, the Champasak Province is a direct area of influence by the project and its population is about 500,000 which is 55% of the Study Area. Population of the Pakse district was about 60,000 with population density of 187.3 persons per km² in 1994.

Agriculture activities in the Study Area are dominated by rice cultivation. Harvested area for rice and its production are about 77% of total crops in the area and 25% of the whole country. The central feature is the Boloven Plateau which extends to the eastern part of Pakse. Production of coffee in the Plateau is about 90% of the whole country and exported to Thailand.

In addition to agricultural industry, development of hydroelectric schemes are the most important industry in the Study Area. At present, two hydroelectric power stations are under operation, one is 45 MW station at Xeset in the Saravane province and the other is Selabani 5 MW hydrostation in the Champasak province. From these stations, electricity can be exported to Thailand in the rainy season.

B.2.2 Development Plans

(1) National Development Plan

The present economic policy in Laos is based on the New Economic Mechanism (NEM) program which was introduced since 1986. This program aims at transforming the conventional controlled economy into a more flexible market oriented economy. The Government promoted various policies such as the privatization of the majority of state-owned enterprises, a market-adapted commodity economy through the price reform.

Following the 3rd Five Year Plan (1991 – 1995), the Government of the Lao PDR has decided to embark on an ambitious policy agenda for the next five years up to the year 2000. These policies are reflected in the "Public Investment Program (PIP) 1994 – 2000" which was announced in 1994 and indicates that GDP growth will be maintained at 8% up to 2000.

(2) Development Plans in the Study Area

The road improvement projects in the Study area have been executed or are planned in the series of ADB 2nd, 6th, 7th and IDA 3rd improvement projects.

- ADB 2nd Project : (bituminous pavement work for PR 13A and PR20 from Pakse to Saravane/to Paksong, completed in 1995)
- ADB 6th Project : (improvement of PR13 from Paksong/B.Beng, and PR16 from Thateng/to Sekong/to Attapeu, will be completed by 1998)
- ADB 7th Project : (covers sections of NR 13S from Pakse to the Cambodia border with a 160 km long, and NR10 from Pakse to the Thai border with a 40km long, will be completed by 2000)
- IDA 3rd Project : (improvement of NR13S from Savannakhet to Pakse, will be completed by the end of 1996)

The main agricultural projects in the Study area are summarized as follows :

- Lao Upland Agricultural Development Project (LUADP)
The LUADP is financed by the World Bank and Lao PDR with technical assistance of the Australian and French Governments which are also taking a part of funding. The project aims at to increase farmers' income through introducing more suitable production techniques for coffee and field crops, vegetables, fruits and other economic trees.
- Swedish International Development Agency (SIDA) Project
Main purpose of SIDA projects is to provide agriculture infrastructures in order to reduce slash and burn cultivation and to prevent deforestation.
- Integrated Agricultural and Rural Development Project in Boloven Plateau

The project area covers the Boloven Plateau with approximate area of 7,000 km². The ultimate objectives of the project are to increase farming output in the area through improvement and development of irrigation, drainage, rural infrastructures, and to achieve substantial and sustainable improvement in the living conditions of the habitants and their life improvement.

B.3. Natural Conditions at Project Site

B.3.1 Precipitation

The average annual total precipitation amounts to around 2,000 mm, some 95% of which assemble in rainy season, while there is few record that the daily precipitation exceeds 100 mm. The annual total precipitation of 2,938 mm was recorded as the annual maximum in 1979 and the monthly precipitation of 923 mm as the maximum in August 1978, while the mean precipitation in the past August was some 500 mm.

B.3.2 River Hydrology

The maximum flood discharge in 100-year return period is estimated at around 54,000 cubic meters. Annual average maximum discharge is around 36,000 cubic meters while the discharge at the lowest low water levels around 1,700 cubic meters. The water flow velocity in time of flood is 2.1 - 2.8 m/sec, while the mean velocity in dry season is less than 0.5 m/sec.

B.3.3 Geography and Geology

Pakse locates at 700 km downstream from Vientiane and 869 km upstream from the estuary of the Mekong river. Average land height of Pakse city area as well as the paddy fields extended along river banks is around 100 m from sea level. Generally the geography around the Project site presents the plains but Mount Saleo of 385 m height.

The base rock of sand stone and mud stone lays widely in the river side area around Pakse. Mount Saleo is a mountain of sandstone. The basalt of 5 - 6 m thickness covers partially the sandstone around left river bank in the area of southern part of Pakse city. On the plains around both river banks the laterite layers of around 10 m thickness deposits. In the river the sands and gravel of 2 - 20 m thickens deposit but hard sand stone exposes around the shore line near the foot of Mount Saleo.

B.4. Alternative Routes

The proposed bridge route will be connected with NR10 in Phonthong side, and with NR 13 in Pakse side. Using the existing topographical map (scale of 1/20,000) several alternative routes were found, and among them three alternative routes (Route-A, B, C)

were selected for comparative study to select the optimal route of the Project.

- Route-A: Selected as upstream side route to Pakse town connected with NR 13 to the north of Pakse air port. The proposed bridge length is longest among the alternatives, but river water depth is shallowest. The total route length is 5,360 m.
- Route-B: Selected as downstream side route to Pakse town. The closest to Pakse town. Both of the proposed bridge length and water depth are middle. The total route length is 4,410 m.
- Route-C: Selected as the shortest bridge length route. The route location is faraway from Pakse town and the approach roads become long. The water depth is the deepest among alternatives. The total route length is 5,790 m.

B.5. Traffic Forecast

B.5.1 Present Traffic Volume

The river crossing traffic volume surveyed by the Study Team (31 July 1995 - 6 August 1995) are summarized as follows :

<u>Vehicle Type</u>	<u>Traffic Volume (day)</u>
Motorcycles	388
Car, Pickup, etc.	95
Bus, Truck	113
(Sub-total)	(596)
Bicycle, Pedestrian	1,942

B.5.2 Future Traffic

Future traffic volumes on the project bridge were forecast estimating the future O-D matrix of the traffic crossing the Mekong river.

The results of traffic forecast are as shown below:

<u>Route</u>	<u>Vehicles / day (ADT)</u>			<u>Growth rate per year</u>	
	<u>2000</u>	<u>2010</u>	<u>2020</u>	<u>2000-10</u>	<u>2010-20</u>
A	1,467	3,474	5,775	9.0%	5.2%
B	1,460	3,451	5,737	9.0	5.2
C	1,448	3,422	5,691	9.0	5.2

Present traffic volume 596 vehicles (including motorcycles) will grow to about 5,700 vehicles in 2020 and it is about 9.6 times of the present traffic.

MEKONG BRIDGE PROJECT AT PAKSE

B.6. Selection of Optimal Bridge Route

B.6.1 Preliminary Design for Alternative Routes

(1) Design Conditions

Taking into consideration the traffic volume of existing ferry, future traffic demand and ADB 7th project, the fundamental cross elements for proposed routes were determined as follows:

Number of traffic lane	:	Dual single lane
Carriageway width	:	3.5 m per each lane
Shoulder width	:	2.0 m for approach roads 0.5 m for bridge
Sidewalk width	:	1.5 m at both side (bridge section only)

The live loads corresponding to AASHTO HS25 was applied in the preliminary design.

The existing design standards and design criteria, Road Design Manual compiled by MCTPC IN 1994, were advantageously applied to the Project. However the international standards including Japanese were also applied. Especially Road Bridge Specifications recompiled by Japan Road Association in 1992 were applied for bridge design. The geometric design of roads was made with design speed of 80 km/h.

(2) Bridge Length

The proposed bridge length of each alternative route was determined as follows:

Route-A:	1,560 m	(Total route length : 5,360 m)
Route-B:	1,380 m	(Total route length : 4,410 m)
Route-C:	1,100 m	(Total route length : 5,790 m)

(3) Structural Type Selection

Considering the superstructure size and span length aimed, the foundation types applicable to site conditions of each alternative route were nominated as follows:

- Direct foundation with spread footing
- Cast-in-situ pile foundation of extrusion type
- Inter-locking steel pipe pile well
- Open caisson

Cast-in situ pile foundation of extrusion type, pile diameter of 1.5 m, was selected for all alternative routes in the aspect of construction cost and workability of foundation.

Selecting 8 superstructure types applicable to the Project as shown beneath, the

economic span length was looked for by each type.

- Steel bridge type: Continuous steel box girder with RC deck
 Continuous steel box girder with steel deck
 Through type arch girder
 Continuous through type steel truss girder
- PC bridge type: Continuous PC box girder
 Continuous rigid frame PC box girder with center hinges
 Extra-dosed PC box girder
 Cable stayed PC box girder

The optimal bridge type and the optimal span length were found as follows:

- Route-A: Continuous rigid frame PC box girder, Span length = 100 m
 Route-B: Continuous rigid frame PC box girder, Span length = 100 m
 Route-C: Continuous rigid frame PC box girder, Span length = 150 m

For a section of Route-B having deep foundations the span length of more than 100 m which is given as the economic span for Route-C was applied since the foundation conditions of Route-B around this section are similar to Route-C.

B.6.2 Economic Benefits for Alternatives

(1) Economic Benefits of Bridge Construction

Estimated benefits by each benchmark year by alternative route are shown below :

SUMMARY OF BENEFIT ESTIMATION

BENEFIT	ROUTE	(US\$1,000)		
		2000	2010	2020
Users Cost Savings	A	362	2034	4149
(VOC)	B	391	2219	4509
(Time Costs)	C	349	2021	4093
Savings in Ferry Service Costs		996	3750	6038

Note: Opening timing of the Bridge is scheduled to be at the middle of 2000.
 A half of yearly benefits is reckoned.

(2) Economic Project Costs

The economic costs are calculated by deducting such transfer items as taxes and duties from market prices and expressed in constant 1995 price as presented below.

ECONOMIC PROJECT COSTS

(US\$1,000)

ROUTE	Total ('96-2000) (1995 prices)	1996	1997	1998	1999	2000
ROUTE-A	74,688	1,386	24,413	23,078	20,621	5,190
ROUTE-B	62,689	1,160	20,618	20,369	17,257	3,286
ROUTE-C	62,456	1,148	20,793	20,172	17,089	3,254

(3) Preliminary Economic Evaluation

The cost benefit cash flows were tabulated in order to calculate the values of Economic Internal Rate of Return (EIRR) by each alternative. The Route-B showed the highest EIRR of 8.0% among alternatives while Route-A and Route-C were 6.8% and 7.8% respectively.

B.6.3 Optimal Bridge Route

The optimal bridge route was selected grading the appraised points on the evaluation items which consist of economic evaluation, engineering evaluation and environmental evaluation. The evaluation results scored with appraised points are shown in the following Table.

EVALUATION TABLE FOR THE ALTERNATIVE ROUTES

		Route-A	Route-B	Route-C
Project Length (m)		5,360	4,410	5,790
Bridge Length (m)		1,560	1,380	1,100
Evaluation Items	Weighting			
(1) Economic Evaluation	0.65	0.65	1.69	1.56
Economic Internal Rate of Return (EIRR %)	0.60	1 (6.8%)	3 (8.0%)	2 (7.8%)
Initial Capital Cost	0.40	1	2	3
(2) Engineering Evaluation	0.15	0.32	0.44	0.15
Alignment / Road Network	0.35	2	3	1
River Hydrology	0.10	3	2	1
Superstructure	0.05	2	3	1
Foundation	0.20	2	3	1
Construction Period	0.05	2	3	1
Future Maintenance	0.25	2	3	1
(3) Environmental Evaluation	0.20	0.46	0.35	0.39
Biophysical Environment	0.25	3	1	2
Human/Built Environment	0.40	3	2	1
Critical Development Restriction	0.15	1	2	3
Public Consultation Outcome	0.20	1	2	3
Summation		1.43	2.48	2.1
Score Out of the Full Marks of 100		48	83	70
Evaluated Priority Rank		3	1	2

According to the above results, it was concluded that Route-B should be selected for the optimal bridge route of this project.

B.7. Engineering Study of Proposed Route

The further engineering study on the proposed route following the preliminary design was carried out to clarify the Project features and to facilitate the data for the project evaluation and to establish the implementation plan.

B.7.1 Design of Structures

The structural type selected is a 14-span continuous rigid frame PC box girder with center hinges having a main span length of 100 - 102 m and 150 m. The geometric main dimensions of box girder structure are determined for the span of 102 m length. For the section of 150 m span extradosed PC cables system are adopted not to change the main dimensions of girder.

The Pavement for approach roads consists of Subbase Course, Base Course and Surface Course. Subbase Course having a 15 cm thickness shall be constructed with lateritic soil. Base Course is constructed with a mixture of gravel with lateritic soil. It should have a thickness of 20 cm. The Road surface of the carriageway are paved by DBST using screened gravel.

The general view as a results of structural design is shown in following plate.

B.7.2 Construction Method and Schedule

For the reasonable construction period of the Project a term of around 3 years is proposed. As the foundation works should be done in dry season, August will be optimal commencement month considering a term of 3 months for preparatory works. It takes for 2 dry seasons for substructure to be constructed. The erection of superstructure can be started one year later the commencement of foundation construction. For the erection method of PC box girder precast segment method is recommended in the aspect of construction schedule management and quality control.

B.8 Project Cost

B.8.1 Capital Cost

The Capital cost for the Project comprises the construction costs including bridge and approach roads construction, land acquisition and compensation costs, engineering services, project administration costs, and physical and price contingencies. The total project cost was estimated at US\$68.4 million as shown below.

PROJECT COST

(Unit: x 1000)

Item	L.C	F.C	Total
	US\$	US\$	US\$
A. Construction Costs	9,884	42,884	52,768
1. Preparatory Works	816	4,887	5,703
2. Bridge Construction	7,551	35,909	43,460
3. River Bank Protection	338	206	544
4. Approach Road Construction	1,179	1,882	3,061
B. Physical Contingency	988	4,288	5,277
C. Engineering Services	369	3,324	3,693
D. Administration Costs	792	0	792
E. Land Acquisition and Compensation Costs	485	0	485
F. Price Contingency	1,048	4,334	5,418
Total	13,566	54,831	68,397

B.8.2 Maintenance Cost

The maintenance cost comprise administration cost, routine and periodic inspection costs, routine maintenance cost and periodic maintenance cost. The annual maintenance cost of the bridge of a length of 1,380 m and the approach roads of a total length of 3.03 km (Pakse side: 0.68 km, Phontong side: 2.35 km) was estimated at US\$15,000 per years.

B.9. Project Evaluation

B.9.1 Economic Evaluation

(1) Economic Project Costs

Economic costs of the selected route are summarized in the table below which were estimated based on the design work :

ECONOMIC PROJECT COSTS (1995 PRICES)

(US\$1,000)

ITEM	YEAR	Total ('96-2000) (1995 Prices)	1996	1997	1998	1999	2000
- Construction Cost		52,768		19,124	14,833	15,729	3,082
- Physical Contingency		5,276		1,912	1,483	1,573	308
Sub-total		58,044		21,036	16,316	17,302	3,390
- Engineering Service		3,693	1,387	520	826	804	156
- Administration		792	79	158	238	238	79
- Land Acquisition and Compensation		485		436	49		
TOTAL		63,014	1,466	22,150	17,429	18,344	3,625

The annual maintenance costs after opening are estimated at US\$15,000 per year.

(2) Economic Benefits

The direct benefits of the project bridge consist of mainly the time savings of the traffic that will divert from the ferry boats to the new bridge. In addition to those benefits, the future ferry service costs which would be not needed after opening of the bridge are also counted as benefits from a view point of national economy. The calculated benefits including savings in future investment costs for the new slope type jetties in 2000 are summarized as follows :

BENEFIT ESTIMATION

(US\$1,000)

BENEFIT	TRAFFIC	Year		
		2000	2010	2020
Users Cost Savings (VOC and Time Cost)	Normal Traffic	371	2,101	4,275
	Induced Traffic	20	118	234
	Sub-total	391	2,219	4,509
Savings in Ferry Service Costs	Operations	781	3,750	5,823
	Investment(Boats)	215	0	215
	Investment(Jetties)	500		
	Sub-total	1,496	3,750	6,038
TOTAL		1,887	5,969	10,547

In addition to the above benefits, the Pakse bridge is expected to generate many kinds of indirect benefits through realization of non-waiting, continuous and all-weather traffic flows. These indirect benefits will be enjoyed as regional development effects such as agricultural, industrial and tourism development.

(3) Results of Economic Evaluation

Based on the conventional Discount Cash Flow analysis, evaluation indicators were

calculated as below :

	7%	9%	10%
- Discount Rate			
- Net Present Value (NPV : US\$'000)	8,996	-6,374	-11,571
- Benefit Cost Ratio (B/C)	1.18	0.87	0.75
- Economic Internal Rate of Return (EIRR : %) = 8.0%			

EIRR of the project bridge is estimated at 8%. The results above are based on the only quantifiable direct benefits. In addition to the direct benefits, regionwide and nationwide development effects by the Project should be taken into account for the evaluation. Considering such wide range and long term indirect effects together with the direct benefits, the implementation of the Project will be sufficiently justified.

B.9.2 Sensitivity Analysis

The sensitivity tests were carried out by changing key factors within the probable range as shown below:

		(Change in EIRR)
1) GDP growth	(low growth: 6% p.a. high growth: 10% p.a.)	6.9% - 8.5%
2) Traffic demand	(-30% to +30%)	5.9% - 9.8%
3) Time value	(-30% to +30%)	7.1% - 8.8%
4) Ferry operation costs	(-30% to +30%)	6.8% - 9.1%
5) Construction cost	(-30% to +30%)	10.2% - 6.5%

B.9.3 Financial Analysis

(1) Possibility of Toll Bridge

Imposing toll charges on bridge users will be justified from a point of "Beneficiaries Pay Principle" and originally ferry tariff has been levied on the river crossing traffic.

Results of analysis indicate that the recovery of the initial investment costs with the toll revenues will be very difficult because of low financial returns. On the other hand, the annual maintenance costs can be covered sufficiently with the annual toll revenues.

(2) Financial Resources and Investment Capacity

The size of the Pakse bridge project in terms of the project cost (63 US\$ million) is about 10 times of the total local fund of MCTPC budget of 1994/95 and also 3.6 times of the total budget for all CTPC sectors. Considering such project size and the present Government financial situation, implementation of the project only by the local fund or local loans will impose a big burden to the Government budget.

B.9.4 Environmental Impact Assessment

The environmental impact caused by implementation of the Project and the proposed mitigation measures against the impact are summarized as shown in the table below. Carrying out these mitigation measures described in the Table is seemed to be not so difficult while resettlement will be required for 44 families.

SUMMARY OF PROPOSED MITIGATION MEASURES

Activity	Environmental Component Affected	Predicted Impact	Rating ¹ of Potential Impact and Severity	Proposed Mitigation Measure
Vehicle Traffic	Air	Periodic air pollution over Pakse Town	A	1. Good traffic management to prevent congestion at intersections 2. Establish landuse controls within ROW and within the 200m wide impact zone
	Noise	Increase in overall ambient noise level plus periodic annoying noise episodes	S	1. Provide vegetation buffers (plantings of trees, shrubs) 2. Create noise berms and use natural attenuation features
Capping of existing wells in ROW	Aquatic and Human	Loss of potable water supply	V	Reconnection of water supply
Resettlement	Human/Built	Community and family stress	V	Compensation and relocation assistance
		Relocation of 44 families	V	Same
Clearing of ROW and approach road alignment	Human/Built and Agriculture	Removal of 70,000 m ² of rice fields plus many market garden and grazing plots	V	Compensation and assistance Revegetation
Construction of a vertically elevated approach road	Human/Built	access restrictions to fields and property	V	Placement of nine 2.5m x 3m box culverts along approach road, with location based on engineering limits and consultation with residents. Specification of operational period maintenance needs
	Visual	Obstruction of views with embankment walls	S	Vegetation screens and buffer zones planted and maintenance of these once operational period begins

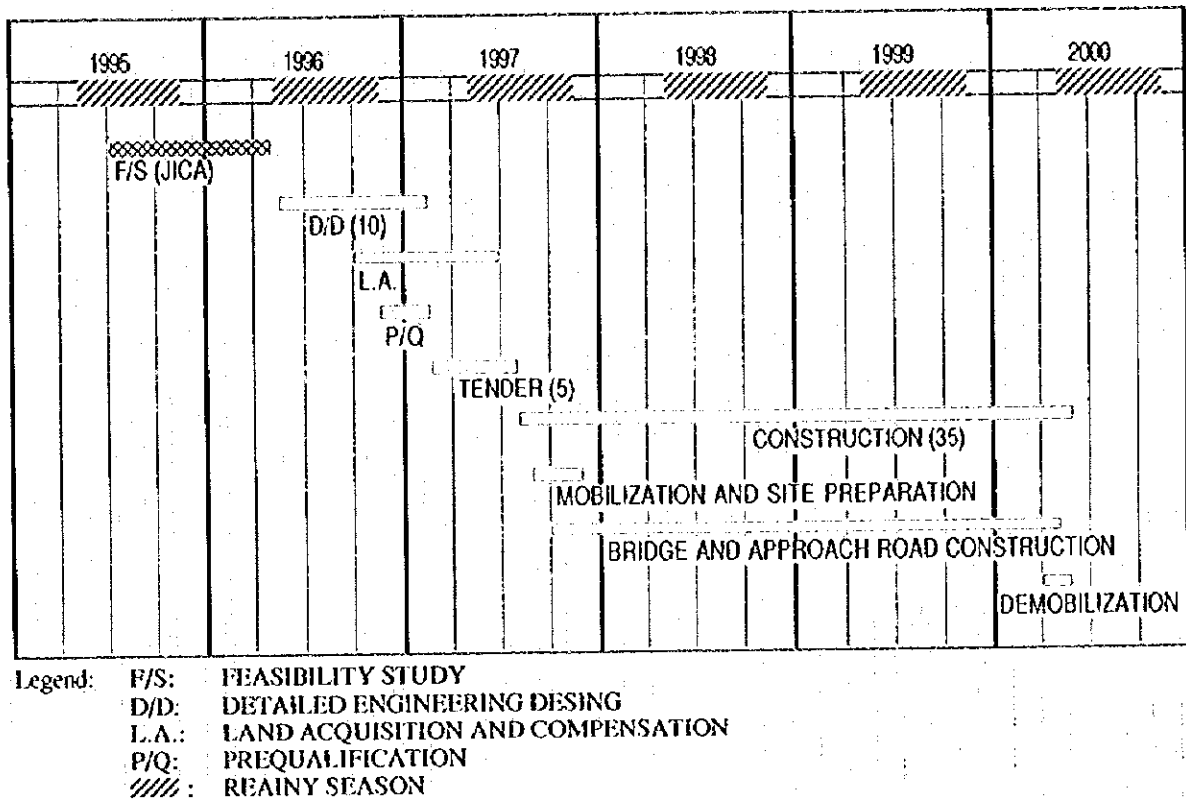

A: annoying but tolerable impact

S: significant degradation

V: very severe impact needing immediate mitigation to prevent occurrence .

B.10. Implementation Program

The implementation schedule of the Project was studied considering the optimal commencement time in a year for foundation construction in the river and using the condition that the construction project would be completed by middle of 2000. Prior to the commencement of the construction it is necessary to carry out such pre-construction works as soils and geological investigation, detailed design, land acquisition, financial arrangement, etc. The overall project implementation schedule considered above conditions is shown below.

EXECUTIVE SUMMARY

1. INTRODUCTION

1.1	Authority	1-1
1.2	Background	1-1
1.3	The Feasibility Study on the Construction of the Mekong Bridge at Pakse.....	1-2
1.4	Implementation of the Study	1-3
1.5	Organization.....	1-4

2. SOCIO-ECONOMIC CONDITIONS IN LAOS AND STUDY AREA

2.1	Socio-Economic Conditions in Laos.....	2-1
2.1.1	Population.....	2-1
2.1.2	Labor Force and Employment.....	2-1
2.1.3	Structure of the National Economy.....	2-1
2.1.4	National Development Plan.....	2-15
2.1.5	Transportation in Laos.....	2-18
2.2	Socio-Economic Conditions in Study Area	2-25
2.2.1	Definition of Study Area.....	2-25
2.2.2	Population.....	2-27
2.2.3	Economic Activity	2-27
2.2.4	Road Network in Study Area	2-34
2.2.5	Socio-Economic Development Plan.....	2-36

3. GEOMORPHOLOGY AND HYDROLOGY IN STUDY AREA

3.1	Geomorphology in Study Area.....	3-1
3.2	Meteo-hydrology in Study Area.....	3-2
3.2.1	General.....	3-2

3.2.2	Air Temperature.....	3-2
3.2.3	Precipitation and Rainfall Intensity.....	3-3
3.2.4	Evaporation and Humidity.....	3-4
3.2.5	Wind Pattern.....	3-5
3.2.6	Tropical Cyclone.....	3-7
3.3	River Hydrology.....	3-8
3.3.1	General.....	3-8
3.3.2	River Conditions.....	3-8
3.3.3	Discharge and Water Level.....	3-9
3.3.4	River Flow Velocity.....	3-15
3.3.5	River Erosion, Scouring and Sedimentation.....	3-17
4.	PROPOSED BRIDGE ROUTES	
4.1	Site Conditions.....	4-1
4.2	Selection of Bridge Route.....	4-2
4.2.1	General.....	4-2
4.2.2	Long-listed Alternative Routes.....	4-3
4.3	Alternatives of Proposed Bridge Route.....	4-6
4.3.1	In Area - A (Northern Area of the Pakse Town).....	4-6
4.3.2	In the Area - B (Southern Area of the Town).....	4-10
4.3.3	In the Area - C (Narrowest River Section).....	4-10
5.	TRAFFIC STUDY	
5.1	Present Traffic Characteristics.....	5-1
5.1.1	General.....	5-1
5.1.2	Existing Traffic Data.....	5-1
5.1.3	Traffic Survey.....	5-4
5.2	Traffic Forecast.....	5-14
5.2.1	General.....	5-14
5.2.2	Establishment of Socio-Economic Framework.....	5-16
5.2.3	Traffic Demand Forecast.....	5-17
6.	ENVIRONMENTAL EXAMINATION	
6.1	Objectives.....	6-1
6.2	Methodology.....	6-1
6.3	Existing Environmental Issues.....	6-2
6.3.1	Biophysical Environment.....	6-2
6.3.2	Human and Built Environment.....	6-7
6.3.3	Impact Comparison Indicators.....	6-9

6.4	Environmental Considerations.....	6-12
6.4.1	Overall Environmental Issues.....	6-12
6.4.2	Environmental Considerations of Each Alternative Routes.....	6-13
7.	ENGINEERING SITE SURVEYS	
7.1	General.....	7-1
7.2	Topographic and Bathymetric Surveys.....	7-1
7.2.1	Topographic Survey.....	7-1
7.2.2	Bathymetric Survey.....	7-4
7.2.3	Data Processing.....	7-5
7.3	Water Flow Velocity Survey.....	7-5
7.4	Geology and Subsoil Investigation.....	7-6
7.4.1	Regional Geology.....	7-6
7.4.2	Subsoil Investigation.....	7-9
7.4.3	Geology in the Site.....	7-13
7.5	Soil and Rock Materials.....	7-14
8.	DESIGN STANDARDS AND CRITERIA	
8.1	Design Standards.....	8-1
8.2	Design Criteria for Road.....	8-1
8.2.1	General.....	8-1
8.2.2	Geometric Criteria.....	8-1
8.2.3	Standard Cross Section.....	8-2
8.3	Design Criteria for Bridge.....	8-3
8.3.1	Design Load.....	8-3
8.3.2	Material Properties.....	8-6
8.3.3	Navigation Clearance.....	8-7
8.3.4	Design Water Levels.....	8-7
9.	PRELIMINARY DESIGN OF ALTERNATIVE ROUTES	
9.1	General.....	9-1
9.2	Preliminary Design of Bridge.....	9-1
9.2.1	Bridge Length.....	9-1
9.2.2	Proposed Height Formation.....	9-2
9.2.3	Bridge Type.....	9-2
9.2.4	Preliminary Bridge Configurations.....	9-13
9.3	Preliminary Design of Approach Roads.....	9-18
9.3.1	Geometric Design.....	9-18
9.3.2	Cross Section.....	9-19

9.4	Construction Plan and Cost estimate.....	9-21
9.4.1	Construction Method.....	9-21
9.4.2	Construction Schedule.....	9-22
9.4.3	Cost Estimate.....	9-24
10.	OPTIMAL BRIDGE ROUTE	
10.1	Preliminary Economic Analysis by Route.....	10-1
10.1.1	General.....	10-1
10.1.2	Methodology.....	10-1
10.1.3	Economic Project Costs.....	10-2
10.1.4	Economic Benefits.....	10-3
10.1.5	Economic Evaluation.....	10-18
10.2	Engineering Evaluation.....	10-19
10.3	Environmental Evaluation.....	10-20
10.3.1	The Alternatives.....	10-21
10.3.2	Considerations.....	10-23
10.4	Optimal Bridge Route.....	10-23
11.	ENGINEERING STUDY ON PROPOSED ROUTE	
11.1	General.....	11-1
11.2	Main bridge.....	11-1
11.2.1	Span Arrangement.....	11-1
11.2.2	Superstructure.....	11-1
11.2.3	Substructure.....	11-2
11.2.4	Foundation.....	11-3
11.3	Approach Road.....	11-4
11.4	Summary of Quantities.....	11-6
12.	CONSTRUCTION PLAN	
12.1	General.....	12-1
12.2	Construction Materials Required.....	12-1
12.3	Procurement of the Materials and Equipment.....	12-2
12.3.1	Local Materials.....	12-2
12.3.2	Imported Material.....	12-2
12.4	Transportation of Construction Materials and Equipment.....	12-3
12.4.1	Ocean Transportation.....	12-3
12.4.2	Inland Transportation.....	12-3
12.5	Construction Facilities.....	12-3
12.5.1	Construction Yard.....	12-3

12.5.2	Access Road.....	12-4
12.5.3	Utilities Supply	12-4
12.6	Working Conditions	12-6
12.7	Construction Method and Schedule.....	12-6

CHAPTER 1

INTRODUCTION

1. INTRODUCTION

1.1 Authority

This Final Report on the Feasibility Study on the Construction of the Mekong Bridge at Pakse (hereinafter referred to as "the Study") was prepared in accordance with the Scope of Work for the study on the captioned Project agreed upon between Ministry of Communication, Transport, Post and Construction (hereinafter referred to as "MCTPC") of the Lao People's Democratic Republic (Lao PDR) and Japan International Cooperation Agency (hereinafter referred to "JICA") on April 6, 1995. This Report also presents the general observation on the economy and transportation in Lao PDR as well as the Project area, the proposed bridge routes, the traffic study in and around the Project site, the environmental examination, engineering site surveys, preliminary design of alternative routes, selection of the optimal bridge route, design of proposed route, cost estimate, economic evaluation, environmental impact assessment and implementation plans.

1.2 Background

Since "New Economic Mechanism (NEM)" has been introduced as a policy for national socio-economic development in 1986, the Lao PDR has begun to step forward to reorganize her economy under the market economy principle. The new policy is expected to promote foreign investment, activate national economy and increase international trade with surrounding Indochina countries .

In order to stimulate and activate economy on the basis of an international trade with market economy countries, relationship with Thailand shall be focused on as the first priority, which recently keeps good economic performance and accumulates biggest economic power in the surrounding countries. In this sense, the Pakse Area and Mekong bridge at Pakse shall be paid special attention as a regional development center in the South Region with a short highway connection to Thai boarder.

Although the southern provinces of Lao PDR are rich in agricultural resources such as rice, coffee, fruit, crops, timber product, etc., and Pakse is located at only one hour distance from the Thai border, such commodities have not been transported efficiently because of a bottleneck to cross the Mekong river.

The crossing over the Mekong river was and is always a key issue for the improvement of road network in Indochina countries. The road rehabilitation projects in the Southern provinces such as National Road 13 and National Road 10 are under way by the assistance of Asian Development Bank (ADB) and efficient and all season international links will be completed with the construction of the Mekong bridge at Pakse.

Under such situation, the Government of Lao PDR requested to the Government of Japan for the feasibility study on Construction of Mekong Bridge at Pakse.

In response to the request, the Government of Japan has decided to conduct the Feasibility Study on Construction of Mekong Bridge at Pakse.

Accordingly, JICA the official agency responsible for the implementation of the technical cooperation program of the Government of Japan, undertook the Study and organized a study team. The Study Team commenced the study July 1995 and the study was completed in March 1996.

1.3 The Feasibility Study on the Construction of the Mekong Bridge at Pakse

1) Objectives of the Study

The objectives of the Study are to conduct the feasibility study for the construction project of Mekong bridge at Pakse including its approaches for the period up to the year 2010 and to carry out technology transfer to the counterpart personnel of the Government of Lao PDR in the course of the Study.

2) Study area

The Mekong river basin in and around Pakse, Champasak province, is of the subject area for the Study.

3) Scope of the Study

The study is composed of the works in Laos including field survey as the first stage and the home office works in Japan as the second stage. The scope of the study stagewise is summarized as follows:

(1) The works in Laos (Stage 1)

The study in Laos was carried out the following items:

- Data collection and analysis
- Site survey which was composed of traffic survey, topographic/bathymetric survey and traffic volume survey
- Traffic forecast
- Environmental examination
- Comparative study and evaluation of alternatives on proposed bridge routes

(2) The works in home office in Japan (Stage 2)

The study in home office in Japan was carried out the following items:

- Preliminary design and cost estimate on the optimum bridge route
- Planning and scheduling of construction works
- Maintenance program
- Environmental impact assessment

- Economic and financial evaluation
- Implementation program
- Conclusions and recommendations

1.4 Implementation of the Study

The Study run for about 11 months from the middle of July 1995 through May 1996 and was carried out in the following schedule.

1995						1996						
July	Aug	Sept	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	July
△		▲		▲		▲		▲		△		
Inception Report		Progress Report		Interim Report		Draft Final Report		Final Report				

The study was carried out by the Study Team composed of staff from Japanese consultants, Nippon Koei Co., Ltd. and Construction Project Consultants Inc. entrusted by JICA, under the supervision of the Advisory Committee organized by JICA which comprises Japanese Government officials.

The objective and the scope of work for the Study were determined by the Scope of Work document signed between MCTPC and JICA on April 6, 1995. Points of agreements reached during the discussions held prior to the signing were officially recorded in the Minutes of Discussion also signed on April 6, 1995. These documents are reproduced in A.1-1 and A.1-2 (Annexes : Volume II).

The Study was broadly divided into three (3) phases :

The works in Laos (Stage 1)

- Phase I : Project characteristics, Traffic study and Preparation of Bridge route alternatives.
- Phase II : Preliminary design of alternative routes, Preliminary evaluation and selection of the optimal bridge route.

The works in home office in Japan (Stage 2)

- Phase III : Engineering study of proposed route, project cost estimate, evaluation and implementation program

Phase I Study was commenced on July 18, 1995 with the arrival of the Study Team. Explanation on the Inception Report was proceeded by the Study Team prior to the arrival of the Advisory Team. The Advisory Team visited and stayed in Vientiane in early August, 1995. Discussions were held on the Inception Report between MCTPC, the Advisory Team and the Study Team on August 8, 1995. Points of agreement were recorded in the Minutes of Meeting signed on 10, 1995 as attached in A.1-3 (Annexes : Volume II).

Meetings were held in early September 1995, with MCTPC and the Study Team on progress. The main items discussed at the meetings were the results of the future traffic forecast and alternative bridge routes.

The second visit of the Advisory Team was from December 12 to December 16, 1995 to discuss the contents of the Interim Report which includes works, findings and study results during the Phase II Study. During the stay of the Advisory Team, the Interim Report was submitted to MCTPC by the Study Team on December 13, 1995. As a conclusion, the route of the project bridge proposed by the Study Team was accepted along with other study results such as traffic study, preliminary design and so on. Points of agreement were recorded in the Minutes of Meeting signed on December 15, 1995, as attached in A.1-4 (Annexes : Volume II).

Phase III Study followed in the form of desk work in Japan from January to March 1996 to conduct design of the project facilities and to evaluate the project feasibility. A Draft Final Report was prepared as the outcome of the Study by incorporating the earlier reports of Progress Report, Interim Report and the results of the Phase III Study.

The Advisory Team and the Study Team visited Vientiane from March 20th to March 27th, 1996 to submit the Draft Final Report to MCTPC. During their stay, a meeting was held to discuss the contents of the Draft Final Report and points of discussion were recorded in the Minutes of Meeting signed on March 26, 1996 as attached in A.1-5 (Annexes : Volume II).

MCTPC reviewed again the contents of the Draft Final Report and afterwards, the Study Team completed this Final Report in June, 1996.

1.5 Organization

The Study was carried out by the Study Team appointed by JICA. On commencement of the Study, JICA organized the Advisory Committee composed of experts and Japanese Government officials, to advise the Study Team and review the results of the Study. The Study Team kept close collaboration with the counterpart officials of MCTPC in carrying out the Study.

The members participated in the Study are listed below :

JICA Advisory Committee

Mr.Kozo HIGUCHI	Chairman, Honshu-Shikoku Bridge Authority
Mr.Seiichi SAITO	Bridge Planner, Ministry of Construction
Miss Mari ITO	Coordinator, JICA

JICA Study Team

Mr.Junji MASHIBA	Team Leader (NK).
Mr. Kenji NAGASAKI	Deputy Team Leader (CPC)
Mr. Akio MORIKAWA	Traffic Engineer (NK)
Mr. Junji YASUI	Bridge Engineer (NK)
Mr. Takao SAKAMOTO	Bridge Engineer (CPC)
Mr. Keishi IHARA	Highway Engineer (CPC)
Mr. Seiji IKEDA	Geologist (NK)
Dr. J.R.Montano MICHEL	Meteo-Hydrologist (NK)
Mr. Geza.C. TELEKI	Environmental Expert (CPC)
Mr. Atsuya SAISHO	Construction Planner (NK)
Mr. Masahito HOMMA	Economist (NK)

(NK) : Nippon Koei Co., Ltd.

(CPC) : Construction Project Consultants, Inc.

Ministry of Communication, Transport, Post and Construction

Dr. Khamseng SAYAKONE	Deputy Director, Communication Department
Mr. Somad PHOLESENA	Acting Director, Communication Department
Mr. Bounchanh SINTHAVONG	Deputy Director, Communication Department
Mr. Lattanamany KHOUNYVONG	Deputy Director, Cabinet
Mr. Math SOUNMALA	Deputy Director, Cabinet
Mr. Phetsamone VIRAPHANTH	Deputy Director, Cabinet
Mr. Khanngoun KHAMVONGSA	Director, International Relations Division, Office of the Permanent Secretary
Mr.Say VIXAYXONGDETH	Director, Inland Waterway Division
Dr. Koung SOUK ALOUN	Deputy Director, CTPC of Champasack Province
Mr. Khanla SAYAVONGSA	Head, Administration Division
Mr. Oulay PHADOUANGDETH	Acting Director, Technical Division
Mr. Dapkeo DOUANGACHANH	Senior Engineer, Technical Division
Mr. Khamphay SIRIPHONE	Civil Engineer, Technical Division

1. The first part of the document discusses the importance of maintaining accurate records in a business setting. It emphasizes that proper record-keeping is essential for legal compliance, financial reporting, and operational efficiency. The text notes that businesses must adhere to various regulations and standards, which require detailed documentation of transactions, contracts, and internal processes.

2. In the second section, the author explores the challenges associated with data management in the digital age. With the increasing volume of data generated by modern technologies, organizations face significant difficulties in storing, securing, and analyzing this information. The text highlights the need for robust data governance frameworks and advanced analytics tools to effectively manage these large datasets.

3. The third part of the document focuses on the role of technology in enhancing business performance. It discusses how automation, artificial intelligence, and cloud computing can streamline operations, reduce costs, and improve decision-making. The author argues that embracing these technologies is crucial for staying competitive in a rapidly changing market environment.

4. The final section addresses the importance of human resources in driving organizational success. It stresses that while technology is a powerful tool, it is the skills and capabilities of the workforce that ultimately determine a company's long-term viability. The text advocates for continuous learning and development programs to ensure that employees are equipped with the necessary skills to thrive in a digital economy.

CHAPTER 2

**SOCIO-ECONOMIC CONDITIONS IN LAOS
AND STUDY AREA**

2. SOCIO-ECONOMIC CONDITIONS IN LAOS AND STUDY AREA

2.1 Socio-Economic Conditions in Laos

2.1.1 Population

According to the 1995 census, the population of Lao PDR is estimated at about 4.6 million and annual growth rate for the last 10 years (1985 - 1995) is 2.44 %. The population density is estimated about 19.4 persons/km² in the whole country and 135.7 persons/km² in the capital city of Vientiane (Table 2.1-1). The total number of households is about 7.52 million in 1995 and average household size is estimated at 6.1 persons/household.

2.1.2 Labor Force and Employment

(1) Labour Force

The preliminary result of 1995 census showed that the total population was about 4,581,000 persons of which 2,137,000 persons were estimated to be working age population (defined as 16-60 years old for males and 16-55 years old for females) as presented in Table 2.1-2. The percentage ratio of labour force to the total population is about 46.6% in the whole country in 1995.

(2) Status of Labour Force Participation

The sample survey, the Lao Urban Labour Force Survey, conducted in August 1994 indicated that 3.4 % of the total working age population were unemployed (Table 2.1-3). Another sample survey, the Lao Expenditure and Consumption Survey 1992/93, estimated also a low unemployment rate at 4% (Table 2.1-4). (The definition of the status "unemployment" of the survey is "no work to do on any of the seven days in the week preceding the interview" which is different from the criteria of the ILO definition.)

(3) Employment Structure

The Lao Urban Labour Force Survey 1992 indicated that 42% of the total households engaged in the agriculture sector as shown in Table 2.1-5.

2.1.3 Structure of the National Economy

(1) General

With the introduction of the New Economic Mechanism (NEM) in 1986, the Government of Lao P.D.R. started to move toward a market determined resource allocation and has concentrated on addressing infrastructure development, leaving much of the development of agriculture and industry to the private sector. This process of

privatization is now still under way and stimulating economic activities in the country.

1) Gross Domestic Product (GDP)

Over the past four years (1990 - 1994) fairly steady growth averaging 6.2% per year has been achieved. Especially in 1994, actual GDP has recorded an 8.% of high growth rate. This growth has been led almost totally by private sector activity. Although the agriculture sector is still a dominant sector of the economy, considerable growth has been achieved in the industrial sector.(Table 2.1-6, and Figures 2.1-1 and 2.1-2)

2) National Budget

Until the introduction of the New Economic Mechanism (NEM), the traditional revenue of the Government was based on transfers from state enterprises whose profitability was assured by price controls. Although these revenue bases were severely affected by NEM, a substantial progress has been made in tax base revenue and accordingly the Government revenue as a proportion of GDP has been increased from 10% in 1990 to about 13 % in 1994. In addition, the deficits in current balance has turned into positive surplus since 1992/3 (Table 2.1-7, Figure 2.1-3).

3) Trade

The export amount of Lao PDR totaled US\$ 203 million in 1993, 3.5 times of US\$ 57.9 million in 1988 as shown in Table 2.1-8. Between 1988 and 1993, while the share of electricity and timber exports fell from 50.9% of total export to 12.6%, the share of manufactured exports increased from 5.5% to 35.5%. The total imports amounted US\$353 million in 1993 of which machinery and raw materials (54%), rice and other foods (9%) and petroleum (6%) are the major import items as shown in Table 2.1-9.

4) Prices and Consumer Price Index

As compared to December last year, prices (in Vientiane Municipality) have slowly increased. In 1989, however, consumer price index jumped by 82% in a year. Since 1990, consumer price index has moderately increased in a tendency toward lower prices as shown in Table 2.1-10 and Figure 2.1-4. But in 1995 as of September, consumer price index has increased again very fast compared to the previous year (34% up in 9 months). This high increase of price index was due to mainly the increase in price level of food.

5) Vehicle Ownership

The past trend of vehicle registration in the whole country is presented in Table 2.1-11. The average growth rate in the total number of vehicles for the period 1977 - 1992 was estimated to be 12 % p.a. The composition ratios of motorcycles and heavy vehicles have increased for the same period. The ownership rate per 1,000 population was about 27 vehicles / 1,000 persons in 1992.

TABLE 2.1-1

MID-YEAR POPULATION BY PROVINCE

Province	Land Area (km ²)	Population (1000 persons)		Average Annual Growth Rate (%) 1985 - 95	Density in 1995 (persons/km ²)

(2) Agriculture and Forestry

The present Lao economy depends heavily upon the performance of the agriculture sector. About 52% of the total land area is covered with agriculture land and forest use (Table 2.1-12), while 56% of GDP in 1994 were shared by agriculture and forestry. This sector contributes approximately 30% of official export earnings. Most of these exports have historically consisted of raw timber and wood products, but recent abuses with indiscriminate logging have forced the Government to impose severe restrictions.

Table 2.1-13 indicates the harvested area and production of major crops in Lao PDR from 1976 to 1994. More than 85% of the harvested area and 75% of the total production (in terms of tons) was rice, about 600,000 ha and 1,577,000 tons in 1994. Overall, Lao PDR is self-sufficient in rice during years of good weather but its annual paddy output is subject to sharp reduction caused by drought, and/or floods. Due to severe drought in both 1991 and 1993, as examples of recent experiences, production of rice was substantially declined as shown in Table 2.1-13.

Coffee is mainly planted in Boloven Plateau in Southern provinces, about 96% of the total area planted and is one of the important agricultural exports. Livestock husbandry is mainly characterized by small scale units.

In order to increase of productivity of agriculture and to improve living standard, the Government has taken effective efforts in the sector as introducing market-oriented economic system and providing the individual cultivation right.

(3) Industry

The sector of industry in the Lao PDR has experienced high growth in GDP with about 12% annual rate from 1990 to 1994. However, the Government policy for this sector is to promote small-scale industries and handicrafts with emphasis placed on value-added activities and import substitution. At present, medium and large scale industries are few and mostly undertaken by foreign companies in joint ventures.

Table 2.1-14 shows the number of business establishments by scale for the whole country registered in 1990 - 1991. Of the total manufacturing establishments, about 92% was shared by small size establishments.

(4) Mining

The mining sector in the Lao PDR represents one of the country's most promising long term prospect for growth. Although the sector accounted for only 1.4% of GDP in 1992, its growth rate was 12% per year. Development of minerals and energy in Laos, however, has been low because of the agrarian nature of the economy, scarce financial restriction on investments. The only significant minerals to have been exploited recently in the first and second five year plan (1981-1985, 1986-1990) are shown in Table 2.1-15. Comparing those actual output shown in the table with the targets of the two five

year plans (tin: 1,500 tons, gypsum: 180,000 tons, coal: 15,000 tons), it is easily found out that the targets were not realized.

The followings are main existing mines explained in the National Transport Study (NTS) for the purpose of transport demand analysis:

- The gypsum mine, about 60 km east of Savannakhet. The average production is about 90,000 tons per year. The proven reserves exceed 15 million tons (although the actual production during 1988 - 1989 was only 50 - 70,000 tons due to the transport problems within Vietnam).
- The tin mine and concentration facilities at Phontiou in Khammouan Province. The average production is about at 500 tons per year.
- The coal mine, at Bo Chan in Vientiane Province. The present production is about 3,500 tons per year.

Although they are believed to be large reserves of several other minerals in the country, exploration has so far been limited.

(5) Energy

About 90% of the energy in the country is produced from fuel woods, while electricity provides only 5% and petroleum the remaining 5%. Regarding the electricity, it has been estimated that the Lao PDR has an potential of over 18,000 MW within its borders of which only about one percent has been developed.

The largest hydropower plant in the country is Nam Ngum power station located on the Nam Ngum river 80 km north of Vientiane. It has an installed capacity of 150 MW generating 800 Gwh annually and about 70 % of output is exported to Thailand. The second largest power station is Xeset in Saravane Province which has 45 MW capacity and generates 180 Gwh annually. The present total hydrogenerating capacity of the country is 220 MW including other small hydroplants and diesel plants.

The following four significant distribution grids are working at present as major distribution networks :

- The Vientiane grid, with 67,000 consumers covering the Vientiane plain.
- Luang Prabang grid, serving some 5,500 consumers.
- Savannakhet and Thakhek grid, serving about 24,000 consumers and
- Champassak, Saravane and Sekong grid, with a total of 13,000 consumers and is being significantly extended through the Southern Provinces Electrification Project.

2.1.4 National Development Plan

(1) New Economic Mechanism Program (NEM)

Since 1986 Laos has embarked on an new reform program whose main purpose is to transform the Lao economy into a market economy. This reform program consists of the following components :

- the removal of the official distribution network and of the state marketing boards,
- a price reform to help the emergence of prices reflecting relative scarcities,
- the establishment of more clearly defined property rights and the privatization of the majority of state-owned enterprises,
- the development of factor markets
- the opening up of the Lao economy to international competition,
- a financial reform to favour the creation of a market-adapted banking and financial system,
- a tax and budget policy reform,
- a reform of the system of macroeconomic management and
- institutional reforms necessary to the functioning of a market economy

Under the NEM the Government has pursued and managed various improvement of bureaucratic activities as well as stabilization of national economy. Some of these consequences are observed in the actual achievements during the Third Five Year Plan period as shown below :

	Average Growth Rate per year (%)	
	<u>3rd Five Year Plan</u> (1991-1995)	<u>Actual achievement</u> (1991-1994)
GDP	7.0 %	7.0 %
Agriculture	5.7 %	6.4 %
Industry	9.6 %	8.9 %
Service	7.8 %	6.0 %
Per Capita GDP	3.9 %	4.2 %

The above results indicate that the growth targets of the Third Five Year Plan are almost satisfied with a 7.0 % of growth rate of total GDP.

In the circumstances, the Government of Lao PDR has decided to embark on an ambitious policy agenda for the next 5 years up to the year 2000. These policies are reflected in the Public Investment Program (PIP) as shown in Table 2.1-16 which indicates that the GDP growth will be maintained at 7% per year to 1995/6 and then at 8% up to 2000. At the same time, the proportion of the Government revenues funded from domestic resources is expected to reach to around 30% of GDP.

Table 2.1-17 shows the Program Budget from the year 1994/5 to 1999/2000 with an

allocation plan to each sector. A high growth rate (43.8 % per annum) is attached to the budget for industrial sector and at the same time the highest proportion to the total amount of budget is to be allocated to the transport sector for the next five years. Among the transport sectors, about 88 % of budget will be input to the road sector as shown in Table 2.1-18.

TABLE 2.1-16 PUBLIC INVESTMENT PROGRAM TARGETS

2.1.5 Transportation in Laos

(1) General

Since Laos, located in the Indochina Peninsula, is a landlocked country sharing its border with China, Vietnam, Cambodia, Thailand and Myanmar, the Transportation system in Laos is developed in economic/political relation to such neighbor countries. Especially, the establishment of effective transportation system with Thailand and Vietnam which have international seaports is expected to enable to access their seaports for the socio-economic development in Laos.

The transportation system in Laos is mainly composed of roads, inland waterway and aviation, and no railway. The vertebra of the transportation system is the road transport overwhelmingly. As shown in Table 2.1-19 the total transport volumes as of 1993 amount to 1,730 thousand tons for freight and to 16.8 million persons for passenger. The shares of road transport are 1,437 thousand tons or 83.1% freight transport and 16.0 million persons or 94.9% of passenger transport, which of inland waterway transport are 290 thousand tons or 16.8% of freight transport and 7.0 million persons or 4.2% of passenger transport as of 1993.

TABLE 2.1-19 TRANSPORT VOLUME

Year	Freight (1,000 tons)				Passenger (1,000 persons)			
	Roads	Waterway	Air	Total	Roads	Waterway	Air	Total
1989	583	29	1	613	91,015	490	105	91,610
1990	542	263	1	806	12,588	583	117	13,288
1991	615	1066	1	1,682	14,118	636	118	14,872
1992	1,409	284	2	1,695	15,648	690	160	16,498
1993	1,437	290	2	1,729	15,961	703	162	16,826

(2) Road Network

The total length of the roads for the whole country as of 1994 is 18,344 km while the ones as of 1992 and 1993 were 14,130 km and 14,176 km respectively according to the Basic Statistics of Lao PDR as shown in Table 2.1-20. This stretch of road length by around 4,000 km for recent one year was caused by registration of rural roads. Of the whole road network 2,450 km and 5,140 km are paved and gravel respectively. The remainings are earthen and mostly not passable for vehicles in rainy season.

TABLE 2.1-20 LENGTH OF ROADS FOR WHOLE COUNTRY

Tarred Roads	2,403	2,450	2,446
Graveled Roads	4,724	4,622	5,138
Earthen Roads	7,003	7,104	10,760
Total length of the roads	14,130	14,176	18,344

The road network is classified into 4 classes consisting of National Road, Provincial Road, local roads and special roads. The National Road serves the nation's socio-economic and cultural development and national defense, connecting the capital city with other provinces and neighboring countries. Provincial Road serves socio-economic and cultural development within a province and links province to province or district to district. Local roads are distributed in towns, villages and districts. Special roads intend to serve mining, industrial or forestry development.

However, the identification of the National Road network as well as the Provincial Road network is not completely clarified. In the Decree No 43/CM of October 1987 the National Road system was defined as "existing" and "intended", the total length of the former being 3374 km. After that MCTPC made adjustment and estimated the length of National Road Network to be 5,449 km which is composed of 3,782 km of Official, 1,195 km of Unofficial and 472 km of Assumed. Of the National Road Network defined as "existing" 1,570 km are paved, 1,060 km are gravel and the remainings are earthen according to National Transport Study (NTS) 1991.

The National Road Network in Lao PDR is shown in Figure. 2.1-5. The major National Roads as the internal network are NR 1, NR 2, NR 4, NR 6, NR 7, NR 8, NR 9 and NR 13. The NR 13 having a length of 1,370 km is the trunk road in the Lao PDR, which links Luang Prabang in the North with Khon, the border with Cambodia, in the South. This route passes through the major urbanized area of Vientiane, Thakhek, Savannakhet and Pakse. NR 7, NR 8 and NR 9 lead to the Vietnam borders, and NR 1 to China. Among these National Roads NR 1, 4, 6, 7 located in the northern provinces are less than 5 meters in width and in an poor surface condition although paved roads. NR 8, NR 9, NR 12 and NR 10 were and will be playing an important role as the international routes for land -locked Laos. NR 8 leads from Thakhek via Lak Xawo to Vinh, sea port of Vietnam. NR 9 leads from Savannakhet to Da Nang, sea port of Vietnam. NR 12 will link Thakek with Hon La of Vietnam and NR 10 connects Pakse through Chong Mek with Ubon Ratchathani in Thailand.

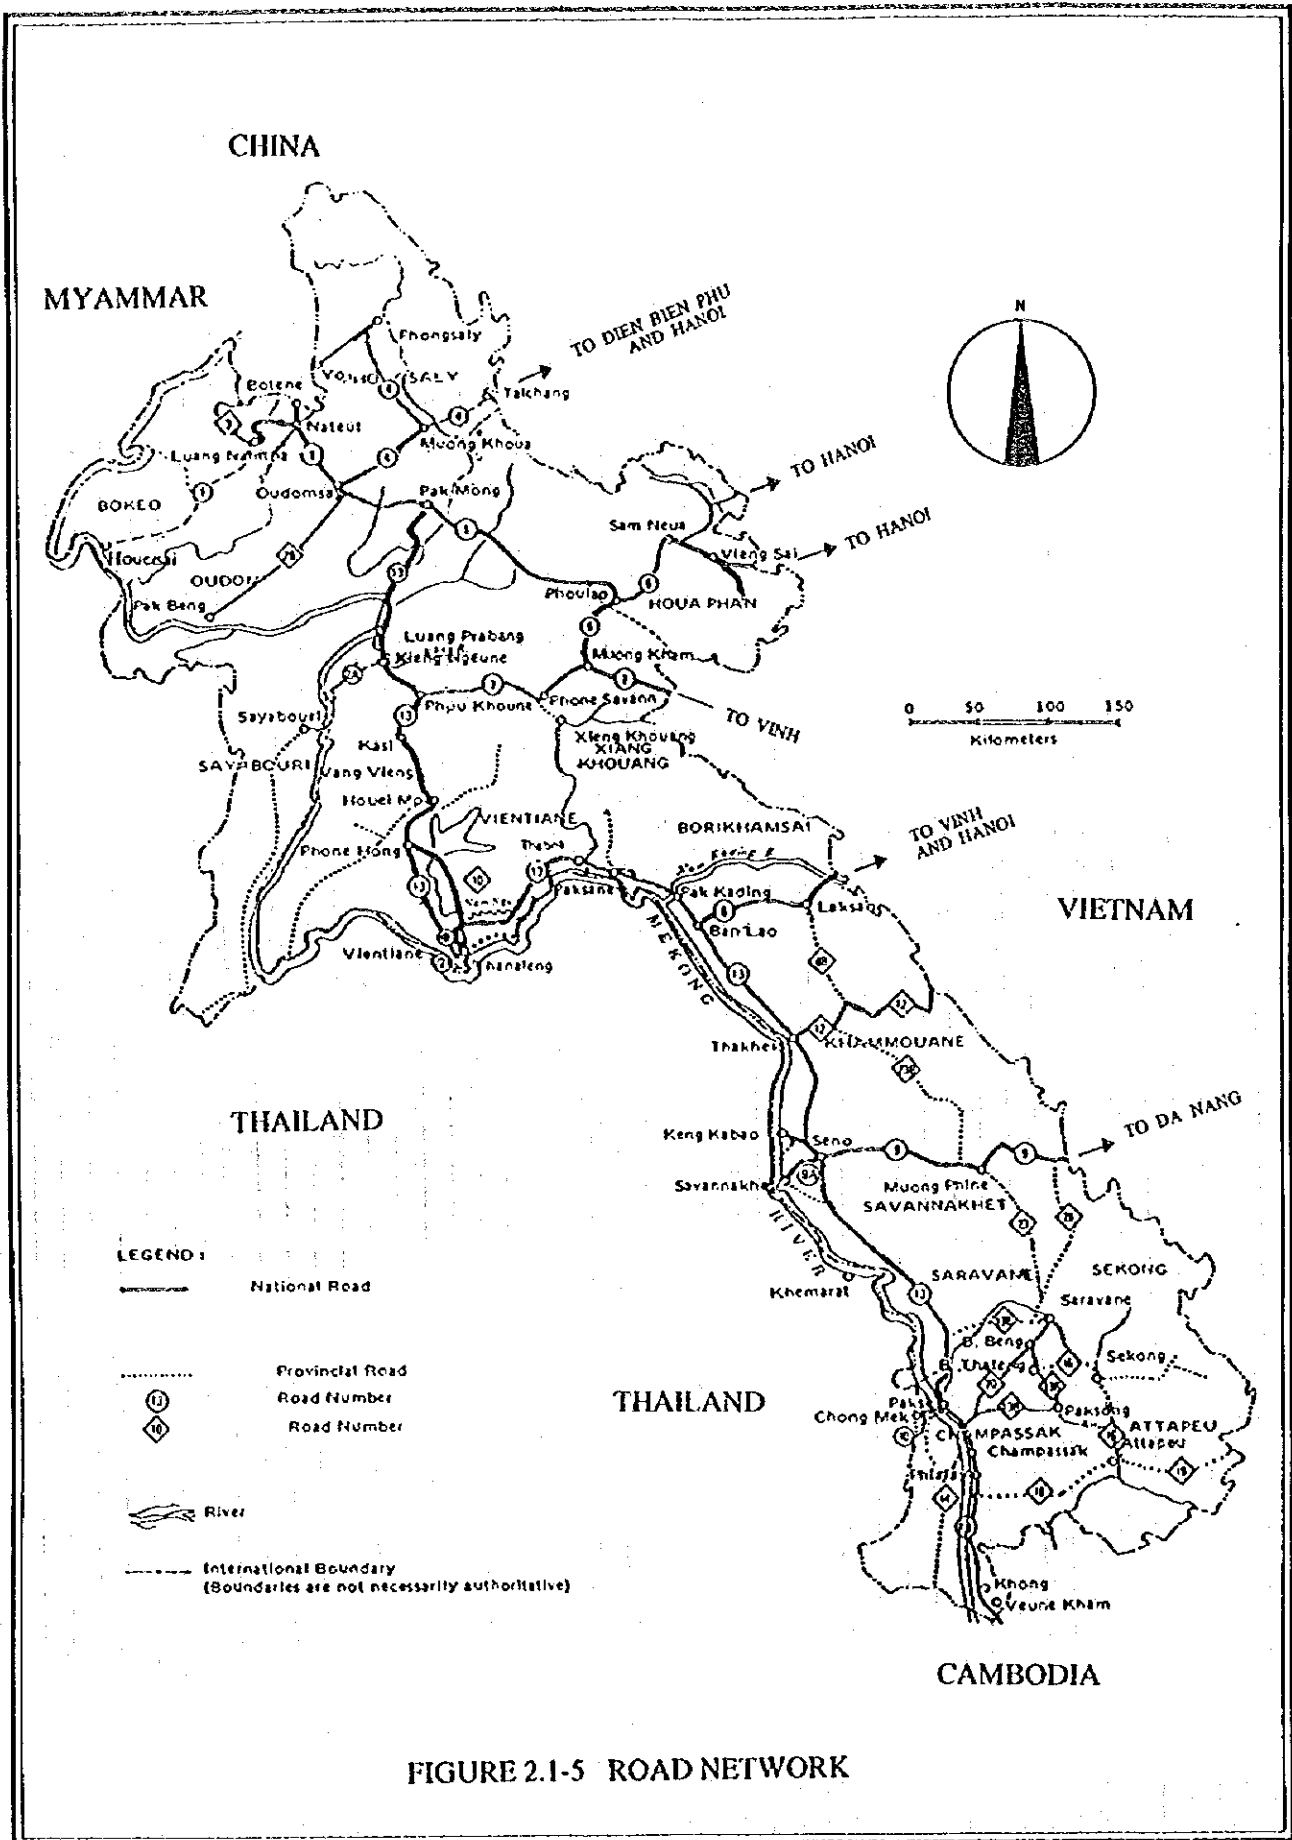

FIGURE 2.1-5 ROAD NETWORK

(3) Inland Waterway

The Mekong river, 40% of the whole length of around 5,000 km run through Lao PDR, plays a major role of inland water-borne transport. The waterway section from Ban Houei Sai to Luang Phrabang is navigable throughout the year for 25 - 40 DWT boats. The section from Luang Phrabang to Vientiane is observed to be passable for 60 DWT boats during the high-water season although there are many rapids and the section is not navigable in the dry season except small boats. The section between Vientiane and Savannakhet, the main river transport section of the Mekong river in Laos, is navigable throughout the year and for up to 200 DWT vessels in rainy season although there are many sand bars and rocks. The section from Savannakhet to Pakse is not passable except during a few months of the rainy season for small boats limitedly. The section from Pakse to Khinak which is located near the border with Cambodia, the southmost running of the Mekong river in Laos, is used for tour traffic and local trade traffic through the year. (Referred from NTS and Statistics on Inland Water-borne Transport, IMC 1987).

The year-round traffic densities in line haul on the Mekong river, according to the survey of Interim Mekong Committee (IMC) conducted from November 1985 to October 1986, on the section of 459 km reach from Vientiane to Savanakhet were 5,990 thousand ton-km for freight and 7,846 thousand p-km for passenger. These densities are as almost equal as ones on the section of 714 km reach from Vientiane to Ban Houei Sai.

The share of river transport decreases in recent years since NR 13 is being improved, NR 8 has been completed and there was some opening of Thai border crossing by ferry and new bridge.

(4) Aviation

There is one airline enterprise in Laos at present. Lao Aviation, which was reorganized as an autonomous enterprise in 1989, services on both domestic and international airlines. The domestic services operate Y-7 (52 seats), Y-12 (18 seats) and ATR-42 (50 seats). The main airlines of domestic services link Vientiane with Pakse, Savanakhet, Luangprabang, Xayaboury, Xiengkhuang, Namtha, Thakhek and Vienxay on a regular basis. The international services with B-737 (150 seats) link Vientiane Bangkok, Hanoi and Phnompen via Ho Chi Min, and with ATR-42 Chiangmai. Two foreign airline, Thai International Airline and Vietnam Airline, enter the services to Vientiane. There are some non-regular flight between Vientiane and the capitals of neighbor countries. The international transport volume by Lao Aviation as of 1994 are 83,000 persons for passenger and 2,000 tons for freight, while by Thai International are 78,000 persons and 2,500 tons. The volume by Vietnam Airline are small.

(5) Current Transportation Policies

1) Policies and Strategies

Although Lao PDR is landlocked surrounding by 5 countries, the location is centered among the countries in the Indochina Peninsula. This geographical situation, changing the viewpoint, enables Lao PDR to be also the center of communication/ transportation in the Indochina area. However, the network of the existing transportation systems and facilities are all old and deteriorated and limited in capacity, which previously impeded the development of socio- economy in Lao PDR.

To resolve situations above and to expedite the development of socio-economy the government of Lao PDR has established the Development plan for Socio-economy to year 2000. In the transportation sector of the Development Plan the policies and strategies for establishing an efficient transport network are summarized as follows:

- to complete the construction of vertical and horizontal strategic roads, rehabilitate and develop the roads to every province and to every important town in all over the country and concentrate to develop the rural roads in complex in the cooperation with other sectors;
- to establish an efficient network between road transport and other transport mode such as water-borne transport, aerial way and traditional transport;
- to establish the exit roads to seaports in the seashore of Indochina;
- to develop the roads and railways for mining, agriculture, forestry industry and exportation;
- to conduct the inland transport, transit transport, and transport through the borders to be lawful.

2) Development Plan for Transport

Succeeding to the Strategy plans for State Investment to year 2000, the development plans for Communication, Transport, post and Construction for the Period from 1995 - 2000 have been established by MCTPC. The major development plan on transportation sector by transport mode are follows:

Road

- Continue to complete the betterment construction of NR 13 with double bitumen surface treatment;
- Construct the strategic road NR 1 from Thathom - Xieng Khouang - Kha Keut to be completed as 2-season passable road;
- Construct and rehabilitate the Xieng Khouang road to link with international road, Houei Sai - Boten, Hongsa - Pak Beng and Luang Namtha - Xiengkong;
- Construct NR 8 as paved road;
- Rehabilitate NR 9 to be passable through seasons;
- Survey/design and construct paved road for NR 18;
- Rehabilitate NR 7 as paved road;
- Improve NR 10 (Pakse - Muang Kao - Thai border);

- Study for the Construction of the Mekong bridges at Pakse, Pak Beng and Savannakhet.

Waterway

- Survey the fluvial way in the Mekong river from North to South;
- Construct and/or rehabilitate the ports in the Economic Quadrangle Area to Luang Prabang;
- Continue to construct the bank protection of the Mekong river to prevent from the erosion;

Aerialway

- Continue to rehabilitate Wattay airport and study for New International Airport in new location;
- Rehabilitate the domestic airfields, medium size and small size airfields, following the existing Master Plan for the Aviation Development in which planned to rehabilitate and upgrade Luang Prabang Airport for the landing of B 737;
- Rehabilitate the airport services to open widely the domestic and international airlines;

Railway

- Survey, design and implement the construction of railway from Vientiane to Nongkhai in Thailand;
- Survey the feasibility for some railways: From China border to Vientiane, Vientiane to Xienkhong, Vientiane to southern provinces, Thakhek to Vietnam and on the NR 8.

3) Current Projects

The Government of Lao PDR, each year, has spent about 30% - 40% of the total national budget to the maintenance and construction project for communication, transportation system, out of which the road projects account for more than 90%. The sources of the fund almost depend on the foreign Aids. The main donor among the aid agents and countries is Asian Development Bank (ADB) which has extended loans since the beginning of 1980's. The major current projects for the improvement of roads as of 1995 are follows:

- ADB 4th Road Improvement Project for NR 13N

This project comprises of the improvement of a section 223 km long with double bitumen surface treatment (DBST) from Vang Vieng to Luang Phrabang, the reconstruction of 27 bridges and repair of the ferry facility of Nam Ou, the construction of a workshop and the provision of equipment, materials and spare parts for road maintenance work. The construction started in March 1992 and will be completed in the end of 1995. The total cost amounts 32.4 million USD.

- ADB 5th Road Improvement Project for NR 13N

The project components are to improve the section from Luang Phrabang to Pak Mong

of 114 km long as DBST, to reconstruct 34 bridges and to provide equipment, materials and spare parts for road maintenance. The construction started in the mid-1993 and will be completed by mid-1996. The total cost amounts 20.5 million USD.

- ADB 6th Road Improvement Project for NR 16

The project components are composed of the improvement with DBST of a section 193 km long between Saravan and Attapeu via B. Beng, Tha Teng and Xe Kong and the construction of 27 bridges. The construction has started this year. The total budget amounts 26.3 million USD.

- ADB 7th Road Improvement Project for NR 10 and NR 13S

The status of this project is now at the tender stage for construction implementation, the components of which are composed of the improvement of the whole length of NR 10 (39 km) from the Thai border to Pakse and the improvement of 160 km long section from the Cambodian border to Pakse. The completion is scheduled in the year 2000.

- Pavement Project for NR 6

This project financed by Germany is to construct pavement along the section of 93 km long from Phoulao to Xam Neua. The construction started in 1994 and will be completed in 1997. The budget is composed of a loan of 15 million DM and a grant of 2.5 million DM.

- 39 Bridges Reconstruction Project along NR 13S

This project comprises the reconstruction of 15 bridges/culverts and their approach roads along NR 13S between Namkading and Thakhek. The project cost granted by Japan amounts 1,080 million yen. The project started in January 1995 and will be completed in February 1996. The phase - 2 project between Thakhek and Savanakhet is now under the design stage.

- 3 Bridges Reconstruction Project along NR 13S.

The objective of this project is to reconstruct 3 bridges with long spans along NR 13S (Xebangfay bridge, Xebanghiang bridge and Xebangnouan bridge). The finance for this project is granted by AIDAB. The project is now at the tender stage.

2.2 Socio Economic Conditions in Study Area

2.2.1 Definition of Study Area

(1) Project's Area of Influence

The project bridge is planned at the strategic location in the Southern part of the Lao PDR from the viewpoints of transportation and commodity flows. Pakse is at the location accessing to Cambodia and Southern Vietnam via NR 13, and to the gateway of Thailand via NR 10. In the eastern side of Pakse, there exist a wide hinterland of the project bridge with high development potential in agricultural activities. The study area which would be affected directly and indirectly by the project bridge consists of the following four provinces in the southern part of Lao P.D.R. :

- Saravane province
- Sekong province
- Champasak province and
- Attapeu province

The present socio-economic conditions of the influenced area are summarized in Table 2.2-1 in order to grasp its potential in the whole country. The shares of socio-economic activities of the study area in the whole country are as follows:

Land area	= 18.6% of the whole country
Population	= 19.8%
Rice production	= 25.3%
Vegetable production	= 37.7%
Coffee production	= 91.5%
Tea production	= 51.1%
No. of establishments	= 20.9%

About 20% of total population and establishments of the country are concentrated in the study area.

Another feature of the area is represented by the production of agricultural commodities. The Champasak province almost monopolizes coffee production of the country with about 92% of share in 1994.

(2) Champasak Province - Direct Influence Area

The area of influence explained above is an extremely wide area. Therefore, analysis below will focus on the direct influence area of the project bridge, mainly within the Champasak Province.

The Champasak province is a direct influence area of the project bridge and at the same time, Pakse, the provincial capital city, is a center of economic activities in the southern provinces.

TABLE 2.2-1 ECONOMIC INDICES OF SOUTHERN PROVINCES

Province	Index		
	Population '95 (1,000 persons)	Rice Production '94 (tons)	Vegetable Production '94 (tons)
Southern 4 Provinces			
1. Saravane	258	124,582	18,275
2. Sekong	64	13,100	30,800
3. Champasak	503	226,702	1,830
4. Attapeu	88	34,230	2,450
(A) Total	913	398,614	53,355
(B) Whole Country	4,605	1,577,023	141,391
(A)/(B)*100 %	19.8	25.3	37.7

Province	Coffee Production '94 (tons)	Tea Production '94 (tons)	No. of Establishments '91
Southern 4 Provinces			
1. Saravane	1,253	907	994
2. Sekong	720		98
3. Champasak	6,280	86	3,940
4. Attapeu	17		350
(A) Total	8,270	993	5,382
(B) Whole Country	9,035	1,943	25,807
(A)/(B)*100 %	91.5	51.1	20.9
