ATTACHMENT - 1 QUESTIONNAIRE FOR HOUSEHOLD SURVEY

### **QUESTIONNAIRE**

NO.	4
Area	:
Date	:

SURVEY
ON
PRESENT WATER USE
AND
HOUSEHOLD INCOME

This questionnaire is prepared by the JICA Study Team (the Japan International Cooperation Agency) in cooperation with WAJ (the Water Authority, Jordan) to upgrade the water service level in Zarqa District. Results of the survey are key information to formulate a water system improvement program. Your cooperation would be most grateful.

Name	 	•
Address	1	- :
Occupation	1	_

			dults :		· · · · · · · · · · · · · · · · · · ·	person person
2. House made of : 1) Brick 2) Con	ncrete / stone	3) Wood	4) Others			
3. Religion : 1) Islam 2) Chri	stian (Catholi	c, Protestant, etc	c.) 3) Othe	ers		
4. Major water source :				: 7		
Source	Drinking & cooking	Laundering	Bathing	Toilet	Gardening	Others if any
1) WAJ'S Pipe Water House connection 2) Tank lorry (private)						
3) Bottled Water	<del></del>					
4) Spring or wells				<del></del>		
5) Others						
6. How is water pressure at your house tap  1) Low  2) Avera  7. Do you use any water purifier (filter) at	ge 3)	High os?	<u> </u>			
1)Yes 2) No			ė.			•
8. Do you use any house pumps? 1) Yes 2) No						*
D. How much water are you using?	:					
litre / day or		buckets	/ day	•	·	
0. How many days a week you can have p	oiped water?					
io. Flow many days a week you can have p	-					

2) 1.5 times 4) 3 times or more

1) Same as the present 3) 2 times

1) Yes	2) No
13. How much tariff do you pay	for water, sewerage and electricity per month?
2) Sewerage Puplic : Private :	JD / month  JD / month  JD / month  JD / month
14. Do you feel your monthly pa	yment reasonable?
1) Yes	2) No
* If no, select the reason 1) Poor quanlity 3) Expensive as c	from the following:  2) Less quantity or pressure ompared to the total income
1) Less than 100 JD 2) 100 JD - 200 JD 3) 200 JD - 300 JD 4) 300 JD - 400 JD 5) 400 JD - 500 JD 6) 500 JD - 600 JD	
7) 600 JD or more, (Appro	ximately JD / month)

12. Do you have any water storage device in your house?

18 m

1

Thank you for your cooperation!

### 1. GENERAL

1

There are several studies being carried out by GTZ and USAID. Particularly, "Draft Report on Water Scarcity as a Challenge for Jordanian Industry" prepared by GTZ on April 1994 provides a complete set of information on 35 major factories in Amman and Zarqa area.

The Team, composed of JICA Study Team and WAJ Zarqa officials/engineers, accordingly, focused on obtaining information on water use pattern and future water demand of major factories located within the study area. Stress was also placed on whether they have keen concerns about nowadays issues such as water conservation and environmental pollution.

The factory survey, finally, involved total 43 factories in Zarqa and Rusaifa. First, 21 large and medium sized industries which have own wells were selected for the survey. The survey was conducted in a period from 14 January to 8 March 1995, having an interview with the managers concerned for inquiry. In the course of the field reconnaissance, it was found many small and medium sized factories exist in the study area, facing serious water shortage. Supplemental survey on the remaining 22 medium and small scale factories was, eventually, planned to have contact mainly by telephone. It required a whole month of July 1995. Particular attention was paid to their water sources, amount of groundwater usage, and willingness to connect with WAJ pipes.

### 2. MAJOR INDUSTRY OF THE AREA

Zarqa and Rusaifa are one of principal industrial center of the country, manufacturing a variety of goods. They are products from oil refinery, tanning, power generation, pulping, spinning, weaving, tanning, brewery, soft drinks, reinforced bars, steel pipes, chemical processing and dairy. These product are both for internal and overseas markets.

Large scale factories are Jordan Petroleum Co., Pepsi Cola Co. and Spinning and Weaving Co. in terms of number of employees. Most of the factories, 15 out of 21 factories surveyed, started operation in 1960s and 1970s when the government has stressed needs of urgent industrial development in the country. Employees working at these 43 factories exceed 10,000 persons in 1994. They are mainly residents in Zarqa and Rusaifa.

### 3. FACTORIES SURVEYED

Prior to the factory survey, the Team has asked WAJ Zarqa engineers to provide general information on major factories in the study area, including those of wastewater quality, water consumption, number of wellfields, etc., all available at WAJ. In review of the data collected, the Team determined to have direct or indirect contacts with several factories to update and supplement the data. Tentatively selected were 21 large and medium sized factories that have more than 30 employees and are consuming a large quantity of water from their wells. As described in the preceding section, 22 medium and small sized factories were then added to the survey. To show exact location of these factories the Team visited and telephoned, an industrial location map was prepared as seen in Fig.-D1.

### 4. METHOD OF SURVEY

As regards large scale factories, the Team prepared a questionnaire sheet prior to initiation of the survey as shown in tables in Attachment - 1. This arrangement is to fill out the latest data in an uniform format. Each item contained in the questionnaire sheet was inquired carefully to minimize miscommunication and misunderstanding. Any obscure remarks made by interviewees were reconfirmed and examined at the site.

As to the medium and small scale factories, inquiries are made by telephone to the selected 22 factories. Following are major inquiries:

- 1) How many wells are constructed and in operation in the factory?
- 2) How much drafting capacity does the pump have?
- 3) How much water do you abstract from the wells?
- 4) How much water are supplied daily from WAJ and by water tankers?
- 5) How much water do you want from WAJ?
- 6) How many employees are working in the factory?

### 5. SUMMARY OF RECONNAISSANCE SURVEY AND INTERVIEW

Many valuable data and information were obtained in the survey. They are all helpful in familiarizing general aspects of industrial activities in the project area, in projecting future industrial water demand, and in assessing methods and processes applied for industrial wastewater treatment and disposal. All information obtained at the large and medium sized factories were filled out in the uniform format during the interview at the site.

Table - D1 shows a summary of present water use and future water demand of the factories. More detailed information are presented in Annex Tables - AD1 to AD42 including wastewater quality records of WAJ. Major findings are described hereunder with emphasis on present water use pattern and future water requirements.

### 5.1 WATER CONSUMPTION

1

1

From the survey results, total water consumption by these factories including groundwater from their private wells and water conveyed through WAJ pipes and/or by water tankers may exceed 18,000 m3/day.

There are more than 33 industrial wells constructed and being in operation in the study area. In addition, 7 wells exist and are not operated mainly because of aggravated water quality.

Groundwater from the wells is their major water source of the industry. Groundwater consumption accounts for approximately 90% of total consumption at the factories. Pumps installed in the wells have a drafting capacity 2,300m3/hour or 20.1 mcm annualy in total. Groundwater drafting by these factories may reach to 15,000 - 17,000m3/day or 5.5 - 6.2 mcm annualy, equivalent to approximately 30 % of the pump capacity. As compared to 25.5mcm, annual water production by WAJ Zarqa in 1993, their water consumption is considered not negligible (25%).

Fairly large number of 30, out of 43 factories, are receiving water through WAJ's pipes. The water supplied to these factories, however, are mainly for drinking purpose. WAJ data show relatively small water consumption, around 700 m3/day in 1994.

Out of them, Jordan Petroleum Co., Pepsi Cola Co. and Hussein Power Station are the largest water users. They operate 14 deep wells equipped with submersible pumps. Their groundwater consumption is approximately 12,000m3/day or 70 or 80 % of total water consumption by factories

surveyed.

In a broad term, large and medium scale factories rely on their private wells, while small scale factories depend on water tankers, of which water tariff is usually five to ten times as expensive as that set up by WAJ. Some of them, according to the survey, are being obliged to stop operation simply because of water shortage. It is recommended that some urgent remedial measures to curb this critical situation are of vital importance to enhance industrial activities in the area.

### 5.2 FUTURE WATER REQUIREMENT

Despite growing water demand according to expansion plans of the factories, large scale factories tend to rely on their own wells for future. Their willingness to receive WAJ's water stands relatively low. Most of them addressed their intention to receive WAJ's water only for drinking purpose of employees as enumerated in the tables. One exception is seen at Hussein Thermal Power Station where aggravation of groundwater quality is eminent. The manager we interviewed ardently showed his desire to receive WAJ's water which contains less TDS.

To the contrary, middle and small scale factories who have no bore holes are suffering from water shortage. This can be understood from the fact that they rely on tank water and their willingness to connect is comparatively large. Since WAJ places first priority on domestic water supply, they may not be allowed to use WAJ piped water for industrial purpose.

It can be concluded that large and medium sized factories will rely on their own wells rather than WAJ's piped water in future. This may be attributable to the fact that WAJ is currently practicing intermittent water supply at most of Rusaifa where many large scale factories are located.

To ensure industrial development of the area, however, it is considered essential 1) to supply piped water to the factories which have no wells and/or 2) to promote construction of private wells. Their water demand is tentatively estimated from the survey results at 600 m3/day at most excluding that of Hussein thermal power station. In the present study, this value is considered as additional industrial water demand.

### 6. TEAM'S FINDINGS AND RECOMMENDATION

1

The Government has been exerting effort to strengthen monitoring and management of wastewater and solid waste disposal. It was, however, observed during the survey that some factories are not necessarily taking appropriate measures for pollution control and monitoring. Following are Team's findings and recommendation related to the factory survey.

- 1) It is favorable that the Government of Jordan has introduced a groundwater abstraction charge since January 1994. Thanks to the enforcement, most of interviewees usually have their keen concern about water recycling insides plants. Some of them, however, are still at a low level of awareness about needs of wastewater quality control and conservation of the natural environment. Because of their nature of profit oriented companies, they tend to disregard their significant impacts on human life and environment. This can be explained from the fact that they, although considered a few, are not properly treating their contaminated industrial wastewater to a satisfactory level. Regulatory measures to enhance wastewater quality control and monitoring shall be established by the ministry concerned as early as possible.
- 2) It is desirable that WAJ Zarqa has been taking an appropriate measure, by periodically conducting wastewater sampling and testing at most of the factories in Zarqa Governorate. According to the laboratory testing, some factories often fail in meeting the industrial wastewater quality standards established by the Government. As WAJ Zarqa is not in a position to sue for this non-observance, Zarqa Governorate or related agencies may be recommended to take legislative measures against such factories in accordance with the law and regulation established.
- 3) The Team and WAJ officials have visited garbage and waste disposal sites in Rusaifa. All garbage from industry and households in Zarqa, Rusaifa and Amman, except liquid waste, are dumped at the designated garbage disposal site for land reclamation. It's located a few hundred meters east from Zarqa-Amman Highway. It collects 1,500 ton of garbage daily. To monitor groundwater contamination by infiltration and leach of the rainwater, periodical water samplings at a nearby obserbation well are conducted under the authority of the Amman Municipality. Number, depth and site of the observation wells are definitely inappropriate and insufficient. There is another liquid waste disposal site near boundary of Rusaifa and Amman municipalities. They receive waste of 35-40 tankers daily, each of which has a carrying capacity of 10m3. A wastewater pond constructed for 2 year use is a lagoon type that expects natural evaporation. The staff stationed there believes rainfalls during winter seasons are flushing out the contaminated wastewater into the tributary of the Zarqa River. Selection of disposal sites shall be carefully made in consideration of groundwater contour, topography, dominating wind direction, demographic features of the area, city planning, etc.

- 4) Recycling of wastewater is not always common in the factories. The survey shows merely 30 % of the factories achieved 50 % water recycling ratio. If the ratio could be raised, water consumption will drop simultaneously, resulting in water saving and conservation. In view of declined water table at most of the existing wells in Zarqa-Amman Aquifer, enhancement of water recycling by laws and regulation will be effective and beneficial on water conservation in the area.
- 5) For some end users, quality of water supplied is not major concern. Their requirements are variant to the purpose of the water usage. In the study area, WAJ Zarqa has several abandoned wells which are not in operation. It is also observed on the premises of the factories that total 7 wells constructed are abandoned mainly because of the declined groundwater quality. If dual water supply systems could be established to convey slightly brine water to such water users separately from the domestic water supply, these wells can significantly alleviate the water shortage of the area. For this purpose, further study to verify viability of this system is required.
- 6) A number of small scale factories which cannot afford having own wells are suffering from the chronic water shortage. They are obliged to use water supplied by water tankers, nevertheless it's costly, insufficient in quantity and unreliable. The government's policy is to push industrial development in the country. To support this policy, water supply through piping system to such factories shall be established as early as possible.

E. SYSTEM LAYOUT

Į.

#### APPENDIX E SYSTEM LAYOUT

1

As the first step to perform a network analysis of the existing water supply system, system layout was prepared. We obtained the updated 1/10,000 scale topographic maps from the Royal Jordanian Geographic Center which were used to plot on them the existing water supply systems for the whole area from Sukhneh and Hashemiyah in the North to Russaifa and Schneller Camp in the Southwest. These maps have been organized on A1 size drawings (7 sheets). The town planning has been superimposed on these maps for the purpose of supporting and properly show the water lines.

Work on each area within the study limits is defined as follows:

- The distribution system in Sukhneh and Hashemiyah has been completed and drafted on the newly obtained topographic maps of scale 1/10,000. Only few locations were checked by excavation to verify information obtained.
- The location of the Zarqa city water mains have been completed and checked with WAJ staff and "as built" drawings for Zarqa Water Supply Project, Contract No. 56/90-C, dated 1993 and other drawings prepared by WAJ showing the pumps, wells and distribution mains, and plotted on the base maps to a scale of 1/10,000. Some time was spent before the permits from the concerned authorities could be obtained in order to be able to start the excavations to verify the pipes and connections.
- The Russaifa water supply mains data were collected and checked with the "as-built" drawings of Zarqa Russaifa Water Distribution System and Sewerage System, Contracts 2A, 6A, 7A, 3B, 4B and 7C of 1982 1985 and other drawings prepared by WAJ showing the pumps, wells and distribution mains, and with the help of the WAJ staff including verification pits and plotted on the Russaifa base maps.
- The System Layout Drawings of 7 sheets are produced which show alignment, size, material and installed year of the pipes of more than 80 mm in diameter.

F. FLOW & PRESSURE MEASUREMENT AND CALIBRATION

1

# Appendix F - Flow & Pressure Measurement and Meter Calibration -

## Table of Contents

1.	Objec	ctives	F-1				
2.	Pipelins, Bulk Meters and Large Consumer Meters Surveyed						
3.	Surve	ey Method	F - 2				
4.	Survey Results						
	4.1	Flow and Pressure Survey	F - 2				
	4.2	Calibration of Bulk Meters	F-3				
	4.3	Calibration of Large Consumer Meters	F - 3				
Attacl	hment -	1 C - Value Computation	F-4				

#### 1. OBJECTIVES

1

1

Existing transmission mains are installed in 1980s. They are in use more than 15 years. WAJ's bulk meters are functioning but their accuracy is not known. In the service area, there are many large consumers who consume much water.

The Survey was organized to assess conveyance capacity of the major pipelines and to calibrate the existing bulk meters and large consumer meters.

#### 2. PIPELINES, BULK METERS AND LARGE CONSUMER METERS SURVEYED

Figs.- F1(1) to (3), F2(1) to (2) and F3 show the location map of the transmission lines, WAJ's bulk meters, and the large consumer meters respectively, where surveys are conducted.

#### (1) Flow and Pressure Measurement Survey

For flow and pressure measurement, following three lines are selected in view of their relatively large flow rates.

- 1) Azraq Khaw Line (600 mm in diameter, black steel pipes installed in 1980)
- 2) Khaldieh Khaw Line (600 mm in diameter, black steel pipes installed in 1986)
- 3) Khaw Zarqa Line (400 mm in diameter, black steel pipes installed in 1982)

#### (2) Calibration of WAJ's Bulk Meters

Calibration involved all existing bulk meters installed in pumping/booster pumping stations in Zarqa District. They are 22 in number which are given in the existing system flow chart. Flow meters calibrated in the flow and pressure survey stated above are excluded.

#### (3) Calibration of Large Consumer Meters

Large consumers scatters in Zarqa District. Selected 10 large consumers are based on the information provided by WAJ.

#### 3. Survey Method

#### (1) Flow and Pressure Measurement Survey

To assess the performance of the existing transmission lines, flow rate and pressure were measured at the outlet of the pumping station, ie, the starting point of the water transmission and the terminal point of the inlet to tank/reservoirs at the same time. Flow meter used are portable Ultra-sonic Flow Meter. Continuous measurement was made for twelve (12) hours.

#### (2) Calibration of WAJ's Bulk Meters & Large Consumer Meters

Portable ultrasonic flow meters gave accurate results of flow rate measurement. Diameter of meters measured covers wide range of 25 mm - 600 mm. The flow rate recorded by the ultrasonic flow meters was then compared to the measurement made by WAJ and customer meters at the same time.

#### 4. Survey Results

#### 4.1 Flow and Pressure Survey

The results are summarized in the table below:

Line (From - To)	Pipeline Length (km)		Pressure at Lower point (Bar)	, ,	Diff. Elevations (m)	C-Value
Khaldieh - Khaw	17.0	6.2	1.4	1,375	. 0	137
Khaw - Zarqa	8.0	10.0	1.5	1,268	-28	153
Azraq - Khaw	66.0	34	2.4	2,300	56	165

The C-values obtained are unexpectedly large in comparison with the general characteristics of the similar aged pipes. This may be attributable to the hydraulic profile of these pipelines which have less friction losses.

#### 4.2 Calibration of WAJ's Bulk Meters

Most of the meters are functioning well within an allowable limit of 15% deviation. They have a general tendency to record lower flow rate than normal, particularly at Khaldieh pumping station and Murhib pumping station.

#### 4.3 Calibration of Large Consumer Meters

Most of the meters are also likely to record lower flow rate than normal. This situation becomes worse at Jaber Zaidan and Talhony Mill. The flow meter calibration suggests necessity of meter replacement or further detailed pipeline survey at Al-Hikma Hospital.
