Chapter 1 Mexican Economy and Automotive and Electrical/Electronic Industries

Chapter 1 Mexican Economy and Automotive and Electrical/Electronic Industries

1.1 Mexican Economy and Manufacturing Industry

1.1.1 GDP Share of the Manufacturing Industry

Table 1.1-1 shows changes in GDP and sectoral share between 1990 and 1995. The manufacturing industry was the second largest sector measured by a percentage share of real GDP, next to the tertiary sector consisting of sales and service. Although the industry's share fell from 22.92% to 22.48% between 1991 and 1994, it has picked up to 22.61% in 1995. According to data during the decade up to 1991, the share maintained a 21% level since 21.65% in 1981, except for 1983 and 1984 when it dropped to a 20% level, then rose to a 22% level on and after 1989. Generally, a country with its manufacturing sector's share exceeding 30% is considered to be an industrialized country, and the share peaks out at a nearly 40% level. This represents the emergence of the tertiary industry to replace the secondary industry.

The government has announced that the growth rate of real GDP was minus 6.9% in 1995, following the economic crisis triggered by the marked devaluation of the peso at the end of 1994.

1.1.2 Employment in the Manufacturing Industry

Changes in Mexico's working population between 1986 through 1994 and sectoral breakdown are shown in Table 1.1-2. Yearly changes in the manufacturing industry's share during the same period are shown below. It has been relatively stable at a 10%-11% range with some declining trend.

1.1 - 2

1.1.3 Exports and Imports by the Manufacturing Industry

According to trade statistics during the past decade (Table 1.1-4), the country's total trade balance turned into a deficit in 1990, which continuously increased to 18.5 billion US\$ in 1994. Then, the drastic devaluation of the peso at the end of the year spurred exports and diminished imports, resulting in a surplus of 7.3 billion US\$ in 1995. Changes in the total trade balance shown in Table 1.1-4 are plotted on a graph in Figure 1.1-1. Detailed export and import data during the four years after 1992 are shown in Attachment 1-1. From these data, trade balance of the manufacturing sector was estimated as shown in Figure 1.1-2.

Table 1.1-5 shows the contribution of the manufacturing sector to the overall trade balance. Clearly, the manufacturing sector's continuous deficit (except for 1995) has been offset by a surplus in the mining sector including petroleum.

Finally, Maquiladora has gradually been increasing its share in the country's exports and imports, as shown in Figure 1.1-3 and 1.1-4 for 10-years. For instance, Maquiladora's share in export was 43.1% in 1994 and 39.2% in 1995, and that in import 25.8% and 36.1% respectively.

1.1.4 Manufacturing Trade Organizations

1) Outline of trade organizations

All the enterprises in Mexico are required to register with any of national chamber (Cámara) under the law, "Ley de las Cámaras de Comercio y de las de Industria." In the manufacturing sector, there are 67 industrial chambers organized for each industry, under the United Federation of Industrial Chambers (Confederación de Cámaras Industriales de los Estados Unidos Mexicanos: CONCAMIN). In addition to CONCAMIN, there are two other federations, COPARMEX and CONCANACO. CCE (Consejo Coordinador Empresarial) coordinates the three federations. Legally, Cámaras are private organizations, and those related to the automobile and electric/electronics industries are listed as follows:

National Chamber of Manufacturing Industry

(CANACINTRA: Cámara Nacional de la Industria de Transformación)

Chamber of Manufacturing Industry in the State of Nuevo Leon

(CAINTRA: Cámara de la Industria de Transformación del Estado de Nuevo León) Chamber of Manufacturing Industry in the State of Jalisco

(CAREINTRA: Cámara Regional de la Industria de Transformación del Estado de Jalisco)

National Chamber of Electric Manufacturers

÷,

(CANAME: Cámara Nacional de Manufacturas Eléctricas)

National Chamber of Electronics and Telecommunications Industries

(CANIECE: Cámara Nacional de la Industria Electrónica y de Comunicaciones Eléctricas)

In addition to legally authorized Cámara, there are 30 trade associations (Asociación) that are purely private in nature and which enterprises join on a voluntary basis. The following are the five trade associations which are related to the automotive and electric/electronic industries:

AMIA	Asociación Mexicana de la Industria Automotriz, A.C.
ANPACT	Asociación Nacional de Productores de Autobuses, Camiones y Tractocamiones, A.C.
INA	Industria Nacional de Autoprates, A.C.
ANFAD	Asociación Nacional de Fabricantes de Aparatos Domésticos, A.C.

ANIPCO Asociación Nacional de la Industria de Programas de Cómputo, A.C.

Figure 1.1-5 shows an organizational structure of the above trade organizations.

2) Problems of trade organizations

In principal, it is desirable for all the enterprises to participate in any trade organization. And the trade organizations, regardless of whether they are divided into several factions, should be ready to cooperate in dealing with issues on a nationwide scale. There are several reasons for this. Firstly, trade organizations can be used as a channel of communication for private enterprises to exchange opinions and to convey their view or request to the government or other organizations. Secondly, if the majority of enterprises do not belong to any trade organization, it would be difficult to grasp the real situation they are in.

According to the survey by the Team, however, there are not a few enterprises which do not register with any Cámara. Furthermore, Cámara does not have a complete, and updated list of registering companies, nor statistical data of the industry. This makes it difficult to offer nationwide services such as subcontract intermediary and data base services.

"Ley de las Cámaras" has recently been revised (December 1996 - January 1997). Before the revision, as mentioned above, even though the registration with any Cámara was obligatory to all the enterprises, there were some enterprises who did not comply with this, especially among micro- and small-sized enterprises. And those enterprises registered with any Cámara,

automatically, were affiliated to it. The revised law separates the obligatory "Registration" and the voluntary "Affiliation" to Cámara. The new law has the penalty clause for not-registering enterprises. On the other hand, the registration fee to be incurred by all the enterprises is reasonably low to avoid that it may excuse nonfulfillment of registration. All the "Cámaras" are to submit the registration list to SECOFI, which will serve as base data of "Sistema de Información Empresarial Mexicano" It is expected that the complete nationwide list of enterprises to be available under this scheme will facilitate the grasp the real situation of each industry.

1.2 Mexican Manufacturers and the Automotive and Electrical/Electronic Industries

1.2.1 GDP and Employment

Real GDP and employment of the manufacturing sector by industry are shown in Tables 1.2-1 and 1.2-2. Note that both automobile and electrical/electronic industries, including final products and parts, are included in Item VIII of the macro-economics statistics. Item VIII is divided into 11 sections (Rama), out of which the following 4 sections are covered by this study.

- 53 Electrical
- 54 Electronic
- 56 Automotive assemblers
- 57 Autoparts

Tables 1.2-3 and 1.2-4 illustrates the GDP and employment by aforementioned classification(Rama).

Measured by the four-year average after 1990, the automotive industry (including both finished products and parts) accounted for 10.0% of the manufacturing sector's share of real GDP (2.3% of total GDP). As for employment, it accounted for 6.2% of the manufacturing sector's share and 0.7% of total employment. In comparison, the electrical/electronic sector amounted to 2.6% of the manufacturing sector's share in terms of real GDP (0.6% of total GDP), and 3.0% in terms of employment (0.6% of total employment).

INEGI's data were used for employment among various statistical data available.

1.2.2 Trade Balance

Table 1.2-5 and 1.2-6 shows the share of the entire manufacturing sector in total exports and imports, in addition to the respective shares of the automobile and electrical/electronics industries. Note that the figures include parts exports and imports, and that both household- and industrial-electrical equipment are taken into account with regard to electrical/electronic industries. Figure 1.2-1 illustrates breakdown in 1995.

の理想

Contraction of the

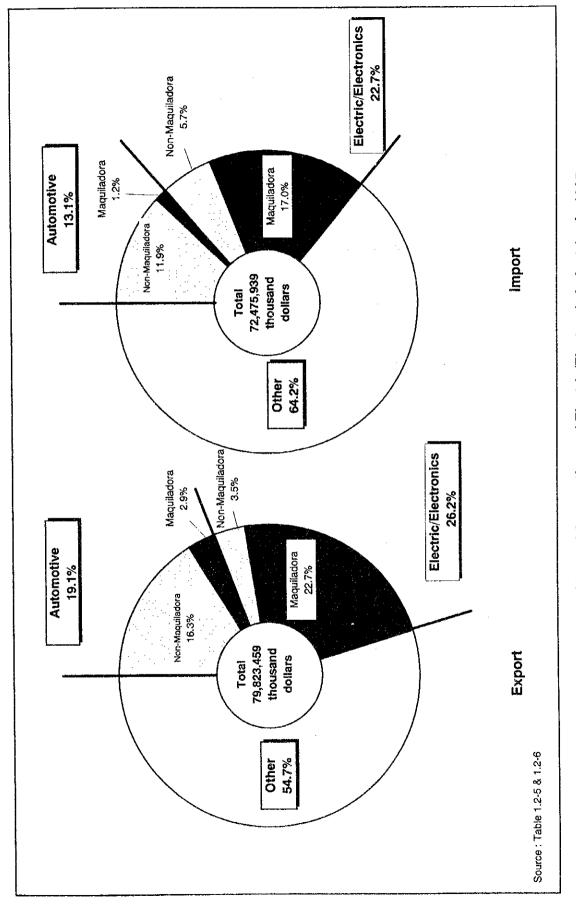

Figure 1.2-1 Trade Share of Automotive and Electric/Electronic Industries in 1995

1.2 - 7

に調える

The average share of the manufacturing sector in total exports was approximately 84% during the 2-year period between 1994 and 1995, or 73% if Maquiladora's contribution is excluded. The average share for 1992 and 1993 was 80.1% and 66.2%, respectively, indicating the steady growth of the manufacturing sector's weight in exports.

In 1995, automobiles and electrical/electronic products in total accounted for nearly half (45.3%) of all exports, serving as major foreign-currency earners. While both industries play a crucial role in Mexico's exports, their relations with Maquiladora differ significantly. Comparing Maquiladora firms' contribution to total exports with that of non-Maquiladora companies, as far as the automotive industry is concerned, the former accounted for 2.9% and the latter 16.3%, indicating that exports of completed cars and automotive parts by non-Maquiladora sources represent a much larger share. On the other hand, exports of electrical/electronic products by Maquiladora companies accounted for 22.7% of total exports, and non-Maquiladora 3.5%, the former outstripping the latter.

(and

1.3 Automotive Industry in Mexico

1.3.1 Historical Background of the Automotive Industry and Government Policy

(1) 1920s - 1980s

Į.

The history of the automotive industry in Mexico dates back to 1926 when Ford started knockdown production, which was followed by GM in 1937 and Chrysler in 1938. In 1961, the number of manufacturers grew to 12 and total annual production reached 60,000 units.

In 1962, a decree was issued to accelerate import substitution in the automotive industry and promote integrated production within the country. Major targets of the decree are as follows:

- 1) Import ban on engines and mechanical parts, and designation of some local parts as mandatory contents.
- 2) Prior approval of imported parts
- To raise the share of local contents regarding finished cars to 60% or more of direct production cost.
- 4) Ban on parts production by assemblers, except for engines
- 5) Mandatory participation of 60% or more local capital in parts manufacturers

The decree controlled the import of automotive parts by assemblers and raised the minimum ratio of local contents to 60% in an attempt to foster local parts manufacturers. In response, assemblers started to build assembly as well as engine plants in 1962, mainly in Mexico City and its surrounding areas, to meet import substitution requirements. At the same time, a large number of local parts manufacturers and factories were established. Among them were manufacturers of key components such as transmissions and crank-shafts under technical assistance of U.S. leading suppliers.

(2) 1970s

In the 1960s, the industry recorded a threefold increase in production volume. Increased parts imports for car assembly, however, deteriorated the country's overall trade balance. In 1972, a decree required assemblers to offset a certain percentage of imports by exports. In particular, the decree required the export/import ratio of each manufacturer, which was 30% in 1973, to increase by 10 percentage point annually. In addition, the following incentives were introduced to encourage exports by assemblers:

- 1) Requiring each assembler to export parts made by local suppliers in which local capital holds a majority of share, at least 40% of total exports.
- An assembler who maintains a trade surplus can increase its production quota.
- An assembler who exports 60% or more of total production can additionally manufacture new type engines.

At the same time, a policy was taken to encourage local contents and save foreign currency, including: (a) to mandate parts manufacturers to comply with the 60% local-contents rate, and (b) to grant an additional production quota by 1% in excess of the 60% level.

In response, assemblers made new investment plans for increased exports. However, the first oil crisis in 1973 drove the world economy into recession, which brought about lower automobile demand, making it difficult for the automotive industry to reduce trade deficits through export growth.

In 1977, the government issued a decree requiring assemblers to establish a foreign currency balancing rule in an attempt to encourage the automotive industry to reduce the trade deficit. The decree, at the same time, intended to boost exports of automobiles and related products by developing Mexico into a world-class automobile production base. The following matters were enforced under the decree:

- To introduce a foreign currency balancing rule, requiring assemblers to offset all foreign currency spending required for production activities by exports.
- 2) 50% of exports consist of products made by parts manufacturers in which local capital holds a majority of share (40% in the 1972 decree).
- 3) Higher ratio of mandatory local-contents in real terms

- 4) To increase the minimum ratio of local contents required for parts, which may be included in local contents for assemblers and exports by parts manufacturers, from 60% to 80%.
- 5) Abolition of production quota and price control

As the 1977 decree required assemblers to compensate for all foreign currency expenditure required for production by their own exports, they started to build assembly plants that mainly produce export cars, mainly in the northern part of the country. However, the second oil crisis in 1979 brought about a worldwide decline in automobile demand, which diminished automotive exports from Mexico. This was followed by the oil boom which boosted domestic demand (1978 - 1981) and spurred imports of raw materials and parts required for automobile production, further deteriorating trade balance of the automotive industry as a whole.

(3) 1980s to the present

In 1982, Mexico faced a serious debt crisis, which made the country suffer from a severe shortage of foreign currency reserves and a drastic reduction in domestic automobile demand. In 1983, the government announced a decree to counteract the situation, which aimed to convert the automotive industry (which generated nearly half of the country's trade deficit) into an foreign currency earner, and improve the industry's productivity to enhance its international competitiveness. The decree contained the following regulations:

- 1) Restriction on the number of types and models produced
- 2) Higher ratio of mandatory local contents
- 3) An assembler who maintains a trade surplus and exports more than 50% of total production can produce additional model(s).
- 4) Lower ratio of local contents for export cars corresponding to the export/production ratio.

Exports of engines rapidly increased in early 1980 as engine factories built in the beginning of 1980 started commercial production. Exports of finished cars soared in the mid-1980s, with the lower ratio of mandatory local contents for export cars and the Big Three's strategy to establish Mexico as a source to

1.3 - 3

supply small cars to the U.S. market. In 1983, the trade balance of the automotive industry turned into a surplus, which continued until 1989.

It was around 1986, the year in which Mexico joined GATT, that her policy shifted from protectionism to deregulation and liberalization. In 1989, a decree was issued in line with this policy change, abolishing restrictions based on the local-contents formula and the list of parts considered as mandatory local-contents: a shift from the previous import substitution strategy. Major reforms initiated by the decree are as follows:

- 1) Assemblers are able to import passenger cars and trucks on condition that the total imports must be below 15% of domestic sales.
- For every 1.00 US\$ worth of import of new cars, assemblers must export 2.50 US\$ of the same in 1991, 2.00 US\$ in 1992 and 1993, and 1.75 US\$ in 1994.
- 3) Following the termination of local-contents designation rule for parts, the ban on imports was lifted, while limited by the domestic rate of additional value in 5).
- 4) Abolition of restrictions on in-house production by assemblers.
- 5) Calculation of the ratio of local contents on the basis of value added within the country, rather than on parts cost or imported materials (domestic value added rate : 36%).

The import of finished cars was deregulated (liberalized) with import restrictions on small cars upheld; finished cars have actually been imported since in 1990. At the same time, assemblers were allowed to procure parts from overseas sources, even though they still had to achieve the local-contents ratio based on the domestic value-added rate. Consequently, domestic parts manufacturers were exposed to competition with foreign products, and thus forced to introduce international-class technology and make efforts to improve productivity and quality. In fact, after the decree, assemblers increased parts import for assembly. Imports of materials for assembly purposes jumped from 950 million US\$ to 3.89 billion US\$ between 1989 and 1990. This brought the automotive industry back to a trade deficit. On the other hand, parts manufacturers who modernized and upgraded production facilities steadily increased indirect exports through assemblers. Exports of

Carlos and

automotive parts grew from slightly below 400 million US\$ in 1990 to 2.1 billion US\$ in 1995.

In 1995, as NAFTA became effective, the decree was amended with some additions to ensure harmonization with NAFTA requirements. In particular, the decree contained gradual amendments in the Automobile Decree to avoid contravention of the NAFTA agreement within 10 years after the effectuation (by 2003). Major provisions are summarized as follows:

- To maintain the domestic value-added rate at 34% up until 1998 and cut it by 1% on an annual basis so that it settles at 29% in 2003. In principle, the rate will be suspended on and after 2004.
- To lower the export/import ratio of each enterprise from 0.8 in 1994 to 0.55 in 2003. The ratio system is to be abolished after 2004.
- 3) To immediately eliminate import quota restrictions on finished cars.

It remains unclear whether the Automobile Decree will be completely eliminated.

(4) Summary of changes in promotional policy for the automotive industry in Mexico

As discussed in the previous sections, the Mexican government issued a series of decrees to promote the automotive industry (collectively referred to as the Automobile Decree) in 1962, 1972, 1977, 1983, and 1989. The first four decrees were designed to encourage import substitution for automotive parts, mainly relying on regulatory measures consisting of: 1) designation of parts subject to mandatory local contents, 2) import restrictions on finished cars, and 3) restriction on the in-house production of parts. In addition, the 1972, 1977 and 1983 decrees obliged assemblers to export their products, and gradually imposed stricter export obligations. Then, the 1989 decree made a sharp turn in that it aimed to remove protective measures for the auto parts industry to transform it into an internationally competitive industry. To this end, the decree was geared to encourage the automotive industry to participate in the international market, enhance price competitiveness, and raise productivity by attracting foreign investment.

義

Then, in May 1995, amendatory and supplementary decrees were enforced to ensure that the "Decree on Modernization and Promotion of the Automobile Industry" (Automobile Decree) complies with North American Free Trade Agreement (NAFTA). (For the details of the current Automobile Decree amended in May 1995, see section 2.4.1.)

1.3.2 Production, Exports and Imports of Finished Products

The production, domestic sales, imports and exports of passenger cars, minibuses/trucks, trailers and buses between 1982 and 1995, based on SECOFI's statistical data, are summarized in Tables 1.3-1 and 1.3-2, and Figure 1.3-1. In 1995, as shown in Table 1.3-2, domestic sales of passenger cars and minibuses/trucks dropped by 71.7% and 64.9%, respectively, compared to the previous year. Accordingly, their production for the domestic market in 1995 plummeted 70.9% ad 72.0%, respectively. In terms of overall production, however, they managed to limit the reduction at 16.3% in 1995, as export growth largely compensated for the sluggish domestic market following the devaluation of the peso in 1994.

The Table 1.3-3 describes exports of passenger cars and mini-buses/trucks as a percentage of total production volume in recent years. Even if we ignore the anomalous figure of 88.8% in 1995 which resulted from the gloomy domestic market and dramatic export growth, it is clear that exports have significant share in total production of automobiles.

1.3.3 Export/Import of Automobile Industry

(1) Balance of trade of the automobile industry

Table 1.3-6 depicts the trade balance of the Mexican automobile industry, including both finished cars and autoparts. In general, a trade deficit prevailed up until 1994, despite autoparts exports from Maquiladora. The situation reversed in 1995, when the exports enjoyed substantial growth following the devaluation of the peso.

(2) Export/import of autoparts

The trade balance of the autoparts industry (excluding finished parts) is illustrated in Table 1.3-7 and Figure 1.3-2. With the figures including Maquiladora, there has been excessive imports of autoparts ever since the revision of the Automobile Decree.

10.00

1.3 - 12

In export and import statistics of autoparts in Mexico, approximately 70% of imported parts are classified as " parts for automobile assembly" and no further classification is made, due to the following reasons.

Under the import duty act, the import tariff rates depends of the type of autoparts, ranging between 10% and 15%. On the other hand, up until June 1995, there was a special provision which allowed a 10% uniform tariff rate to be applied to imported autoparts without any classification provided that they were approved by Comisión Intersecretarial de la Industria Automotriz, under HS No.89.03 of the tariff table. The special provision brought the following two benefits:

- 1) Lower import duties compared to those which depend on the classification of autoparts; and
- 2) Simplification of import procedures by eliminating the need to undergo several procedures when various autoparts are involved.

In practice, this provision was applied upon the import of autoparts by assemblers, which accounted for a substantial part of autoparts import. To be specific, it was applied to autoparts under the heading of HS No.98 in the import/export statistics by Anuario Estadístico del Comercio Exterior de los Estados Unidos Mexicanos -INEGI) imported by assemblers, and those under other HS codes imported by other autoparts companies for OEM and aftermarket purposes.

"Assemble materials for automobiles" in the import category in Table 1.3-7 are those imported by assemblers under the special provision, accounting for 67.1% of all autoparts imported in 1994. The special provision has not been applied since July, 1995.

Tables 1.3-8 and 1.3-9 tabulates major autoparts other than those under HS No.98 in the import/export statistics. These parts have been imported by autoparts firms other than assemblers.

A 1158) Allinity The

(3) Trade Specification Index (TSI)

Trade Specification Index is calculated by the following formula:

TSI = (Export - Import)/(Export + Import)

Any product exported from a country has a comparative advantage in international trade, while a product imported to a country has a comparative disadvantage. TSI is designed on the basis of this principle, and a trade surplus results in a positive value for TSI, while export without import becomes 1. A trade deficit appears as a negative value for TSI, and import with no export results in -1. The TSI value approaches 1 as the product's comparative advantage becomes bigger. On the other hand, a product with a higher comparative disadvantage comes closer to -1.

TSI values determined from data in Table 1.3-7 are presented in Tables 1.3-10 (autoparts as a whole). Although the TSI value has been taking a favorable turn, imports are still exceeding exports i.e. a comparative disadvantage. The TSI values for major autoparts in Tables 1.3-8 and 1.3-9 are shown in Table 1.3-11; as mentioned in (1), parts imported by assemblers are not included in these rough figures.

			(Unit :	Thousand US\$)

1.3.4 Structure of the Automobile Industry

(1) Assemblers

Under the current system, automobile assemblers are required to register with any of three national chambers, CANACINTRA, CAINTRA (State of Nuevo León), and CAREINTRA (Jalisco). However, member lists and data of two trade associations, AMIA and ANPACT, seem to be most reliable. According to them, assemblers of passenger cars, mini-buses/trucks, trailers, and buses, based on 1995 production data for the domestic market, are listed as follows:

Passenger cars	 8 companies: Ford, General Motors, Chrysler, Nissan, Volkswagen, BMW, Mercedes Benz, and Honda Note: Renault and Vehículos Automotores were engaged in production before 1986.
Mini hugo /tmialro	0 companies

Mini-buses/trucks	9 com	panies:		, ·		
	Ford,	General	Motors,	Chrysler,	Nissan,	DINA,

	 Mercedes Benz, Kenworth, Chasises y Autopartes Oshmex, and Volkswagen Note: Companies previously operated are Fábrica de Autotransportes (up to 1989), Renault (1986 only), Trailers de Monterrey (up to 1993), Vehículos Automotores (up to 1985), and Victor Patron (1994 only).
Trailers	 4 companies: DINA, Kenworth, Mercedes Benz, and Trailers de Monterrey Note: 3 companies operated previously are Fábrica de Autotransportes (up to 1990), Traksomex (up to 1983), and Victor Patron (up to 1993).
Buses	3 companies: DINA, Mexicana de Autobuses, and Omnibuses Integrales

Note: 2 companies previously operated are Fábrica Nacional de Autobuses (up to 1994) and Trailers de Monterrey (1990 only).

Assembly plants and production capacities of the above assemblers are listed below. Note that location is indicated by state.

Assembler	Assembly Plant Location	Plant Capacity
Ford	Chihuahua	n.a.
	Sonora	168,000 unit/year
	Edo, de México	150,000 unit/year
General Motors	Coahuila	150,000 unit/year
	Guanajuato	n.a.
Chrysler	Edo. de México	175,000 unit/year
	Coahuila	n.a.
NISSAN	Aguascalientes	120,000 unit/year
	Morelos	170,000 unit/year
Volkswagen	Puebla	185,000 unit/year
BMW	Edo. de México	1,450 unit/year
Mercedez Benz	Edo. de México	2,000 unit/year
Honda	Jalisco	15,000 unit/year
DINA	Hidalgo	n.a.
Kenworth	Baja California	n.a.
Trailers de Monterry	Nuevo León	n.a.
MASA	Edo, de México	n.a.

Table 1.3-12 List of Assembly Plants

Source: Banco de México, ELM Guide to Mexican Automotive Sourcing (Third Edition), SECOFI

.

While the current automobile decree specifies the minimum national value added rate of 34%, the interview survey reveals that some assemblers have achieved nearly 40%. Importantly, in-house manufactured parts are not considered in the calculation of the national value added rate. If they are counted, local contents of automobiles in Mexico reach a fairly high level.

Note: Before the amendment of the Automobile Decree in 1989, the localization rate of 60% on a parts cost basis was required (applied to passenger cars only). Based on rough estimates, the national value added rate of 34% seems to be equivalent to or higher than the 60% localization rate.

(2) Autoparts manufacturers

The directory of Association of Automotive Parts Industry (INA) lists approximately 500 companies as autoparts manufacturers in Mexico, of which 111 companies are INA members. According to INA, all of its member companies are primary (OEM) suppliers who deliver products directly to assemblers. Note that the directory does not include Maquiladora.

The table below (1.3-13) classifies approximately 500 automotive parts manufacturers listed in INA's directory according to type of parts. Needless to say, many companies manufacture two or more parts, resulting in grand total of 721.

Parts	No. of INA Members	Others
Accessories	11	59
Lubricating oil/Grease	3	21
Seats	4	27
Electrical	16	51
Radiators	3	2.2
Stamping	0	79
Brakes	10	23

Puebla	4	8
Yucatán	0	11
Total	111	387

Table 1.3-14 Autoparts Manufacturers by State

Source: INA Directorio 1994

In the automotive parts industry in Mexico, there are several group companies such as UNIK and CONDUMEX. In fact, 50 out of 111 companies having INA membership belong to group companies. Furthermore, in terms of employment size, 52 (62%) out of 84 INA member companies for which employment data are available are categorized as large enterprise having 250 or more employees.

Table 1.3-15	No. of Employees	of INA Members
--------------	------------------	----------------

No. of Employees	No. of INA Members
15 or less	0
16-100	13
101-250	19
251 or more	52
Total	84

Source: INA Directorio 1994

Ę

The number of years in operation is available only for 44 companies, of which 40 companies (more than 90%) have operated for more than ten years.

Other corporate data related to the automotive parts industry include BANCOMEXT's classification of 651 companies by processing technology, and CANACINTRA's list of 135 automotive parts manufacturers located in the state of Mexico and its vicinities.

Data on parts plants of assemblers are contained in "ELM Guide to Mexican Automotive Sourcing". Table 1.3-16 summarizes parts plants (including Maquiladora) and types of parts produced of six (6) assemblers, namely the Big Three (Ford, GM, Chrysler), Nissan, Honda, and Volkswagen, by state. The total production of passenger cars and mini-buses/trucks in 1994 by these six (6) assemblers is 1,096,791 units, accounting for 98.3% of total. Parts produced are export-oriented if produced by Maquiladora, and those manufactured by domestic plants are also partly exported, although major portions are used for domestic assembly. Some parts are supplied to other assemblers.

(3) Characteristics of the Mexican automotive industry

The Mexican automotive industry has the capacity to produce about 1 million care per year, including passenger cars, buses and trucks. As assemblers, there are 5 passenger-car manufacturers (the Big Three, Volkswagen and Nissan, which account for 99% of total production in 1994), and 12 bus/truck assemblers in addition to these. The number of autoparts manufacturers amount to 500-600 in total according to various statistics, out of which 110-150 firms are presumed as OEM suppliers.

In comparison, the Japanese automotive industry apparently consists of 11 assemblers, under which roughly 20,000 autoparts manufacturers operate. In Japan, about 20,000 firms form the subcontracting framework which is divided in stages primary parts production, parts unit and process, within the uniquely stratified, specialized production system.

Location	Assembler	Parts	Process
Sonora	Ford	Light, Lamp	Injection molding
Chihuahua	Ford	Electronic parts	
	Ford	Glass parts	
	Ford	Radiator, Heater, Condenser	Soldering, Stamping, Injection molding, Brazing, etc.
	Ford	Hose, Radiator tube	Plastic injection molding
	Ford	Engine	Machining
	GM	Ignition Switch, Signal, Oil pump	Wiring, Plastic
	GM	Engine control, Solenoid, Lamp	Soldering, Plastic, Wiring
	GM	Seat cover	Sewing
	GM(12)	Wiring harness	Soldering, Wiring
Coahuila	Chrysler	DOHC Engine	Machining
	GM(2)	Wiring harness	Soldering, Wiring
	GM	Engine	Machining
Nuevo León	Ford	Glass parts	
	Ford	Plastic components	Injection molding
	GM(5)	Wiring harness	Soldering, Wiring
Tamaulipas	Ford	Spring, Bracket, Steering wheel	Stamping
	GM	Panel cover	Injection molding
	GM	Body molding	Molding
	GM(3)	Wiring harness	Soldering, Wiring
	GM(2)	Control, Display	Wiring
	GM	Control, Audio	Soldering, Wiring
Aguascalientes	NISSAN	Engine	Aluminum die-casting, Stamping
Jalisco	GM	Shock absorber	Assembly
	Honda	Panel, Fender, Hood, Bracket	Welding, Stamping, Bending
Querétaro	Ford	Air conditioning	Brazing, etc.
México	Chrysler	Condenser	Brazing, Soldering, Stamping
	Chrysler	Engine	Machining, Welding
	Chrysler	Body components	Stamping
	Chrysler	Transaxles	Machining, Welding
	Ford	Engine block, etc.	Casting, Machining
	GM	Engine	Machining, Welding, Casting
	NISSAN	Engine	Casting
Morelos	NISSAN	Bumper	Plastic injection
Puebla	VW	Engine, etc.	Stamping, Assembly

Note : Numbers in parentheses indicate no. of plants. Source : ELM Guide to Mexican Automotive Sourcing(Third Edition).

Table 1.3-17 shows the subcontracting ratio in assembler. Generally speaking, European and American assemblers adopt a different purchasing system from Japanese and Korean counterparts. They tend to directly deal with parts manufacturers even if the parts in question are small, implying that they deal with more manufacturers directly. On the other hand, in Japan, suppliers are organized into a multilayered structure led by primary suppliers, so that assembly makers deal with a limited number of suppliers. Furthermore, suppliers are classified as to which assembly maker they supply their products, i.e., each supplier is captive to a particular assembler and few of them deal with more than two makers.

Automoti	ve Manufacturers	Rate of In-House Production	Transacting Enterprises
Toyota	(Japan)	30%	229 (Only cooperative group members)
Nissan	(Japan)	30%	193 (Only cooperative group members)
GM	(U.S.)	70%	12,000 (1,500 firms per one factory)
Ford	(U.S.)	50%	2,300
M. Benz	(Germany)	43%	2,000 (Small venders excluded)
Peugeot	(France)	50-60%	950 (Including 300 primary suppliers)
Renault	(France)	50-60%	1,100 (Planning to decrease to 700 - 800)
Fiat	(Italy)	-	1,000 (Planning to decrease to 300 - 400)
Kia	(S. Korea)	30%	250 (Only Korean domestic makers)

Table 1.3-17	Rate of the Specialization Structure of
Automotive	Industries of U.S., Europe and Asia

Source: International Comparison of Subcontracting Dealing Practices, March 1993, National Association for Subcontracting Enterprises Promotion

(and the second

Figure 1.3-3 is a conceptual drawing of the relationship between assembly makers and suppliers by using hypothetical examples of Japanese company A and U.S. company B. The figure also shows the comparable structure of the Mexican automobile industry; autoparts manufacturers in Maquiladora are excluded to make comparison much easier. In-house production refers to the

share of assembler's parts factories other than those in Maquiladora, and parts from Maquiladora are not included in the imports shown in the Figure.

Company A (Japan) has 230 primary suppliers and 2,000 - 3,000 secondary suppliers, whereas Company B (the U.S.) has 8,500 suppliers including both primary and secondary. If subcontractors serving for primary and secondary suppliers (tertiary and below) are added, both, A and B, companies have more than 10,000 SIs each. In contrast, taking Mexico as a whole, SIs merely amount to 500-600 even if repair-parts and motorcycle-parts manufacturers are included. This shows that the foundations of the Mexican autoparts industry are fragile, and the industrial structure of the automobile sector is shaped like an umbrella rather than a pyramid as in developed countries.

Naturally it is difficult to compare the figures directly with those of the hypothetical Japanese and U.S. companies whose production is 5 times as much as total production in Mexico. In addition, the number of suppliers is not necessarily proportional to the number of vehicles produced. According to Japan Automotive Parts Industry Association (JAPIA), automotive parts manufactured by Japanese suppliers are classified into 130 types, meaning that there would be more than 130 firms even if it is assumed that each company produces only one type.

1.4 Electrical and Electronics Industries in Mexico

1.4.1 Electrical and Electronics Industry in Mexico

(1) Historical background

The history of the electrical and electronics industry in Mexico divided into two phases; the period up to the mid-1980s during which the industry was protected under import substitution policy, followed by the period of trade liberalization. During the protection period, the household appliance industry serving the domestic market emerged, with the progress of parts localization. During the trade liberalization period, the appliance industry deteriorated, and companies who manufactured and shipped color TVs to the U.S. market, operating near the boundary (Maquiladora) thrived. In addition to the household appliance industry, the government's industrial promotion policy extended to the computer industry in the 1980s.

The following section describes historical background of two major electrical and electronics segments in the country, namely the TV and computer industries.

1) TV industry

History of TV manufacturing in Mexico starts from black-and-white TVs in 1950s, followed by color TVs in the 1960s. Then the industry operated under local products protection policy based on import substitution policy, until 1982, and it produced TVs for the domestic market. Major protection measures were import license and tariff designed to encourage the development of manufacturers of final products and parts. Also, to nurture parts manufacturers, assemblers were required to localize assembly of final products. In response, many parts manufacturers were established and started commercial production of picture tubes, transformers, and capacitors by making large capital investment. In the late-1970s, the country had local production capacities for major parts and components. However, a small domestic market prevented the industry to enjoy economy of scale, so that products were relatively expensive and lacked international competitiveness.

The economic crisis in 1982 led to sluggish domestic demand, and European and U.S. electric manufacturers withdrew from the market. In 1984, the government announced the Plan for Industry and Trade (PRONAFICE) and the Program for Comprehensive Export Promotion (PROFIEX), based on which the abolishment of the import license system and tariff reduction were implemented by the yearend. Manufacturers who had supplied their products to the domestic market which is exclusive to imports under the protection policy were way behind international standards in terms of quality, price, and design. They lost market share to imported products and were forced to reduce or terminate production or sell imported products. In 1980, 15 manufacturers were active in the TV industry, and by 1986, 7 withdraw from manufacturing. As a result, domestic production declined considerably and the 1988 figure became nearly one half (58%) of the 1981 level. Manufacturers further decreased in number, and in 1990, there were only four manufacturers of TVs for the domestic market, namely one Japanese company (Panasonic), one joint venture with a Japanese company (Clarion), and two local enterprises (Grupo Majestic and Zonda).

In exchange for withdrawal or suspension of production by manufacturers of TVs for the domestic market, production of some labor-intensive parts started to relocate from the U.S. in 1980, as driven by intensive competition in the These manufacturers moved into the Mexican border area to U.S. market. In late 1980, a large number of benefit from the Maquiladora program. Japanese companies built large assembly shops in the northern border area to produce color TVs and chassis. During the same period, Korean companies started production of TVs for export in Tijuana and Mexicali. As a result, color TV production by major Maquiladora companies surged from 3.8 million units in 1990 to 13.2 million units in 1995. During the same period, manufacturers of one million or more color TV sets grew in number from 1 to 10. At present, however, Maquiladora companies procure small portions of components and parts from local companies, thus not forming an effective linkage to the local industries. The Mexican government, in recognition of the situation, has been making efforts to foster local enterprises into supporting industries for Maquiladora.

2) Microcomputer industry

ani-

Again, the history of the microcomputer industry in Mexico is roughly divided into two phases: 1) the period during which foreign computer companies invested in Mexico under the government's protectionism and export-oriented policy, and 2) the period when non-competitive companies withdrew from manufacturing after liberalization of trade and investment. In this section, the historical progress of the industry in Mexico after 1981 is described with a particular emphasis on government policy that had major impacts on the computer industry.

Prior to the announcement of the 1981 Computer Program¹⁾, microcomputer demand in the country was all met by imports. The program enacted in 1981 intended to reserve production of microcomputers and peripherals for companies controlled by local capital, and protect and foster them. Another objective of the program was to help develop the computer industry by using proprietary technology in Mexico, while promoting import substitution and saving and earning foreign currency. In response to this policy, multinationals established joint ventures as the gateway to the growing Mexican market.

In 1985, IBM applied for approval of a investment project to establish a wholly owned, export-oriented venture. The government, holding high expectation for IBM in job creation, export expansion, and access to leading-edge technology, approved construction of a manufacturing plant wholly owned by the foreign company, which, however, was prohibited under the Computer Program. In fact, the IBM case triggered off the liberalization, and the government started to issue a permit for microcomputer production - which was previously issued to local companies only - to foreign companies (wholly owned subsidiaries) under the condition that they would export major portions of projects.

The GATT membership in 1986 entailed the broad-based policy shift to trade liberalization. In line with the new policy, the import license for

¹⁾ "Program Fostering Production of Electronic Computing Systems, Their Main Modules, and Peripheral Equipment"

computer parts, components, and semi-completed products was terminated, and tariff rates were lowered. While import restriction on final products remained in place, increased assembly of imported SKD kits diluted the effect of such restriction.

Under the Computer Decree issued in 1990²⁾, the termination of the import license system for computer products, the lowering of tariff rates, and the abolishment of the export/import restriction (previously 3:1) were incorporated³⁾. At the same time, however, the decree required computer manufacturers to balance foreign currency revenues and expenditures. This allowed foreign companies to ensure production activity leveraging low-cost labor in Mexico, while importing required parts and operating their plants to full capacity. Meanwhile, reduced protection of the domestic market forced uncompetitive U.S. computer companies to withdraw from Mexico. As a result, the computer industry is dominated by IBM, HP, and their parts suppliers.

1.4.2 Production, Exports and Imports of Finished Products

Unlike the automotive industry, the electrical and electronics industry is not required to report production, sales, exports and imports to the government, and statistical data have to rely on trade organizations. However, the following data furnished by different trade organizations are incomplete and inconsistent, and thus simply not suitable for analysis.

Domestic sales of electrical products between 1980 and 1995, based on data furnished by Association of Household Appliance Manufacturers (ANFAD), are shown in Table 1.4-1. Note that the data do not include imported products.

As for electronic products, CANIECE's production data - one and only source - are shown in Table 1.4-2. As for Maquiladora production, the Maquiladora Association provides data on color TVs - Maquiladora's principal product - which are shown in Table 1.4-3.

蘯

²⁾ "Decree to Establish Tax Incentives for Modernization of the Computer Industry"

³⁾ The export/import ratio for wholly-owned foreign companies (Apple Computer and Hewlett Packard) was 3:1, while 1:1 for companies which are 49% owned by foreign capital.

1.4.3 Export and Import of the Electrical/Electronic Industries

(1) Trade balance of the electrical/electronic industries

Table 1.4-4 shows the trade balance of the electrical/electronic industries in Mexico, in which household appliances and industrial equipment are both indulged with regard to the electric industry.

In Mexico, electrical/electronic industries are exporters enjoying a trade surplus, and 87% of exports are from Maquiladora (4-year average).

Following the devaluation of the peso which helped promote exports in 1995, growth in exports from non-Maquiladora companies amounted to 48% in the automotive industry whereas that in the electrical/electronic industries was much lower, namely 15.2%. This is because the automotive industry already had an international sales network with assemblers at the core, which enabled

A new

them to make export some of the products originally intended for the domestic market simply by making minor modifications in the specifications. On the other hand, non-Maquiladora companies in the electrical/electronics industries failed to enjoy substantial export growth because: (1) the marketability of their products in the international market is low considering their quality and design; and (2) they lacked the sales network change the direction of products to exports.

Table 1.4-5 shows the import and export data on household appliances, electronic equipment, and their parts compiled from Annuario Estadístico del Comercio Exterior de los Estados, including exports and imports by Maquiladora companies.

In Mexico, "Supplemental Regula #8 to the Import Duty Act" is provided to reinforce competitiveness of local products against imported ones. Many non-Maquiladora companies in the electrical/electronics industry, including assemblers, use Regula #8 under approval of SECOFI and imports parts under HS No.98.02 of the tariff table. Essentially, importers can enjoy the same benefits as importers of automotive parts subject to HS No.98.03 under the special provision.

(2) Trade Specification Index (TSI)

The TSI values calculated from trade balance in Table 1.4-5 are shown in Tables 1.4-6 (finished electrical and electronic products) and 1.4-7 (electrical and electronic parts). While finished products show a comparative advantage generally due to contribution by Maquiladora exports, the TSI value for parts has been negative for four years, ranging between -0.2 and -0.53.

1.4.4 Structure of the Electric/Electronics Industry

biological de la

Assemblers of household appliances, such as refrigerators and washing machines, are listed by CANAME and ANFAD. CANAME's directory classifies manufacturers according to product segment, and electrical products for home and office uses are categorized in Section 8 where 16 assemblers are listed. On the other hand, ANFAD's directory registers 26 member firms, Attachment 1-2 is a list of assemblers and their products on CANAME and ANFAD's directories, in addition to those estimated by the study team. Note that products are not known for some assemblers.

Among he ANFAD member firms, 21 companies are classified according to capital structure, as follows:

Wholly owned by foreign capital	9 companies
Majority owned by domestic capital	6
Wholly owned by domestic capital	6

CANAME's directory lists 218 companies, and if industrial electric apparatus and electric machinery related companies and household/office electric appliance assemblers are excluded, there are 67 parts manufacturers subject to this study.

The one and only directory of electronic industry is available from CANIECE. CANIECE's directory consists of 12 sections, and 589 companies were registered at D.F. and Jalisco as of July 1996. Table 1.4-9 shows breakdown of the membership. It registers only five companies in the state of Nuevo León where the second largest industrial city, Monterrey is located. Electronic equipment manufacturers in other states have their own sub-organization within CAINTRA.

manufacturers without clear indication, they have to be distinguished through hearing. Annex 1-2 lists electronic assemblers so identified and their products.

According to CANIECE's annual report, 62 companies newly registered with CANIECE in 1994 while 142 withdrew. In 1995, new registration totaled 45 companies, and withdrawal 100 companies. According to the data, 620 companies were registered in 1995, compared 770 in 1990. As far as the number of CANIECE-registered companies are concerned, the number of firms in the Mexican electronic industry is clearly in the declining trend.

1.5 **Maguiladora Companies**

Maquiladora has 30 years of history since 1965, and the number of companies registering with SECOFI totaled 2,184 as of October 1995. Of total, 1,489 companies (68%) are located along the border. Maquiladora companies, consisting of 12 industry sectors, employed approximately 670,000 persons as of October 1995. In 1994, employment amounted to 600,229, which accounted for 2.6% of the country's total and 26.1% of workers in the manufacturing sector. Changes in the numbers of enterprises and employment between 1988 and 1995, by sector, are shown in Tables 1.5-1 and 1.5-2. Note that there is another data indicating that 303 companies newly registered between January through August 1995, totaling 2,782 as of August. SECOFI's data base registers 3,133 companies.

Tables 1.5-3 and 1.5-4 show percentage shares of automotive parts and electric/electronic industries in Maquiladora in terms of the numbers of enterprises and employees. Compared to the automotive parts industry, the electric and electronics industry has more enterprises with less employees.

Then, based on 3,133 companies in SECOFI's data base, ownership structures of all the industries, the automotive parts industry, and the electric/electronics industry are compared as follows.

				(Unit : %)
(Capital	All Sectors	Autoparts	Electric/Electronic
Foreign	100%	41.9	61.4	57.6
Local	1-49%	9.9	11.6	15.9
Local	50%	0.8	0.5	0.3
Local	51-99%	4.3	2.4	3.7
Local	100%	43.0	24.2	22.5
Total No.	of Enterprises	3,117*	207	592

Table 1.5-5 Maguiladora by Capital

Source : SECOFI

Note : * Data for 16 companies are not available.

First of all, companies whose majority of the capital is owned by foreign capital account for 51.8% of all the industries, whereas the automotive parts and the electric/electronics industries represent approximately 73%, a 21 percentage points higher than the average. Compared to other dominant sectors in Maquiladora, textile and woodworking, the two industries are clearly positioned as major assembly bases of foreign manufacturers. Automotive parts are dominated by U.S. companies, and electric and electronic products by Japanese and Korean companies.

Finally, 592 electric and electronics Maquiladora companies are classified according to geographical location, as shown below. Major concentrations are seen in Tijuana and Cd. Juárez which are color TV assembly centers. Attachment-3 lists electric and electronics assemblers in Maquiladora.

Tijuana	(Baja California)	166
Cd. Juárez	(Chihuahua)	125
Matamoros	(Tamaulipas)	34
Nogales	(Sonora)	45
Reynosa	(Tamaulipas)	27
Mexicali	(Baja California)	18
Monterrey	(Nuevo León)	24
Chihuahua	(Chihuahua)	23
Piedras Negras	(Coahuila)	15
Others		115
Total		592
