P-wave velocity (km) Depth to interface(km)

6.2	0.0
6.6	13.0
8.0	38.0
8.1	50.0
8.2	80.0
8.4	300.0

Vp/Vs velocity ratio: 1.74
Lg velocity : 3.5 km/sec

Coda magnitude scale $Mc = -1.2 + 1.9 \log(coda) + 0.0004 * dist$ where coda is coda length in secs and distance is epicentral distance.

Information Page

Abreviations:

TIME: Origin time in GMT (hour, minute and second)

LAT: Latitude of epicenter LON: Longitude of epicenter

DEPTH: Focal depth in kilometer (Trailing F indicates fixed depth)

AGENCY: Hypocenter reporting agency

MAGNITUDES: Up to 3 different magnitudes are given

followed by type and reporting agency

RMS: Root mean square value of travel time residuals

STAT: Station code CO: Component DIST: Distance (km)

AZI: Azimuth from source to station

PHAS: Phase; The first letter characterizes onset

E(mergent) or I(mpulsive)

P: Polarity

HR: Hour, a * in front of of HR means that S - P time has been used

MN: Minute SECON: Seconds

TRES: Residual (seconds)

CODA: Signal duration in seconds

AMPL: Ground Amplitude (0.5*pp, nm) at period PERI PERI: Period of phase where amplitude is measured

BAZ: Back azimuth (station to event)

ARES: Back azimuth residual
VELO: Apparent velocity of phase
WT: Weight of phase in the location

APPENDIX 7 ENVIRONMENTAL IMPACT ASSESSMENT

7.1 Water Quality Test for the Shire River Water.

(1) Water quality test.

The water quality test of the Shire River water is carried out in order to obtain the baseline data for of Mangochi Bridge reconstruction project. Six water sampling points are chosen in the vicinity of the existing Mangochi Bridge (Figure 7.1). The water quality test is carried out with respect to following 12 parameters such as pH, conductivity, TDS, dissolved oxygen (DO), biological oxygen demand (BOD), chemical oxygen demand (COD), phosphate, nitrate, turbidity, permanganate value, suspended solid (SS), and E-Coli.

Traditional methods for the analysis/analytical examination of water samples were used according to "Standard Methods for the examination of water, 13-th edition". A filtration and incubation method was used for the microbiological examination of water (i.e., E-Coli quantification). Results of all parameters tested are summarized in Table 7.1.

(2) Discussions.

The water quality with respect to each parameter will be discussed, separately. Compared with water quality data, measured by Talling et al. [Main Report Table 5.1], no big difference between results obtained through this study and Talling's one is recognized, so it can be said that the water quality sampling work conducted within this study is valid and its results is meaningful and useful as the baseline data of current Shire River water at rain season. Impact of the bridge construction activity on the local water quality will be summarized, briefly.

- 1. pH The high pH ranging between 8.0 8.3 indicates that the biological photosynthetic activity in the water, that produce a lot of CO_2 is dominant the water body around the existing Mangochi Bridge. CO_2 may also be produced in water through the biological oxidation of organic matter, in particular in polluted water (World Health Organization Guideline values range between 6.5 8.5).
- 2. Electrical conductivity Measurement of this parameter is made on site immediately since this value change with time. The conductivity of the Shire River water is almost same at all six points (ranging between 298 301 MSCM⁻¹). This indicates that the same ions are distributed and hence the same water chemistry in this stretch of the river. This range is normal for the surface water of this nature. EC value will be increased during the construction since more ions will come into solutions due to the re-suspension of deposited sediments from the river bottom.
- 3. Total dissolved Solids (TDS)

 TDS values range between 146 150 mg/l, i.e., the river water is in almost same river water chemistry. This range is normal for the natural water bodies (World Health Organization Guideline value is 1000 mg/l).
- 4. Dissolved oxygen (DO) DO values range between 5.1 6.3 mg/l, and this range is far below the saturation concentration (10.0 mg/l). The oxygen level concentration should be expected to become lower when river bottom sediments will be re-suspended due to the scouring or the construction activities. These will increase the oxygen demand and hence would reduce the oxygen level of the water body.

- 5. Biological oxygen demand (BOD) BOD values range between 0.2 1.6 mg/l, indicating that the river water is relatively clean. The BOD is mostly natural organic matter which forms the detritus/organic sink in the aquatic system. There is a possibility that BOD value might be increased when the bridge construction that would provide a river bottom disturbance locally and cause re-suspension of river bottom sediments will commence.
- 6. Chemical oxygen demand (COD) COD values range between 18.0 25.9 mg/l, indicating that complex organic compounds, e.g., microplants and glucose are both oxidized completely. However, that range is still in the low level, so it can be said that the Shire River water is relatively clean.
- 7. Phosphate Phosphate levels range between 0.019 0.032 mg/l, indicating that the phosphorous of the Shire River water is not limiting. This explains the proliferation of several aquatic plants in the water.
- 8. Turbidity Generally low with values normally less than 5 NTU.
- 9. Nitrate Nitrate levels range between 0.90 1.0 mg/l, which is quite normal for the surface water bodies of this nature (World Health Organization Guideline value is 10mg/l). The nitrate concentration should have resulted from the nitrification process and contributions from inorganic fertilizers washed away from upland agricultural fields. Some of the nitrate is also released from the decomposition process of organic matter, dead algae and other detritus materials. The low nitrate level suggests that the Shire River is clean and has not been affected by any big-scale wastewater discharge and agricultural run-off with high level nitrate concentration.

Construction of the bridge will increase the amount of the nitrates released upon the re-suspension of the deposited sediments.

- 10. Permanganate Values are generally above the 0.1mg/l (World Health Organization Guideline value, this is a value based on the aesthetic quality, not constitute a health risk).
- 11. Suspended solids SS values range between 1.8 8.7 mg/l. These are quite low values, indicating that the river around the Mangochi Bridge is relatively clean. This might be explained by the fact that the water body around this area does not receive any domestic/or industrial effluents.
- 12. E-Coli values range between 440 740, suggesting a healthy river system with a sound microbiological base.

7.2 Project Brief

The Republic of Malawi Ministry of Works and Supplies

THE FEASIBILITY STUDY

ON

THE RECONSTRUCTION OF MANGOCHI ROAD BRIDGE

IN

THE REPUBLIC OF MALAWI

ENVIRONMETAL IMPACT ASSESSMENT

PROJECT BRIEF

Submitted by

JAPAN INTERNATIONAL CO-OPERATION AGENCY NIPPON KOEI CO., LTD CHODAI CO., LTD

MARCH 1997

1. INTRODUCTION

The transportation of export and import of Malawi has depended upon northern corridor via Port Dar es Salaarn in Tanzania and southern corridor via Port Durban in South Africa since the transportation from Port Nacala deteriorated due the political turmoil and following inner war in Mozambique. Recently, because of recent termination of inner war in Mozambique, the Government of Malawi has placed high priority on the Nacala corridor improvement within its country. The existing Mangochi Bridge across the Shire River, a bridge facility on this Nacala corridor between Malawi and Mozambique, becomes fatigued because it has been 30 years since its operation started.

Within the Nacala corridor in Mozambique, the Government of Japan is implementing rehabilitation of three bridges with the grant aid, and the World Bank has the urgent road rehabilitation plan. Within the section of this corridor in Malawi, the feasibility study and detail design between the Mangochi Bridge and Chiponde has been completed by the aid of Kuwait Fund. Under these circumstances, the rehabilitation of the Mangochi Bridge becomes urgent matter in order to enhance the international transportation flow through the Nacala corridor.

2. PROJECT BRIEF

Reference is made to Appendix C of the Administrative Guidelines for Environmental Impact Assessments which sets out requirements for an acceptable Project Brief, including Draft Terms of Reference for the study and the approval prior to the implementation of the main body of the work (See Appendix 1).

C.1.1 The nature of the project

The main purpose of this project is to carry out the feasibility study on the reconstruction of Mangochi Bridge targeting year 2005. The area of concern covers the existing Mangochi Bridge across the Shire River and the area around related candidate bridge routes (three alternative bridge routes and five alternative structure designs, that will be described later, are to be considered).

C.1.2 Activities to be undertaken

The new bridge will make the access (market, work, school, cultural event and so on) to/and from each side of the river easier. In addition, it will enhance the transportation of Nacala corridor after the entire road rehabilitation project of this corridor is completed.

C.1.3 The possible products and by-products anticipated

This new bridge project will provide a new landmark at the waterfront of Upper Shire River around Mangochi town.

C.1.4 The number of people the project will employ

Precise number of people to be employed in this project depends on the type of bridge to be chosen, that is currently investigated through this feasibility study. So, it is difficult to provide exact information about this issue at this moment. However, roughly 40 through 50 workers will be hired temporally during the bridge construction period. After its construction, the maintenance and the operation of the new bridge will be transferred to the local government.

C.1.5 The area of land, air or water that may be affected.

During the construction period, the temporal water quality degradation at the downstream side of the Shire River might occur due to the bridge pier construction. Also, minor bank cut or embankment due to the access road construction at both ends of new bridge will take place. Minor resettlement or relocation of the facility close to the new bridge route might be required (depending on the new bridge route to be selected). Erosion or sedimentation around the pier of the new bridge might occur due to the change of the river cross-section.

C.1.6 Any other matters

C.1.6.1 Basic Description

There are three (3) alternative plans for bridge route and five (5) for bridge-design type, respectively. The best bridge plan will be selected among those alternatives, reflecting several evaluation factors such as (1) approximate construction and maintenance cost, (2) construction period, (3) structural characteristic, (4) availability of local materials, (5) technique transfer, (6) social and environmental impact, (7) land acquisition and compensations, and (8) conformity with existing facilities.

C.1.6.2 The stage in the project cycle

This investigation is at the feasibility study level, so it is very difficult to provide more detailed information about the new bridge construction schedule at this stage.

APPENDIX 1. Draft Terms of Reference for the Environmental Impact Assessment Study of the Feasibility Study on the Reconstruction of Mangochi Road Bridge in the Republic of Malawi.

Followings are major tasks to be studied in this EIA study after the route and the structure design type of the new bridge is finalized.

- 1. To summarize current water use practice and the water quality of the Shire River, in consultation with the Ministry of Water Development, and describe the importance of the Shire River as water resources to the local community around the project site.
- 2. To describe the scale of temporal water quality degradation caused by the bridge construction (pier, embankment or cut) during the construction period.
- To describe the likelihood of the sedimentation or erosion caused by the bridge construction, and evaluate those effects on the local flow pattern around the project site.
- 4. To describe the effect of the bridge construction on the floatation of the Water Hyacinth and Sudd islands around the project site.
- 5. To describe the status of the fish and wildlife such as crocodile and hippopotamus around the project site (type of species, their behavioral pattern and value to the local populace).
- 6. To describe the vegetation at both river banks around the project site and evaluate the impact of the bridge construction and its approach road.
- 7. To summarize the current activity of the local fishery operating around the project site, and to describe the effect of the bridge construction on their livelihood (e.g., new employment opportunities).
- 8. To describe the socio-cultural and economic activities of the community including their small local fishery around the project site.
- 9. To describe the current land use practice in the vicinity of the project sites, and evaluate the impact of the bridge construction and its approach road on surrounding residential area, business activities, historical monuments, traffic movement and pedestrian and cyclist' safety.

Detector of Environmental Affairs

ENVIRONMENTAL AFFAIRS DEPARTMENT PRIVATE BAG 394 LILONGWE 3 MALAWI

2nd April, 1998

Mr. Takanori Hayashida Chodai Co. Ltd. c/o Wendel's Guest House P.O. Box 31037 Lilongwe 3.

Dear Mr. Hayashida,

RE: OUTCOME OF REVIEW OF THE PROJECT BRIEF FOR THE MANGOCHI BRIDGE RECONSTRUCTION PROJECT

We have now completed our review of the above-noted project brief which you submitted on behalf of your client, the Ministry of Works and Supplies, Government of Malawi.

We have attached the comments that we have received from our technical reviewers on the project brief for your reference.

Based on the above-noted review comments, and on the review of the project brief conducted by this office, we conclude that an environmental impact assessment (EIA) of this project will be required. Furthermore, we advise that the following changes be made to the draft terms of reference for the EIA that you submitted.

First, to make the best informed decision about the alternative bridge designs and locations, one has to evaluate them based on technical criteria and public preference. In other words, EIA must be conducted of each of

the alternatives being considered, not just of the alternative selected, as the first sentence in your draft ToRs implies.

Second, for each of the ToRs where you are proposing to describe an environmental situation and evaluate the project's environmental effects, you must also recommend how those effects will be mitigated and by whom.

Third, the following specific revisions to your draft ToRs should be made:

- ToR #1 should be re-written to read: "To summarise current water use practice and the water quality of the Shire River, in consultation with the Ministry of Water Development, and describe...."
- The words: ".....currently generated by the eutrophication of Lake Malawi and the Upper Shire River...." from ToR #4 should be deleted.
- ToR #9 should be expanded to read: ".....on surrounding residential areas, business activities, historical monuments, traffic movement and pedestrian and cyclists' safety."

Fourth, the following new terms of reference should be added to the list of things that the EIA of the Mangochi Bridge Reconstruction Project will consider:

 To study the relationships, in consultation with Malawi Railways, between improving the Nacala road corridor and improving the Nacala railway corridor;

= then Dark

- To design the final bridge structure to allow the best possible boat navigability on the Shire River and the best possible movement of vehicles, bicycles and pedestrians on the bridge;
- To minimise the relocation of people and the costs and administrative difficulties associated with human relocation;

• To study the future plans for the development of Mangochi Boma and the Mangochi Lakeshore so that the bridge design and location are consistent with these plans;

• To study the environmental effects of the temporary aspects of the bridge construction (e.g. workers' camp, quarry stone mining) and to recommend measures by which these effects will be minimised;

• To study the implications, if any, of the Shire River Flow Augmentation Project at Samama on the bridge project; and

• To involve the local communities in deciding on what the best bridge design and location would be.

We trust that the above provides you with clear guidance on what the EIA of the Mangochi Bridge Reconstruction should consider. In terms of the structure of the EIA report that you need to submit, Appendix C of the Malawi EIA Guidelines provides details on this issue.

Should you have any questions on may of the foregoing, please do not hesitate to contact us.

Yours sincerely,

Peter W, Somers

MANGOCHI BRIDGE ACTIVITY SURVEY

A. BACKGROUND INFORMATION

Survey Date

Occupation Age Sex M/F

Education

No. of years staying at Mangochi yrs

Staying at East / West side of the Shire River

How far from your house to Mangochi Bridge?

B. BRIDGE RELATIONSHIP

- 1. What kind of changes will take place if the bridge is improved?
- 2. Any ethnic groups/indigenous people likely to be affected by the bridge?
 - a. If yes, how?
 - b. No
- 3. Any rare animals (game, bird, fish, amphibian, others) around the bridge?
- 4. Any cultural / historical / archeological / conservation / religious places near the existing bridge?
 - a. If yes, Which place & Where?
 - b. No
- 5. Any opinions if the new bridge construction would temporally affect any cultural / historical / archeological / conservation / religious places you mentioned in question 4?
- 6. Any opinions if any cultural / historical / archeological / conservation / religious places you mentioned in question 4 will be relocated due to the new bridge construction?
- 7. Any opinions about the bridge attracting new settlers? If you have, please answer following questions.
 - a. Likely origins/ ethnicity of new settlers?
 - b. How many?
 - c. Their kind of work?
- 8. Any opinions or possibility that a new bridge may lead to:
 - a. Environmental degradation (specify)
 - b. More market access
 - c. Availability of more services
 - d. More educational opportunities
 - e. More employment opportunities

- f. More spread of diseases g. Fish losses
- h. Other impacts (specify)
- 9. Any thoughts on the potential national/international significance of the bridge?

C. CURRENT EXISTING BRDIGE USE ACITIVITY

No. of Times/week

Travel Mode

- 1. Go to a. Work.
 - b. Visit Relatives, Friends
 - c. Church/or Mosque
 - d. School
 - e. Clinic
 - f. Store, Market
 - g. Post office, Bank
 - h. Government office
 - i. Home
 - j. Others (specify)
- 2. Attend
- a. Community Meeting
- b. Sports, Party, Event
- c. Others (specify)

D. WATER RESOURCES

- 1. Source of drinking water from:
 - a. Shire River without treatment
 - b. Well
 - c. Town water supply system
 - d. Others (specify)
- 2. Quality of the water
 - a. Pure
 - b. Little salty
 - c. Others (specify)
- 3. Water for other uses:

Sources

Daily amount

Quality

- a. Irrigation
- b. Livestock
- c. Cleaning
- d. Others (specify)
- 4. How has source of water changed over the years?

- 5. Do you go to the banks of the Shire River to do laundry?
 - a. If Yes, how often (No./day)?
 - b. No

E. BIOTA AND ENVIRONMENT

- 1. What are the current main local environmental concerns or issues?
- 2. If the new bridge is built, what will be the main local environmental concerns or issues?

F. FISHERY

- 1. Do you catch any fish at the Shire River for your Eating/ or Selling?
 - a. If yes, How often (No./ week), quantity, and the type of fish?
 - b. No, but I used to, How often (No./ week), quantity, and the type of fish?
 - c. No.
- 2. What are the current main local fishery concerns or issues?
- 3. If the new bridge is built, what will be the main local fishery concerns or issues?
- 4. Any opinions about the sustainable local fishery industry?

G. MISCELLANEOUS

- 1. If the community should desire to undertake this new bridge construction project, what should be the priorities?
- 2. Beside this new bridge project, what kind of infrastructure improvement project would be necessary for the community?

THANK YOU FOR YOUR CO-OPERATION !! ZIKOMO! !

Too many fishermen	1
High fish price	1
Loan for fishermen	1

(3) F-3 If the new bridge is built, what will be the main local fishery concerns or issues?

ATTRIBUTE	Results
None	83
Fishing ban	4
Fish resources depletion	40
Threatened by crocodile.	2
Navigation clearance for fishing boat	1
Flood control	1
More fish transport	11
More employment	2
Fish price hike	2
Fish price down	4
More accessibility to fish port	2

(4) F-4 Any opinions about the sustainable local fishery industry?

ATTRIBUTE	Results
None	59
New fish regulation	63
Monopolization of local fish industry by MADECO	1
Civic education to fishermen	21
New job training for fishermen (with loan)	3
Local land use near the river	1
Recent water quality degradation	1

G. Miscellaneous

(1) G-1 If the community should desire to undertake this new bridge construction project, what should be the first priority?

ATTRIBUTE	Results
Bridge structure design (2 lanes,	128
enough space for pedestrians &	
enough cycle track, paved surface and	
so onlike Liwonde barrage).	
Should be 1-way	2
Same to existing bridge	1
Resettlement	10
Temporally access	12
Environmental conservation	2
None	6

(2) G-2 Beside this new bridge project, what kind of infrastructure improvement project would be necessary for the community?

ATTRIBUTE	Results
Modern market	36
School & hospital	49
Road improvement	47
More employment	11
Housing	6
Water supply	8
Post office	5
Transportation	3
Reopen airport	2
Community Hall	2
Public Toilet	2
Police station	2
Others	5
None	9

Appendix E Guidelines on Maximum Sound Levels

Location	Measurement Position	Recommended Maximum Sound Level		
Village adjacent to work sites	1 m from the nearest building	Rating level 7 dB (A) above residual sound level.		
Villages adjacent to access roads	1 m from the nearest building	Rating level of 60 dB (A) and maximum sound pressure level of 70 dB (A).		
Schools	Inside classroom with partially opened windows	Rating level of 40 dB (A)		
Health Clinics/ Hospital	Inside building with partially opened windows	Rating level of 45 dB (A)
